## 前言

經修正的《1974年國際海上人命安全公約》(簡稱《安全公約》)涉及海上安全的各個方面，並在第VI章A和B部分以及第VII章A-1部分中分別包括了固體散裝貨物的裝運和散裝固體危險貨物裝運的強制性規定。《國際海運固體散貨規則》對這些規定作了詳述。

固體散貨運輸船的消防的具體安排以第10和19條納入了《安全公約》第II-2章中。請注意經修正的《安全公約》第II-2/19.4條。它規定，為2002年7月1日或以後建造的、裝運《公約》第VII/7條界定的散裝固體危險貨物(第6.2和7類除外)的船舶簽發一份適當文書，作為船舶構造和設備符合第II-2/19條要求的證明。

對於：

- 在1984年9月1日以後但在2002年7月1日之前建造的500總噸或以上的貨船；或
- 1992年2月1日以後但在2002年7月1日之前建造的低於500總噸的貨船，

適用經第MSC.1(XLV)、MSC.6(48)、MSC.13(57)、MSC.22(59)、MSC.24(60)、MSC.27(61)、MSC.31(63)和MSC.57(67)號決議修正的《1974年安全公約》第II-2/54條的要求，(見《安全公約》第II-2/1.2條)。

對於在1984年9月1日以後但在1992年2月1日之前建造的500總噸或以下的貨船，建議締約國政府儘可能將該適用擴大至這些船舶。

參加 1960 年國際人命安全會議的代表認識到裝運散貨的有關問題，但除散裝穀物除外，當時不可能形成詳細要求。不過，會議在公約 D 附則第 55 條建議在國際海事組織的幫助下起草一套國際上接受的散貨運輸安全實用規則。該工作由該組織的集裝箱和貨物分委會承擔，自 1965 年初版以來，《國際固體散貨安全適用規則》（《散貨規則》）已數度改版。該分委會曾擴大，以包括危險貨物，現在它被稱作危險貨物、固體散貨和集裝箱分委會。

船運固體散貨的主要危險是貨物分佈不均引起的結構損壞、航行期間失去或減小穩性以及貨物化學反應的有關危險。因此，該《規則》的主要目的是通過提供船運某些種類的固體散貨的危險的相關資料和在完成固體散貨船運時採用的程序的有關說明，便利固體散貨的安全積載和船運。運輸散裝穀物的要求載於《國際散裝穀物安全運輸規則》（《1991 年國際穀物規則》）中。

以第 MSC.268（85）號決議通過的《固體散貨規則》曾被推薦給各會員國政府，以在履行經修正的《安全公約》規定的義務時採納並用作國內法規的基本文件。從 2011 年 1 月 1 日起，本規則根據《公約》的規定具有強制性。但是，規則中的某些部分仍然為建議性或資料性的。需要強調的是，就本規則的文字而言，“Shall”、“Should”和“May”等詞用於《規則》時，係指其有關規定分別為“強制性”、“建議性”和“選擇性”的。遵守本規則將協調有待遵循的操作做法程序以及在裝載、平艙、裝運和卸載海上運輸的固體散貨時將採取的適當預防措施，從而確保符合《安全公約》的強制性規定。

本規則已在結構和內容方面歷經修改，以跟上行業的發展和進步。本組織大會授權海安會通過本規則修正案，使海事組織能夠對運輸發展迅速作出響應。

海安會在第 85 屆會議上同意，為便利固體散貨的安全運輸，在本規則於 2011 年 1 月 1 日正式生效前，可在自願的基礎上從 2009 年 1 月 1 日起實施，沒有任何過渡時期。第 MSC.268 (85) 號決議對此作了詳述。

## 第 1 節

### 一般規定

#### 1.1 註釋

1.1.1 應注意到，存在其他國際和國家規則，那些規則可能承認本規則的全部或部分。此外，港口當局和其他機構和組織應承認本規則，可把它用作其裝卸區內的存放和裝卸細則的基本文件。

#### 1.2 列入本規則的貨物

1.2.1 目前散貨運輸的典型貨物以及關於它們的特性和裝卸方法的建議列於各個貨物明細表。但是，這些明細表並非詳盡無遺，所列出的貨物性質僅供作指導用。因此，裝貨前需從託運人那裏獲得交運貨物的物理和化學性質的最新而有效的資料。託運人須提供關於裝船貨物的充分信息（見第 4.2 節）。

1.2.2 如一種固體散貨詳細列於本規則附錄 1（固體散貨明細表）中，除本規則第 1 至 10 節和第 11.1.1 節的規定外，它還須按照其明細表的規定予以運輸。必要時，船長須就有效並適用的裝運要求諮詢裝貨港和卸貨港主管機關。

#### 1.3 未列入本規則的貨物

1.3.1 如果一種未列入本規則附錄 1 的固體貨物擬交付散裝運輸，託運人須在裝貨前按照本規則第 4 節要求向裝貨港主管機關提供該貨物特性資料。基於所收到的資料，主管機關將對安全運輸的可能性進行評估。

1.3.1.1 當估計擬裝運的固體散裝貨物會呈現出第 1.7 節定議的本規則 A 或 B 組界定的那些危險時，需尋求卸貨港和船旗國主管機關的建議。三個主管機關將共商裝運該貨物的合適條件。

1.3.1.2 當估計擬裝運的固體散裝貨物不會呈現出運輸危險時，須批准裝運該貨物。並將此種批准通知該卸貨港和船旗國主管機關。

1.3.2 裝貨港主管機關須向船長簽發一份陳述該貨物特性以及要求的該貨物裝運和裝卸條件的證書。裝貨港主管機關還須在簽發證書後一年內將一份申請提交本組織，以便將該種固體散裝貨物納入本規則附錄 1 中。該種申請表格式須如第 1.3.3 節所列。

### 1.3.3 未列入本規則貨物的特性及裝運條件格式

#### 1.4 本規則的適用和實施

1.4.1 本規則中的規定適用於經修正的《安全公約》適用的、裝運《公約》第 VI 章 A 部分第 1-1 條界定的固體散裝貨物的所有船舶。

1.4.2 雖然本規則在法律上根據《安全公約》被視為強制性文書，但本規則中的下列規定仍然為建議性或資料性的。

第 11 節 保安規定（第 11.1.1 小節除外）；

第 12 節 積載因數換算表；

第 13 節 參考相關資料和建議；

除附錄 1 “固體散裝貨物明細表” 以外的附錄；和

附錄 1 中各固體散貨明細表的“描述”、“特性”、“危險性”和“應急程序”各節的文字。

1.4.3 在本規則的某些部分，規定了具體的行動，但貫徹行動的責任沒有具體劃給任何特定的人。此類責任可依不同國家的法律和習慣及它們參加的國際公約而異。就本規則而言，不必作者以劃定，但僅需要明確行動本身。劃定該責任依然是每一政府的特權。

## 1.5 免除和等效措施

1.5.1 如果本規則要求遵守固體散裝貨物運輸的某一特殊規定，一個或多個主管機關（始發港港口國、抵達港港口國或船旗國）在認為這樣的規定最起碼與本規則的要求具有同等的效果及安全時，可通過免除批准任何其他規定的規定。對沒參予該規定的主管機關接受根據本節批准的免除，由該主管機關自行決定。所以，在此種免除涵蓋的任何運輸之前，獲得此種免除的一方須通知其他有關的主管機關。

1.5.2 就有關免除採取主動行動的一個或多個主管機關：

- .1 須向本組織提交一份此種免除規定的副本，以由它提請《安全公約》締約國注意；和
- .2 須採取行動修改本規則，以酌情列入該免除條款。

1.5.3 免除的有效期限自批准免除之日起不得超過 5 年。第 1.5.2.2 節未包括的免除可根據本節規定予以續期。

1.5.4 免除規定的副本或電子副本須酌情按照免除規定留存在運輸固體散裝貨物的船舶上。

1.5.5 有關的主要被指定國家主管機關的聯繫資料載於本組織分發的另一文件中。

## 1.6 公約

經修正的《安全公約》第 VI 章 A 和 B 部分以及第 VII 章 A-1 部分分別涉及固體散裝貨物的裝運以及散裝固體危險貨物的裝運，並全文重述如下。本摘錄包括預計於 2011 年 1 月 1 日生效的修正案。

### 第 VI 章 貨物的裝運 A 部分 一般規定

#### 第 1 條

##### *適用範圍*

1 本章適用於因其對船舶或船上人員的特別危險性而需在本規則所適用的一切船舶上及在小於 500 總噸的貨船上採取特別預防措施的貨物的裝運（散裝液體、散裝氣體和其他章節已作出裝運規定者除外）。但是，對小於 500 總噸的貨船，如果主管機關認為因航行的遮蔽性和條件，適用本章 A 部分或 B 部分的任何具體

要求為不合理或不必要，則可採取其他有效措施確保這些船舶的所需安全。

2 為補充本章 A 部分和 B 部分的規定，每一締約國政府須保證提供有關貨物及其積載和繫固的有關資料，特別說明安全裝運此類貨物所需的預防措施。

### **第 1-1 條**

1 裝運除穀物以外的固體散裝貨物須符合《*固體散貨規則*》的有關規定。

### **第 2 條**

#### *貨物資料*

1 託運人須在裝貨前及早向船長或其代表提供關於該貨物的有關資料，以使為此類貨物的適當積載和安全裝運所必需的預防措施得以付諸實施。此類資料須在貨物裝船前以書面形式和適當的運輸單證予以確認。

2 貨物資料須包括：

.1 對於雜貨和以貨物單元運輸的貨物，應有貨物的一般說明、貨物或貨物單元的毛重和貨物的任何有關特性。就本條而言，須提供本組織以第 A.714 (17) 決議通過並可能經修正的《貨物積載和繫固安全實用規則》第 1.9 節所要求的貨物資料。第 1.9 節的任何修正案須按照有關《公約》附則除第 I 章外的適用修正案程序的《公約》第 VIII 條規定予以通過、實施和生效；

.2 對於固體散貨，應有《國際海運固體散貨規則》第 4 節要求的資料。

2 主管機關須採取措施，確保船員在上述儀器使用方面受到培訓。

## 第 4 條

### *船上使用殺蟲劑*

在船上使用殺蟲劑，尤其是為熏艙而使用殺蟲劑時，須採取適當預防措施。

## 第 5 條

### *積載和繫固*

- 1 在甲板上和甲板下裝運貨物、貨物單元和貨物運輸單元，其裝載、積載和繫固須儘可能防止在整個航程中對船舶和船上人員造成損害或危險，以及防止貨物落水滅失。
- 2 貨物、貨物單元和貨物運輸單元，其在單元中的包裝和繫固須能防止在整個航程中對船舶和船上人員造成損害或危險。
- 3 在重型貨物或異常外形尺寸貨物的裝載和運輸過程中，須採取適當的預防措施，確保不發生船舶結構性損壞，並在整個航程中保持足夠的穩性。
- 4 在滾裝船上貨物單元或貨物運輸單元的裝載和運輸過程中，須採取適當的預防措施，特別是注意這種船上和貨物單元和貨物運輸單元上的繫固裝置，以及繫固點和捆索的強度。
- 5 貨運集裝箱的裝載須不超過經修正的《國際集裝箱安全公約》（CSC）規定的安全認可牌上註明的最大總重量。

的船舶，須在離開泊位之前按照《貨物繫固手冊》完成所有這些貨物、貨物單元和貨物運輸單元的繫固。《貨物繫固手冊》的編製標準須至少與本組織制定的相關指南相當。

## 第 5-1 條

### 物質安全資料單

- 1 裝運《1973 年防止船舶造成污染國際公約的 1978 年議定書》附則 I 附錄 I 中定義的 MARPOL 附則 I 貨物和船用燃油的船舶，應在載運這些物質之前，按本組織制定的建議案提供一份物質安全資料單。

## B 部分

### 固體散裝貨物的特別規定

## 第 6 條

### 裝運的可接受性

- 1 在固體散裝貨物裝船前，船長須得到有關船舶穩性和標準裝載條件下貨物分佈的綜合資料。提供此類資料的方法須令主管機關滿意。

## 第 7 條

### 散裝貨物的裝卸和積載

- 1 就本條而言，碼頭代表係指船舶裝卸貨物的碼頭或其他設施使用方指定的人員，他負責該碼頭或設施為特定船舶執行的作業。

2 為使船長能防止船體結構中產生過大應力，須給船舶配備一本小冊，它須以負責貨物作業的高級船員所熟悉的語言寫成。如該語言文字不是英文，則船上也須配備一本以英文寫成的小冊。該小冊須至少包括下列內容：

- .1 第 II-1/5-1 條所要求的穩性數據；
- .2 加壓載和減壓載的速率和能力；
- .3 內底板上單位表面積的最大許用載荷；
- .4 每艙最大許用載荷；
- .5 有關船體結構強度的一般裝卸須知，包括對裝卸貨物、壓載作業及航行期間的最不利作業狀態的任何限制；
- .6 任何特別的限制，例如主管機關或由其認可的組織所施加的最不利作業狀態的限制（如適用）；和
- .7 如要求強度計算，在裝卸貨物及航行期間船體上的最大許用載荷和力矩。

3 在裝或卸固體散裝貨物之前，船長和碼頭代表須商定一項計劃，該計劃須確保在裝卸貨物期間不超過船上的許用應力和力矩，同時還須包括裝卸貨物的次序、數量及速率，同時應考慮到裝卸貨物的速度、船上添注口的數量及減壓載或加壓載的能力。該計劃及其後的任何修改，須提交給港口國的有關當局。

4 船長和碼頭代表須確保裝卸貨物作業按照商定的計劃進行。

5 如果在裝或卸貨物期間，本條第 2 款所述的對船舶的任一限制已經超出或者如果裝卸繼續進行下去可能導致超出，則船長有

權中止裝卸作業並有責任將此通知給批准這個計劃的港口國有關當局。船長和碼頭代表須確保採取糾正措施。當卸貨時，船長和碼頭代表須確保卸貨方法不損壞船體結構。

6 船長須確保船上人員連續不斷地監視貨物裝卸作業。如有可能，在裝卸貨物期間須定期校核吃水以確認提供的噸位數。每次測得的吃水和噸位數須記入貨物日誌。如發現與商定的計劃有顯著的偏差，則須調整貨物裝卸或壓載作業，或兩者，以確保偏差得到糾正。

## 第 VII 章

### 危險貨物的裝運

#### A-1 部分

#### *固體散裝危險貨物的裝運*

### 第 7 條

#### *定義*

*固體散裝危險貨物*係指《國際危規》涵蓋的除液體或氣體以外的、直接裝入船舶裝貨處所而不需任何中間容器的、由成分大體一致的微粒、顆粒或任何較大塊碎片組成的任何物質，包括裝入載駁船上的駁船內的此類物質。

### 第 7-1 條

#### *適用範圍*

2 每艘裝運固體散裝危險貨物的船舶須具有一份特別清單或艙單，列出船上危險貨物及其位置。標明所有危險貨物的類別並表明其在船上位置的詳細的配載圖，可用來代替上述特別清單或艙單。船舶駛離前應備有一份這些單證的副本，以供港口國當局指定人員或組織使用。

## 第 7-3 條

### 積載和隔離要求

1 固體散裝危險貨物須按其性質安全和適當地予以裝載和積載。對於互不相容的貨物，應將其彼此分開。

#### 第 7-5 條

##### *固體散裝危險貨物的裝運要求*

固體散裝危險貨物的裝運須符合第 VI/1-1.1 條界定的《固體散貨規則》的相關規定。

### 1.7 定義

就本規則而言，除另有明文規定外，下列定義須適用：

靜止角

1.7.2 散裝貨物船運名 (BCSN) 用於在海上運輸中識別一種散貨。如果一種貨物被列於本規則中，該貨物的“散裝貨物船運名”由各明細表或索引中的大寫字母來識別。如果該貨物為《安全公約》第 VII/1.1 條界定的危險貨物，該貨物的“正確船運名”即為其“散裝貨物船運名”。

1.7.5 易流態化貨物係指至少含有部分細顆粒和一定量水份的貨物。在運輸中，如果這些貨物的水分含量超過其適運水分極限，會流態化。

1.7.6 黏性物質係指除非黏性物質以外的物質。

1.7.7 主管當局係指就本規則任何相關目的指定或認可的任何國家法規機構或當局。

1.7.8 精礦係指通過濃縮或精選過程，利用物理或化學的方法從原礦中分離並去除不需要的成分而得到的物質。

- 1.7.9 交運貨物係指託運人委託運輸的固體散裝貨物。
- 1.7.10 流動水分點係指使物質的代表性樣品在規定的試驗過程中（見附錄 2 第 1 段）產生流態的含水百分比（按濕重計）。
- 1.7.11 流態係指顆粒狀物質內飽含液體時，由於振動、撞擊或船舶搖擺等外部因素的影響，喪失其內部抗剪強度而呈現出如同液體一樣的狀態。
- 1.7.12 A 組包括在超出適運水分極限進行船運時可能會流態化的貨物。
- 1.7.13 B 組包括會使船舶產生危險局面的具有化學危險的貨物。
- 1.7.14 C 組包括既不易液化（A 組）也不具有化學危險（B 組）的貨物。

## 第 2 節

### 一般裝載、裝運和卸載預防措施

#### 2.1 貨物的分佈

##### 2.1.1 概述

一些事故的發生是因為不當裝載和卸載固體散裝貨物而造成的。為使船舶具備足夠的穩性和使其結構不超過其強度負荷能力，須注意確保固體散裝貨物在全船的合理分佈。此外，託運人須向船長提供第 4 節中所要求的所運貨物的充分信息，以確保船舶的適當裝載。

##### 2.1.2 防止結構超負荷

雜貨船的構造一般在滿載時積載因數約為  $1.39\text{m}^3/\text{t}$  至  $1.67\text{m}^3/\text{t}$  的貨物。當裝載高密度固體散貨時，須特別注意貨物重量的分佈，以免產生過度應力；要考慮到由於某些貨物的密度較大，不合理的重量分佈可能會使承載貨物的局部結構或整個船體的應力過大。由於每艘船舶結構佈置千差萬別，為所有船舶的荷載分佈作出確切的規定是不實際的。因此，可向船長提供穩性資料手冊中提及的貨物適當分佈信息和使用配載計算機所得出的結果（如有的話）。

##### 2.1.3 維護船舶穩性

2.1.3.1 考慮到經修正的《1974 年國際海上人命安全公約》第 II-1/22.1 條，在受公約約束的所有船舶上須配備穩性資料手冊。船長須能夠計算出預期航程中最惡劣狀態下以及離港時的船舶穩性，計算結果應表明有足夠穩性。

2.1.3.2 當將有可能產生移動的散貨裝載在二層艙處所中或貨物處所只有部分裝滿時，則須設置具有足夠強度的防移板或防移箱。

2.1.3.3 高密度貨物須儘可能裝載在底艙而不是二層艙處所中。

2.1.3.4 如果需要將高密度貨物裝載在二層艙或較高的貨物處所內，須充分注意保證其下的甲板不得超負荷，並且船舶的穩性不得小於提供給船長的船舶穩性信息手冊中規定的最小允許值。

## **2.2 裝載和卸載**

2.2.1 裝貨前須檢查和準備貨物處所，使其適於擬裝的特定貨物。

2.2.2 應充分注意保持污水井和濾板暢通無阻，做好特殊準備很有必要，以防止貨物落入污水排放系統。

2.2.3 污水管、測深管和貨物處所內的其他管系須處於良好狀態。

2.2.4 考慮到高密度散貨的裝載速度，可能有必要採取特別措施以防貨物處所設備受到損壞。在完成裝載後，測量污水可能是查出貨物處所設備損壞的有效辦法。

2.2.5 若可能，為最大限度地減少粉塵進入船舶生活區或其他艙室，在裝載或卸貨期間須關閉或遮蓋通風系統並將空調系統（如有的話）調為內部循環。

2.2.6 須充分注意儘可能減少粉塵與甲板機械及室外助航儀器的活動部件的接觸。

## 第 3 節

### 人員與船舶安全

#### 3.1 一般要求

3.1.1 在裝載、裝運和卸載散裝固體散貨之前和期間，須遵守所有必要的安全預防措施。

3.1.2 每艘船舶須配備一套處理散裝固體危險貨物事故的應急反應和醫療急救指南。

#### 3.2 中毒、腐蝕和窒息危險

3.2.1 某些散裝固體貨物易於氧化，從而造成缺氧、散發毒氣或煙霧及自熱。某些貨物不易於氧化，但可能散發毒性氣體，尤其是在潮濕時。還有一些貨物潮濕時對皮膚、眼睛、黏膜或對船舶結構具有腐蝕性。在裝運這些貨物時，須特別注意人身防護以及在裝載前或卸載後採取必要的特別預防措施。

3.2.2 須適當注意貨物處所及其毗鄰處所可能缺氧或存在毒性或窒息性氣體，而且曾在一段時間內保持關閉狀態的空貨物處所或液艙中的氧氣可能不足以維持生命。

3.2.3 很多固體散裝貨物容易在貨物處所或液體艙內造成缺氧。這類貨物包括但不限於大多數植物和林木製品、黑色金屬、硫金屬礦和貨煤等。

3.2.4 進入船上封閉處所之前，須遵守適當的程序，同時考慮國際海事組織制訂的建議案。需要注意，經測試發現可安全進入的貨物處所或液艙中，仍可能存在缺氧或存在有毒氣體的局部區域。

3.2.5 在運輸易散發有毒氣體或易燃氣體和（或）易造成貨物處所缺氧的散貨時，須配備可測量貨物處所內氣體或氧氣濃度的合適儀器。

3.2.6 在緊急情況下進入貨物處所時，須配戴自給式呼吸器和防護服，總是在負責高級船員的監督下由經過訓練的人員進入。

### 3.3 粉塵對健康的危險性

為了將因人體暴露於某些固體散貨粉塵中所造成的慢性和急性危險減小到最低程度，那些暴露於粉塵中的人員需要高標準的個人衛生，這一點無論怎樣強調也不過分。須根據需要採取預防措施，包括使用合適的呼吸保護裝置、穿防護服和塗抹護膚膏、充分的人體沖洗和外衣洗滌。

### 3.4 易燃空氣

3.4.1 某些固體散裝貨物產生的粉塵會構成爆炸危險，特別是在裝載、卸載和清掃時。通風以防止形成充滿粉塵的空氣以及用水龍頭沖洗而不用掃把清掃，會使爆炸危險減至最小。

3.4.2 某些貨物可能放出大量的可燃氣體，足以構成火災或爆炸危險。若貨物的這一性質列明在本規則貨物明細表中或者託運人提供貨物信息中，則貨物處所須根據需要進行有效通風。須使用適當氣體探測器對貨物處所內的空氣進行監測。須充分注意通風和監測貨物處所的毗鄰封閉處所中的空氣。

### 3.5 通風

3.5.1 除非另有明文規定，在所裝運的貨物可能釋放有毒氣體時，須為貨物處所提供機械或自然通風；在所裝運的貨物可能釋放易燃氣體時，須為貨物處所提供機械通風。

3.5.2 如果保持通風會危及船舶或貨物安全，則可以中斷通風，除非中斷通風會造成爆炸危險。

3.5.3 如本規則明細表或託運人提供的貨物信息要求對某貨物保持通風，當貨物在艙內時，則須保持通風，除非出現通風將危及船舶的情況。

3.5.4 擬裝載需要持續通風的貨物的貨物處所須裝有在需要時能保持開啟狀態的通風口。這種開口須滿足經修訂的《載重線公約》關於無關閉裝置的開口的要求。

3.5.5 通風系統須防止任何泄漏的危險氣體、蒸氣或粉塵到達生活艙室或有危險濃度的其他內部處所。須充分注意防止任何泄漏的危險氣體、蒸氣或粉塵飄到工作處所。採取充分預防措施保護那些工作處所人員的安全。

3.5.6 如貨物會發生自熱，不得採用表面通風以外的通風。絕不能將空氣送入貨物堆中。

### 3.6 正在途中熏蒸的貨物

須按照本組織制訂的建議案進行熏蒸。

## 第 4 節

### 評定貨物的安全適運性

#### 4.1 識別和分類

4.1.1 本規則中的各種固體散貨均被指定一個散貨船運名 (BCSN)。如果某種散貨經海上運輸，須通過其散貨船運名在其運輸單證上對其予以識別。如果該貨物是危險貨物，散貨船運名須用聯合國 (UN) 編號加以補充。

4.1.2 如果廢棄貨物是為處置或為處置前加工而運輸，該貨物名稱前須標有“廢物”字樣。

4.1.3 散裝貨物的正確識別有利於確定安全裝運該貨物的必要條件和適用的應急程序。

4.1.4 固體散貨須酌情根據聯合國試驗和標準手冊第 III 部分的要求進行分類。若存在原產地國主管當局認可的試驗程序，本規則要求的固體散貨的各種特性須按照此種程序以適合該貨物的方式予以測定。若不存在此種試驗程序，固體散貨的那些特性須按照本規則附錄 2 所述的試驗程序以適合該貨物的方式予以測定。

#### 4.2 提供信息

4.2.1 在裝載前託運人須充分提前向船長或其代表提供貨物的適當信息，以便能夠採取必要的措施對貨物進行妥善積載和安全運輸。

4.2.2 這些信息須在貨物裝船前以書面形式和通過運輸單證予以確認。貨物信息須包括：

- .1 若該貨物已列入本規則，散裝貨物船運名。除散裝貨物船運名之外，還可使用第二名稱；
- .2 貨物組別（A 和 B、A、B 或 C）；
- .3 該貨物的海事組織類別，如適用；
- .4 該類貨物的聯合國編號，以字母 UN 開頭，如適用；

- .14 與水接觸釋放出易燃氣體的特性，如適用；
- .15 放射特性，如適用；和
- .16 國家主管當局要求的任何其他相關信息。

4.2.3 託運人提供的信息須隨附一份聲明。貨物聲明表格的樣本見下一頁。貨物聲明可用其他表格。可使用電子數據處理（EDP）或電子數據交換（EDI）技術，作為紙頭單證的輔助手段。

### 4.3 測試證書

4.3.1 為獲得第 4.2.1 節所要求的信息，託運人須安排貨物的妥善取樣和試驗。如本規則有要求，託運人須向船長或其代表提供適當的測試證書。

4.3.2 當船舶裝運精礦或其他貨物時，託運人須向船長或其代表提供一份經簽字的適運水分極限證書和一份經簽字的水分含量證書或聲明。該適運水份極限證書須包括或另附測定適運水份極限的試驗結果。該水分含量聲明須包括或附有託運人的聲明：就其所知和看法，在將該聲明提交船長時，貨物的水分含量是當時貨物的平均水分含量。

4.3.3 如果易流態化精礦或其他貨物擬裝入船上一個以上貨艙，則水分含量證書或聲明須證明裝入各艙中的每一種細顆粒貨物的水分含量。儘管有此規定，如果按國際或國家認可的標準程序進行的採樣表明貨物的水分含量對於整批貨物是均勻的，則可接受一份關於所有貨物處所平均水分含量的證書。

4.3.4 如果具有化學危險的貨物的明細表要求提交證書，該證書須包括或另附託運人聲明：就其所知，船舶裝貨當時的貨物化學性質即為證書中所列者。

#### 4.4 採樣程序

4.4.1 除非在裝貨前對真正有代表性的試樣進行試驗，否則對貨物的任何物理特性的測定都將毫無意義。

4.4.2 試樣的採集只能由受過採樣程序訓練的人員進行，並應在熟悉託運貨物特性以及適用的採樣原則和實踐的人員的監督下進行。

4.4.3 在採樣前，如果可行，須對將要裝船的託運貨物進行外觀檢查。對看上去受到沾染或者性質或水分含量與大部分散貨明顯不同的部分應予分別採樣和分析。根據這些測試所取得的結果，可能需要拒絕裝運不適合運輸的特定部分貨物。

4.4.4 試樣的採集所用技術須考慮到以下因素：

- .1 貨物的種類；
- .2 顆粒尺寸的分佈；
- .3 貨物的成分及其差異；
- .4 貨物的儲存方式，如堆積、裝在鐵路貨車或其他容器內；貨物的轉運或裝載方式，如利用傳送帶、裝貨滑槽、抓斗起重機等；
- .5 化學危險（毒性、腐蝕性等）；
- .6 需測定的特性：水分含量、適運水分極限、散貨密度/積載因數、靜止角等；

- .7 由於天氣和自然排水條件等，在整批貨物中水分分佈的差異，如水分向貨堆或容器底部的滲移或其他形式的移動；
- .8 因貨物凍結而產生的差異。

4.4.5 在採樣過程中，須特別注意防止品質和特性的變化。採樣後，試樣須立即存放在合適的密封容器中，並妥善作出標記。

4.4.6 除另有明文規定外，本規則要求的用於試驗採樣須按照國際或國家認可的標準程序進行。

#### **4.5 確定“適運水分極限”和“水分含量”的採樣/試驗與裝載的間隔期**

4.5.1 固體散裝貨物的適運水分極限的測定試驗須在裝貨之日前 6 個月內進行。儘管有此規定，如果貨物成分或性質因某種原因發生了變化，在有理由認為此種變化已經發生的情況下，須再次進行試驗以測定適運水分極限。

4.5.2 測定水分含量的採樣和試驗時間應儘可能與裝貨時間接近。若從試驗到裝貨期間遇到大的雨雪，則須進行核對試驗，以確保貨物水分含量仍低於適運水分極限。採樣/試驗與裝載的間隔期不得超過 7 天。

4.5.3 凍結貨物的試樣，須在全部解凍後測定其適運水分極限或水分含量。

#### **4.6 精礦貨堆的採樣程序**

4.6.1 因為物質的性質及其狀態會影響採樣程序的選擇，目前對所有貨物規定單一的採樣方法是不切實際的。如果沒有國際或國家承認的採樣程序，可使用下述精礦採樣程序來測定適運水分極限和水分含

量。這些程序無意取代可得出相等或更準確適運水分極限和水分含量的採樣方法，如使用自動採樣法。

4.6.2 如果從平整的貨堆中取樣，則子樣應在基本均佈的格點上採集。

4.6.3 畫出貨堆平面圖，劃分成區，根據待運精礦的數量，每區約包括 125 噸、250 噸或 500 噸。此平面圖將為採樣人員指出所需子樣的數量以及每一子樣的採集點。每一子樣應從指定區域的表面下約 50cm 處提取。

4.6.4 所需子樣的數量及試樣的重量應由主管當局確定，或按下述比例確定：

貨重在 15,000 噸以下時：

每 125 噸貨物應取子樣 200 克。

貨重超過 15,000 但少於 60,000 噸時：

每 250 噸貨物應取子樣 200 克。

貨重在 60,000 噸以上時：

每 500 噸貨物應取子樣 200 克。

4.6.5 用於測定水分含量的子樣，提取後應立即裝入密封的容器中（如塑料袋、罐、或小型金屬桶），以便運往試驗室。應在試驗室將子樣充分混合，以得到一份具有充分代表性的試樣。如果試驗場所沒有試驗設施，則子樣應在貨堆處在控制條件下混合，然後將代表性試樣裝入密封容器中運往試驗室。

4.6.6 基本採樣步驟包括：

- .1 確定擬採樣的貨物；
- .2 按第 4.6.4 節確定所需子樣和代表性試樣的數量；
- .3 確定子樣的採樣點和混合這些子樣以取得代表性試樣的方法；
- .4 收集各子樣並將它們封裝在密封容器中；
- .5 充分混合各子樣，以得到代表性試樣；和
- .6 如果需將試樣運往試驗室，則將代表性試樣封裝在密封容器中。

### 4.8 裝運危險貨物的船舶上要求配備的文件

4.8.1 每條裝運散裝固體危險貨物的船舶須持有一份符合《安全公約》第 VII/7-2.2 條的特殊清單或艙單，列明危險貨物及其位置。標明船載危險貨物類別及其所在位置的詳細積載圖可用來代替此特殊清單或艙單。

4.8.2 船上裝運散裝固體危險貨物時須隨船配備危險貨物事故或事件應急反應的適當說明。

4.8.3 需滿足《安全公約》第 II-2/19.4 條（或第 II-2/54.3 條）的 1984 年 9 月 1 日或以後建造的 500 總噸以上的貨船和 1992 年 2 月 1 日或以後建造的 500 總噸以下的貨船，在裝運散裝固體危險貨物（第 6.2 類和第 7 類除外）時，須持有《符合證明》。

## 第 5 節

### 平艙程序

#### 5.1 平艙的一般規定

5.1.1 對貨物平艙可減少貨物移動的可能性並能最大限度減少可能導致自熱的空氣進入貨物。為降低風險，必要時，對貨物須進行合理平艙。

5.1.2 為防止固體散貨移動，貨物處所須儘量裝滿，但不超過底艙或二層艙甲板強度。在考慮到貨物移動、縱向運動以及船舶應力的同時，適當考慮各貨物處所的固體散貨的總量。貨物應儘可能合理地散佈到貨物處所邊界。也可能需要考慮到《安全公約》第 XII 章所要求的隔艙裝載限制。

5.1.3 考慮到船舶特性及預定航程，若基於所提供的信息而對船舶穩性存在任何擔心，船長有權要求對貨物進行平艙。

#### 5.2 多層甲板船的特殊規定

5.2.1 如果固體散貨僅裝入底艙處所，則須進行充分平艙以使貨物重量均勻分佈在艙底結構上。

5.2.2 在二層艙中裝載固體散貨時，如果裝載資料載明，敞開二層艙蓋會使艙底結構的應力超負荷，則須關閉二層艙蓋。貨物須予以合理平艙並將貨面平至兩舷，或者利用具有足夠強度的縱向隔板進行穩定。須注意二層甲板的安全荷載能力，保證甲板結構不超載。

5.2.3 如果在二層艙中裝載貨煤，艙口須緊緊封閉以阻止空氣從艙口進入到二層艙中的煤體。

### 5.3 黏性散貨的特殊規定

5.3.1 所有潮濕貨物及某些乾散貨均具有黏性。第 5.1 節中的一般性規定適用於黏性散貨。

5.3.2 靜止角並非黏性散貨穩定性的可靠指標。因此，靜止角沒有被納入黏性貨物的各明細表中。

### 5.4 非黏性散貨的特殊規定

5.4.1 非黏性散貨為列於附錄 3 第 1 段的貨物以及顯示出非黏性物質特性的未列入該附錄的任何其他貨物。

5.4.2 從平艙的角度出發，固體散裝貨物可分為黏性和非黏性兩類。靜止角是表示非黏性散貨穩定性的一種特性並已包括在非黏性貨物各明細表中。貨物的靜止角決定適用本節哪些規定。確定靜止角的方法見第 6 節。

#### 5.4.3 靜止角小於或等於 30° 的非黏性散貨

這類貨物會像穀物一樣自由流動，須按適用於穀物積載的規定進行運輸。在確定下述各項時應考慮到散貨的密度：

- .1 隔板和漏斗型艙壁的尺寸和穩固佈置；和
- .2 自由流動的貨物面對穩性的影響。

#### 5.4.4 靜止角大於 30° 至並包括 35° 的非黏性散貨

這些貨物須按下述衡準平艙：

- .1 貨物表面的不平整程度即貨物表面最高點與最低點間的垂直距離 ( $\Delta h$ ) 不得超過  $B/10$ ，其中  $B$  為船寬 (m)， $\Delta h$  的最大允許值為 1.5 m；或
- .2 裝貨中使用經主管當局認可的平艙設備。

#### 5.4.5 靜止角大於 $35^\circ$ 的非黏性散貨

這些貨物須按下述衡準平艙：

- .1 貨物表面的不平整程度即貨物表面最高點與最低點間的垂直距離 ( $\Delta h$ ) 須不超過  $B/10$ ，其中  $B$  為船寬 (m)， $\Delta h$  的最大允許值為 2 m；或
- .2 裝貨中使用經主管當局認可的平艙設備。

## 第 6 節

### 確定靜止角的方法

#### 6.1 概述

非黏性貨物的靜止角須通過本規則第 4.1.4 節要求的經有關當局認可的方法予以測定。

#### 6.2 建議性測定法

用於測定非黏性固體散貨物質靜止角的方法多種多樣。該建議性測定法羅列如下：

##### 6.2.1 傾箱法。

這種試驗室測試方法適合粒度不大於 10 mm 的非黏性粒狀物質。在附錄 2 的第 2.1 段中詳細說明了該方法使用的設備和程序。

##### 6.2.2 船上測定法。

在沒有傾箱測量儀時，附錄 2 的第 2.2 段中給出了一種測定近似靜止角的替代方法。

## 第 7 節

### 易流態化貨物

#### 7.1 引言

7.1.1 本節旨在提請船長和其他負責散貨裝載和運輸的人員注意貨物移動的潛在危險以及最大限度降低此危險的預防措施。這類貨物在裝載時可能呈乾燥的顆粒狀，但卻可能含有相當的水分，由於航行中出現的沉積和振動作用使之流態化。

7.1.2 船舶運動可能引起的貨物移動足以使船舶傾覆。貨物移動可以分為兩種類型，即滑動危險或流態影響。根據第 5 節進行平艙可防止滑動危險。

7.1.3 某些易流態化貨物也可能發生自熱。

#### 7.2 危險性條件

7.2.1 A 組貨物含一定比例的小顆粒和一定水分。A 組貨物在航行中易流態化，即使貨物具有黏性並已平艙。流態化會導致貨物移動。這種現象可描述如下：

- .1 由於船舶運動使貨物密實，從而顆粒之間的空隙體積減小；
- .2 顆粒間的空隙減小引起水壓的增加；
- .3 水壓的增加減小了顆粒間的摩擦，造成貨物抗剪強度的減小。

7.2.2 如果滿足以下條件則不會出現流態化：

- .1 貨物含有非常細的顆粒。在這種情形裏，顆粒的運動受到黏性的限制，貨物顆粒間的空隙的水壓不會增加；
- .2 貨物由大顆粒和塊體組成。水通過顆粒間的空隙，不導致水壓的增加。完全由大顆粒組成的貨物不會流態化；
- .3 貨物內含空氣的百分比高，水分含量低。抑制了任何水壓的增加。乾燥貨物不易流態化。

7.2.3 當水分含量超過適運水分極限（TML）時，可能出現流態化造成的貨物移動。即使平均水分含量低於適運水分極限，有些貨物也易於出現水分滲移，形成危險的濕底。儘管貨物表面可能呈乾燥狀，導致貨物移動的不被察覺的流態化也可能出現。高水分含量的貨物易於滑動，尤其是當貨物很淺且遇到較大傾斜角時。

7.2.4 在形成的黏性流體狀態中，當船舶往一側傾斜時貨物可能流向船舶的一舷，但船舶往另一側傾斜時不一定完全回流。這樣，船舶可能會達到一個危險的傾斜角而突然傾覆。

### 7.3 易流態化貨物的規定

#### 7.3.1 概述

7.3.1.1 只有在實際含水量少於適運水分極限時，方可裝載易流態化的精礦或其他貨物。儘管有本規定，在專門建造或裝有專用設備的船舶上，即使貨物的含水量超出適運水分極限，也可裝載此類貨物。

7.3.1.2 除罐裝或類似包裝的貨物外的含液體貨物，不得裝在同一貨物處所中這些固體散裝貨物的上方或相鄰處。

7.3.1.3 在航行期間，須採取適當措施，防止液體進入載有固體散裝貨物的處所。

7.3.1.4 須警告船長，當船舶在海上時，用水冷卻這類貨物會產生危險。進水會使這類貨物的水分含量極易達到流動狀態。在必要時，須適當注意以噴灑的方式用水。

### 7.3.2 專門建造的或裝有專門設備的貨船

7.3.2.1 水分含量超過適運水分極限的貨物只能以專門建造的或裝有專門設備的船舶運輸。

7.3.2.2 專門建造的貨船設有永久性結構限界，其佈置可將貨物的移動限制在允許的範圍內。這種船舶須攜帶其經主管當局批准的證明。

7.3.2.3 裝有專門設備的貨船須裝有專門設計的可拆卸的分隔，以將貨物的移動限制在允許的範圍內。裝有專門設備的船舶須符合下列要求：

- .1 這種專門設備的設計和安裝，須不僅能充分抵禦高密度散貨的流動所產生的強大衝力，而且能滿足將貨物在艙內流動所產生的潛在橫傾力矩減小到允許的安全水平內的要求。滿足這些要求的防移分隔不得用木材製作。
- .2 必要時須加強船舶結構中圍閉這種貨物的構造。
- .3 專門設備的佈置圖及設計所基於的穩性條件，須經船舶登記國的主管機關認可。有關船舶須攜帶經主管當局認可的證明。

7.3.2.4 向主管機關申請認可時提交的資料須包括：

- .1 有關結構圖，包括按比例縱、橫剖面圖；

- .2 穩性計算書，其中應考慮到裝載設備及貨物的可能移動，並標明艙內貨物和液體以及易流態化貨物的分佈；  
和
- .3 有助於主管當局評審所提交資料的其他信息。

## 第 8 節

### 易流態貨物的測試程序

#### 8.1 概述

對於 A 組貨物，除非由專門建造的或裝有專門設備的貨船裝運，其實際水分含量和適運水分極限須按照本規則第 4.1.4 節要求，根據有關當局認可的測試程序測定。

#### 8.2 測量水分含量的測試程序

有一些測量各種物質水分含量的被承認的國際和國家方法。見附錄 2 第 1.1.4.4 段。

#### 8.3 確定適運水分極限的方法

測定適運水分極限的推薦方法見附錄 2。

#### 8.4 確定流態化可能性的補充測試程序

船長可以利用下述輔助方法在船上或岸邊近似確定貨物的流動可能性：

取一圓筒或類似容器（0.5 至 1 升容量），將物質的試樣盛到容器的一半。用一隻手提起容器，從高度約 0.2 m 處砸向一硬表面，如硬桌面。以 1 至 2 秒為間隔，重複 25 次。觀察貨樣表面是否出現游離水分或流動狀態。如果出現游離水分或流動狀態，則應在裝貨前安排對物質的附加實驗室試驗。

## 第 9 節

## 9.3 積載與隔離要求

### 9.3.1 一般要求

9.3.1.1 由於列入 B 組和屬於第 9.2.2 和 9.2.3 段所述類別的物質具有潛在危險性，因而其中的不相容的貨物須進行隔離。隔離還須考慮到所確定的任何次危險。

9.3.1.2 除整類物質之間的一般隔離之外，某一具體貨物也可能需要與其他貨物隔離。就與易燃物質的隔離而言，須理解為不包括包裝材料、天花板和墊艙材料；在這些情況下，後者的數量應控制在最少量。

9.3.1.3 就不相容物質的隔離而言，“貨艙”和“艙室”被視為係指由鋼質艙壁或船殼板及鋼質甲板圍蔽的貨物處所。這種圍壁應為防火和防液的。

9.3.1.4 當裝運兩種或兩種以上不同的 B 組固體散貨時，它們之間的隔離須符合第 9.3.4 節要求。

9.3.1.5 如果同一貨艙中裝有不同隔離等級的貨物，則適用於任何不同等級的最嚴格的規定須適用於所有貨物。

9.3.1.6 當裝運 B 組固體散貨與包裝危險貨物時，它們之間的隔離須符合第 9.3.3 節要求。

9.3.1.7 不相容貨物不得同時裝卸。裝完一種此類貨物後須關閉各貨物處所的艙蓋，在開始裝載其他貨物之前須清除甲板上的殘渣。在卸貨時也須採取同樣步驟。

9.3.1.8 為防止沾染，一切食品須按下列要求積載：

- .1 與標明有毒的物質“隔離”；
- .2 與感染性物質“用一整個艙室或貨艙隔離”；
- .3 與放射性物質“隔離”；和
- .4 與腐蝕性物質“遠離”。

9.3.1.9 可能產生的毒氣足以危害健康的物質，不得裝載在使毒氣能滲入起居處所或與起居處所相連的通風系統的處所。

9.3.1.10 其腐蝕強度足以損害人體組織或船舶結構的物質，須在採取充分的預防措施和保護措施之後方可裝船。

9.3.1.11 卸下有毒或氧化物後，須對裝運這些物質的貨物處所作沾染狀況檢查，然後才能用於裝運其他物質。在用於裝運其他貨物之前，須對受到沾染的貨艙進行嚴格清洗和檢查。

9.3.1.12 卸貨後，須仔細檢查船舶是否存有任何殘留物；在船舶裝運其他貨物之前，須將殘餘物清除。

9.3.1.13 對於在緊急情況下須打開艙蓋的貨物，貨艙的艙蓋須保持隨時能夠打開的狀態。

### 9.3.2 特殊要求

#### 9.3.2.1 第 4.1、4.2 和 4.3 類物質

9.3.2.1.1 這些類別的物質須切實可行地儘量保持涼爽和乾燥，而且除非另有明文規定，須在“遠離”一切熱源和火源的處所積載。

9.3.2.1.2 電器設備和電纜須處於良好狀態，並有妥善的保護，避免短路和產生電火花。如果要求艙壁適合於隔離用途，則穿過甲板和艙壁的電纜及導管處須作密封處理，以防氣體和蒸氣通過。

9.3.2.1.3 散發出的氣體能與空氣形成可爆混合物的貨物，須在有機械通風的處所積載。

9.3.2.1.4 應嚴格禁止在危險區內吸煙，並須顯著標示“嚴禁吸煙”字樣。

#### 9.3.2.2 第 5.1 類物質

9.3.2.2.1 該類貨物須切實可行地儘量保持涼爽和乾燥，而且除非另有明文規定，須在“遠離”一切熱源和火源的處所積載。它們還須與其他可燃物質“隔離”積載。

9.3.2.2.2 在裝載此類貨物之前，須特別注意清潔擬裝載這類貨物的貨艙。須切實可行地儘量使用不燃的固定和防護材料，並儘量少用乾燥墊艙木。

9.3.2.2.3 須採取防護措施，防止氧化物質滲入其他貨物處所或污水溝和含有可燃物質的其他貨物處所。

### 9.3.2.3 第 7 類物質

9.3.2.3.1 用於裝運低比度放射性物質 (LSA-I) 和表面受到放射沾染的物體 (SCO-I) 的貨物處所，不得用於裝載其他貨物，除非經過合格人員消除了放射性沾染，使任何表面上非固定沾染平均每  $300 \text{ cm}^2$  不超過下述水平：

$4\text{Bq/cm}^2$  ( $10^{-4} \mu \text{ Ci/cm}^2$ )  $\beta$  和  $\gamma$  放射源和低毒性的  $\alpha$  放射源；天然鈾；天然鈾；鈾-235 或鈾-238；鈾-232；含有的鈾-228 和鈾-230 的礦石、物理或化學精礦；半衰期低於 10 天的放射性核素；和

$0.4\text{Bq/cm}^2$  ( $10^{-5} \mu \text{ Ci/cm}^2$ ) 所有其他  $\alpha$  放射源。

### 9.3.2.4 第 8 類物質或具有類似特性的物質

9.3.2.4.1 該類物質須切實可行地儘量保持乾燥。

9.3.2.4.2 在裝載該類貨物前，須注意清潔擬裝載此類貨物的貨艙，特別要確保貨艙乾燥。

9.3.2.4.3 須防止該類物質漏入其他貨艙、污水溝、污水井及艙壁護板間的縫隙。

9.3.2.4.4 卸貨後須特別注意清潔貨物處所，因為這類貨物的殘渣可能對船體結構具有極強的腐蝕性。須考慮用水管沖洗貨艙後仔細進行乾燥處理。

### 9.3.3 具有化學危險的散裝物質與包裝危險貨物的隔離

9.3.3.1 除非本節或明細表中另有明文要求，否則，B 組中的散裝貨物與包裝危險貨物須按下表隔離。

對於包裝危險貨物積載和隔離的附加要求，須參照《國際海運危險貨物規則》中的危險貨物清單。

散裝貨物 (屬危險品類)	類別	包裝危險貨物

編號指的是下列隔離術語：

1 “遠離”：

有效的隔離從而使互不相容的物質在萬一發生意外事故時不致於互相起危險反應，但只要在垂直投影的水平距離不小於 3m，仍可在同一艙室或貨艙內或艙面上積載。

2 “隔離”：

在艙內積載時，裝於不同的貨艙中。如果中間甲板是防火和防液的，垂向隔離，即在不同的艙室積載，可以看成是等效隔離。

3 “用一整個艙室或貨艙隔離”：

係指垂向的或水平的隔離。如果甲板不是防火和防液的，可以接受只用一縱向隔離，即用介於中間的整個艙室隔離。

4 “用一介於中間的整個艙室或貨艙作縱向隔離”：

僅垂向隔離不符合這一要求。

X 如有，隔離要求應查閱《國際海運危險貨物規則》的危險貨物名錄和本規則中的明細表。

雜類危險物質和物品	X	X	X	X	X	2	X	X	
僅在散裝時有危險的物質（MHB）	X	X	X	X	X	2	X	X	X

表中數字表示下列隔離要求：

2 “隔離”：

在艙內積載時，裝於不同的貨艙中。如果中間甲板是防火和防液的，垂向隔離，即可接受在不同的艙室積載為等效隔離。

3 “用一個整艙或貨艙隔離”：

垂向的或水平的隔離。如果甲板不是防火和防液的，可以接受只用一縱向隔離，即用介於中間的整個艙室隔離。

10.6.3 依據危險特性和性質進行分類須按以下方法進行：

- .1 通過測量或計算確定物理特性、化學特性和生理特性，然後以適用於其成分的衡準進行分類；或

- .2 若確定上述特性為不切實際，該廢物須按構成的主要危險的成分進行分類。

#### 10.6.4 確定主要危險時須考慮到下述衡準：

- .1 若一種或以上的成分屬於某一危險類別而且廢物具有這些成分所具有的危險，則該廢物屬於該類危險物質；或

### 10.7 廢物的積載與裝卸

廢物的積載與裝卸須按本規則第 1 至 9 節的規定進行，並須符合適用於構成主要危險的成分的 B 組具體條目中的附加規定。

### 10.8 隔離

廢物須按第 9.3.3 和 9.3.4 段的適用要求進行隔離。

### 10.9 事故處理程序

在運輸中，如果廢物發生了危及船舶或環境的危險，該船長則須立即通知起運國和目的國的主管機關，並取得他們關於應採取行動的建議。

## 第 11 節

### 保安規定

#### 註釋

本節規定針對海上運輸散裝貨物的保安問題。應當考慮到，作為散裝貨物運輸的一些物質，通過其固有的性質，或與其他物質混合運輸時，可能會被用作從事違法行為時使用的武器的成分或用以提高武器的效力。（還應考慮到，通常裝運散裝貨物的船舶還可能被用來運輸經批准的武器、燃燒裝置或爆炸品，不管其裝運的貨物特徵如何。）國家主管機關可制定額外的保安規定，以在提供或運輸散裝貨物時考慮採用。除了第 11.1.1 小節外，該節規定仍然是建議性的。

#### 11.1 對公司、船舶和港口設施的一般規定

11.1.1 經修正的《1974 年安全公約》第 XI-2 章和國際船舶和港口設施保安（ISPS）規則 A 部分的相關規定須適用於從事散裝貨物裝卸運輸的公司、船舶和港口設施，並且考慮到 ISPS 規則 B 部分給出的指南，經修正的《1974 年安全公約》第 XI-2 的規定亦適用。

11.1.2 應酌情關注與保安有關的 ILO/IMO 港口保安實用規則和《國際海運危險貨物規則》。

11.1.3 任何從事散裝貨物裝卸和運輸的岸上公司人員、船上人員和港口設施人員，除了掌握 ISPS 規則規定的與其職責相應的保安要求外，還應了解這些貨物的任何保安要求。

11.1.4 對從事散裝貨物裝卸和運輸的公司保安員、承擔具體保安任務的岸上公司人員、港口設施保安員和承擔具體保安任務的港口設施

人員的培訓還應包括與這些貨物特性相關的保安知識，例如在何情況下這些貨物僅在散裝運輸時具有危險性。

11.1.5 第 11.1.4 節中未提及而又從事散裝貨物運輸的所有船上人員和港口設施人員均應熟悉與這些貨物相關的並與其職責相應的有關保安計劃的規定。

## 11.2 對岸上人員的一般規定

11.2.1 就本小節而言，岸上人員包括負責以下工作各方人員：

- 製作散裝貨物運輸單證；
- 將散裝貨物託付運輸；
- 接收運輸的散裝貨物；
- 裝卸散裝貨物；
- 編製散裝貨物裝載/積載計劃；
- 裝載/卸載船舶裝運的散裝貨物；和
- 實施或檢驗或檢查符合適用規則和規定；或
- 參與裝卸和運輸經主管機關確定的散裝貨物。

但是，第 11.2 小節的規定不適用於：

- ISPS 規則第 A/13.1 提及的公司保安員和有關岸上公司人員；
- ISPS 規則第 A/13.2 和 A/13.3 節提及的船舶保安員和船上人員；

- ISPS 規則第 A/18.1 和 A/18.2 節提及的港口設施保安員、有關港口設施保安人員和承擔具體保安任務的港口設施人員。

對這些保安員和人員的培訓，見《國際船舶和港口設施保安（ISPS）規則》。

11.2.2 從事海運散裝貨物的岸上人員應遵守與其職責相應的有關散裝貨物運輸的保安規定。

### **11.2.3 保安培訓**

11.2.3.1 岸上人員的培訓還應包括保安知識、控制接近貨物和船舶的必要性、以及各種散裝貨物保安重要性的一般性指南。

11.2.3.2 保安知識培訓應針對保安危險性質、對保安危險（風險）的認識、處理和減少危險的方法以及發生保安違章事件時應採取的行動。它應包括了解與各自職責相應的保安計劃（如適當，參見第 11.3 節）和他們在實施保安計劃時的作用。

11.2.3.3 應為招聘涉及散裝貨物運輸的崗位人員提供培訓或確認受過培訓，並應定期提供再培訓。

11.2.3.4 僱主應保存所進行的所有保安培訓記錄並應在需要時提供給被僱人員。

### **11.3 對可產生嚴重後果的散裝貨物的規定**

11.3.1 就本小節而言，具有潛在保安問題的、可產生嚴重後果的散裝貨物是指在違法行為中可能被濫用而產生諸如大量人員傷亡或大

規模毀滅的嚴重後果的散裝貨物，例如：第 5.1 類硝酸銨 UN1942 和硝酸胺化肥 UN2067。

11.3.2 本小節規定不適用於船舶和港口設施（見有關船舶保安計劃和港口設施保安計劃的 ISPS 規則）。

11.3.3 發貨人和運輸具有潛在保安問題的、會造成嚴重後果的散裝貨物的其他人應採用、實施和符合至少包含第 11.3.4 節中所述內容的保安計劃。

11.3.4 保安計劃應至少包含下列內容：

- .1 將保安職責具體分配給適任和稱職的人員，並為履行其職責賦予適當授權；
- .2 具有潛在的嚴重保安問題的散裝貨物的記錄或所運輸的具有潛在的嚴重保安問題的散裝貨物的種類；

自給式呼吸器。

### 應急程序

穿防護服和佩戴自給式呼吸器。

### 火災時的應急行動

含有這種物質的貨物處所中的火災：打開艙口提供最大限度的通風。船舶的固定式氣體滅火將不夠用。使用大量的水。可以考慮水淹貨艙，並應充分考慮到船舶的穩性。

鄰近貨艙中的火災：打開艙口提供最大限度的通風。從鄰近處所傳遞來的熱量會引起物質分解並隨之生成毒煙。應為分隔艙壁降溫。

### 備註：

只有火災明顯時才能使用二氧化碳或惰性氣體（如果裝有的話）。

## 附錄

### 褐煤磚

#### 危險性

1. 該貨物易於點燃，易自燃並消耗貨艙中的氧氣。
2. 該貨物易於氧化，因而能消耗貨物處所中的氧氣並增加貨艙的二氧化碳含量（亦見第 3 節）。
3. 該貨物易於自熱，從而導致貨物在貨艙中自燃。在發生自燃時，會釋放出包括一氧化碳在內的易燃和有毒氣體。一氧化碳是一種無味氣體，比空氣略輕，在空氣中的燃燒極限為 12%至 75%（體積）。吸入該氣體後會中毒，它與血紅蛋白的親和力要比氧高出 200 倍。暴露在一氧化碳內的建議閾值（TLV）為 50 ppm。

#### 積載和隔離

1. 裝載這些貨物的貨物處所艙壁須防火和防液。
2. 該貨物須與第 1（第 1.4 分類）、2、3、4 和 5 類包裝貨物“隔離”（見《國際海運危險貨物規則》）並與第 4 和 5.1 類固體散裝貨物“隔離”。
3. 禁止在該貨物上方或下方積載第 5.1 類包裝貨物或者第 5.1 類固體散裝貨物。
4. 該貨物須與除 1.4 類以外的第 1 類貨物“用一整個艙室或貨艙縱向隔離”。
5. 該貨物不得靠近熱區域積載。

註：有關隔離術語的解釋見第 9 節。

## 裝載

1. 裝載前，託運人或其指定的代理須以書面形式向船長提供貨物的特性和建議性的貨物安全裝載及運輸程序。在貨物合同中須至少列明水分含量、含硫量及型號。
2. 在裝載前，該貨物須存放 7 天。這樣能大大降低其在以後運輸、積載和裝卸過程中發生自燃的危險性。
3. 在裝載該貨物前，船長須確保做到：
  - 3.1 對貨物處所的露天甲板封閉裝置進行檢查以確保其完好。該裝置在開始裝載前應關閉並密封；
  - 3.2 貨艙和毗鄰的圍閉貨物處所內的所有電纜和電器設備應無缺陷，電纜和電器設備在易燃和（或）粉塵環境下或在完全隔離時能夠安全使用；若機艙與貨物處所是由一氣密艙壁分隔並無直接通道，本款規定不必適用於機艙。
4. 在貨物區域及毗鄰的處所內禁止吸煙和使用明火，並在明顯的位置張貼適當的警告標識。禁止在貨艙附近或其他毗鄰的處所進行燃燒、切割、鏟鑿、焊接或其他構成火源的作業。
5. 為了儘量減少灰塵和粉塵的產生，在裝載期間不得在超過一米高處向下投放該貨物。
6. 如果可能，須在獨立貨艙中進行連續的裝卸作業。艙口敞開超過六天（或在 30°C 以上的天氣裏少於六天），艙內有可能形成熱點。
7. 離港開航前，須對貨物表面進行合理平艙至貨物處所邊界，並達到船長的滿意的水平，以免產生氣穴並防止空氣滲入磚體。進入

貨物處所的通道應充分密封。託運人須確保船長能得到裝貨碼頭的必要合作。

8. 各自獨立的貨艙在裝載後須儘快關閉並密封。

### 注意事項

1. 船舶須有適當裝備並配備適當的儀器以便不需進入貨物處所就能測定下列數據：
  - .1 在貨物和敞開的貨物處所圍閉處，甲烷的濃度；
  - .2 在貨物上方的氧氣濃度；
  - .3 在貨物上方空氣中的一氧化碳濃度；
  - .4 貨艙艙底水樣的 pH 值。

這些儀器須定期檢修和校準。船上人員須接受使用這些儀器的培訓。

2. 建議船舶配備貨物溫度測量儀，量程為 0°C 至 100°C，以便在航行過程中不需進入貨物處所就可以監測貨物的溫度。

### 裝運

1. 須儘可能確保貨物產生的任何氣體不會積聚在毗鄰的封閉處所內，例如：儲藏室、木工房、通道、軸隧等。這些處所須充分通風並定期監測甲烷、氧氣和一氧化碳的含量。
2. 在航行途中，除非在緊急情況下，絕對不可打開艙蓋或進行貨艙通風。

3. 須對每個貨艙中貨物上方空間的空氣中甲烷、氧氣及一氧化碳的含量進行定期監測。
4. 監測的頻率須根據託運人提供的數據及對貨物處所內空氣的分析獲得的數據確定。至少每天須記錄測定值，而且每天測定的時間須儘可能相同。託運人可以要求測定數據的次數更加頻繁，尤其是在有證據表明，航行途中貨物出現了明顯的自熱時。
5. 下列問題須予以考慮：
  - 5.1 在封閉的艙內，氧氣濃度在幾天內將從最初的 21% 下降並穩定在 6% 至 15% 的水平上。如果氧氣濃度沒有降到 20% 以下，或者最初下降之後又迅速上升，則貨艙可能沒有充分密封並且存在自燃的危險。
  - 5.2 在一個安全、封閉良好的艙室內，一氧化碳將會上升到一定的濃度並在 200 至 2000 ppm 之間波動。如果在 24 小時內，褐煤磚貨艙內一氧化碳的含量迅速增加約 1000 ppm，尤其是伴有甲烷含量的增加，則表明可能發生了自燃。
  - 5.3 甲烷成分在褐煤磚貨物中所佔比例通常很低，不到 5 ppm 且不會構成危險。但是，如果出現甲烷含量突然增加，濃度高於 10 ppm，則表明艙內發生了自燃。
  - 5.4 在封閉完好的貨艙中的褐煤磚貨物溫度通常保持高出海水溫度 5 至 10°C，這一溫度的增加是由於通常貨艙內吸入少量的空氣，使褐煤磚產生一定的熱量而致。關鍵的是檢查貨艙密封條以儘量減少空氣滲入。在 24 小時內溫度迅速增加大約 20°C 可證明貨物已自燃。

6. 通常須系統地對艙底水進行定期試驗，如果 pH 值監測表明存在腐蝕性危險，船長須確保在航行途中所有的艙底保持乾燥，以避免內底和艙底污水系統內可能積聚酸液。
7. 如果航行途中貨物的某些變化情況與貨物申報單上所列內容不同，則船長須將不同之處通知託運人。這些報告將使託運人能夠對該貨物的變化情況作好記錄，從而根據運輸經驗，重新審查向船長提供的有關信息。
8. 如果船長擔心貨物有自熱或自燃的跡象，例如上述甲烷、一氧化碳或氧氣的濃度增加或溫度升高，則須採取下列措施：
  - 8.1. 諮詢裝貨港船方的代理人。立即通知公司指定的岸上負責人。
  - 8.2. 查驗貨艙封條，必要時重新加封。
  - 8.3. 除非船長認為事關船舶及人員性命，否則禁止人員進入貨艙內以及打開艙蓋。在人員從貨艙出來後，應立即將貨艙重新加封。
  - 8.4. 在可行時，增加氣體成分及貨物溫度的監測次數。
  - 8.5. 儘快將下列信息送達船舶所有人或裝貨港代理，以便獲得專家的建議：
    - .1 所涉及艙室的數目；
    - .2 一氧化碳、甲烷和氧氣含量的監測結果；
    - .3 如果可能，貨物的溫度、位置和取得結果所用的測量方法；
    - .4 進行氣體分析的時間（日常監測）；
    - .5 所涉及的貨艙內褐煤磚的數量；

- .6 託運人的申報單中提供的貨物描述及申報單中列明的任何特別注意事項；
- .7 裝載日期及在預計到達下一個預定卸貨港口（須具體指定）的時間（ETA）；和
- .8 船長認為必要的其他評論或意見。

## 卸貨

在卸貨前及卸貨過程中：

1. 貨物艙蓋須在卸貨開始前一直保持關閉。可用細霧狀水噴灑貨物以減少粉塵。
2. 在未檢測貨艙中空氣之前，人員不得進入貨艙。如果空氣中的含氧量低於 21%，須佩戴自給式呼吸器。還須測試貨艙中二氧化碳和一氧化碳的含量。一氧化碳的建議閾限值（TLV）為 50 ppm。
3. 在卸貨過程中，須注意貨物中出現的熱點跡象（例如蒸汽），如果發現熱點，須用細霧狀水噴射熱點，以便立即除去熱點，以防止其擴散。將產生熱點的貨物在碼頭上遠離其他貨物鋪散開。
4. 如果卸貨間隔超過八小時，須關閉艙蓋和所有其他通風設備。

## 褐煤磚貨物的氣體監測程序

### 1 注意事項

- 1.1 如果根據以下程序對一氧化碳進行監測，將會及早測定出該貨物自熱的可靠情況。這樣就可以及時考慮預防措施。如果在貨艙內

探測出其一氧化碳含量急速上升，特別是如果伴隨甲烷含量的增加，這是正在發生自熱的確證。

1.2 從事該貨物運輸的所有船舶均須攜帶監測甲烷、氧氣和一氧化碳氣體濃度的測試儀器，從而能夠監測貨艙中的空氣。這類儀器須按照製造商的規定進行定期保養和校準。在未進行通風的貨艙中常出現的含氧量較低的貨物處所中測定甲烷含量時，須注意對測定值的解釋。通常用於測定甲烷含量的催化傳感器的精度有賴充分的氧氣含量。這一現象不影響一氧化碳含量的測定，也不影響利用紅外線傳感器測定甲烷含量。可從儀器生產廠家取得進一步的指導。

## **2 採樣和測試程序**

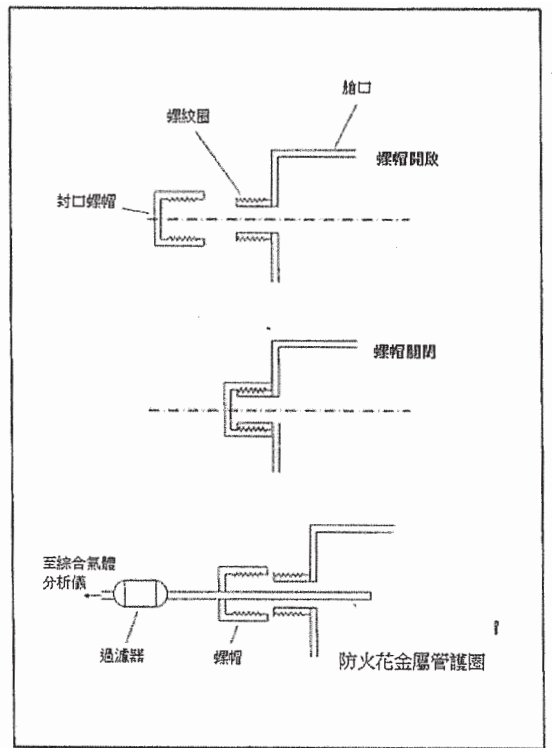

### **2.1 設備**

2.1.1 要求船上裝配一部能測定甲烷、氧氣和一氧化碳含量的儀器。該儀器須裝有吸氣管、軟管和一節防火花金屬管，以便能從艙內採集出具有代表性的樣本。

2.1.2 如製造商的建議，須使用過濾器防止水汽進入儀器中。即使少量水汽存在也會影響測量精度。

### **2.2 採樣點的確定**

2.2.1 為了得到艙內貨煤狀態的有意義資料，各貨艙的每次測量須在同一點處進行。但是，為了保證在惡劣天氣中進行測量的靈活性，每一艙內均須設兩個測量點，一個在艙蓋的左側，另一個在艙蓋的右側（參見氣體測量點的示意圖）。測量可在兩個測量點中的任何一個進行。

氣體採樣點的示意圖

2.2.2 每一採樣點須為直徑約 12 毫米的測量孔構成，並且儘可能靠近艙口圍板的頂部。測量孔螺帽須封緊以防海水和空氣進入。關鍵的是每次測量後，須將螺帽及時更換，以保持貨物處所密封。

2.2.3 任何採樣點的提供不得損害船舶適航性。

### 2.3 測量

測量程序的解釋如下：

- .1 擰下密封螺帽，將剛性管子插入取樣點，上緊連接帽並確保充分密封；
- .2 將測量儀與取樣管子連接好；

- .3 用吸氣管從測量孔中吸出貨艙空氣樣品，直到獲得穩定讀數；
- .4 將測量結果填入表中，並記錄每次測量的相應艙號、日期和時間。
- .5 擰緊密封螺帽。

## 水泥

### 描述

水泥是一種在含空氣或受到嚴重擾動時幾乎具有流動性的粉末，因此使其具有非常小的靜止角。在裝載完成之後幾乎立刻出現脫氣，該貨品沉降後穩定成堆。如果船舶不是專門設計的水泥運輸船，或者岸上設備沒有安裝專門的粉塵控制設備，水泥粉塵是裝載和卸貨期間關心的主要問題。

### 特性

該貨物為非易燃或具有低失火危險。

### 積載和隔離

沒有特別要求。

### 貨艙清潔程度

按貨物的危險性保持清潔和乾燥狀態。

## 天氣注意事項

該貨物須儘可能保持乾燥。該貨物不得在降水期間裝卸。在裝卸該貨物期間，須關閉裝載或擬裝載該貨物的處所的不在使用中的所有艙蓋。

## 裝載

在裝載此貨物時，船舶須保持垂直。貨物須平艙至貨艙邊緣，使其貨物表面角度與水平面的夾角不超過 25 度。水泥的比重和靜止角均取決於貨物的空氣含量。水泥從含空氣到不含空氣體積收縮約 12%。在沉降前，該貨物體現出流動狀態。運載該貨物的船舶不得在貨物沉降前啟航。水泥沉降後，若其表面與水平面的夾角不超過 30°，則不太可能發生移動。

## 注意事項

須採取適當預防措施以防該貨物的粉塵進入機器處所和起居處所。須防止貨物進入其處所的艙底污水井。須適當考慮設備的貨物粉塵防護。可能接觸該貨物粉塵的人員須根據需要穿戴防護服、護目鏡或其他等效的眼睛防塵保護用品和防塵口罩。污水井須保持清潔、乾燥和適當遮蓋以防止貨物進入。

## 通風

在航行期間，不得對裝運該貨物的貨物處所進行通風。

## 裝運

貨物裝完後，必要時須密封貨艙蓋。在航行期間，須關閉所有排氣孔和貨艙進出通道。不得在沒有採取特別措施時泵排水泥艙的污水。

## 卸貨

沒有特別要求。

## 清掃

就清洗貨物殘留物來說，在沖洗前，貨艙和與貨物接觸的其他結構及設備須徹底清掃並且清除所有粉塵。須特別注意污水井和艙內框架。不得使用固定式污水泵沖洗貨艙，因為水泥將會使污水系統無法使用。

## 水泥燒結塊

### 描述

水泥是由含黏土的石灰岩焙燒而成的。焙燒產生粗糙的渣塊隨後壓碎成細粉生產出水泥。粗糙的渣塊叫做熔渣並以此種狀態運輸，從而避免運載水泥粉的困難。

### 描述

煤（瀝青質的及無煙的）是一種包含非晶質碳和碳氫化合物的天然、固體、易燃物質。

### 特性

靜止角	散貨密度 (kg/m <sup>3</sup> )	積載因數 (m <sup>3</sup> /t)
不適用	654 至 1266	0.79 至 1.53
尺寸	類別	組別

### 天氣注意事項

如果貨物的水分含量超過運輸含水量極限，而且不是在專門建造或配備的、符合《規則》第 7.3.2 小節要求的船舶中運輸，該貨物可能在航行途中流態化。所以，須遵守以下規定：

- 1 航行期間須將貨物的含水量保持在運輸含水量極限以下；

- .2 除非在本明細表中有明確規定，不得在降水期間裝卸；
- .3 除非在本明細表中有明確規定，在貨物裝卸期間，須關閉裝載或擬裝載該貨物的處所的不在使用中的所有艙蓋；
- .4 如果貨物的實際含水量小於運輸含水量極限，足以使實際含水量不會由於降水而可能超過運輸含水量極限，則可以在降水期間裝卸；
- .5 如果貨艙中的全部貨物將在一個港口中卸完，可以在降水期間卸下貨艙中的貨物。

### **裝載**

**備註：**

只有火災明顯時才能使用二氧化碳或惰性氣體（如果裝有的話）。

## 附錄

### 煤

#### 特性和特點

1. 煤會產生可燃氣體甲烷。甲烷含量在 5%至 16%的甲烷/空氣混合氣體即為可爆氣體，能被火花或明火點燃，例如電火花、摩擦火花、燃着的火柴或香煙。甲烷比空氣輕，因此會積存於貨物處所或其他封閉處所上方。如果貨物處所艙壁不氣密，則甲烷可滲入鄰近貨物處所內。
2. 煤會發生氧化，導致貨物處所內缺氧和二氧化碳或一氧化碳濃度增加。一氧化碳為無味氣體，比空氣略輕，在空氣中的燃燒極限體積比為 12%至 75%。吸入一氧化碳會中毒，因其與血紅蛋白的親和力比氧大 200 倍。
3. 某些煤易於自熱並在貨艙內引起自燃。可產生一氧化碳等易燃和有毒的氣體。
4. 某些煤會與水發生反應，並產生具有腐蝕性的酸液。還可以產生氫氣等易燃和有毒的氣體。氫氣為無味氣體，比空氣輕得多，在空氣中的燃燒極限體積比為 4%至 75%。

#### 隔離和積載要求

1. 除非另有明確規定，裝煤的貨物處所艙壁須能阻火和阻液體。
2. 該貨物須與第 1（第 1.4 類）、2、3、4 和 5 類包裝貨物“隔離”（見《國際海運危險貨物規則》）並與第 4 和 5.1 類固體散裝貨物“隔離”。

3. 禁止在該貨物的上方或下方積載第 5.1 類包裝貨物或者第 5.1 類固體散裝貨物。
4. 船長須確保不將該貨物積載在熱的區域附近。
5. 該貨物須與除第 1.4 類以外的第 1 類貨物“用一個完整艙室或船艙縱向隔離”。

註：對這些名詞解釋，見第 9 節。

#### 對所有種類的這些貨物的一般要求

1. 裝載前，託運人或其指定的代理須以書面形式向船長提供關於貨物特性的材料，以及裝載及運輸該貨物的、推薦的安全裝卸程序。貨物合同須至少列明水分含量、含硫量及尺寸，並須特別說明是否會釋放甲烷或自熱。
2. 在裝載前，船長須確保：
  - 2.1 所有貨物處所和艙底污水井清潔和乾燥。除去任何廢物殘留物或原先的貨物，包括可拆卸的貨物壓條；和
  - 2.2 貨物處所及毗鄰圍閉處所內的全部電纜及電器組件應無缺陷。這些電纜及電器組件可在爆氣體中安全使用或做好陽極隔離。如機艙與貨物處所以沒有直接通道的氣密艙壁分隔，本款規定不必適用於機艙。
3. 船舶須適當配備有關儀器設備，以便不進入貨物處所即可測得下列數據：
  - .1 空氣中的甲烷濃度；
  - .2 空氣中的氧氣濃度；

- .3 空氣中的一氧化碳濃度；及
  - .4 貨物處所艙底污水樣品的 pH 值。
4. 這些儀器設備須進行定期維修和校準。船上人員須經過使用這些儀器的培訓。氣體測量儀的使用方法列於本附錄末尾。
  5. 建議船舶配備溫度測量儀，量程為 0° 至 100°，以便在裝載和航行途中不進入貨艙就可以測得煤的溫度。
  6. 在貨區和毗鄰處所內禁止吸煙和使用明火，並須在顯著位置張貼相應的告示。除非貨艙已經完全通風並且甲烷氣體含量經測量表明安全，否則不得在靠近貨物處所或其他毗鄰處所進行燃燒、切割、鏟鑿、焊接或其他產生火源的作業。
  7. 離港前，應對貨物表面進行合理平艙直至延伸到艙壁並應令船長滿意，以防形成積存氣體的坑窪及空氣滲入煤磚中。進入貨物處所的通道須充分密封。託運人須確保船長得到裝貨碼頭的必要合作。
  8. 須對每個貨艙內貨物上方空間氣體中的甲烷、氧氣和一氧化碳的含量進行定期監測。詳細的氣體監測程序列於本附錄的末尾。監測結果須做記錄。測量頻率取決於託運人提供的資料及通過艙內氣體分析所取得的信息。
  9. 除非另有明文規定，否則各貨物處所裝完貨離港後 24 小時之內須進行表面通風。在此期間，每一貨艙須選定一點進行一次測量，而且就該氣體檢測而言，須在氣體監測之前在適當時間內停止通風。

10. 如果離港 24 小時之後測得的甲烷含量處於可接受的較低水平，則須關閉通風口並須監測貨物處所中的氣體。如果離港 24 小時之後測得的甲烷含量不是處於可接受的較低水平，須維持表面通風，只有監測氣體的適當時段除外，並須監測貨物處所中的氣體。在甲烷含量低至可接受的水平之前，須遵循這一程序。在兩種情況下，均須每天進行甲烷含量的測量。
11. 如果在未通風的艙內後來產生了相當濃度的甲烷，則須對煤炭釋放甲烷採取適當的特別措施。
12. 船長須儘可能保證貨物釋放出的氣體不在臨近封閉處所中積聚。
13. 船長須確保定時監測物料間、木工間、通道、軸隧等圍閉處所中的甲烷、氧氣和一氧化碳的含量。這些處所須充分通風。
14. 在裝運該貨物期間，須定期系統地對貨艙的艙底污水進行檢測。如果監測的 pH 值表明存在腐蝕危險，須在航行途中經常泵排艙底污水，以防內底和污水系統中積存酸性物質。
15. 在航行途中，如果貨物的特性與申報值有差異，船長須將差異報告託運人。這種報告有助於託運人保持對貨物性質的記錄，以便能根據運輸經驗複議提供給船長的資料。

## 特別注意事項

### 1 會釋放甲烷的煤

如果託運人已經說明貨物會釋放甲烷，或貨物處所內氣體分析表明甲烷含量超過其爆炸下限（LEL）20%，須採取以下附加措施：

- .1 須保持對貨物表面的通風，只有監測氣體的適當時段除外。

- .2 由於包括卸貨在內的任何原因而開啟艙蓋或其他開口之前，須注意將積存的氣體排出。艙蓋或其他開口須小心開啟，以免產生火花。禁止吸煙和使用明火。
- .3 除非貨物處所或附近封閉處所已經通風且測試表明不存在有害氣體，並且含有足以支持生命的氧氣，否則人員不得進入。儘管有上述規定，在負責的高級船員的監督下，由受過訓練的人員配戴自給式呼吸器，以及採取特別預防措施以保證不將火源帶入處所內，則可在緊急情況下進入貨物處所。
- .4 船長須確保定時監測物料間、木工間、通道、軸隧等圍閉處所中的甲烷含量。這些處所須經充分通風，而且在使用機械通風時，只能使用可以在可爆氣體中安全使用的設備。

## 2 自熱煤

如果託運人已經告知貨物可能發生自熱，或貨物處所內氣體分析表明一氧化碳含量增加，則須採取以下附加措施：

- .1 裝載完畢後須立即將各艙口關閉。艙口蓋還可以用密封膠帶進行附加密封。只允許使用自然表面通風，而且通風時間須以排除積存的甲烷氣體所需的絕對最少時間為限。
- .2 除非配戴自給式呼吸器且進入貨物處所對保障船舶或人命安全非常必要，否則不允許人員進入貨物處所。
- .3 在裝載前，須監測該貨物的溫度。只有在該貨物的溫度不超過 55°C 時，方能裝載。
- .4 如果艙內一氧化碳含量穩定上升，則可能將發生自熱。在這種情形裏，須將貨物處所完全封閉，停止一切通風。船長須

立即徵求專家意見。在海上，不得用水冷卻貨煤或用水撲救煤火，但可以用水冷卻貨物處所邊界。

- .5 如果任何貨物處所的一氧化碳水平達到 50 ppm，或連續三天穩定上升，則可能正在發生自熱，船長須在準確評估形勢之後最少將以下信息告知託運人和公司：
  - (1) 明確所涉及的貨艙，一氧化碳、甲烷和氧氣含量的監測記錄；
  - (2) 如有可能還應提供貨煤的溫度、位置和取得測量結果的方法；
  - (3) 艙內氣體的採樣時間（監測常規）；
  - (4) 通風機的開/關時間；
  - (5) 艙內載煤的數量；
  - (6) 託運人申報的貨煤種類及申報時說明的特殊注意事項；
  - (7) 裝載日期和及在預定到達擬卸貨港口的時間（須具體說明）；以及
  - (8) 船長的意見或看法。

### 3 重力裝填式自卸散貨船

3.1 重力裝填式自卸散貨船係指具有貨艙底部重力裝填系統的船舶，使用可以開啟或關閉的門，將貨物送到傳送帶上。這些傳送帶在貨艙底下往船首或船尾方向運行；貨物通過傳送帶系統從那兒運至甲

板和卸到岸上，它有可以延伸到岸上並配備傳送帶的自卸臂。這不適用於配備起重機和抓斗的船舶。

3.2 當該貨物在重力裝填式自卸散貨船上運輸時，本附錄的以下要求不必適用：

- “隔離和積載要求” 的第 1 款；和
- “對所有種類的這些貨物的一般要求” 的第 9 款。

### 3.3 載貨航行的貨物空氣監測程序

#### 3.3.1 煤散貨安全程序

3.3.1.1 當這些裝載於重力裝填式自卸散貨船時，適用這些要求。建議船舶經營人為船舶提供一份文件，諸如流程圖等，說明貨物作業和裝運程序。

### 3.4 通風

3.4.1 在通風時，須保證不會有過量的空氣進入煤貨體，因為這最終會促進自熱。

3.4.2 由於在緊靠隧道上方的開底貨艙底部裝有非氣密卸貨門，須使用以下通風方法：

- 如果在隧道中測出甲烷，須對它進行“正壓”通風（隧道中的供氣量大於廢氣，以除去甲烷氣體）；和
- 如果在隧道中測出一氧化碳，須對它進行“負壓”通風（隧道中的廢氣量大於供氣，以除去一氧化碳）。釋放出一氧化碳可能表示出現自燃。

## 貨煤的氣體監測程序

### 1 注意事項

1.1 如果按照以下程序對一氧化碳進行監測，將會及早測定出貨煤自熱的可靠情況。這樣就可以及時採取預防措施。

如果在貨艙內探測出其一氧化碳含量穩定上升，則肯定正在發生自熱。

1.2 從事煤運輸的船舶均須攜帶甲烷、氧氣和一氧化碳含量測試儀器，從而能夠監測貨物處所中的空氣。這類儀器須按照製造商的須知進行定期保養和校準。對在未進行通風的貨艙中經常出現的低含氧量情況中的甲烷測量，須謹慎做出解釋。通常用於測定甲烷含量的催化傳感器的測量精度依賴於充足的氧氣含量。這一現象不影響一氧化碳含量的測定，也不影響利用紅外線傳感器測定甲烷含量。可向儀器生產廠家獲取進一步的指導。

### 2 採樣和測量程序

#### 2.1 儀器

2.1.1 運輸該貨物的船上須配備一部能測定甲烷、氧氣和一氧化碳含量的儀器。該儀器須裝有吸氣管、軟管和一節防火花的金屬管，以便能從艙內方形空間採集出具有代表性的氣樣。

2.1.2 須按製造商的建議使用過濾器防止潮氣進入儀器中。即使少量潮氣存在也會影響測量精度。

## 2.2 採樣點的確定

2.2.1 為了得到艙內貨煤狀態的有意義的信息，氣體測量須通過每一貨艙的一個取樣點進行。但是，為了保證在惡劣天氣中仍能進行測量，每一艙內須設兩個測量點，一個在艙蓋或艙口圍欄的左側，另一個在其右側（見下面的取樣點示意圖）。測量可在兩個測量點中的任何一個進行。

氣體採樣點的示意圖

2.2.2 每一採樣點須包含直徑約 12 毫米的一個測量孔，並且儘可能靠近艙口圍欄的頂部。測量孔螺帽須封緊以防水和空氣進入。每次測量後，須將螺帽蓋緊，以保持貨物處所密封。

2.2.3 任何測量孔的設置均不得降低船舶的適航性。

## 2.3 測量

對測量程序的解釋如下：

- .1 打開密封螺帽，將防火花金屬管插入取樣點，上緊連接帽以確保適當密封；
- .2 將測量儀與探頭連接好；
- .3 用吸氣管從測量孔中吸出貨艙空氣樣品，直到獲得穩定讀數；
- .4 將測量結果填入表中，並記錄每次測量的相應艙號、日期和時間；以及
- .5 上緊密封螺帽。

## 2.4 測量策略

在未通風的狀態下，更容易利用測量數據識別初始自熱。但不一定在什麼時候均有必要採用這種做法，因為甲烷的積聚可能達到危險的程度。這種情況主要在航行開始階段發生，但也不排除其他階段。所以，建議開始時先對貨物處所進行通風，直到測定的甲烷含量達到可接受的低水平。

## 2.5 在未進行通風的貨艙內測量

作為預防措施，一般每天測量一次即可。但是，如果一氧化碳含量超過 30 ppm，則測量頻率須增至每天至少兩次，中間適當間隔。任何額外的測量結果須記錄在航海日誌中。

## 2.6 在通風後的貨艙內進行測量

2.6.1 如果因甲烷的存在需要通風口保持開啟狀態，則須採取不同的程序以探測艙內的初始自熱。

2.6.2 為了得到有意義的數據，在進行測量之前須將通風口關閉一段時間。這個期間可按船舶操作性要求確定，但建議不少於四小時。為做好數據解釋，關鍵是無論選定多長時間，關閉通風口的時間須固定。測量須每天進行。

## 2.7 在重力裝填式自卸散貨船的貨物和自卸處所中的測量

### 2.7.1 未經通風的貨物和自卸處所中的測量

2.7.1.1 如託運人已經聲稱煤貨具有或可能具有自熱特點，除非本節另有說明，不得對貨艙進行通風。

2.7.1.2 在正常條件下，作為預防措施，每天測量一次即可。如果一氧化碳含量超過 30 ppm，則測量頻率須增至每天至少兩次，中間適當間隔。任何額外的測量結果須記錄在航海日誌中。

2.7.1.3 如果任何貨艙中的一氧化碳表明穩定上升，或達到 50 ppm，可能正在形成自熱條件，須按本程序所述通知船舶所有人。超過這一水平時，船舶須採用“負壓”通風，以減少一氧化碳量。須繼續定期監測一氧化碳量。

2.7.1.4 除非配帶自給式呼吸器，否則任何人不得進入一氧化碳量大於 30 ppm 的貨艙或卸貨處所。

### 2.7.2 已通風的貨物和自卸處所中的測量

2.7.2.1 如果監測器表明存在甲烷，而且需要通風，則須適用不同的程序，以發現可能開始的任何自熱。須採用“正壓”或“過流式通風”，以除去甲烷。

2.7.2.2 為取得有用的數據，通風口和（或）通風須關閉一段時間，然後再測量。可根據船舶的作業要求選擇這段時間，但建議不少於四小時。不管選擇什麼樣的時間段，關閉的時間要始終如一，這對解釋數據至關重要。須每天進行這樣的測量。如果任何一天的一氧化碳的結果表明穩定上升，或超過 50 ppm，須通知船舶所有人。

2.7.2.3 此外，須考慮以下各點：

- 當船員在自卸處所中時，任何時候均不得關閉通風；
- 船舶可能需要特殊消防設備和（或）程序；和
- 為重力裝填式自卸散貨船進行具體的船員培訓。

該貨物須在裝載和航行期間儘可能保持乾燥。在裝載前可露天存放。該貨物不得在降水期間裝卸或在船或駁船之間駁運。在裝載該貨物期間，須關閉裝載或擬裝載該貨物的處所的不在使用中的所有艙蓋。只有在天氣允許時，方可在每次倒入貨物後將不使用的艙蓋打開最少一小時，以讓散貨在裝卸後冷卻。

### 裝載

在裝載該貨物之前，託運人須向船長提供由裝貨港國家主管機關認可的主管人員簽發的證明，說明所託運的貨物在裝載時適合於船運並且符合本規則的要求；碎末和小顆粒（尺寸最大達 6.35 毫米）按重量計含量不超過 5%；含水量小於 1.0%和溫度不超過 65°C。

如果溫度超過 65°C，如果含水量超過 1.0%，如果碎末和小顆粒（尺寸最大達 6.35 毫米）按重量計含量大於 5%，不得裝載該貨物。

在裝貨期間，須採取適當預防措施，以裝載主要由整塊構成的貨物。貨物的裝載方式須儘量減少塊體破碎、產生更多的碎末和小顆粒以及碎末在貨物的任何地方聚集。須禁止在同質的塊體貨物中增加碎末和小於 6.35 毫米的顆粒或粉末。

按照《規則》第 4 和 5 節要求的有關規定進行平艙。須適當注意將貨物均勻地分佈在艙底，以儘量減少碎末聚集。

在裝貨期間，須監測貨物溫度，並記入航海日誌，詳細說明所裝的每批貨物的溫度。向船長提供一份記錄副本。在裝載後，須由裝貨港國家主管當局認可的適任人員簽發一份證書，證實整票貨的碎末和小顆粒（尺寸小於 6.35 毫米）按重量計含量小於 5%。

### 注意事項

承運人指定的技術人員或其他代表須可以合理地查看貨堆和裝貨設備。

託運人須提供關於貨物和緊急情況中採用的安全程序的全面資料。託運人也可以提供詳述本規則的建議，但這樣的建議不得與其安全建議相左。

若有可能，除雙層底艙以外的該貨物的處所毗鄰的壓載艙須排空。露天甲板上的封閉裝置應經檢查和測試，以確保在整個航程必須維持的完整性和風雨密。

須採取適當預防措施以防該貨物的粉塵進入機器處所和起居處所。須為雷達和外露的無線電通信設備做好貨物粉塵防護。貨物處所的污水井須保持清潔、乾燥並使用不燃材料防止貨物進入。可能接觸該貨物粉塵的人員須根據需要穿戴防護服、護目鏡或其他等效的眼睛防塵保護用品和防塵口罩。

貨物裝卸期間，須在甲板上和貨物處所毗鄰區域張貼“嚴禁吸煙”的告示牌；不允許使用明火。

裝載該貨物的處所的氧氣可能被耗盡。可燃氣體也可能在這些區域聚集。進入貨物處所和相鄰處所時須採取一切預防措施。

### 通風

在航行期間，只能根據需要僅對貨物表面進行自然或機械通風。絕對不能將空氣導入貨物體內。如使用機械通風，須使用經認證的防爆型風機，並須防止產生火花，從而避免點燃氫氣和空氣混合氣體的可能性。進風和出風開口應設有合適的金屬絲網。通風應使進入生活區的逸出氣體不會達到有害濃度。

### 裝運

為測量氧氣含量，在裝運貨物期間須在船上裝有合適的探測器。探測器須適合在無氧氣的空氣中使用，並通過認證，可在可爆氣體中使用。在航行期間，須定期測量裝運這些貨物的處所中的氫氣濃度，並須記錄測量結果和起碼在船上保存兩年。如監測到的氫氣濃度按體積算大於 1% (>25%LEL)，須按照託運人提供的應急程序採取適當的安全措施。如有疑問，須徵詢專家意見。

須定期檢查污水井是否有水。若發現有水，須將其從污水井中泵或排掉。

在航行期間，須定期測量貨物溫度，其記錄起碼在船上保存兩年。如貨物處所的溫度高於 65°C，須按照託運人提供的應急程序採取適當的安全措施。如有疑問，須徵求專家意見。

### 卸貨

在打開艙蓋的任何行動之前的一刻，須測量貨物處所中的氫氣濃度。如氫氣濃度按體積算大於 1% (>25%LEL)，須按照託運人提供的程序

或主管當局的建議採取一切適當的安全措施。如有疑問，須徵詢專家意見。

在卸貨期間，只有在貨物將存放於露天場所時，方可在貨物表面噴灑清水以防粉塵。若貨物將存放於圍閉場所或將要轉運，建議不要在貨物表面噴灑清水。

### 清掃

須儘快清除在甲板上或在貨物處所周圍聚集的貨物粉塵。須考慮仔細清潔可能沾上貨物粉塵的外露的無線電通信設備，如雷達、電台天線、甚高頻設備、自動識別系統和全球定位系統。應避免用海水沖洗。

### 描述

直接還原鐵 (DRI) (B) 係在低於鐵的熔點以下溫度時對氧化鐵進行直接還原 (除氧) 的過程形成的多孔的黑/灰色金屬物質。冷模磚係指溫度在 650°C 以下形成的或密度在 5,000 千克/m<sup>3</sup> 以下的磚坯。尺寸小於 6.35 毫米的碎末和小塊不得超過重量的 5%。

### 特性

靜止角	散貨密度 (kg/m <sup>3</sup> )	積載因數 (m <sup>3</sup> /t)
不適用	1750 至 2000	0.5 至 0.57
尺寸	類別	組別
塊與球粒：平均粒度為 6.35 毫米至 25 毫米。冷模塊：最大尺寸約 35 毫米至 40 毫米。尺寸小於 6.35 毫米的碎末和小塊不得超過重量的 5%。	MHB	B

### 危險性

散裝貨物裝卸後暫時自熱可達 30°C。

在運輸期間，有過熱、着火和爆炸的危險。該貨物與空氣或水或海水發生反應產生熱和氫氣。氫氣是一種可燃氣體，與 (按體積算) 濃度為 4% 以上的空氣混合時會形成爆炸氣體。該貨物的反應活動取決於礦的來源、還原的過程和溫度，以及隨後的陳化程序。貨物發熱會產生足以使貨物起火的很高的溫度。粉末的積聚也會導致自熱、自動着火和爆炸。貨物和圍閉處所的氧氣可能被耗掉。

## 積載和隔離

與包裝形式的第 1（第 1.4S 類）、2、3、4 和 5 類及第 8 類中的酸類貨物“隔離”（見《國際危規》）。

與第 4 和 5 類固體散裝貨物“隔離”。

除第 1.4S 類外，第 1 類物質不得與該貨物同船運輸。

裝載直接還原鐵的貨艙艙壁應能阻火和阻止液體通過。

## 貨艙清潔程度

貨物處所須保持清潔和乾燥，沒有鹽和先前貨物的殘留物。在裝載前，須卸掉諸如壓條等木質裝置、不固定的襯墊料、碎片和可燃物質。

## 天氣注意事項

在裝載前、裝載期間和航行期間，該貨物須儘可能保持乾燥。該貨物不得在降水期間裝卸或在船或駁船之間駁運。在貨物裝卸期間，須關閉裝載或擬裝載該貨物的處所的不在使用中的所有艙蓋。

## 裝載

在裝載前，碼頭須確保用於裝貨的傳送帶沒有積水或其他物質。每次開始或重新啟動作業時，尤其是在雨後或沖洗後，任何裝貨傳送帶均須空載運行和避開船舶貨物處所上方。

在裝載前，須進行超聲波測試或以使用合適儀器的另一種方法確保艙蓋和關閉裝置的風雨密，而且所有讀數均證實風雨密。

在裝載該貨物之前，託運人須向船長提供由裝貨港國家主管機關認可的主管人員簽發的證明，說明所託運的貨物在裝載時適合於船運並且符合本規則的要求；碎末和小顆粒按重量計含量不超過 5%；含水量

低於 0.3%和溫度不超過 65°C。該證書須說明每批待裝載貨物的生產日期，以滿足陳化和物質溫度方面的裝載標準。

如果溫度超過 65°C，如果含水量超過 0.3%，如果碎末和小顆粒按重量計含量大於 5%，不得裝載該貨物。濕過或已知濕過的任何貨物不得裝入任何貨物處所。

在裝載前，須採取措施，將乾惰氣輸入艙頂部，以讓惰氣除去貨物產生的空氣並充滿貨物上方的空間。最好使用氮氣。須關閉和密封可能讓惰氣從裝運該貨物的貨物處所逸走的所有透氣口、通道和其他諸如圍板排水孔等開口。

貨物的裝載方式須盡量減少冷模磚、小球、塊的破碎和增加碎末及碎末在任何貨物區域的積聚。該貨物須同質，沒有添加的廢物。須禁止在同質的塊體貨物中增加碎末和顆粒或粉末。

須適當注意將貨物均勻地分佈在艙底，以盡量減少碎末聚集。按照《規則》第 4 和 5 節要求的有關規定進行平艙。

在裝貨期間，須監測貨物的溫度和濕度，並記入航海日記，詳細記明裝載的每批貨物的溫度，並向船長提供一份副本。在裝載後，須由裝貨港國家主管當局認可的適任人員簽發一份證書，證實整票貨的碎末和小顆粒（尺寸小於 6.35 毫米）按重量計含量小於 5%，含水量不超過 0.3%，溫度不超過 65°C。

完成一艙的裝貨時，須立即關閉和密封。然後輸入足夠的惰氣，使整個貨艙的氧氣濃度小於 5%。

## 注意事項

為避免裝濕貨或部分濕貨，須適當考慮到貨堆內濕氣的可能性，認識到儘管貨堆表面似乎乾燥，貨堆底部可能濕。承運人指定的技術人員或代表可合理檢查貨堆或裝貨設備。

在裝船前，貨物須陳化最少 3 天，或經過空氣鈍化技術或另一種等效方法的處理，將反應能力降到陳化產品的同等水平。這種陳化過程須得到主管當局的批准，主管當局也須簽發批准證書。

船運人須提供有關貨物的完整資料和緊急情況中使用的程序。該建議可以是本規則的進一步說明，但不得與安全方面的建議相左。

在可能的情況下，除雙層底貨艙外，與裝有該貨物的貨物處所相鄰的壓載水處所須保持空置。在整個航程中，須保持風雨密。貨物處所的污水井須保持清潔、乾燥和使用不燃材料防止貨物進入。

須適當考慮防止該貨物的粉塵進入設備、機器和起居處所。須為運載該貨物的船舶的雷達和外露的無線電通信設備做好貨物粉塵防護。可能接觸該貨物粉塵的人員須根據需要穿戴防護服、護目鏡或其他等效的眼睛防塵保護用品和防塵口罩。

貨物裝卸期間，須在甲板上和貨物處所毗鄰區域張貼“嚴禁吸煙”的告示牌；不允許使用明火。在裝有該貨物處所附近，任何時候均禁止吸煙、燃燒、切割、鏟鑿、打磨或其他產生火源的作業。

裝載該貨物的處所和毗鄰的氧氣可能被耗盡。可燃氣體也可能在這些區域聚集。進入貨物處所時須採取一切預防措施。

須為船舶配備設備，以確保滿足本規則關於使整個航程的氧氣濃度保持在 5% 以下的要求。船舶的固定式二氧化碳系統不得用於此目的。

須計及整個航程，適當考慮為船舶提供手段，為貨艙添加額外的惰氣供應。

須為船舶提供手段，以在船首數處可靠地測量溫度，和確定貨物處所內空氣的氫氣和氧氣濃度，同時儘量減少惰性氣體的損失。

已經裝入貨物處所但隨後變濕或已經開始反應的任何貨物，須及時卸下。

在船長和裝貨港的國家主管當局認可的主管人員對以下情況感到滿意之前，船舶不得排開航：

- .1 全部已裝貨的處所均適當密封和惰化；
- .2 所有測量點的貨物溫度已經穩定，而且溫度不超過 65°C；和
- .3 在惰化過程結束時，貨艙中自由空間的氫氣含量已經穩定，而且按體積算不超過 0.2%。

### 通風

在航行期間，裝運該貨物的處所須保持密封和惰化狀態。

### 裝運

為測量氧氣和氫氣含量，在裝運貨物期間，須在船上裝有適用的探測器。探測器須適合在無氧氣的空氣中使用，並通過認證，可在可爆氣體中使用。須定期測量裝運這些貨物的處所中的氫氣和氧氣含量，並須記錄測量結果和在船上保存最少兩年。

在整個航行期間，裝運這些貨物的處所中的氧氣濃度須保持在 5% 以下。如監測到的氫氣濃度按體積算大於 1% (>25%LEL)，須按照託運人提供的應急程序採取適當的安全措施。如有疑問，須徵詢專家意見。

在航行期間，須按固定間隔測量貨物溫度，並須記錄測量結果和在船上保存最少兩年。如貨物處所的溫度超過 65°C，須按照託運人提供的應急程序採取適當的安全措施。如有疑問，須徵詢專家意見。

須定期檢查污水井是否有水。如發現有水，須泵或排乾污水井的水。在不良天氣過後，須考慮增加貨物監測的頻率。須採取一切措施，以儘量減少貨艙處所的惰氣損失。

### 卸貨

在打開艙蓋的任何行動之前的一刻，須測量貨物處所中的氫氣濃度。如氫氣濃度按體積算大於 1% (>25%LEL)，須按照託運人提供的程序或主管當局的建議採取一切適當的安全措施。如有疑問，須徵詢專家意見。

與食品和第 8 類所有酸類物質“隔離”。

## 貨艙清潔程度

按貨物的危險性保持清潔和乾燥狀態。

## 天氣注意事項

如果貨物不是在專門建造或配備的、符合《規則》第 7.3.2 小節要求的船舶中運輸，須遵守以下規定：

- .1 航行期間須將貨物的含水量保持在可運輸含水量極限以下；
- .2 除非在本明細表中有明確規定，不得在降水期間裝卸；
- .3 除非在本明細表中有明確規定，在貨物裝卸期間，須關閉裝載或擬裝載該貨物的處所的不在使用中的所有艙蓋；

- .5 如果貨艙中的全部貨物將在一港口中卸完，可以在降水期間卸下貨艙中的貨物。

## 裝載

須對該貨物進行平艙，從而使貨物表面峰穀間的高度差不超過船舶寬度的 5%，而且貨物從艙口的邊界均勻坡向艙壁，在航行途中不出現陡面坍塌現象，尤其是小船，即長度為 100 米或以下的船舶上。

## 裝運

除非絕對必要，不要泵排運載該貨物的貨物處所的艙底污水井。該貨物的艙底污水可能會含一定量的舊機器污垢和油。見本明細表附錄。

## 卸貨

當用磁鐵或抓斗卸貨時：

1. 防止甲板和甲板機械等受貨物掉落損壞；和
2. 卸貨完成以後，仔細檢查對船舶的損壞。

## 清掃

在清掃運載該貨物的貨物處所之前，須告知船員碎玻璃和鋒利邊緣的危險性。在清洗該貨物的殘留物之前，須清除貨物處所艙底和艙底污水井的溢油。

## 附錄

### 廢金屬

裝卸廢金屬的方式通常取決於貨物的尺寸而採用磁鐵或抓斗。該貨物包括的物品尺寸可大到車身，小到細碎金屬削屑（鐵屑）。單件的重量也有很大的差別，大到重型機械小到易開罐。

### 裝載

在裝載前，應針對每一次裝載操作對貨艙進行準備。容易被掉落的廢金屬砸壞的區域應使用墊艙木加以保護。這包括將貨物送往貨艙途中的甲板和艙口圍板。建議拆除船側的護欄。

艙口下區域的內底上應仔細鋪上一層廢金屬以緩衝任何掉落貨物的衝擊。應向磁鐵或抓斗的操作員說明，不要在離貨堆太高的位置釋放貨物。

通常的裝載方法是在船舶的中心線堆成一堆，然後利用坡度使貨物滾入兩端和兩側。須盡最大努力使兩舷和前後端的貨物重量均勻分佈。如果沒有這樣做，體積大、重量輕的物品將向兩側滾動，重量大、體積小的貨物將集中在艙口以下。

當抽排污水井的水時，船長須意識到舊機器中可能會有一定數量的污垢和廢油。可能會有碎玻璃和鋒利的鋸齒狀邊緣，在廢金屬附近工作的人員應小心注意。

在艙蓋關閉以前進行檢查，不要有可能刺破船側的鋒利突出物。

**備註**

對於溶劑萃取的種子餅，在未見明火前，不得使用二氧化碳。

二氧化碳僅限用於控制火勢，當船舶在海上航行期間，可能需要不時輸入更多的二氧化碳量，以減少艙內氧氣含量。到達港口後，需要將貨物挖出以便到達火底。

### 特性

靜止角	散貨密度 (kg/m <sup>3</sup> )	積載因數 (m <sup>3</sup> /t)
不適用	478 至 719	1.39 至 2.09
尺寸	類別	組別
0.1 毫米至 5 毫米	4.2	B

### 危險性

可緩慢自熱，並且，如果潮濕或含有未經氧化的油比例過高，會自燃。易發生氧化，隨後引起貨物處所內缺氧。還可能產生二氧化碳。

### 積載和隔離

除本規則 9.3 段中的說明之外，沒有特殊的要求。

如貨物處所和機艙之間艙壁的絕緣不能達到 A-60 級的標準，經溶劑萃取的種子的積載應“遠離”艙壁。

### 貨艙清潔度

按貨物的危險性保持清潔和乾燥狀態。

### 天氣注意事項

該貨物須儘可能保持乾燥。不得在降水期間裝卸貨物。在貨物裝卸期間，須關閉裝載或擬裝載該貨物的處所的不在使用中的所有艙蓋。

## 裝載

只有在該貨物基本不含可燃溶劑，而且由裝運國主管機關認可的人員簽發了說明含油量和含水量的證書後，才能夠裝載。

按照《規則》第 4 節和第 5 節的有關要求進行平艙。

## 注意事項

在航行期間，須定時測量艙內不同深度處的溫度並作記錄。如果貨物溫度超過 55°C 並繼續上升，則須停止貨艙的通風。如果繼續自熱，則須輸入二氧化碳或其他惰性氣體。對於經溶劑萃取的種子餅，先確定貨物處所中明顯不會出現着火的可能性，才能使用二氧化碳，以避免將溶劑蒸氣點燃的可能性。除非經過測試並確定氧氣含量已恢復到正常水平，否則禁止人員進入貨物處所。如計劃的貨物開始裝載和完成卸載間隔時間超過 5 天，則船舶應裝設將二氧化碳或其他惰性氣體導入艙內的設備，否則不能裝載該貨物。在裝載和卸貨期間並在其他任何時間進入貨物處所時，禁止吸煙和使用明火。貨物處所內不適合用於爆炸性空氣中的電路，須通過拆除系統內保險絲以外的連接予以絕緣。通風機上須裝設防火星網。

## 通風

在必要時，應根據需要對表面進行自然或機械通風，以驅除殘存溶劑的蒸氣。為防止貨物自熱，在使用機械通風時應謹慎。

## 裝運

運載該貨物的貨物處所的艙口須達到風雨密，以防止水進入。

## 卸貨

由於該貨物密度極高，除非貨物在艙底均勻鋪開以使重量平均分佈，否則艙底可能會受力過度。在航行和裝載期間，須適當注意確保不要把貨物堆起而使艙底受力過度。

## 注意事項

裝載前，須由生產廠家或託運人向船長出具證書，證明該貨物生產後在遮蓋下存放，但在裝運前露天存放不少於三天。船上只要裝有該種貨物時，須嚴禁在甲板上和貨物處所內吸煙，並在甲板上張貼“禁止吸煙”的明顯標誌。電器設備和電纜須處於良好狀態，並有妥善的保護，避免短路和產生電火花。如果要求艙壁適合於用作隔離的目的，則穿過甲板和艙壁的電纜及導管處須作密封處理，以防有害氣體和蒸汽通過。在可能時，在裝載和卸貨期間，須關閉或遮蔽居住處所的通風系統，並將空調系統（如果有的話）調至內循環模式，以便最大限度地減少粉塵進入起居處所或船舶的其他內部處所。須採取措施最大限度地降低粉塵可與甲板機械可移動部分及外部航行設備（例如航行燈）接觸的程度。

除非經過測試證明所有處所內的氧氣含量已恢復到正常水平，不存在有毒氣體，且貨物上面的空餘處所進行了足夠通風和空氣循環，否則禁止人員進入封閉的處所。

應嚴禁在危險區內吸煙，並在張貼“禁止吸煙”的明顯標誌。

電器設備和電纜應處於良好狀態，並有妥善的保護，避免短路和產生電火花。如果要求艙壁適合於用作隔離的目的，則穿過甲板和艙壁的電纜及導管處須作密封處理，以防有害氣體和蒸汽通過。

在可能時，在裝載和卸貨期間，須關閉或遮蔽居住處所的通風系統，並將空調系統（如果有的話）調至內循環模式，以便最大限度地減少粉塵進入起居艙室或船舶的其他內部處所。

應採取措施最大限度地減少粉塵可與甲板機械可移動部分及外部航行設備（例如航行燈）接觸的程度。

### **通風**

在航行期間，須根據需要對運載該種貨物的貨物處所進行表面機械通風。

### **裝運**

圓柱體 3 毫米至 12 毫米 直徑：10 毫米至 20 毫米	MHB	B

### 危險性

貨物會發生氧化，導致貨物和互通處所缺氧及增加一氧化碳和二氧化碳。

遇水會膨脹。如果含水量超過 15%，木球團在一段時間後會發酵，導致產生窒息和易燃氣體，這些氣體會引起自燃。

### **裝載**

按照《規則》第 4 節和第 5 節要求的有關規定進行平艙。

### **注意事項**

## 附錄 2

### 實驗室測試程序、使用的儀器和標準

#### 1 易流態化貨物的測試程序及有關儀器

目前測試適運水分極限（TML）有三種通用方法：

- .1 流盤試驗；
- .2 插入度試驗；
- .3 葡氏/樊氏試驗。

由於各方法各有優點，應按當地實際情況或由主管機關確定測試方法。

#### 1.1 流盤試驗程序

##### 1.1.1 適用範圍

流盤一般適用於最大粒度為 1 毫米的精礦或其他顆粒物質。最大粒度達到 7 毫米時也可以使用。顆粒大於此限的物質不適用，對於含黏土比例較高的同類物質，測試結果也不理想。如果貨物不適用於用流盤測試，則採用的測試程序應由港口國主管機關批准。

下述試驗用於測試：

- .1 貨樣的含水量，下文將貨樣稱為試驗物質；
- .2 試驗物質在流盤振動力或周期力作用下的流動水分點（FMP）；和
- .3 試驗物質的適運水分極限。

### 1.1.2 儀器（見圖 1.1.2）

- .1 標準流盤及框架（ASTM 代號（C230-68）—見 3）。

圖 1.1.2 流盤及附屬裝置

- .2 流盤的安裝（ASTM 代號（C230-68）—見 3）。
- .3 圓模（ASTM 代號（C230-68）—見 3）。
- .4 搗棒（見圖 1.1.2.4）：利用裝有彈簧並經校核的搗棒（示例見圖 1.1.2.4）或其他構造的搗棒可達到所要求的捶搗壓力。這種搗棒可以通過直徑為 30 毫米的搗棒頭施加可控壓力。
- .5 天平與法碼（ASTM 代號（C109-73）—見 3）及適用的貨樣容器。
- .6 容量分別為 100—200 ml 和 10 ml 的帶有刻度的玻璃量筒和量管。

- .7 直徑約為 30 厘米的半球形攪拌容器、膠皮手套及烘乾盤或鍋。也可用相當大小的自動攪拌器進行攪拌操作，但這時應注意確保機械攪拌器不會降低試驗物質的粒度和均勻性。
- .8 能使溫度控制在 110°C 左右的烘乾爐，其內應無空氣循環。

圖 1.1.2.4 裝有彈簧的搗棒樣本

### 1.1.3 溫度與濕度

最好在試樣不受溫度、氣流和濕度變化影響的房間中進行試驗。試樣的準備和試驗過程的各階段應在合理時間間隔內完成，以使水分損失最小，而且無論在任何情況下，試驗須當天完成。若可能，試樣容器應用塑料薄膜或其他蓋子蓋上。

### 1.1.4 試驗程序

測定流動水分點的試樣數量依試驗物質的比重不同而不同。煤約需 2 千克，而精礦需 3 千克。採集的試樣應能代表所運輸的物質。經驗表明，使試樣的水分漸增至流動水分點所得結果比漸減時所得結果準確。

因此，建議在流動水分點的主試驗開始前，按以下步驟進行流動水分預備試驗，以確定試樣的狀態，即試樣的含水量及在進行主試驗之前向試樣中加水的速率或試樣是否需經空氣乾燥以減少其水分。

#### 1.1.4.1 試樣的準備

將試驗物質的代表性試樣盛入攪拌容器中進行充分攪拌。按下述步驟將試樣分成三個子樣（A）、（B）和（C）：（A）為試樣的五分之一，對其立即稱重，並置於烘乾爐中烘乾，以確定試樣“收到時”的含水量。另兩份子樣各約為試樣的五分之二，其中一份（B）用於預備試驗，另一份（C）用作主試驗。

- .1 裝填圓模。將圓模置於流盤中心，用攪拌器中的試樣分三層裝填。經搗實後的第一層應約佔圓模深度的三分之一。為此而需要的試樣數量依試驗物質的不同而不同，

但對試驗物質的填密性取得某些經驗之後就能很容易地確定。

經搗實後的第二層應約達到圓模深度的三分之二，最後一層試樣經搗實後應剛好達到圓模頂邊的下部（見圖 1.1.4.2）。

- .2 搗實程序。搗實的目的是將試樣壓實到類似在船舶艙底積載時的程度。相應的壓力應為：

$$\begin{aligned} \text{搗棒壓力 (Pa)} &= \text{散貨密度 (kg/m}^3\text{)} \\ &\quad \times \text{最大貨物深度 (m)} \\ &\quad \times \text{重力加速度 (m/s}^2\text{)} \end{aligned}$$

含水量為裝載時數值的貨樣的散貨密度可利用 ASTM 標準 D-698 或 JIS-A-1210 中所述的葡氏 C 儀器一次測出。

計算搗棒的壓力時，若無貨物深度的資料，則應用貨物的最大可能深度。

壓力亦可以從表 1.1.4.1 中估算出。

底層應用搗棒捶搗 35 次，中層 25 次，上層 20 次（每次應用平穩而適當的壓力）。每一層均應在全部表面上連續捶搗至邊緣，以形成均勻的平整表面。

- .3 撤去圓模。輕拍圓模四周至其鬆動，取去圓模，將截錐狀試樣留在流盤上。

表 1.1.4.1

典型貨物	散貨密度 (kg/m <sup>3</sup> )	貨物最大深度			
		2m	5m	10m	20m
←-----搗棒壓力 (kPa) -----→					
煤	1000	20 [ 1.4 ]	50 [ 3.5 ]	100 [ 7.1 ]	200 [ 14.1 ]
	2000	40 [ 2.8 ]	100 [ 7.1 ]	200 [ 14.1 ]	400 [ 28.3 ]
鐵礦	3000	60 [ 4.2 ]	150 [ 10.6 ]	300 [ 21.2 ]	600 [ 42.4 ]
鐵精礦	4000	80 [ 5.7 ]	200 [ 14.1 ]	400 [ 28.3 ]	800 [ 56.5 ]
鉛精礦	5000	100 [ 7.1 ]	250 [ 17.7 ]	500 [ 35.3 ]	1000 [ 70.7 ]

(方括號內為用直徑為 30 毫米的搗棒頭產生的等效值 kgf)

#### 1.1.4.2 流動水分點的預備試驗

- .1 撤去圓模後，將流盤以 25 次/分的速率自 12.5 毫米高處升落 50 次。如果試樣的含水量低於流動水分點，則會隨連續的顛振而散落並顛成碎塊（見圖 1.1.4-3）。
- .2 到這一步，停止流盤的顛振，將試樣重新裝回攪拌容器中並在試樣表面噴灑 5-10 ml 或更多的水，用戴膠皮套的手指或自動攪拌器攪拌均勻。

重新填裝圓模，按第 1.1.4.2.1 段所述方法將流盤升落 50 次。若未出現流態，則再加水重複上述步驟，直到達到流態。

- .3 流態的識別。流盤的顛振使顆粒間重新鑲嵌，形成緊湊狀態。結果，試祥在某一狀態下所含水分體積佔總體積的百分數增加了。如果水分在緊湊的試樣中達到飽和並且試樣產生塑性變形，則認為試樣的含水量達到了流動

水分點。這時，截錐體會產生變形，形成凸面或凹面（見圖 1.1.4-4）。

隨着流盤的反復顛振，試樣會繼續滑動並向外流動，某些材料的頂面還可能出現裂縫。但是，裂縫中含有自由水分並非表明已達到流態。大多數情況下，測量變形有助於確定是否發生了塑性流動。例如，用卡規可測出在截錐任何部分的直徑增加 3 毫米以上，這是一個有用的特徵。觀察另外一些現象也很有用。例如：當含水量（漸增）接近流動水分點時，截錐體會有黏在圓模中的趨勢；此外，將截錐體推出流盤時會在流盤上留下濕痕（條跡），如果濕痕可見，則表明含水量可能超過了流動水分點，但濕痕（條跡）不可見並不表明含水量低於流動水分點。

測量截錐體底部或中部尺寸總是有用的。加水 0.4% 至 0.5%，顛振流盤 25 次，第一次直徑會增加 1 毫米至 5 毫米；再加一次水，底部直徑會增加 5 毫米至 10 毫米。

- .4 對於許多精礦來說，除上述方法外還可用下述方法快速測出其近似流動水分點：

當含水量肯定超過流動水分點時，顛振流盤 25 次，測出截錐體的直徑；加入一次水後重複上述步驟，再測量截錐體的直徑；畫出表示直徑增加量和含水量的兩個點，見圖 1.1.4-1；通過此二點的直線與含水量軸的交點即是近似的流動水分點。

完成了流動水分點的預備試驗後，將用作主試驗的試樣的含水量調至略低於流動水分點（約低 1%至 2%）。

#### 1.1.4.3 流動水分點的主試驗

在預備試驗中達到流動狀態之後，將子樣（C）的含水量調成比預備試驗中未引起流態化的最後一個含水量低 1%至 2%（此項建議只是為了避免主試驗時的含水量與流動水分點過於接近而需進行乾燥並重新開始）。利用含水量經調整的試樣進行最後的試驗，方法與預備試驗相同，但每次加水的量不超過 0.5%（預備試驗的流動水分點越低，加水量應越小）。每一步完成後，可將圓模中的試樣置於容器中並立即稱重，以備測試含水量。若試樣開始塑性流動或稍加水後開始塑性流動，這樣作就非常必要了。如果不要求，可將其放回攪拌容器中。

達到流動狀態後，應測試兩份試樣的含水量，一份是含水量略高於流動水分點的試樣，另一份為含水量略低於流動水分點的試樣。兩個含水量的差值應小於 0.5%，並將流動水分點取為該兩個含水量的平均值。

#### 1.1.4.4 含水量的確定

##### 簡述

應注意，對於許多物質都有國際上或國家認可的測定含水量的方法。應按這些方法或按已證明能得出相同結果的方法測定含水量。

##### 精礦及類似物質

將精礦的試樣乾燥到恒定質量十分重要。實踐中，將試樣在 105°C 的溫度下乾燥數小時後稱重，連續進行數次以確定這一狀態。若質量不再變化，表明乾燥過程已完成，如果質量仍有減小，則應繼續進行乾燥。

乾燥時間的長短受多種因素影響，如試樣在烘乾爐中的放置、使用的容器、顆粒的大小、傳熱效率等。5 小時對一種精礦試樣可能足夠，而對另一種則可能過短。硫化物精礦易於氧化，因而建議不要使用有空氣循環的烘乾爐，也不要使試樣在爐中的時間超過 4 小時。

## 煤

測定含水量的推薦方法為 ISO 589-1974 “硬煤－總含水量的確定”中所述的方法。應按這一方法或按已證明能給出相同結果的方法測定含水量。

含水量、流動水分點和適運水分極限的計算：

設  $m_1$  是“收到時”子樣的精確質量（見 1.1.4.1），

設  $m_2$  是“收到時”子樣乾燥後的精確質量，

設  $m_3$  是試樣剛達到流態後的精確質量（見 1.1.4.3），

設  $m_4$  是試樣剛達到流態後的經乾燥後的精確質量，

設  $m_5$  是試樣剛達到流態前的精確質量（見 1.1.4.3），

設  $m_6$  是試樣剛達到流態前的經乾燥後的精確質量，

那麼：

- .1 精礦“收到時”含水量為

$$\frac{(m_1 - m_2)}{m_1} \times 100, \% \quad (1.1.4.4.1)$$

- .2 該物質的動水分點為

$$\frac{\frac{(m_3 - m_4)}{m_3} + \frac{m_5 - m_6}{m_5}}{2} \times 100, \% \quad (1.1.4.4.2)$$

- .3 適運水分極限為流動水分點的 90%。

## 泥煤

對所有泥煤，使用 ASTM 方法或使用 CEN（20 升）方法確定散裝密度。

為了獲得正確的適運水分極限（TML），泥煤在乾燥時的密度應為  $90 \text{ kg/m}^3$  左右。

按第 1.1.1 段所示，應測定以下值：

- .1 貨物樣品（MC）的含水量。
- .2 流動水分點（FMP）。
- .3 適運水分極限（TML），通過以下方法測定：
  - .3.1 當泥煤的乾燥散裝密度大於  $90 \text{ kg/m}^3$  時，適運水分極限取為流動水分點的 85%。
  - .3.2 當泥煤的乾燥散裝密度為  $90 \text{ kg/m}^3$  或以下時，適運水分極限取為流動水分點的 90%。

### 1.2 插入度試驗程序

插入度試驗是使試驗物質在圓缸中進行振動，根據其上標尺的插入深度確定流動水分點。

#### 1.2.1 適用範圍

- .1 插入度試驗一般適用於精礦、類似物質及最大顆粒為 25 毫米的煤。

- .2 試驗中，圓缸中試樣以  $2g_{rms} \pm 10\%$ （ $g$  為重力加速度）振動 6 分鐘。如果試樣表面上的標尺插入深度大於 50 毫米，則表明試樣的含水量大於流動水分點。
- .3 本試驗由粗測流動水分點的預備試驗和精測流動水分點的主試驗構成。若已知流動水分點的概值，則可不進行預備試驗。
- .4 對試樣進行測試的試驗室應按第 1.1.3 段備妥。

### 1.2.2 儀器（見圖 1.2.2）

- .1 試驗儀器包括：
  - .1 振動台；
  - .2 圓缸；
  - .3 標尺（插入棒及托架）；
  - .4 搗棒（見第 1.1.2.4 段）；和
  - .5 輔助設備（見第 1.1.2.5 至 .8 段）。
- .2 可將圓缸卡在其上的台式振動器（見圖 1.2.2.2）應能使 30 kg 物質的振動頻率達到 50 Hz 或 60 Hz，加速度為  $3g_{rms}$  以上，而且加速度的大小可以控制。
- .3 圓缸的尺寸如下（見圖 1.2.2.3-1 和 1.2.2.3-2）：

圓缸大小	內徑	深度	壁厚
小型	146 毫米	202 毫米	9.6 毫米或以上
大型	194 毫米	252 毫米	10.3 毫米或以上

圓缸應有足夠的剛性，無磁性，由不可滲透的輕型材料製成，如丙烯酸或氯乙烯。

小型圓缸用於最大顆粒不超過 10 毫米的物質；大型圓缸用於最大顆粒不超過 25 毫米的物質。

- .4 插入棒（見圖 1.2.2.4）由銅製成。對於煤，應將插入棒的質量調為 88 g（5 kPa）；對於精礦，應將其調為 177 g（10 kPa）。若試樣中含有粗粒，建議在貨樣表面上採用二支同樣質量的插入棒，以免判斷錯誤。
- .5 托架（見圖 1.2.2.5）應置於圓缸中部，並以最小的摩擦力導引插入棒。使用二支插入棒時，其放置應按圖 1.2.2 進行。
- .6 應按試樣的性質和狀況即粒度和比重選擇圓缸和插入棒。

### 1.2.3 試驗程序

#### 1.2.3.1 試驗及振動台的準備

- .1 所需試樣的數量不少於所用圓缸容積的 6 倍。圓缸中所裝試樣的數量應為：小型圓缸約為 1700 cm<sup>3</sup>，大型圓缸約為 4700 cm<sup>3</sup>。
- .2 將試樣混合均勻，分成大約相等的（A）、（B）和（C）三個子樣。子樣（A）應立即稱重並置入烘乾爐中以確定試樣“收到時”的含水量。

子樣（B）和（C）分別用作預備試驗和主試驗。

- .3 在進行試驗前，應使用加速度儀對振動台的振動進行校準。當台上放有裝滿試樣的圓缸時，振動台的加速度應調為  $2g \text{ rms} \pm 10\%$ 。

#### 1.2.3.2 流動水分點的預備試驗

本試驗旨在用子樣 (B) 快速測定流動水分點。每一次插入度試驗後均加入一定數量的水。達到流態時，所測得的試樣含水量略高於流動水分點。略低於流動水分點的含水量可由試樣質量中扣除前次加水量算得。

- .1 用子樣 (B) 分四步填裝圓缸，裝入每一層後均用專用的搗棒搗實。精礦的搗實壓力應按第 1.1.4.1 段確定，煤的搗實壓力為 40 kPa。整個試樣的表面上應均勻施壓，直到產生均勻的平面。
- .2 穿過托架，將插入棒置於試樣表面上。
- .3 以頻率為 50 Hz 或 60 Hz，加速度為  $2g \text{ rms} \pm 10\%$  振動 6 分鐘。如果必要，應核對裝在振動台上的加速度儀的讀數。
- .4 振動 6 分鐘後，讀取插入深度。
- .5 若插入深度小於 50 毫米，則認為未達到流態化。這時應：
  - .1 將試樣從圓缸中取出，放回混合容器中與原有試樣混合。
  - .2 混合後稱量混合容器中試樣重量。
  - .3 噴灑一定量的水，但不應超過混合容器中試樣重量的 1%，並均勻攪拌。

- .4 重複第 1.2.3.2.1 至 1.2.3.2.5 段所述步驟。
- .6 若插入深度大於 50 毫米，則認為已達到流態化。這時應：
  - .1 將試樣從圓缸中取出，放入混合容器中。
  - .2 按第 1.1.4.4 段所述方法測定含水量。
  - .3 根據最後一次加水量，計算出略低於流動水分點的含水量。
- .7 若第一次試驗的插入深度大於 50 毫米，亦即試樣收到時便已達到流態化，則應將子樣（B）和子樣（C）混合，在室溫下進行乾燥以減小試樣中的含水量。之後再將試樣分成子樣（B）和子樣（C），重作預備試驗。

#### 1.2.3.3 流動水分點的主試驗

- .1 在預備試驗的基礎上進行主試驗，以精確確定流動水分點。
- .2 將子樣（C）的含水量調為預備試驗中最後一個低於流動水分點的數值。
- .3 按第 1.2.3.2 段，用經調製的子樣（C）進行流動水分點主試驗的第一次試驗。但是，這裏每次加水的數量不得超過試樣總重量的 0.5%。
- .4 若事先已知流動水分點的大約值，則應將子樣（C）的含水量調為該值的 90%左右。
- .5 達到流態時，按第 1.1.4.3 段的方法確定流動水分點。

### 1.3 葡氏/樊氏測試法

#### 1.3.1 適用範圍

- .1 本方法可用於細粒和相對較粗粒精礦或最大顆粒為 5 毫米的類似物質的試驗。本方法不得用於煤或其他多孔物質。
- .2 在對最大顆粒為 5 毫米以上的較粗物質應用葡氏/樊氏測試法方法之前，應對本方法進行仔細研究和改進。
- .3 按葡氏/樊氏測試法，適運水分極限（TML）的取值為臨界水分限制，取為飽和含水量的 70%。

#### 1.3.2 葡氏/樊氏測試法的設備

- .1 葡氏測試儀（見圖 1.3.2）包括一個柱形鐵模和一個可拆卸的加長部分（衝壓圓筒）以及在底端開口的可在導筒中滑動的衝壓器（衝壓錘）。
- .2 天平與砝碼（見第 3.2 段）及相應的貨樣容器。
- .3 能使溫度控制在 100°C 至 105°C 之間的烘乾爐，其內應無空氣循環。
- .4 一隻適當的攪拌器。注意，攪拌器的使用應不降低試驗物質的粒度和均勻性。
- .5 測定固體密度的儀器，如比重瓶。

#### 1.3.3 溫度和濕度（見第 1.1.3 段）

1.3.4 試驗程序

- 1 確定衝壓曲線。按有關標準（見第 20 頁 4.7 節）將具代表性的試樣在約 100°C 溫度下進行乾燥。試樣的總量至少為進行一次完整試驗所需試樣的 3 倍。應利用衝壓試驗測定 5 至 10 個不同含水量（即進行 5 至 10 次不同試驗）。試樣的含水量應從乾燥調製到接近飽和。每次衝壓試驗約需 2000 cm<sup>3</sup> 精礦試樣。

圖 1.3.2 葡氏測試儀

圖 1.3.4.2

每次進行衝壓試驗時應向乾燥的試樣中加入適量的水，充分攪拌約 5 分鐘。取約五分之一的試樣裝入鐵模中並鏟平、然後在增加的試樣表面均勻搗實。搗實用帶有導筒的衝壓器進行，捶搗 25 次，每次的升落高度為 0.2 米。全部五層試樣均應用此法搗實。最後一層試樣搗實後，移去加長模，這時試樣與鐵模頂部平齊。將鐵模與搗實的試樣一同稱重之後取出試樣。將試樣進行乾燥和稱重。

對其他不同含水量的試樣重複進行上述試驗。

.2 定義和計算數據（見圖 1.3.4.2）

- 空模質量（g）：A
- 圓筒與搗實試樣總質量（g）：B
- 濕試樣的質量（g）：C

$$C = B - A$$

- 乾樣的質量（g）：D
- 水的質量（g）（等於體積  $\text{cm}^3$  數值）：E

$$E = C - D$$

圓筒的容積：1000  $\text{cm}^3$

.3 主要參數的計算

- 固體貨物的密度， $\text{g}/\text{cm}^3$ （ $\text{t}/\text{m}^3$ ）：d
- 乾散貨的密度， $\text{g}/\text{cm}^3$ （ $\text{t}/\text{m}^3$ ）： $\gamma$

$$\gamma = \frac{D}{1000}$$

- 淨水含量，體積%： $e_v$

$$e_v = \frac{E}{D} \times 100 \times d$$

- 空隙比：e（空隙體積除以固體體積）

$$e = \frac{1000 - D}{D} = \frac{d}{\lambda} = -1$$

- 飽和度，體積百分比：S

$$S = \frac{e_v}{e}$$

- 總水含量（質量百分比）：W<sup>1</sup>

$$W^1 = \frac{E}{C} \times 100$$

- 淨水含量（質量百分比）：W

$$W = \frac{E}{D} \times 100$$

#### .4 衝壓試驗圖的繪製

將每次衝壓試驗後，將計算出的空隙比（e）作為縱坐標，將淨含水體積比（e<sub>v</sub>）和飽和度（S）分別作為橫坐標參數，畫在圖上。

圖 1.3.4.5

## 1.5 衝壓曲線

全部試驗構成一條具體的衝壓曲線（見圖 1.3.4.5）。

衝壓曲線與飽和度線  $S=70\%$  的交點即為臨界含水量。該含水量即為適運水分極限。

## 2 測定靜止角的程序及有關儀器

### 2.1 細顆粒物質（尺寸小於 10 mm）靜止角的測定：“傾箱試驗”。 在實驗室或裝貨港使用

#### 2.1.1 適用範圍

本試驗用於測定非黏性細顆粒物質（尺寸小於 10 mm）的靜止角。在對有關物質解釋本規則第 5 節和第 6 節時可應用本試驗結果。

#### 2.1.2 定義

本試驗測定的靜止角是試驗箱中的散裝物質剛剛開始滑動時試驗箱的頂面與水平面的夾角。

### 2.1.3 試驗的原則

在利用本試驗測定靜止角時，試驗箱中物質的表面最初應平整並和箱底平行。試驗箱的傾斜時應無振動，並且在箱中物質剛剛開始散滑時停止。

### 2.1.4 儀器（見圖 2.1.4）

所需儀器如下：

- .1 一隻支架，其上裝有一開口試驗箱。試驗箱與支架由固定在箱底邊和支架上的橫軸及軸承鉸接起來，使試驗箱能進行可控傾斜。
- .2 試驗箱的尺寸為：長 600 mm，寬 400 mm，高 200 mm。
- .3 為防止試樣在傾斜時沿箱底滑動，在填裝物質前將一格板（格的尺寸為 30 mm × 30 mm × 25 mm）固定在箱底。
- .4 試驗箱由裝在支架與箱底之間的液壓缸驅動。也可利用其他方法達到所要求的傾斜，但在所有情況下須消除振動。
- .5 給液壓缸加壓，可用一液壓氣動蓄能器，其內的空氣或其他氣體的壓力應為 5 kp/cm<sup>2</sup>。
- .6 傾斜速度應為 0.3°/s。
- .7 試驗箱的傾角範圍應至少為 50°。

圖 2.1.4 試驗箱基本結構圖

- .8 在固定軸的一端裝有量角器。量角器的一邊是固定的，可用螺絲調至水平。
- .9 量角器用以測定試驗箱頂邊與水平線的夾角，精度應在 $0.5^{\circ}$ 以內。
- .10 應備有一氣泡式水準儀或其他水準儀，以將量角器調至零位。

### 2.1.5 試驗程序

向試驗箱內裝填試驗物質時，應從儘可能低的高度上小心緩慢地將試驗物質倒入箱中，保證裝填均勻。

多餘的試樣應用直邊鏟刮掉。鏟刮時，應將其朝着鏟刮的方向傾斜 45°。

驅動傾斜系統，在箱中物質剛剛開始散滑時停止。

用量角器測出試驗箱頂邊與水平線的夾角，並作出記錄。

### 2.1.6 評定

靜止角取從三次測量值中計算出的平均值，在試驗報告中的記錄應精確到半度以內。

備註：試驗最好用三份試樣分別進行。

試驗前應將試驗箱上的橫軸調為水平。

## 2.2 無試驗箱時，測定靜止角的替代方法或船用方法

### 2.2.1 定義

按本方法，靜止角為從試樣圓錐體半高處量起的斜面與底平面的夾角。

### 2.2.2 試驗原理

將一定數量的試樣從砂斗中輕輕地倒在一張粗質紙上，形成對稱的錐形，以測定靜止角。

### 2.2.3 設備

進行該試驗所需設備如下：

- 一張不受振動影響的水平桌；
- 一張堆試樣用的粗質紙；
- 一部量角器；
- 一隻容量為 3 升的錐筒形砂斗。

### 2.2.4 試驗程序

將粗質紙鋪在桌上。將 10 升將要測試的物質分成三個子樣，每份按下述方法進行試驗：

將一份子樣的 2/3 (即 2 升) 倒在粗質紙上，形成一初始錐形。將子樣剩下的部分從距錐頂約幾毫米高處特別仔細地倒在錐頂。注意使錐形形狀對稱，為此可在傾倒時在錐頂近周緩慢轉動砂斗。

測量時應注意量角器不要接觸錐形，否則試樣會滑動而破壞試驗。

應在錐形四周間隔約 90° 的四個位置上測出角度。

其餘二份子樣的試驗應以同樣方法進行。

### 2.2.5 計算

靜止角取 12 個測量值的平均值，報告結果應精確到半度以內。該角度可按下式換算成試驗箱測出的數值：

$$a_t = a_s + 3^\circ \quad (2.2.5)$$

式中  $a_t$  = 傾箱試驗測得的靜止角

$a_s$  = 觀測試驗法測得的靜止角

#### 3.1 標準流盤與座架

##### 3.1.1 流盤與座架

3.1.1.1 流盤各部件應按圖 3 製造。流盤由剛性整鑄鐵質座架、直徑為 10 英寸 $\pm$ 0.1 英寸 (254 mm $\pm$ 2.5 mm) 剛性圓盤及用螺栓與盤底垂直相連的豎向軸構成。與圓盤連接在一起的軸上鑲有接觸肩，其與座架的連接應能使之在凸輪的驅動下垂直升落規定的高度。新流盤的高度允許誤差為 $\pm$ 0.005 英寸 (0.13 mm)，舊流盤的高度允許誤差為 $\pm$ 0.015 英寸 (0.39 mm)。圓盤面應為光車磨光平面，無砂眼，無表面瑕疵，並切出如圖 3 所示的盤面線。圓盤應用黃銅或青銅鑄製，其洛氏硬度不應小於 HRB 25，邊緣厚度應為 0.3 英寸 (8 mm)，並有 6 根徑向加強骨。盤面及與之相連的軸重量應為 9 磅 $\pm$ 0.1 磅 (4 kg $\pm$ 0.05 kg)，並且重量應在軸心周圍對稱分佈。

3.1.1.2 凸輪及豎向軸應以中碳機件鋼製成，並應在圖 3 所標出的部位進行硬化處理。軸應為直杆，新流盤的軸直徑與座架腔筒內徑之差應不小於 0.002 英寸 (0.05 mm)，不大於 0.003 英寸 (0.08 mm)；舊流盤的這一差值應保持在 0.002 英寸至 0.010 英寸 (0.26 mm) 之間。軸的底端在下落時不應落在凸輪上。而且從下落點到與凸輪接觸點應不小於 120°。凸輪邊的曲率半徑應為在 360° 中由 0.50 英寸 (13 mm) 均勻變到 1.25 英寸 (32 mm) 的平滑螺線，而且豎軸與凸輪接觸時應無顯著振動。凸輪的固定、凸輪與豎軸相互接觸的表面應使流盤在

25 次下落中旋轉不超過一周。流盤下落時與座架接觸的表面應保持平滑、水平，並與流盤上表面平行，在整個 360° 間相互完全接觸。

3.1.1.3 流盤的座架應由高級鑄鐵製成。座架的鑄製中應加有三根整體加強骨，與座架同高，相互位置間隔 120°。座架的頂部應淬火到 1/4 英寸（6.4 mm）深，表面應經研磨和拋光，使之與腔筒垂直，和軸的接觸肩有 360° 的接觸。座架底部的外表面應經研磨，使之與下面的鋼板完全接觸。

3.1.1.4 流盤可由一馬達驅動，該馬達通過一個蝸輪減速器和撓性耦合器與凸輪軸相連。凸輪軸的轉速為每分鐘 100 轉。馬達驅動設備不應繫縛或安裝在流盤底部的鋼板或座架上。

在校準試驗中，如果流盤測出的流動水分點與校準試樣的流動水分點相差不超過 5 個百分點，則應認為流盤的性能滿足要求。

### 3.1.2 流盤的安裝

3.1.2.1 流盤座架應用螺栓緊固在一塊鑄鐵或鋼板上，其尺寸至少應為 1 英寸（25 mm）厚，10 英寸（250 mm）見方。該鋼板表面應加工成光滑平面，用 4 個 1/2 英寸（13 mm）的螺栓固定在水泥座上；螺栓應穿過鋼板，嵌入水泥至少 6 英寸（150 mm）。水泥座應反鑄在鋼板上，使鋼板與水泥座各點完全接觸。不得在鋼板與水泥座之間設螺栓作水平調整裝置。應將適當的水平調整裝置裝在水泥座的底部。

圖 3

3.1.2.2 水泥座應用比重不小於 140 磅/平方英尺 (2240 kg/m<sup>2</sup>) 的水泥整塊鑄成，其頂部應為 10 英寸至 11 英寸 (250 mm 至 275 mm) 見方，底部為 15 英寸至 16 英寸 (375 mm 至 400 mm) 見方，高為 25 英寸至 30 英寸 (625 mm 至 750 mm)。水泥座底部四角應各嵌入 0.5 英寸 (13 mm) 厚、4 英寸 (102 mm) 見方的軟木墊。流盤盤面的水平性、鋼板與水泥間螺栓及螺母的緊固性應經常進行檢查 (扭緊這些螺母時建議用 20 磅英尺 (27 Nm) 的扭矩。

3.1.2.3 流盤安裝在水泥座架上之後，盤面無論升起或落下，兩條互相垂直的直徑均應保持水平。

### 3.1.3 流盤的潤滑

3.1.3.1 流盤的豎向軸應保持清潔，並應以輕質油 (SEA-10) 作輕度潤滑。盤面與座架的相互接觸面上不應塗油。在凸輪接觸面上塗油有助於減輕磨損和提高運行平穩性。若流盤較長時間未使用，則使用前應升落十幾次或更多次。

### 3.1.4 圓模

3.1.4.1 模制試樣的圓模應由生青銅或黃銅鑄成，其構造如圖 3 所示。所用金屬的洛氏硬度應不小於 HRB25。新圓模頂口的直徑應為 2.75 英寸 ±0.02 英寸 (69.8 mm ±0.5 mm)，舊圓模頂口的直徑應為 2.75 英寸 +0.05 英寸 (+1.3 mm) 至 -0.02 英寸。頂部和底部的平面應相互平行，並與錐體的豎向中心軸垂直。圓模壁厚至少應為 0.2 英寸 (5 mm)。圓模頂邊的外緣應製成凸緣，以便於將其提起。所有表面均應進行光面修整。圓模應與一環形防護板一起使用，以防止灰漿濺灑在

盤頂上。該防護板應由不易與水黏附的非吸收性材料製成，其直徑應約為 10 英寸（254 mm），中心開口直徑應約為 4 英寸（102 mm）。

### 3.2 天平與砝碼

#### 3.2.1 天平

3.2.1.1 所使用的天平應滿足下述要求：舊天平稱量 2000 克重量的允許誤差應在  $\pm 2.0$  克以內，新天平的允許誤差應為上述數值的一半。靈敏度倒數應不超過允許誤差的兩倍。

#### 3.2.2 砝碼

3.2.2.1 舊砝碼的允許誤差如下表所示。新砝碼的允許誤差為表中各對應值的一半。

#### 4 測定含硝酸鹽化肥自續放熱分解的試驗槽試驗

##### 4.1 定義

能自續分解的化肥係指在其中局部開始的分解將擴散至其全部的化肥。交運的化肥會發生此類分解傾向可用試驗槽的方法來測定。試驗中，將擬交付運輸的化肥盛入水平試驗槽中，使分解從局部開始。移去熱源後，測出其分解的擴散速度。

- A 鋼板（規格 150 mm×150 mm，厚 1 mm 至 3 mm）
- B 氣體燃燒器（如：Teclu 或 Bunsen）
- C 防熱屏（厚 2 mm）
- D 支架（如：由 15 mm 寬，厚 2 mm 的鋼板製成）
- E 網狀試驗槽（150×150×500 mm）

圖 4-1 帶支架和燃燒器的網狀試驗槽

#### 4.2 儀器與材料

該儀器（如圖 4-1）由一個內尺寸為 150 mm×150 mm×500 mm、頂部開口試驗槽構成。試驗槽由方孔鋼絲網（最好為不鏽鋼鋼絲）製成，網孔寬為 1.5 mm，鋼絲直徑為 1.0 mm，其支架應為 15 mm 寬，2 mm 厚的鋼架。試驗槽的兩端可用厚 1.5 mm、150 mm×150 mm 見方的不鏽鋼板代替鋼絲網。試驗槽應有合適的支撐。若化肥的粒度分佈會使大量化肥從網孔中漏出，則應使用網孔較小的試驗槽進行試驗，或用襯有較小網孔鋼絲網的試驗槽進行試驗。在開始階段，應持

續供足量熱量以形成一個均勻的分解鋒。這裏推薦以下兩種可供選擇的供熱方法，即：

- A 鋁或不鏽鋼防護板（厚 3 mm）
- B 隔熱板（厚 5 mm）
- C 鋁箔或不鏽鋼板（厚 3 mm）
- D 槽中加熱器位置

圖 4-2 電加熱器（250W）

#### 4.2.1 電加熱器

將一個裝在不鏽鋼盒內的電熱器（250W）置於試驗槽一端內側（如圖 4-2）。不鏽鋼盒的尺寸為 145 mm×145 mm×10 mm、壁厚為 3 mm。不鏽鋼盒不與化肥接觸的一側應裝有一隔熱板（隔熱板厚應為 5 mm），加熱一側應用鋁箔或不鏽鋼板防護。

#### 4.2.2 氣體燃燒器

在試驗槽一端的內側置一鋼板（厚為 1 mm 至 3 mm），使之與絲網相接觸（如圖 4-1），用兩個氣體燃燒器加熱。這兩個燃燒器應固定在支架上，並能將不鏽鋼板的溫度保持在 400°C 至 600°C 之間，即處於暗紅熱狀態。

4.2.3 為了防止熱量沿試驗槽外邊傳導，在裝有加熱器一端距端邊 50 mm 處應裝設不鏽鋼板（厚為 2 mm）。

4.2.4 如果全部用不鏽鋼製成，則該設備的壽命會延長。這對網狀試驗槽來說特別重要。

4.2.5 測定擴散速度時，可將熱電耦置入試驗物質中，當分解鋒到達熱電耦並使之溫度達到某一數值時將時間記下。

#### 4.3 試驗程序

4.3.1 該儀器應置於吸煙罩下以將分解時產生的毒氣排出，或置於開敞空間以使產生的煙霧可及時散盡。儘管沒有爆炸危險，但建議進行試驗時在觀測者和儀器之間設置防護屏，如透明塑料板。

4.3.2 在試驗槽中盛滿擬交付運輸的化肥，在一端用上述電加熱器或氣體燃燒器加熱，使之開始分解。加熱應持續到化肥分解已充分展開，能觀察到分解鋒已開始擴展（約超過 30 mm 至 50 mm）為止。對具有較高熱穩定性的化肥可能需連續加熱 2 小時。如果化肥有易熔傾向，則加熱應謹慎進行，即用小火加熱。

4.3.3 停止加熱後約 20 分鐘，記下分解鋒的位置。分解鋒可根據化肥顏色的差別來識別，例如棕色（未分解的化肥）對白色（已分解的

化肥)；也可利用分解鋒兩端的熱電耦所指示的溫度來識別。擴展速度可通過觀測和計時或從熱電耦的記錄來確定。應注意停止加熱後是否未發生擴展，或是否擴展到了所有化肥。

#### **4.4 試驗衡準和結果的評價方法**

4.4.1 如果分解擴展到了所有化肥，則表明該化肥能自續分解。

4.4.2 如果分解未擴展到所有化肥，則表明這種化肥無自續分解的危險。

### **5 抗爆試驗的介紹**

#### **5.1 原理**

5.1.1 將試樣裝入鋼管，以經受助爆藥的爆炸振動。試驗期間，鋼管平置在鉛柱上，以鉛柱受到擠壓的程度來確定爆炸的蔓延度。

#### **5.2 試樣的準備**

5.2.1 該試驗須在貨物的代表性試樣上進行。進行抗爆試驗前，全部試樣應在封閉的鋼管中以 25°C 和 50°C ( $\pm 1^\circ\text{C}$ ) 的溫度至少循環預熱五次。應保持試樣處於預熱期間的最高溫度至少一小時，而且在試驗前完成預熱時的溫度至少應為 20°C ( $\pm 3^\circ\text{C}$ )，該溫度應從試樣的中心測得。

### 5.3 材料

不鏽鋼管應達到 ISO 65-1981-Heavy 或與之相當的標準：

管長	1000 mm
標稱外徑	114 mm
標稱壁厚	5—6.5 mm

座板（160×160 mm）應由具有良好焊接性能的鋼板製成，厚為 5 至 6 mm，與鋼管的一端全周對接焊。

起爆系統和引爆劑

電雷管或非金屬外皮的點火索（10 至 13 g/m）。

壓製的助爆藥球團，如旋風炸藥/臘 95/5 或三硝基苯甲硝胺，中心壓有凹穴以裝起爆藥。

含 83 至 86% 季戊炸藥的塑料炸藥 500±1 克，用紙板或塑料管作出柱形，爆炸速度為 7300 至 7700 m/s。

六個用於檢測爆振的精煉鑄鉛鉛柱

直徑 50 mm × 高 100 mm，由精煉鉛製成，含鉛純度至少為 99.5%。

### 5.4 試驗程序

試驗溫度：15 至 20°C。試驗裝置如圖 1 和 2 所示。

將試樣填充至測試管 1/3 處，在離地 10 cm 處垂直跌落五次。在跌落之間用錘子輕敲管壁以增加壓力。應向管內繼續添裝試樣，經

過 20 次提起和跌落及 20 次的敲擊和壓實，直至裝填的試樣離管口的距離為 70 mm。

將塑料炸藥填入鋼管中，並用一個凸形木模壓緊。將壓製的助爆藥球團置於塑料炸藥中的凹處。將鋼管用木盤封妥，以保證該裝置與試樣的完全接觸。將鋼管平放在 6 個中心間距為 150 mm 的鉛柱上，最後一個鉛柱的中心距管底板的距離應為 75 mm。鉛柱應放置在不會發生變形、不會發生移動的水平硬質平面上。將電雷管或點火索插入助爆藥中。

採取一切必要的安全措施後，連接和引爆炸藥。

記錄每一根鉛柱被壓縮的高度佔原高度 100 mm 的百分比。由於壓縮不均勻，所取變形應為最大值和最小值的平均值。

### 5.5 結論

該試驗應進行 2 次，若每次試驗中有一個或一個以上鉛柱的壓縮量小於 5%，則可認為該試驗物質符合抗爆性要求。

## FOREWORD

The International Convention for the Safety of Life at Sea, 1974 (SOLAS Convention), as amended, deals with various aspects of maritime safety and contains, in parts A and B of chapter VI and part A-1 of chapter VII, the mandatory provisions governing the carriage of solid bulk cargoes and the carriage of dangerous goods in solid form in bulk, respectively. These provisions are amplified in the International Maritime Solid Bulk Cargoes Code (IMSBC Code).

Detailed fire protection arrangements for ships carrying solid bulk cargoes are incorporated into chapter II-2 of the SOLAS Convention by regulations 10 and 19. Attention is drawn to regulation II-2/19.4 of the SOLAS Convention as amended. This provides for an appropriate document as evidence of compliance of construction and equipment with the requirements of regulation II-2/19 to be issued to ships constructed on or after 1 July 2002 and carrying dangerous goods in solid form in bulk as defined in regulation VII/7 of the Convention, except class 6.2 and class 7.

For:

- cargo ships of 500 gross tonnage or over constructed on or after 1 September 1984 but before 1 July 2002; or
- cargo ships of less than 500 gross tonnage constructed on or after 1 February 1992 but before 1 July 2002,

the requirements of regulation II-2/54 of SOLAS, 1974, as amended by resolutions MSC.1(XLV), MSC.6(48), MSC.13(57), MSC.22(59), MSC.24(60), MSC.27(61), MSC.31(63) and MSC.57(67), apply (see SOLAS regulation II-2/1.2).

For cargo ships of less than 500 gross tonnage constructed on or after 1 September 1984 and before 1 February 1992, it is recommended that Contracting Parties extend such application to these cargo ships as far as possible.

The problems involved in the carriage of bulk cargoes were recognized by the delegates to the 1960 International Conference on Safety of Life at Sea, but at that time it was not possible to frame detailed requirements, except for the carriage of grain. The Conference did recommend, however, in paragraph 55 of Annex D to the Convention, that an internationally acceptable code of safe practice for the shipment of bulk cargoes should be drawn up under the sponsorship of the International Maritime Organization (IMO). This work was undertaken by the Organization's Sub-Committee on Containers and Cargoes and several editions of the Code of Safe Practice for Solid Bulk Cargoes (BC Code) have been published, since the first edition in 1965. The Sub-Committee was expanded to include dangerous goods and is now called the Sub-Committee on Dangerous Goods, Solid Cargoes and Containers (DSC Sub-Committee).

The prime hazards associated with the shipment of solid bulk cargoes are those relating to structural damage due to improper cargo distribution, loss or reduction of stability during a voyage and chemical reactions of cargoes. Therefore the primary aim of this Code is to facilitate the safe stowage and shipment of solid bulk cargoes by providing information on the dangers associated with the shipment of certain types of solid bulk cargoes and instructions

on the procedures to be adopted when the shipment of solid bulk cargoes is contemplated. The requirements for the transport of grain are covered by the International Code for the Safe Carriage of Grain in Bulk (International Grain Code, 1991).

The IMSBC Code that was adopted by resolution MSC.268(85) was recommended to Governments for adoption or for use as the basis for national regulations in pursuance of their obligations under regulation of the SOLAS Convention, as amended. The Code is mandatory under the provision of the SOLAS Convention from 1 January 2011. However, some parts of the Code continue to be recommendatory or informative. It needs to be emphasized that, in the context of the language of the Code: the words “shall”, “should” and “may”, when used in the Code, mean that the relevant provisions are “mandatory”, “recommendatory” and “optional”, respectively. Observance of the Code harmonizes the practices and procedures to be followed and the appropriate precautions to be taken in the loading, trimming, carriage and discharge of solid bulk cargoes when transported by sea, ensuring compliance with the mandatory provisions of the SOLAS Convention.

The Code has undergone many changes, both in layout and content, in order to keep pace with the expansion and progress of industry. The Maritime Safety Committee (MSC) is authorized by the Organization’s Assembly to adopt amendments to the Code, thus enabling the IMO to respond promptly to developments in transport.

The MSC, at its eighty-fifth session, agreed that, in order to facilitate the safe transport of solid bulk cargoes, the provisions of the Code may be applied as from 1 January 2009 on a voluntary basis, pending their official entry into force on 1 January 2011 without any transitional period. This is described in resolution MSC.268(85).

## Section 1

### General provisions

#### 1.1 Introductory note

1.1.1 It should be noted that other international and national regulations exist and that those regulations may recognize all or part of the provisions of this Code. In addition, port authorities and other bodies and organizations should recognize the Code and may use it as a basis for their storage and handling bye-laws within loading and discharge areas.

#### 1.2 Cargoes listed in this Code

1.2.1 Typical cargoes currently shipped in bulk, together with advice on their properties and methods of handling, are given in the schedules for individual cargoes. However, these schedules are not exhaustive and the properties attributed to the cargoes are given only for guidance. Consequently, before loading, it is essential to obtain current valid information from the shipper on the physical and chemical properties of the cargoes presented for shipment. The shipper shall provide appropriate information about the cargo to be shipped (see section 4.2).

1.2.2 Where a solid bulk cargo is specifically listed in appendix 1 to this Code (individual schedules for solid bulk cargoes), it shall be transported in accordance with the provisions in its schedule in addition to the provisions in sections 1 to 10 and 11.1.1 of this Code. The master shall consider to consult the authorities at the ports of loading and discharge, as necessary, concerning the requirements which may be in force and applicable for the carriage.

#### 1.3 Cargoes not listed in this Code

1.3.1 If a solid cargo which is not listed in appendix 1 to this Code is proposed for carriage in bulk, the shipper shall, prior to loading, provide the competent authority of the port of loading with the characteristics and properties of the cargo in accordance with section 4 of this Code. Based on the information received, the competent authority will assess the acceptability of the cargo for safe shipment.

1.3.1.1 When it is assessed that the solid bulk cargo proposed for carriage may present hazards as those defined by group A or B of this Code as defined in 1.7, advice is to be sought from the competent authorities of the port of unloading and of the flag State. The three competent authorities will set the preliminary suitable conditions for the carriage of this cargo.

1.3.1.2 When it is assessed that the solid bulk cargo proposed for carriage presents no specific hazards for transportation, the carriage of this cargo shall be authorized. The competent authorities of the port of unloading and of the flag State shall be advised of that authorization.

1.3.2 The competent authority of the port of loading shall provide to the master a certificate stating the characteristics of the cargo and the required conditions for carriage and handling of this shipment. The competent authority of the port of loading shall also submit an application to the Organization, within one year from the issue of the certificate, to incorporate this solid bulk cargo into appendix 1 of this Code. The format of this application shall be as outlined in subsection 1.3.3.

**1.4 Application and implementation of this Code**

1.4.1 The provisions contained in this Code apply to all ships to which the SOLAS Convention, as amended, applies and that are carrying solid bulk cargoes as defined in regulation 1-1 of part A of chapter VI of the Convention.

1.4.2 Although this Code is legally treated as a mandatory instrument under the SOLAS Convention the following provisions of this Code remain recommendatory or informative:

Section 11 Security provisions (except subsection 11.1.1);

Section 12 Stowage factor conversion tables;

Section 13 References to related information and recommendations;

Appendices other than appendix 1 Individual schedules of solid bulk cargoes; and

The texts in the sections for “DESCRIPTION”, “CHARACTERISTICS”, “HAZARD” and “EMERGENCY PROCEDURES” of individual schedules of solid bulk cargoes in appendix 1.

1.4.3 In certain parts of this Code, a particular action is prescribed, but the responsibility for carrying out the action has not been specifically assigned to any particular person. Such responsibility may vary according to the laws and customs of different countries and the international conventions into which these countries have entered. For the purpose of this Code, it is not necessary to make this assignment, but only to identify the action itself. It remains the prerogative of each Government to assign this responsibility.

**1.5 Exemptions and equivalent measures**

1.5.1 Where this Code requires that a particular provision for the transport of solid bulk cargoes shall be complied with, a competent authority or competent authorities (port State of departure, port State of arrival or flag State) may authorize any other provision by exemption if satisfied that such provision is at least as effective and safe as that required by this Code. Acceptance of an exemption authorized under this section by a competent authority not party to it is subject to the discretion of that competent authority. Accordingly, prior to any shipment covered by the exemption, the recipient of the exemption shall notify other competent authorities concerned.

1.5.2 Competent authority or competent authorities which have taken the initiative with respect to the exemption:

- .1 shall send a copy of such exemption to the Organization, which shall bring it to the attention of the Contracting Parties to SOLAS; and
- .2 shall take action to amend this Code to include the provisions covered by the exemption, as appropriate.

1.5.3 The period of validity of the exemption shall be not more than five years from the date of authorization. An exemption that is not covered under 1.5.2.2 may be renewed in accordance with the provisions of this section.

1.5.4 A copy of the exemption or an electronic copy thereof shall be maintained on board each ship transporting solid bulk cargoes in accordance with the exemption, as appropriate.

1.5.5 Contact information for the main designated national competent authorities concerned is given in the separate document issued by the Organization.

## 1.6 Conventions

Parts A and B of chapter VI and part A-1 of chapter VII of the SOLAS Convention, as amended, deal with the carriage of solid bulk cargoes and the carriage of dangerous goods in solid form in bulk, respectively, and are reproduced in full. This extract incorporates amendments envisaged to enter into force from 1 January 2011.

### CHAPTER VI

#### CARRIAGE OF CARGOES

##### Part A

##### *General provisions*

#### **Regulation 1**

##### *Application*

1 This chapter applies to the carriage of cargoes (except liquids in bulk, gases in bulk and those aspects of carriage covered by other chapters) which, owing to their particular hazards to ships or persons on board, may require special precautions in all ships to which the present regulations apply and in cargo ships of less than 500 gross tonnage. However, for cargo ships of less than 500 gross tonnage, the Administration, if it considers that the sheltered nature and conditions of voyage are such as to render the application of any specific requirements of part A or B of this chapter unreasonable or unnecessary, may take other effective measures to ensure the required safety for these ships.

2 To supplement the provisions of parts A and B of this chapter, each Contracting Government shall ensure that appropriate information on cargo and its stowage and securing is provided, specifying, in particular, precautions necessary for the safe carriage of such cargoes.

**Regulation 1-1***Definitions*

For the purpose of this chapter, unless expressly provided otherwise:

1 *IMSBC Code* means the International Maritime Solid Bulk Cargoes (IMSBC) Code adopted by the Maritime Safety Committee of the Organization by resolution MSC.268(85), as may be amended by the Organization, provided that such amendments are adopted, brought into force and take effect in accordance with the provisions of article VIII of the present Convention concerning the amendment procedures applicable to the annex other than chapter I.

2 *Solid bulk cargo* means any cargo, other than liquid or gas, consisting of a combination of particles, granules or any larger pieces of material generally uniform in composition, which is loaded directly into the cargo spaces of a ship without any intermediate form of containment.

**Regulation 1-2***Requirements for the carriage of solid bulk cargoes other than grain*

1 The carriage of solid bulk cargoes other than grain shall be in compliance with the relevant provisions of the IMSBC Code.

**Regulation 2***Cargo information*

1 The shipper shall provide the master or his representative with appropriate information on the cargo sufficiently in advance of loading to enable the precautions which may be necessary for proper stowage and safe carriage of the cargo to be put into effect. Such information shall be confirmed in writing and by appropriate shipping documents prior to loading the cargo on the ship.

2 The cargo information shall include:

.1 in the case of general cargo, and of cargo carried in cargo units, a general description of the cargo, the gross mass of the cargo or of the cargo units, and any relevant special properties of the cargo. For the purpose of this regulation the cargo information required in sub-chapter 1.9 of the Code of Safe Practice for Cargo Stowage and Securing, adopted by the Organization by resolution A.714(17), as may be amended, shall be provided. Any such amendment to sub-chapter 1.9 shall be adopted, brought into force and take effect in accordance with the provisions of article VIII of the present Convention concerning the amendment procedures applicable to the annex other than chapter I;

.2 in the case of solid bulk cargo, information as required by section 4 of the IMSBC Code.

3 Prior to loading cargo units on board ships, the shipper shall ensure that the gross mass of such units is in accordance with the gross mass declared on the shipping documents.

**Regulation 3***Oxygen analysis and gas detection equipment*

1 When transporting a solid bulk cargo which is liable to emit a toxic or flammable gas, or cause oxygen depletion in the cargo space, an appropriate instrument for measuring the concentration of gas or oxygen in the air shall be provided together with detailed instructions for its use. Such an instrument shall be to the satisfaction of the Administration.

2 The Administration shall take steps to ensure that crews of ships are trained in the use of such instruments.

**Regulation 4***The use of pesticides in ships*

Appropriate precautions shall be taken in the use of pesticides in ships, in particular for the purposes of fumigation.

**Regulation 5***Stowage and securing*

1 Cargo, cargo units and cargo transport units carried on or under deck shall be so loaded, stowed and secured as to prevent as far as is practicable, throughout the voyage, damage or hazard to the ship and the persons on board, and loss of cargo overboard.

2 Cargo, cargo units and cargo transport units shall be so packed and secured within the unit as to prevent, throughout the voyage, damage or hazard to the ship and the persons on board.

3 Appropriate precautions shall be taken during loading and transport of heavy cargoes or cargoes with abnormal physical dimensions to ensure that no structural damage to the ship occurs and to maintain adequate stability throughout the voyage.

4 Appropriate precautions shall be taken during loading and transport of cargo units and cargo transport units on board ro-ro ships, especially with regard to the securing arrangements on board such ships and on the cargo units and cargo transport units and with regard to the strength of the securing points and lashings.

5 Freight containers shall not be loaded to more than the maximum gross weight indicated on the Safety Approval Plate under the International Convention for Safe Containers (CSC), as amended.

6 All cargoes, other than solid and liquid bulk cargoes, cargo units and cargo transport units, shall be loaded, stowed and secured throughout the voyage in accordance with the Cargo Securing Manual approved by the Administration. In ships with ro-ro spaces, as defined in regulation II-2/3.41, all securing of such cargoes, cargo units, and cargo transport units, in accordance with the Cargo Securing Manual, shall be completed before the ship leaves the berth. The Cargo Securing Manual shall be drawn up to a standard at least equivalent to relevant guidelines developed by the Organization.

**Regulation 5-1***Material safety data sheets*

1 Ships carrying MARPOL Annex I cargoes, as defined in Appendix I to Annex I of the Protocol of 1978 relating to the International Convention for the Prevention of Pollution from Ships, 1973, and marine fuel oils shall be provided with a material safety data sheet prior to the loading of such cargoes based on the recommendations developed by the Organization.

**Part B***Special provisions for solid bulk cargoes***Regulation 6***Acceptability for shipment*

1 Prior to loading a solid bulk cargo, the master shall be in possession of comprehensive information on the ship's stability and on the distribution of cargo for the standard loading conditions. The method of providing such information shall be to the satisfaction of the Administration.

**Regulation 7***Loading, unloading and stowage of solid bulk cargoes*

1 For the purpose of this regulation, terminal representative means a person appointed by the terminal or other facility, where the ship is loading or unloading, who has responsibility for operations conducted by that terminal or facility with regard to the particular ship.

2 To enable the master to prevent excessive stresses in the ship's structure, the ship shall be provided with a booklet, which shall be written in a language with which the ship's officers responsible for cargo operations are familiar. If this language is not English, the ship shall be provided with a booklet written also in the English language. The booklet shall, as a minimum, include:

- .1 stability data, as required by regulation II-1/5-1;
- .2 ballasting and deballasting rates and capacities;
- .3 maximum allowable load per unit surface area of the tanktop plating;
- .4 maximum allowable load per hold;
- .5 general loading and unloading instructions with regard to the strength of the ship's structure including any limitations on the most adverse operating conditions during loading, unloading, ballasting operations and the voyage;

- .6 any special restrictions such as limitations on the most adverse operating conditions imposed by the Administration or organization recognized by it, if applicable; and
- .7 where strength calculations are required, maximum permissible forces and moments on the ship's hull during loading, unloading and the voyage.

3 Before a solid bulk cargo is loaded or unloaded, the master and the terminal representative shall agree on a plan which shall ensure that the permissible forces and moments on the ship are not exceeded during loading or unloading, and shall include the sequence, quantity and rate of loading or unloading, taking into consideration the speed of loading or unloading, the number of pours and the deballasting or ballasting capability of the ship. The plan and any subsequent amendments thereto shall be lodged with the appropriate authority of the port State.

4 The master and terminal representative shall ensure that loading and unloading operations are conducted in accordance with the agreed plan.

5 If during loading or unloading any of the limits of the ship referred to in paragraph 2 are exceeded or are likely to become so if the loading or unloading continues, the master has the right to suspend operation and the obligation to notify accordingly the appropriate authority of the port State with which the plan has been lodged. The master and the terminal representative shall ensure that corrective action is taken. When unloading cargo, the master and terminal representative shall ensure that the unloading method does not damage the ship's structure.

6 The master shall ensure that ship's personnel continuously monitor cargo operations. Where possible, the ship's draught shall be checked regularly during loading or unloading to confirm the tonnage figures supplied. Each draught and tonnage observation shall be recorded in a cargo log-book. If significant deviations from the agreed plan are detected, cargo or ballast operations or both shall be adjusted to ensure that the deviations are corrected.

## CHAPTER VII

### Carriage of dangerous goods

#### Part A-1

##### *Carriage of dangerous goods in solid form in bulk*

#### **Regulation 7**

##### *Definitions*

*Dangerous goods in solid form in bulk* means any material, other than liquid or gas, consisting of a combination of particles, granules or any larger pieces of material, generally uniform in composition, which is covered by the IMDG Code and is loaded directly into the cargo spaces of a ship without any intermediate form of containment, and includes such materials loaded in a barge on a barge-carrying ship.

**Regulation 7-1***Application*

1 Unless expressly provided otherwise, this part applies to the carriage of dangerous goods in solid form in bulk in all ships to which the present regulations apply and in cargo ships of less than 500 gross tonnage.

2 The carriage of dangerous goods in solid form in bulk is prohibited except in accordance with the provisions of this part.

3 To supplement the provisions of this part, each Contracting Government shall issue, or cause to be issued, instructions on emergency response and medical first aid relevant to incidents involving dangerous goods in solid form in bulk, taking into account the guidelines developed by the Organization.

**Regulation 7-2***Documents*

1 In all documents relating to the carriage of dangerous goods in solid form in bulk by sea, the bulk cargo shipping name of the goods shall be used (trade names alone shall not be used).

2 Each ship carrying dangerous goods in solid form in bulk shall have a special list or manifest setting forth the dangerous goods on board and the location thereof. A detailed stowage plan, which identifies by class and sets out the location of all dangerous goods on board, may be used in place of such a special list or manifest. A copy of one of these documents shall be made available before departure to the person or organization designated by the port State authority.

**Regulation 7-3***Stowage and segregation requirements*

1 Dangerous goods in solid form in bulk shall be loaded and stowed safely and appropriately in accordance with the nature of the goods. Incompatible goods shall be segregated from one another.

2 Dangerous goods in solid form in bulk, which are liable to spontaneous heating or combustion, shall not be carried unless adequate precautions have been taken to minimize the likelihood of the outbreak of fire.

3 Dangerous goods in solid form in bulk, which give off dangerous vapours, shall be stowed in a well ventilated cargo space.

**Regulation 7-4***Reporting of incidents involving dangerous goods*

1 When an incident takes place involving the loss or likely loss overboard of dangerous goods in solid form in bulk into the sea, the master, or other person having charge of the ship, shall report the particulars of such an incident without delay and to the fullest extent possible to the nearest coastal State. The report shall be drawn up based on general principles and guidelines developed by the Organization.

2 In the event of the ship referred to in paragraph 1 being abandoned, or in the event of a report from such a ship being incomplete or unobtainable, the company, as defined in regulation IX/1.2, shall, to the fullest extent possible, assume the obligations placed upon the master by this regulation.

**Regulation 7-5***Requirements for the carriage of dangerous goods in solid form in bulk*

1 The carriage of dangerous goods in solid form in bulk shall be in compliance with the relevant provisions of the IMSBC Code, as defined in regulation VI/1-1.1.

**1.7 Definitions**

For the purpose of this Code, unless expressly provided otherwise, the following definitions shall apply:

1.7.1 *Angle of repose* means the maximum slope angle of non-cohesive (i.e. free-flowing) granular material. It is measured as the angle between a horizontal plane and the cone slope of such material.

1.7.2 *Bulk Cargo Shipping Name (BCSN)* identifies a bulk cargo during transport by sea. When a cargo is listed in this Code, the Bulk Cargo Shipping Name of the cargo is identified by capital letters in the individual schedules or in the index. When the cargo is a dangerous good, as defined in the IMDG Code, as defined in regulation VII/1.1 of the SOLAS Convention, the Proper Shipping Name of that cargo is the Bulk Cargo Shipping Name.

1.7.3 *Bulk density* means the weight of solids, air and water per unit volume. Bulk density is expressed in kilograms per cubic metre ( $\text{kg/m}^3$ ), in general. The void spaces in the cargo may be filled with air and water.

1.7.4 *Cargo space* means any space in a ship designated for carriage of cargoes.

1.7.5 *Cargoes which may liquefy* means cargoes which contain a certain proportion of fine particles and a certain amount of moisture. They may liquefy if shipped with a moisture content in excess of their transportable moisture limit.

1.7.6 *Cohesive material* means materials other than non-cohesive materials.

1.7.7 *Competent Authority* means any national regulatory body or authority designated or otherwise recognized as such for any purpose in connection with this Code.

1.7.8 *Concentrates* means materials obtained from a natural ore by a process of enrichment or beneficiation by physical or chemical separation and removal of unwanted constituents.

1.7.9 *Consignment* means a solid bulk cargo presented by a shipper for transport.

1.7.10 *Flow moisture point* means the percentage moisture content (wet mass basis) at which a flow state develops under the prescribed method of test in a representative sample of the material (see paragraph 1 of appendix 2).

1.7.11 *Flow state* means a state occurring when a mass of granular material is saturated with liquid to an extent that, under the influence of prevailing external forces such as vibration, impaction or ships motion, it loses its internal shear strength and behaves as a liquid.

1.7.12 *Group A* consists of cargoes which may liquefy if shipped at a moisture content in excess of their transportable moisture limit.

1.7.13 *Group B* consists of cargoes which possess a chemical hazard which could give rise to a dangerous situation on a ship.

1.7.14 *Group C* consists of cargoes which are neither liable to liquefy (Group A) nor to possess chemical hazards (Group B).

1.7.15 *High-density solid bulk cargo* means a solid bulk cargo with a stowage factor of 0.56 m<sup>3</sup>/t or less.

1.7.16 *IMDG Code* means the International Maritime Dangerous Goods (IMDG) Code adopted by the Maritime Safety Committee of the Organization by resolution MSC.122(75), as may be amended by the Organization.

1.7.17 *Incompatible materials* means materials that may react dangerously when mixed. They are subject to the segregation requirements of subsection 9.3 and the schedules for individual cargoes classified in Group B.

1.7.18 *International Ship and Port Facility Security (ISPS) Code* means the International Code for the Security of Ships and of Port Facilities consisting of Part A (the provisions of which shall be treated as mandatory) and part B (the provisions of which shall be treated as recommendatory), as adopted, on 12 December 2002, by resolution 2 of the Conference of Contracting Governments to the International Convention for the Safety of Life at Sea, 1974 as may be amended by the Organization.

1.7.19 *Materials hazardous only in bulk (MHB)* means materials which may possess chemical hazards when carried in bulk other than materials classified as dangerous goods in the IMDG Code.

1.7.20 *Moisture content* means that portion of a representative sample consisting of water, ice or other liquid expressed as a percentage of the total wet mass of that sample.

1.7.21 *Moisture migration* means the movement of moisture contained in a cargo by settling and consolidation of the cargo due to vibration and ship's motion. Water is progressively displaced, which may result in some portions or all of the cargo developing a flow state.

1.7.22 *Non-cohesive material* means dry materials that readily shift due to sliding during transport, as listed in appendix 3, paragraph 1, "Properties of solid bulk cargoes".

1.7.23 *Representative test sample* means a sample of sufficient quantity for the purpose of testing the physical and chemical properties of the consignment to meet specified requirements.

1.7.24 *Shipper* means any person by whom or in whose name, or on whose behalf, a contract of carriage of goods by sea has been concluded with a carrier, or any person by whom or in whose name, or on whose behalf, the goods are actually delivered to the carrier in relation to the contract of carriage by sea.

1.7.25 *Solid bulk cargo* means any cargo, other than a liquid or a gas, consisting of a combination of particles, granules or any larger pieces of material generally uniform in composition which is loaded directly into the cargo spaces of a ship without any intermediate form of containment.

1.7.26 *Stowage factor* means the figure which expresses the number of cubic metres which one tonne of cargo will occupy.

1.7.27 *Transportable Moisture Limit (TML)* of a cargo which may liquefy means the maximum moisture content of the cargo which is considered safe for carriage in ships not complying with the special provisions of subsection 7.3.2. It is determined by the test procedures, approved by a competent authority, such as those specified in paragraph 1 of appendix 2.

1.7.28 *Trimming* means any levelling of a cargo within a cargo space, either partial or total.

1.7.29 *Ventilation* means exchange of air from outside to inside a cargo space.

.1 *Continuous Ventilation* means ventilation that is operating at all times.

.2 *Mechanical Ventilation* means power-generated ventilation.

.3 *Natural Ventilation* means ventilation that is not power-generated.

.4 *Surface Ventilation* means ventilation of the space above the cargo.

## Section 2

### General loading, carriage and unloading precautions

#### 2.1 Cargo distribution

##### 2.1.1 General

A number of accidents have occurred as a result of improper loading and unloading of solid bulk cargoes. It shall be noted that solid bulk cargoes have to be properly distributed throughout the ship to provide adequate stability and to ensure that the ship's structure is never overstressed. Furthermore, the shipper shall provide the master with adequate information about the cargo, as specified in section 4, to ensure that the ship is properly loaded.

##### 2.1.2 To prevent the structure being overstressed

A general cargo ship is normally constructed to carry cargoes in the range of 1.39 to 1.67 cubic metres per tonne when loaded to full bale and deadweight capacities. When loading a high-density solid bulk cargo, particular attention shall be paid to the distribution of weights to avoid excessive stresses, taking into account that the loading conditions may be different from those found normally and that improper distribution of such cargo may be capable of stressing either the structure under the load or the entire hull. To set out exact rules for the distribution of loading is not practicable for all ships because the structural arrangements of each vessel may vary greatly. The information on proper distribution of cargo may be provided in the ship's stability information booklet or may be obtained by the use of loading calculators, if available.

##### 2.1.3 To aid stability

2.1.3.1 Having regard to regulation II-1/22.1 of SOLAS Convention, a stability information booklet shall be provided aboard all ships subject to the Convention. The master shall be able to calculate the stability for the anticipated worst conditions during the voyage as well as that on departure and demonstrate that the stability is adequate.

2.1.3.2 Shifting divisions and bins, of adequate strength, shall be erected whenever solid bulk cargoes, which are suspected of readily shifting, are carried in 'tween-deck cargo spaces or in only partially filled cargo spaces.

2.1.3.3 As far as practicable, high-density cargoes shall be loaded in the lower hold cargo spaces in preference to 'tween-deck cargo spaces.

2.1.3.4 When it is necessary to carry high-density cargoes in 'tween-decks or higher cargo spaces, due consideration shall be paid to ensure that the deck area is not overstressed and that the ship's stability is not reduced below the minimum acceptable level specified in the ship's stability data.

## **2.2 Loading and unloading**

2.2.1 Cargo spaces shall be inspected and prepared for the particular cargo which is to be loaded.

2.2.2 Due consideration shall be paid to bilge wells and strainer plates, for which special preparation is necessary, to facilitate drainage and to prevent entry of the cargoes into the bilge system.

2.2.3 Bilge lines, sounding pipes and other service lines within the cargo space shall be in good order.

2.2.4 Because of the velocity at which some high-density solid bulk cargoes are loaded, special care may be necessary to protect cargo space fittings from damage. To sound bilges after the completion of loading may be effective to detect damage on cargo space fittings.

2.2.5 As far as practicable, ventilation systems shall be shut down or screened and air conditioning systems placed on recirculation during loading or discharge, to minimize dust ingress into the living quarters or other interior spaces.

2.2.6 Due consideration shall be paid to minimize the extent to which dust may come into contact with moving parts of deck machinery and external navigational aids.

## Section 3

### Safety of personnel and ship

#### 3.1 General requirements

3.1.1 Prior to and during loading, carriage and discharge of a solid bulk cargo, all necessary safety precautions shall be observed.

3.1.2 A copy of the instructions on emergency response and medical first aid relevant to incidents involving dangerous goods in solid form in bulk shall be on board.

#### 3.2 Poisoning, corrosive and asphyxiation hazards

3.2.1 Some solid bulk cargoes are susceptible to oxidation, which may result in oxygen depletion, emission of toxic gases or fumes and self-heating. Some cargoes are not liable to oxidize but may emit toxic fumes, particularly when wet. There are also cargoes which, when wetted, are corrosive to skin, eyes and mucous membranes or to the ship's structure. When these cargoes are carried particular attention shall be paid to protection of personnel and the need for special precautions to be taken prior to loading and after unloading.

3.2.2 Appropriate attention shall be paid that cargo spaces and adjacent spaces may be depleted in oxygen or may contain toxic or asphyxiating gases, and that an empty cargo space or tank which has remained closed for some time may have insufficient oxygen to support life.

3.2.3 Many solid bulk cargoes are liable to cause oxygen depletion in a cargo space or tank. These include, but are not limited to, most vegetable products and forest products, ferrous metals, metal sulphide concentrates and coal cargoes.

3.2.4 Prior to entry into an enclosed space aboard a ship, appropriate procedures shall be followed taking into account the recommendations developed by the Organization. It is to be noted that, after a cargo space or tank has been tested and generally found to be safe for entry, small areas may exist where oxygen is deficient or toxic fumes are still present.

3.2.5 When carrying a solid bulk cargo that is liable to emit a toxic or flammable gas, and/or cause oxygen depletion in the cargo space, the appropriate instrument(s) for measuring the concentration of gas and oxygen in the cargo space shall be provided.

3.2.6 Emergency entry into a cargo space shall be undertaken only by trained personnel wearing self-contained breathing apparatus and protective clothing and always under the supervision of a responsible officer.

### **3.3 Health hazards due to dust**

To minimize the chronic and acute risks associated with exposure to the dust of some solid bulk cargoes, the need for a high standard of personal hygiene of those exposed to the dust cannot be overemphasized. Precautions, including the use of appropriate breathing protection, protective clothing, protective skin creams, adequate personal washing and laundering of outer clothing, shall be taken as necessary.

### **3.4 Flammable atmosphere**

3.4.1 Dust of some solid bulk cargoes may constitute an explosion hazard, especially while loading, unloading and cleaning. This risk can be minimized by ventilating to prevent the formation of a dust-laden atmosphere and by hosing down rather than sweeping.

3.4.2 Some cargoes may emit flammable gases in sufficient quantities to constitute a fire or explosion hazard. Where this is indicated in the cargo schedule in this Code or by the cargo information provided by the shipper, the cargo spaces shall be effectively ventilated as necessary. The atmosphere in the cargo spaces shall be monitored by means of an appropriate gas detector. Due consideration shall be paid to the ventilation and monitoring of the atmosphere in the enclosed spaces adjacent to the cargo spaces.

### **3.5 Ventilation**

3.5.1 Unless expressly provided otherwise, when cargoes which may emit toxic gases are carried, the cargo spaces shall be provided with mechanical or natural ventilation; and, when cargoes which may emit flammable gases are carried, the cargo spaces shall be provided with mechanical ventilation.

3.5.2 If maintaining ventilation would endanger the ship or the cargo, it may be interrupted unless this would produce a risk of explosion.

3.5.3 When continuous ventilation is required by the schedule for the cargo in this Code or by the cargo information provided by the shipper, ventilation shall be maintained while the cargo is on board, unless a situation develops where ventilation would endanger the ship.

3.5.4 Ventilation openings shall be provided in holds intended for the carriage of cargoes that require continuous ventilation. Such openings shall comply with the requirements of the Load Line Convention as amended for openings not fitted with means of closure.

3.5.5 Ventilation shall be such that any escaping hazardous gases, vapours or dust cannot enter the accommodation or other interior spaces in hazardous concentrations. Due consideration shall be given to prevent escaping hazardous gases, vapours or dust from reaching enclosed work areas. Adequate precautions shall be taken to protect the personnel in these work areas.

3.5.6 When a cargo may heat spontaneously, ventilation other than surface ventilation shall not be applied. On no account shall air be directed into the body of the cargo.

### **3.6 Cargo under in-transit fumigation**

Fumigation shall be performed based on the recommendations developed by the Organization.

## Section 4

### Assessment of acceptability of consignments for safe shipment

#### 4.1 Identification and classification

4.1.1 Each solid bulk cargo in this Code has been assigned a Bulk Cargo Shipping Name (BCSN). When a solid bulk cargo is carried by sea it shall be identified in the transport documentation by the BCSN. The BCSN shall be supplemented with the United Nations (UN) number when the cargo is dangerous goods.

4.1.2 If waste cargoes are being transported for disposal, or for processing for disposal, the name of the cargoes shall be preceded by the word “WASTE”.

4.1.3 Correct identification of a solid bulk cargo facilitates identification of the conditions necessary to safely carry the cargo and the emergency procedures, if applicable.

4.1.4 Solid bulk cargoes shall be classified, where appropriate, in accordance with the UN Manual of Tests and Criteria, part III. The various properties of a solid bulk cargo required by this Code shall be determined, as appropriate to that cargo, in accordance with the test procedures approved by a competent authority in the country of origin, when such test procedures exist. In the absence of such test procedures, those properties of a solid bulk cargo shall be determined, as appropriate to that cargo, in accordance with the test procedures prescribed in appendix 2 to this Code.

#### 4.2 Provision of information

4.2.1 The shipper shall provide the master or his representative with appropriate information on the cargo sufficiently in advance of loading to enable the precautions which may be necessary for proper stowage and safe carriage of the cargo to be put into effect.

4.2.2 Cargo information shall be confirmed in writing and by appropriate shipping documents prior to loading. The cargo information shall include:

- .1 the BCSN when the cargo is listed in this Code. Secondary names may be used in addition to the BCSN;
- .2 the cargo group (A and B, A, B or C);
- .3 the IMO Class of the cargo, if applicable;
- .4 the UN number preceded by letters UN for the cargo, if applicable;
- .5 the total quantity of the cargo offered;
- .6 the stowage factor;
- .7 the need for trimming and the trimming procedures, as necessary;

- .8 the likelihood of shifting, including angle of repose, if applicable;
- .9 additional information in the form of a certificate on the moisture content of the cargo and its transportable moisture limit in the case of a concentrate or other cargo which may liquefy;
- .10 likelihood of formation of a wet base (see subsection 7.2.3 of this Code);
- .11 toxic or flammable gases which may be generated by cargo, if applicable;
- .12 flammability, toxicity, corrosiveness and propensity to oxygen depletion of the cargo, if applicable;
- .13 self-heating properties of the cargo, and the need for trimming, if applicable;
- .14 properties on emission of flammable gases in contact with water, if applicable;
- .15 radioactive properties, if applicable; and
- .16 any other information required by national authorities.

4.2.3 Information provided by the shipper shall be accompanied by a declaration. An example of a cargo declaration form is set out in the next page. Another form may be used for cargo declaration. As an aid to paper documentation, Electronic Data Processing (EDP) or Electronic Data Interchange (EDI) techniques may be used.

### 4.3 Certificates of test

4.3.1 To obtain the information required in 4.2.1 the shipper shall arrange for the cargo to be properly sampled and tested. The shipper shall provide the ship's master or his representative with the appropriate certificates of test, if required in this Code.

4.3.2 When a concentrate or other cargo which may liquefy is carried, the shipper shall provide the ship's master or his representative with a signed certificate of the TML, and a signed certificate or declaration of the moisture content. The certificate of TML shall contain, or be accompanied by the result of the test for determining the TML. The declaration of moisture content shall contain, or be accompanied by, a statement by the shipper that the moisture content is, to the best of his knowledge and belief, the average moisture content of the cargo at the time the declaration is presented to the master.

4.3.3 When a concentrate or other cargo which may liquefy is to be loaded into more than one cargo space of a ship, the certificate or the declaration of moisture content shall certify the moisture content of each type of finely grained material loaded into each cargo space. Notwithstanding this requirement, if sampling according to internationally or nationally accepted standard procedures indicates that the moisture content is uniform throughout the consignment, then one certificate or declaration of average moisture content for all cargo spaces is acceptable.

4.3.4 Where certification is required by the individual schedules for cargoes possessing chemical hazards, the certificate shall contain, or be accompanied by, a statement from the shipper that the chemical characteristics of the cargo are, to the best of his knowledge, those present at the time of the ship's loading.

### 4.4 Sampling procedures

4.4.1 Physical property tests on the consignment are meaningless unless they are conducted prior to loading on truly representative test samples.

4.4.2 Sampling shall be conducted only by persons who have been suitably trained in sampling procedures and who are under the supervision of someone who is fully aware of the properties of the consignment and also the applicable principles and practices of sampling.

4.4.3 Prior to taking samples, and within the limits of practicability, a visual inspection of the consignment which is to form the ship's cargo shall be carried out. Any substantial portions of material which appear to be contaminated or significantly different in characteristics or moisture content from the bulk of the consignment shall be sampled and analysed separately. Depending upon the results obtained in these tests, it may be necessary to reject those particular portions as unfit for shipment.

4.4.4 Representative samples shall be obtained by employing techniques which take the following factors into account:

- .1 the type of material;
- .2 the particle size distribution;

- .3 composition of the material and its variability;
- .4 the manner in which the material is stored, in stockpiles, rail wagons or other containers, and transferred or loaded by material-handling systems such as conveyors, loading chutes, crane grabs, etc.;
- .5 the chemical hazards (toxicity, corrosivity, etc.);
- .6 the characteristics which have to be determined: moisture content, TML, bulk density/stowage factor, angle of repose, etc.;
- .7 variations in moisture distribution throughout the consignment which may occur due to weather conditions, natural drainage, e.g., to lower levels of stockpiles or containers, or other forms of moisture migration; and
- .8 variations which may occur following freezing of the material.

4.4.5 Throughout the sampling procedures, utmost care shall be taken to prevent changes in quality and characteristics. Samples shall be immediately placed in suitable sealed containers which are properly marked.

4.4.6 Unless expressly provided otherwise, sampling for the test required by this Code shall follow an internationally or nationally accepted standard procedure.

#### **4.5 Interval between sampling/testing and loading for TML and moisture content determination**

4.5.1 A test to determine the TML of a solid bulk cargo shall be conducted within six months to the date of loading the cargo. Notwithstanding this provision, where the composition or characteristics of the cargo are variable for any reason, a test to determine the TML shall be conducted again after it is reasonably assumed that such variation has taken place.

4.5.2 Sampling and testing for moisture content shall be conducted as near as practicable to the time of loading. If there has been significant rain or snow between the time of testing and loading, check tests shall be conducted to ensure that the moisture content of the cargo is still less than its TML. The interval between sampling/testing and loading shall never be more than seven days.

4.5.3 Samples of frozen cargo shall be tested for the TML or the moisture content after the free moisture has completely thawed.

#### **4.6 Sampling procedures for concentrate stockpiles**

4.6.1 It is not practicable to specify a single method of sampling for all consignments since the character of the material and the form in which it is available will affect the selection of the procedure to be used. In the absence of internationally or nationally accepted standard sampling procedures, the following sampling procedures for concentrate stockpiles may be used to determine the moisture content and the TML of mineral concentrates. These procedures are not intended to replace sampling procedures, such as the use of automatic sampling, that achieve equal or superior accuracy of either moisture content or TML.

4.6.2 Sub-samples are taken in a reasonably uniform pattern, where possible from a levelled stockpile.

4.6.3 A plan of the stockpile is drawn and divided into areas, each of which contains approximately 125 t, 250 t or 500 t depending on the amount of concentrate to be shipped. Such a plan will indicate the number of sub-samples required and where each is to be taken. Each sub-sample taken is drawn from approximately 50 cm below the surface of the designated area.

4.6.4 The number of sub-samples and sample size are given by the competent authority or determined in accordance with the following scale:

Consignments of not more than 15,000 t:

One 200 g sub-sample is taken for each 125 t to be shipped.

Consignments of more than 15,000 but not more than 60,000 t:

One 200 g sub-sample is taken for each 250 t to be shipped.

Consignments of more than 60,000 t:

One 200 g sub-sample is taken for each 500 t to be shipped.

4.6.5 Sub-samples for moisture content determination are placed in sealed containers (such as plastic bags, cans or small metallic drums) immediately on withdrawal for conveyance to the testing laboratory, where they are thoroughly mixed in order to obtain a fully representative sample. Where testing facilities are not available at the testing site, such mixing is done under controlled conditions at the stockpile and the representative sample placed in a sealed container and shipped to the test laboratory.

4.6.6 Basic procedural steps include:

- .1 identification of consignment to be sampled;
- .2 determination of the number of individual sub-samples and representative samples, as described in 4.6.4, which are required;
- .3 determination of the positions from which to obtain sub-samples and the method of combining such sub-samples to arrive at a representative sample;
- .4 gathering of individual sub-samples and placing them in sealed containers;
- .5 thorough mixing of sub-samples to obtain the representative sample; and
- .6 placing the representative sample in a sealed container if it has to be shipped to a test laboratory.

#### 4.8 Documentation required on board the ship carrying dangerous goods

4.8.1 Each ship carrying dangerous goods in solid form in bulk shall have a special list or manifest setting forth the dangerous goods on board and the location thereof, in accordance with SOLAS regulation VII/7-2.2. A detailed stowage plan, which identifies by class and sets out the location of all dangerous goods on board, may be used in place of such a special list or manifest.

4.8.2 When dangerous goods in solid form in bulk are carried appropriate instructions on emergency response to incidents involving the cargoes shall be on board.

4.8.3 Cargo ships of 500 gross tonnage and over constructed on or after 1 September 1984 and cargo ships of less than 500 gross tonnage constructed on or after 1 February 1992, subject to SOLAS regulation II-2/19.4 (or II-2/54.3), shall have a Document of compliance when carrying dangerous goods in solid form in bulk except class 6.2 and class 7.

## Section 5

### Trimming procedures

#### 5.1 General provisions for trimming

5.1.1 Trimming a cargo reduces the likelihood of the cargo shifting and minimizes the air entering the cargo. Air entering the cargo could lead to spontaneous heating. To minimize these risks, cargoes shall be trimmed reasonably level, as necessary.

5.1.2 Cargo spaces shall be as full as practicable without resulting in excessive loading on the bottom structure or 'tween-deck to prevent sliding of a solid bulk cargo. Due consideration shall be given to the amount of a solid bulk cargo in each cargo space, taking into account the possibility of shifting and longitudinal moments and forces of the ship. Cargo shall be spread as widely as practicable to the boundary of the cargo space. Alternate hold loading restrictions, as required by SOLAS chapter XII, may also need to be taken into account.

5.1.3 The master has the right to require that the cargo be trimmed level, where there is any concern regarding stability based upon the information available, taking into account the characteristics of the ship and the intended voyage.

#### 5.2 Special provisions for multi-deck ships

5.2.1 When a solid bulk cargo is loaded only in lower cargo spaces, it shall be trimmed sufficiently to equalize the mass distribution on the bottom structure.

5.2.2 When solid bulk cargoes are carried in 'tween-decks, the hatchways of such 'tween-decks shall be closed in those cases where the loading information indicates an unacceptable level of stress of the bottom structure if the hatchways are left open. The cargo shall be trimmed reasonably level and shall either extend from side to side or be secured by additional longitudinal divisions of sufficient strength. The safe load-carrying capacity of the 'tween-decks shall be observed to ensure that the deck structure is not overloaded.

5.2.3 If coal cargoes are carried in 'tween decks, the hatchways of such 'tween-decks shall be tightly sealed to prevent air moving up through the body of the cargo in the 'tween decks.

#### 5.3 Special provisions for cohesive bulk cargoes

5.3.1 All damp cargoes and some dry ones possess cohesion. For cohesive cargoes, the general provisions in subsection 5.1 shall apply.

5.3.2 The angle of repose is not an indicator of the stability of a cohesive bulk cargo and it is not included in the individual schedules for cohesive cargoes.

#### 5.4 Special provisions for non-cohesive bulk cargoes

5.4.1 Non-cohesive bulk cargoes are those listed in paragraph 1 in appendix 3 and any other cargo not listed in the appendix, exhibiting the properties of a non-cohesive material.

5.4.2 For trimming purposes, solid bulk cargoes can be categorized as cohesive or non-cohesive. The angle of repose is a characteristic of non-cohesive bulk cargoes which is indicative of cargo stability and has been included in the individual schedules for non-cohesive cargoes. The angle of repose of the cargoes shall establish which provisions of this section apply. Methods for determining the angle of repose are given in section 6.

#### **5.4.3 Non-cohesive bulk cargoes having an angle of repose less than or equal to 30°**

These cargoes, which flow freely like grain, shall be carried according to the provisions applicable to the stowage of grain cargoes. The bulk density of the cargo shall be taken into account when determining:

- .1 the scantlings and securing arrangements of divisions and bin bulkheads; and
- .2 the stability effect of free cargo surfaces.

#### **5.4.4 Non-cohesive bulk cargoes having an angle of repose greater than 30° to 35° inclusive**

These cargoes shall be trimmed according to the following criteria:

- .1 the unevenness of the cargo surface measured as the vertical distance ( $\Delta h$ ) between the highest and lowest levels of the cargo surface shall not exceed  $B/10$ , where  $B$  is the beam of the ship in metres, with a maximum allowable  $\Delta h = 1.5$  m; or
- .2 loading is carried out using trimming equipment approved by the competent authority.

#### **5.4.5 Non-cohesive bulk cargoes having an angle of repose greater than 35°**

These cargoes shall be trimmed according to the following criteria:

- .1 the unevenness of the cargo surface measured as the vertical distance ( $\Delta h$ ) between the highest and lowest levels of the cargo surface shall not exceed  $B/10$ , where  $B$  is the beam of the ship in metres, with a maximum allowable  $\Delta h = 2$  m; or
- .2 loading is carried out using trimming equipment approved by the competent authority.

## Section 6

### Methods of determining the angle of repose

#### 6.1 General

An angle of repose of a non-cohesive solid bulk material shall be measured by a method approved by the appropriate authority as required by section 4.1.4 of this Code.

#### 6.2 Recommended test methods

There are various methods in use to determine the angle of repose for non-cohesive solid bulk materials. The recommended test methods are listed below:

##### 6.2.1 Tilting box method

This laboratory test method is suitable for non-cohesive granular materials with a grain size not greater than 10 mm. A full description of the equipment and procedure is given in subsection 2.1 of appendix 2.

##### 6.2.2 Shipboard test method

In the absence of a tilting box apparatus, an alternative procedure for determining the approximate angle of repose is given in subsection 2.2 of appendix 2.

## Section 7

### Cargoes which may liquefy

#### 7.1 Introduction

7.1.1 The purpose of this section is to bring to the attention of masters and others with responsibilities for the loading and carriage of bulk cargoes, the risks associated with liquefaction and the precautions to minimize the risk. Such cargoes may appear to be in a relatively dry granular state when loaded, and yet may contain sufficient moisture to become fluid under the stimulus of compaction and the vibration which occurs during a voyage.

7.1.2 A ship's motion may cause a cargo to shift sufficiently to capsize the vessel. Cargo shift can be divided into two types, namely, sliding failure or liquefaction consequence. Trimming the cargo in accordance with section 5 can prevent sliding failure.

7.1.3 Some cargoes which may liquefy may also heat spontaneously.

#### 7.2 Conditions for hazards

7.2.1 Group A cargoes contain a certain proportion of small particles and a certain amount of moisture. Group A cargoes may liquefy during a voyage even when they are cohesive and trimmed level. Liquefaction can result in cargo shift. This phenomenon may be described as follows:

- .1 the volume of the spaces between the particles reduces as the cargo is compacted owing to the ship motion, etc.;
- .2 the reduction in space between cargo particles causes an increase in water pressure in the space; and
- .3 the increase in water pressure reduces the friction between cargo particles resulting in a reduction in the shear strength of the cargo.

7.2.2 Liquefaction does not occur when one of the following conditions is satisfied:

- .1 the cargo contains very small particles. In this case particle movement is restricted by cohesion and the water pressure in spaces between cargo particles does not increase;
- .2 the cargo consists of large particles or lumps. Water passes through the spaces between the particles and there is no increase in the water pressure. Cargoes which consist entirely of large particles will not liquefy; and
- .3 the cargo contains a high percentage of air and low moisture content. Any increase in the water pressure is inhibited. Dry cargoes are not liable to liquefy.

7.2.3 A cargo shift caused by liquefaction may occur when the moisture content exceeds the TML. Some cargoes are susceptible to moisture migration and may develop a dangerous wet base even if the average moisture content is less than the TML. Although the cargo surface may appear dry, undetected liquefaction may take place resulting in shifting of the cargo. Cargoes with high moisture content are prone to sliding, particularly when the cargo is shallow and subject to large heel angles.

7.2.4 In the resulting viscous fluid state cargo may flow to one side of the ship with a roll but not completely return with a roll the other way. Consequently the ship may progressively reach a dangerous heel and capsize quite suddenly.

### **7.3 Provisions for cargoes which may liquefy**

#### **7.3.1 General**

7.3.1.1 Concentrates or other cargoes which may liquefy shall only be accepted for loading when the actual moisture content of the cargo is less than its TML. Notwithstanding this provision, such cargoes may be accepted for loading on specially constructed or fitted cargo ships even when their moisture content exceeds the TML.

7.3.1.2 Cargoes which contain liquids other than packaged canned goods or the like shall not be stowed in the same cargo space above or adjacent to these solid bulk cargoes.

7.3.1.3 Adequate measures shall be taken to prevent liquids entering the cargo space in which these solid bulk cargoes are stowed during the voyage.

7.3.1.4 Masters shall be cautioned about the possible danger of using water to cool these cargoes while the ship is at sea. Introducing water may bring the moisture content of these cargoes to a flow state. When necessary, due regard shall be paid to apply water in the form of a spray.

#### **7.3.2 Specially constructed or fitted cargo ships**

7.3.2.1 Cargoes having a moisture content in excess of the TML shall only be carried in specially constructed cargo ships or in specially fitted cargo ships.

7.3.2.2 Specially constructed cargo ships shall have permanent structural boundaries, so arranged as to confine any shift of cargo to an acceptable limit. The ship concerned shall carry evidence of approval by the Administration.

7.3.2.3 Specially fitted cargo ships shall be fitted with specially designed portable divisions to confine any shift of cargo to an acceptable limit. Specially fitted cargo ships shall be in compliance with the following requirements:

- .1 The design and positioning of such special arrangements shall adequately provide not only the restraint of the immense forces generated by the flow movement of high-density bulk cargoes, but also for the need to reduce to an acceptable safe level the potential heeling movements arising out of a transverse cargo flow across the cargo space. Divisions provided to meet these requirements shall not be constructed of wood.

- .2 The elements of the ship's structure bounding such cargo shall be strengthened, as necessary.
- .3 The plan of special arrangements and details of the stability conditions on which the design has been based shall have been approved by the Administration. The ship concerned shall carry evidence of approval by the Administration.

7.3.2.4 A submission made to an Administration for approval of such a ship shall include:

- .1 relevant structural drawings, including scaled longitudinal and transverse sections;
- .2 stability calculations, taking into account loading arrangements and possible cargo shift, showing the distribution of cargo and liquids in tanks, and of cargo which may become fluid; and
- .3 any other information which may assist the Administration in the assessment of the submission.

## Section 8

### Test procedures for cargoes which may liquefy

#### 8.1 General

For a Group A cargo, the actual moisture content and transportable moisture limit shall be determined in accordance with a procedure determined by the appropriate authority as required by section 4.1.4 of this Code, unless the cargo is carried in a specially constructed or fitted ship.

#### 8.2 Test procedures for measurement of moisture content

There are recognized international and national methods for determining moisture content for various materials. Reference is made to paragraph 1.1.4.4 of appendix 2.

#### 8.3 Methods for determining transportable moisture limit

The recommended methods for determining transportable moisture limit are given in appendix 2.

#### 8.4 Complementary test procedure for determining the possibility of liquefaction

A ship's master may carry out a check test for approximately determining the possibility of flow on board ship or at the dockside by the following auxiliary method:

Half fill a cylindrical can or similar container (0.5 to 1 litre capacity) with a sample of the material. Take the can in one hand and bring it down sharply to strike a hard surface such as a solid table from a height of about 0.2 m. Repeat the procedure 25 times at one- or two-second intervals. Examine the surface for free moisture or fluid conditions. If free moisture or a fluid condition appears, arrangements should be made to have additional laboratory tests conducted on the material before it is accepted for loading.

## Section 9

### Materials possessing chemical hazards

#### 9.1 General

Solid bulk cargoes which may possess a chemical hazard during transport, because of their chemical nature or properties, are in Group B. Some of these materials are classified as dangerous goods and others are materials hazardous only in bulk (MHB). It is essential to obtain current, valid information about the physical and chemical properties of the cargoes to be shipped in bulk, prior to loading.

#### 9.2 Hazard classification

9.2.1 The classification of materials possessing chemical hazards and intended to be shipped in bulk under the requirements of this Code shall be in accordance with 9.2.2 and 9.2.3.

##### 9.2.2 Classification of dangerous goods

SOLAS regulation VII/7 defines dangerous goods in solid form in bulk. For the purpose of this Code, dangerous goods shall be classified in accordance with part 2 of the IMDG Code.

###### 9.2.2.1 Class 4.1: Flammable solids

The materials in this class are readily combustible solids and solids which may cause fire through friction.

###### 9.2.2.2 Class 4.2: Substances liable to spontaneous combustion

The materials in this class are materials, other than pyrophoric materials, which, in contact with air without energy supply, are liable to self-heating.

###### 9.2.2.3 Class 4.3: Substances which, in contact with water, emit flammable gases

The materials in this class are solids which, by interaction with water, are liable to become spontaneously flammable or to give off flammable gases in dangerous quantities.

###### 9.2.2.4 Class 5.1: Oxidizing substances

The materials in this class are materials while in themselves not necessarily combustible, may, generally by yielding oxygen, cause, or contribute to, the combustion of other material.

###### 9.2.2.5 Class 6.1: Toxic substances

The materials in this class are materials liable either to cause death or serious injury or to harm human health if swallowed or inhaled, or by skin contact.

### **9.2.2.6 Class 7: Radioactive material**

The materials in this class are any materials containing radionuclides where both the activity concentration and the total activity in the consignment exceed the values specified in 2.7.7.2.1 to 2.7.7.2.6 of the IMDG Code.

### **9.2.2.7 Class 8: Corrosive substances**

The materials in this class are materials which, by chemical action, will cause severe damage when in contact with living tissue or will materially damage, or even destroy, other goods or the means of transport.

### **9.2.2.8 Class 9: Miscellaneous dangerous substances and articles**

The materials in this class are materials and articles which, during transport, present a danger not covered by other classes.

## **9.2.3 Materials hazardous only in bulk (MHB)**

These are materials which may possess chemical hazards when transported in bulk other than materials classified as dangerous goods in the IMDG Code.

## **9.3 Stowage and segregation requirements**

### **9.3.1 General requirements**

9.3.1.1 The potential hazards of the cargoes in Group B and falling within the classification of 9.2.2 and 9.2.3 entail the need for segregation of incompatible cargoes. Segregation shall also take account of any identified subsidiary risk.

9.3.1.2 In addition to general segregation as between whole classes of materials there may be a need to segregate a particular material from others. In the case of segregation from combustible materials this shall be understood not to include packaging material, ceiling or dunnage; the latter shall in these circumstances be kept to a minimum.

9.3.1.3 For the purpose of segregating incompatible materials, the words “hold” and “compartment” are deemed to mean a cargo space enclosed by steel bulkheads or shell plating and by steel decks. The boundaries of such a space shall be resistant to fire and liquid.

9.3.1.4 When two or more different solid bulk cargoes of Group B are to be carried, the segregation between them shall be in accordance with 9.3.4.

9.3.1.5 Where different grades of a solid bulk cargo are carried in the same cargo space, the most stringent segregation provisions applicable to any of the different grades shall apply to all of them.

9.3.1.6 When solid bulk cargoes of Group B and dangerous goods in packaged form are to be carried, the segregation between them shall be in accordance with 9.3.3.

9.3.1.7 Incompatible materials shall not be handled simultaneously. Upon completion of loading one cargo, the hatch covers of every cargo space shall be closed and the decks cleaned of residue before the loading of other material is commenced. When discharging, the same procedures shall be followed.

9.3.1.8 To avoid contamination, all foodstuffs shall be stowed:

- .1 “separated from” a material which is indicated as toxic;
- .2 “separated by a complete compartment or hold from” all infectious materials;
- .3 “separated from” radioactive materials; and
- .4 “away from” corrosive materials.

The terms are defined in 9.3.3 and 9.3.4, as appropriate.

9.3.1.9 Materials which may evolve toxic gases in sufficient quantities to affect health shall not be stowed in those spaces from where such gases may penetrate into living quarters or ventilation systems connecting to living quarters.

9.3.1.10 Materials which present corrosive hazards of such intensity as to affect either human tissue or the ship’s structure shall only be loaded after adequate precautions and protective measures have been taken.

9.3.1.11 After discharge of toxic or oxidizing cargoes, the spaces used for their carriage shall be inspected for contamination before being used for other cargoes. A space which has been contaminated shall be properly cleaned and examined before being used for other cargoes.

9.3.1.12 After discharge of cargoes, a close inspection shall be made for any residue, which shall be removed before the ship is presented for other cargoes.

9.3.1.13 For cargoes for which in case of an emergency the hatches shall be opened, these hatches shall be kept free to be capable of being opened up.

## **9.3.2 Special requirements**

### **9.3.2.1 Materials of classes 4.1, 4.2 and 4.3**

9.3.2.1.1 Materials of these classes shall be kept as cool and dry as reasonably practicable and, unless expressly provided otherwise in this Code, shall be stowed “away from” all sources of heat or ignition.

9.3.2.1.2 Electrical fittings and cables shall be in good condition and properly safeguarded against short circuits and sparking. Where a bulkhead is required to be suitable for segregation purposes, cable and conduit penetrations of the decks and bulkheads shall be sealed against the passage of gas and vapour.

9.3.2.1.3 Cargoes liable to give off vapours or gases which can form an explosive mixture with air shall be stowed in a mechanically ventilated space.

9.3.2.1.4 Prohibition of smoking in dangerous areas shall be enforced, and clearly legible “NO SMOKING” signs shall be displayed.

### 9.3.2.2 Materials of class 5.1

9.3.2.2.1 Cargoes of this class shall be kept as cool and dry as reasonably practicable and, unless expressly provided otherwise in this Code, shall be stowed “away from” all sources of heat or ignition. They shall also be stowed “separated from” other combustible materials.

9.3.2.2.2 Before loading cargoes of this class, particular attention shall be paid to the cleaning of the cargo spaces into which they will be loaded. As far as reasonably practicable, non-combustible securing and protecting materials shall be used and only a minimum of dry wooden dunnage shall be used.

9.3.2.2.3 Precautions shall be taken to avoid the penetration of oxidizing materials into other cargo spaces, bilges and other spaces which may contain a combustible material.

### 9.3.2.3 Materials of class 7

9.3.2.3.1 Cargo spaces used for the transport of Low Specific Activity Materials (LSA-I) and Surface Contaminated Objects (SCO-I) shall not be used for other cargoes until decontaminated by a qualified person so that the non-fixed contamination on any surface when averaged over an area of 300 cm<sup>2</sup> does not exceed the following levels:

4 Bq/cm<sup>2</sup> (10<sup>-4</sup> μCi/cm<sup>2</sup>) for beta and gamma emitters and the low-toxicity alpha emitters; natural uranium; natural thorium; uranium-235 or uranium-238; thorium-232; thorium-228 and thorium-230 when contained in ores, physical or chemical concentrates; radionuclides with a half-life of less than 10 days; and

0.4 Bq/cm<sup>2</sup> (10<sup>-5</sup> μCi/cm<sup>2</sup>) for all other alpha emitters.

### 9.3.2.4 Materials of class 8 or materials having similar properties

9.3.2.4.1 These cargoes shall be kept as dry as reasonably practicable.

9.3.2.4.2 Prior to loading these cargoes attention shall be paid to the cleaning of the cargo spaces into which they will be loaded particularly to ensure that these spaces are dry.

9.3.2.4.3 Penetration of these materials into other cargo spaces, bilges, wells and between the ceiling boards shall be prevented.

9.3.2.4.4 Particular attention shall be paid to the cleaning of the cargo spaces after unloading, as residues of these cargoes may be highly corrosive to the ship's structure. Hosing down of the cargo spaces followed by careful drying shall be considered.

### 9.3.3 Segregation between bulk materials possessing chemical hazards and dangerous goods in packaged form

9.3.3.1 Unless otherwise required in this section or in the individual schedules, segregation between solid bulk cargoes of Group B and dangerous goods in packaged form shall be in accordance with the following table.

The Dangerous Goods List of the IMDG Code shall be consulted for additional requirements with regard to stowage and segregation of packaged dangerous goods.

Bulk cargo (classified as dangerous goods)	Dangerous goods in packaged form																
	Class/ division	1.1 1.2 1.5	1.3	1.4	2.1	2.2 2.3	3	4.1	4.2	4.3	5.1	5.2	6.1	6.2	7	8	9

1 “Away from”:

Effectively segregated so that incompatible materials cannot interact dangerously in the event of an accident but may be carried in the same hold or compartment or on deck provided a minimum horizontal separation of 3 metres, projected vertically, is provided.

2 “Separated from”:

In different holds when stowed under deck. Provided an intervening deck is resistant to fire and liquid, a vertical separation, i.e. in different compartments, may be accepted as equivalent to this segregation.

## Section 10

### Carriage of solid wastes in bulk

#### 10.1 Preamble

10.1.1 The transboundary movement of wastes represents a threat to human health and to the environment.

10.1.2 Wastes shall be carried in accordance with the relevant international recommendations and conventions and in particular, where it concerns transport in bulk by sea, with the provisions of this Code.

#### 10.2 Definitions

10.2.1 *Wastes*, for the purpose of this section, means solid bulk cargoes containing or contaminated with one or more constituents which are subject to the provisions of this Code applicable to cargoes of classes 4.1, 4.2, 4.3, 5.1, 6.1, 8 or 9 for which no direct use is envisaged but which are carried for dumping, incineration or other methods of disposal.

10.2.2 *Transboundary movement of waste* means any shipment of wastes from an area under the national jurisdiction of one country to or through an area under the national jurisdiction of another country, or to or through an area not under the national jurisdiction of any country provided at least two countries are involved in the movement.

#### 10.3 Applicability

10.3.1 The provisions of this section are applicable to the transport of wastes in bulk by ships and shall be considered in conjunction with all other provisions of this Code.

10.3.2 Solid cargoes containing or contaminated with radioactive materials shall be subject to the provisions applicable to the transport of radioactive materials and shall not be considered as wastes for the purposes of this section.

#### 10.4 Transboundary movements under the Basel Convention

Transboundary movement of wastes shall be permitted to commence only when:

- .1 notification has been sent by the competent authority of the country of origin, or by the generator or exporter through the channel of the competent authority of the country of origin, to the country of final destination; and
- .2 the competent authority of the country of origin, having received the written consent of the country of final destination stating that the wastes will be safely incinerated or treated by other methods of disposal, has given authorization for the movement.

## 10.5 Documentation

In addition to the required documentation for the transport of solid bulk cargoes all transboundary movements of wastes shall be accompanied by a waste movement document from the point at which a transboundary movement commences to the point of disposal. This document shall be available at all times to the competent authorities and to all persons involved in the management of waste transport operations.

## 10.6 Classification of wastes

10.6.1 A waste containing only one constituent which is a cargo subject to the provisions of this Code applicable to cargoes of classes 4.1, 4.2, 4.3, 5.1, 6.1, 8 or 9 shall be regarded as being that particular cargo. If the concentration of the constituent is such that the waste continues to present a hazard inherent in the constituent itself, it shall be classified as the class applicable to that constituent.

10.6.2 A waste containing two or more constituents which are cargoes subject to the provisions of this Code applicable to cargoes of classes 4.1, 4.2, 4.3, 5.1, 6.1, 8 or 9 shall be classified under the applicable class in accordance with their dangerous characteristics and properties as described in 10.6.3 and 10.6.4.

10.6.3 The classification according to dangerous characteristics and properties shall be carried out as follows:

- .1 determination of the physical and chemical characteristics and physiological properties by measurement or calculation followed by classification according to the criteria applicable to the constituents; or
- .2 if the determination is not practicable, the waste shall be classified according to the constituent presenting the predominant hazard.

10.6.4 In determining the predominant hazard, the following criteria shall be taken into account:

- .1 if one or more constituents fall within a certain class and the waste presents a hazard inherent in these constituents, the waste shall be included in that class; or
- .2 if there are constituents falling under two or more classes, the classification of the waste shall take into account the order of precedence applicable to cargoes with multiple hazards set out in the IMDG Code.

## 10.7 Stowage and handling of wastes

Wastes shall be stowed and handled in accordance with the provisions of sections 1 to 9 of this Code and with any additional provisions included in the individual schedules for cargoes in Group B applicable to the constituents presenting the hazards.

### **10.8 Segregation**

Wastes shall be segregated in accordance with the provisions of 9.3.3 and 9.3.4, as appropriate.

### **10.9 Accident procedures**

In the event that, during transport, a waste will constitute a danger for the carrying ship or the environment, the master shall immediately inform the competent authorities of the countries of origin and destination and receive advice on the action to be taken.

## Section 11

### Security provisions

#### Introductory note

The provisions of this section address the security of bulk cargoes in transport by sea. It should be borne in mind that some substances shipped as bulk cargo may, through their intrinsic nature, or when shipped in combination with other substances, be used as constituents for, or enhance the effect of, weapons used in the commission of unlawful acts. (It should also be borne in mind that ships used to carry bulk cargoes may also be used as a means to transport unauthorized weapons, incendiary devices or explosives, irrespective of the nature of the cargo carried.) National competent authorities may apply additional security provisions, which should be considered when offering or transporting bulk cargoes. The provisions of this chapter remain recommendatory except subsection 11.1.1.

#### 11.1 General provisions for companies, ships and port facilities

11.1.1 The relevant provisions of chapter XI-2 of SOLAS 74, as amended, and of part A of the ISPS Code shall apply to companies, ships and port facilities both engaged in the handling and transport of solid bulk cargoes and to which regulation XI-2 of SOLAS 74, as amended, applies, taking into account the guidance given in part B of the ISPS Code.

11.1.2 Due regard should be given to the security-related provisions of the ILO/IMO Code of practice on security in ports and the IMDG Code, as appropriate.

11.1.3 Any shore-based company personnel, ship-based personnel and port facility personnel engaged in the handling and transport of bulk cargoes should be aware of any security requirements for such cargoes, in addition to those specified in the ISPS Code, and commensurate with their responsibilities.

11.1.4 The training of the company security officer, shore-based company personnel having specific security duties, port facility security officer and port facility personnel having specific duties, engaged in the handling and transport of bulk cargoes, should also include elements of security awareness related to the nature of those cargoes, for example where such cargoes are materials hazardous only in bulk.

11.1.5 All shipboard personnel and port facility personnel who are not mentioned in subsection 11.1.4 and are engaged in the transport of bulk cargoes should be familiar with the provisions of the relevant security plans related to those cargoes, commensurate with their responsibilities.

#### 11.2 General provisions for shore-side personnel

11.2.1 For the purpose of this subsection, shore-side personnel covers individuals such as those who:

- prepare transport documents for bulk cargoes;
- offer bulk cargoes for transport;
- accept bulk cargoes for transport;
- handle bulk cargoes;
- prepare bulk cargoes' loading/stowage plans;
- load/unload bulk cargoes into/from ships; and
- enforce or survey or inspect for compliance with applicable rules and regulations; or
- are otherwise involved in the handling and transport of bulk cargoes as determined by the competent authority.

However, the provisions of subsection 11.2 do not apply to:

- the company security officer and appropriate shore-based personnel mentioned in section A/13.1 of the ISPS Code;
- the ship security officer and the shipboard personnel mentioned in sections A/13.2 and A/13.3 of the ISPS Code; and
- the port facility security officer, the appropriate port facility security personnel and the port facility personnel having specific security duties mentioned in sections A/18.1 and A/18.2 of the ISPS Code.

For the training of those officers and personnel, refer to the ISPS Code.

11.2.2 Shore-side personnel engaged in transport by sea of bulk cargoes should consider security provisions for the transport of bulk cargoes commensurate with their responsibilities.

### **11.2.3 Security training**

11.2.3.1 The training of shore-side personnel should also include elements of security awareness, the need to control access to cargoes and ships, and general guidance on the types of bulk cargoes of security significance.

11.2.3.2 Security awareness training should address the nature of security risks, recognizing security risks, methods to address and reduce risks and actions to be taken in the event of a security breach. It should include awareness of security plans (if appropriate, refer to subsection 11.3), commensurate with the responsibilities of individuals and their part in implementing security plans.

11.2.3.3 Such training should be provided or verified upon employment in a position involving transport of bulk cargoes by sea and should be periodically supplemented with retraining.

11.2.3.4 Records of all security training undertaken should be kept by the employer and made available to the employee if requested.

### **11.3 Provisions for high consequence solid bulk cargoes**

11.3.1 For the purposes of this subsection, high consequence solid bulk cargoes with high potential security implications are those which have the potential for misuse in an unlawful act and which may, as a result, produce serious consequences such as mass casualties or mass destruction, for example, Class 5.1 ammonium nitrate UN 1942 and ammonium nitrate fertilizers UN 2067.

11.3.2 The provisions of this subsection do not apply to ships and to port facilities (see the ISPS Code for ship security plan and for port security plan).

11.3.3 Consignors and others engaged in the transport of solid bulk cargoes with high potential security implications should adopt, implement and comply with a security plan that addresses at least the elements specified in subsection 11.3.4.

11.3.4 The security plan should comprise at least the following elements:

- .1 specific allocation of responsibilities for security to competent and qualified persons with appropriate authority to carry out their responsibilities;
- .2 records of bulk cargoes with high potential security implications or types of bulk cargoes with high potential security implications transported;
- .3 review of current operations and assessment of vulnerabilities, including intermodal transfer, temporary transit storage, handling and distribution, as appropriate;
- .4 clear statements of measures, including training, policies (including response to higher threat conditions, new employee/employment verification, etc.), operating practices (e.g., choice/use of routes where known, control of access to ships, bulk cargo storage and loading areas, proximity to vulnerable infrastructure, etc.), equipment and resources that are to be used to reduce security risks;
- .5 effective and up-to-date procedures for reporting and dealing with security threats, breaches of security or security-related incidents;
- .6 procedures for the evaluation and testing of security plans and procedures for periodic review and update of the plans;
- .7 measures to ensure the security of transport information contained in the plan; and
- .8 measures to ensure that the distribution of transport information is limited as far as possible.

**LOADING**

Trim in accordance with the relevant provisions required under sections 4 and 5 of the Code.

**PRECAUTIONS**

Prior to loading this cargo, a certificate shall be provided by the manufacturer or shipper stating that the material was stored under cover, but exposed to the weather in the particle size to be shipped, for not less than 3 days prior to shipment. The bulkheads between the cargo spaces and the engine-room shall be gastight and shall be inspected and approved by the competent authority. During handling of this cargo, “NO SMOKING” signs shall be posted on decks and in areas adjacent to cargo spaces and no naked lights shall be permitted in these areas. At least two sets of self-contained breathing apparatus, in addition to those required by SOLAS regulation II-2/10.10, shall be provided on board.

**VENTILATION**

Continuous mechanical ventilation shall be conducted during the voyage for the cargo spaces carrying this cargo. If maintaining ventilation endangers the ship or the cargo, it may be interrupted unless there is a risk of explosion or other danger due to interruption of the ventilation. In any case mechanical ventilation shall be maintained for a reasonable period prior to discharge.

**CARRIAGE**

For quantitative measurements of hydrogen, phosphine and arsine and silane, suitable detectors for each gas or combination of gases shall be on board while this cargo is carried. The detectors shall be of certified safe type for use in explosive atmosphere. The concentrations of these gases in the cargo spaces carrying this cargo shall be measured regularly, during the voyage, and the results of the measurements shall be recorded and kept on board.

**DISCHARGE**

No special requirements.

**CLEAN-UP**

After discharge of this cargo, the cargo spaces shall be swept clean twice. Water shall not be used for cleaning of the cargo space which has contained this cargo, because of danger of gas.

**EMERGENCY PROCEDURES****SPECIAL EMERGENCY EQUIPMENT TO BE CARRIED**

Self-contained breathing apparatus.

**EMERGENCY PROCEDURES**

Wear self-contained breathing apparatus.

**EMERGENCY ACTION IN THE EVENT OF FIRE**

Batten down and use CO<sub>2</sub> if available. **Do not use water.**

“Separated from” foodstuffs.

**HOLD CLEANLINESS**

Clean and dry as relevant to the hazards of the cargo.

**WEATHER PRECAUTIONS**

This cargo shall be kept as dry as practicable. This cargo shall not be handled during precipitation. During handling of this cargo all non-working hatches of the cargo spaces into which this cargo is loaded or to be loaded shall be closed.

**LOADING**

Trim in accordance with the relevant provisions required under sections 4 and 5 of the Code.

**PRECAUTIONS**

Due regard shall be paid to prevent contact of the cargo and combustible materials.

**VENTILATION**

No special requirements.

**CARRIAGE**

No special requirements.

**DISCHARGE**

No special requirements.

**CLEAN-UP**

No special requirements.

**EMERGENCY PROCEDURES****SPECIAL EMERGENCY EQUIPMENT TO BE CARRIED**

Protective clothing (gloves, overalls, headgear).  
Self-contained breathing apparatus.  
Spray nozzles.

**EMERGENCY PROCEDURES**

Wear protective clothing and self-contained breathing apparatus.

**EMERGENCY ACTION IN THE EVENT OF FIRE**

Use copious quantities of water, which is best applied in the form of a spray to avoid disturbing the surface of the material. The material may fuse or melt; in which condition application of water may result in extensive scattering of the molten materials. Exclusion of air or the use of CO<sub>2</sub> will not control the fire. Due consideration should be given to the effect on the stability of the ship due to accumulated water.

This cargo is non-combustible or has a low fire-risk.

Fire is unlikely but may follow an explosion of flammable gas and will be difficult to extinguish. In port, flooding may be considered, but due consideration should be given to stability.

**STOWAGE & SEGREGATION**

“Separated from” foodstuffs and all class 8 liquids.

**HOLD CLEANLINESS**

Clean and dry as relevant to the hazards of the cargo.

**WEATHER PRECAUTIONS**

This cargo shall be kept as dry as practicable. This cargo shall not be handled during precipitation. During handling of this cargo all non-working hatches of the cargo spaces into which this cargo is loaded or to be loaded shall be closed.

**LOADING**

Trim in accordance with the relevant provisions required under sections 4 and 5 of the Code.

**PRECAUTIONS**

Prior to loading this cargo, a certificate shall be provided by the manufacturer or shipper stating that, after manufacture, the material was stored under cover, but exposed to the weather in the particle size to be shipped, for not less than 3 days prior to shipment. Whilst the ship is alongside and the hatches of the cargo spaces containing this cargo are closed, the mechanical ventilation shall be operated continuously as weather permits. During handling of this cargo, "NO SMOKING" signs shall be posted on decks and in areas adjacent to cargo spaces and no naked lights shall be permitted in these areas. At least two self-contained breathing apparatus, in addition to those required by SOLAS regulation II-2/10.10, shall be provided on board. Bulkheads between the cargo spaces and the engine-room shall be gastight. Inadvertent pumping through machinery spaces shall be avoided.

**VENTILATION**

Continuous mechanical ventilation shall be conducted during the voyage for the cargo spaces carrying this cargo. If maintaining ventilation endangers the ship or the cargo, it may be interrupted unless there is a risk of explosion or other danger due to interruption of the ventilation. In any case mechanical ventilation shall be maintained for a reasonable period prior to discharge. Ventilation shall be arranged such that any escaping gases are minimized from reaching living quarters on or under the deck.

**CARRIAGE**

For quantitative measurements of hydrogen, ammonia and acetylene, suitable detectors for each gas or combination of gases shall be on board while this cargo is carried. The detectors shall be of certified safe type for use in explosive atmosphere. The concentrations of these gases in the cargo spaces carrying this cargo shall be measured regularly, during voyage, and the results of the measurements shall be recorded and kept on board.

**DISCHARGE**

**STOWAGE & SEGREGATION**

There should be no sources of heat or ignition in the cargo space.

“Separated by a complete compartment or hold from” combustible materials (particularly liquids), chlorates, chlorides, chlorites, hypochlorites, nitrites, permanganates and fibrous materials (e.g., cotton, jute, sisal, etc.).

- All electrical equipment, other than those of approved intrinsically safe type, in the cargo spaces to be used for this cargo shall be electrically disconnected from the power source, by appropriate means other than a fuse, at a point external to the space. This situation shall be maintained while the cargo is on board.

## APPENDIX

### BROWN COAL BRIQUETTES

#### HAZARD

1. This cargo is easily ignited, liable to heat spontaneously and deplete oxygen in the cargo space.
2. This cargo is subject to oxidation, leading to depletion of oxygen and an increase in carbon dioxide in the cargo space (see also section 3).
3. This cargo is liable to heat spontaneously and may ignite spontaneously in the cargo space. When spontaneous heating occurs, flammable and toxic gases, including carbon monoxide, may be produced. Carbon monoxide is an odourless gas, slightly lighter than air, and has flammable limits in air of 12% to 75% by volume. It is toxic by inhalation, with an affinity for blood haemoglobin over 200 times that of oxygen. The recommended threshold limit value (TLV) for carbon monoxide exposure is 50 ppm.

#### STOWAGE & SEGREGATION

1. Boundaries of cargo spaces where these cargoes are carried shall be resistant to fire and liquids.
2. This cargo shall be “separated from” goods of classes 1 (division 1.4), 2, 3, 4 and 5 in packaged form (see IMDG Code) and “separated from” solid bulk material of classes 4 and 5.1.
3. Stowage of goods of class 5.1 in packaged form or solid bulk materials of class 5.1 above or below this cargo shall be prohibited.
4. This cargo shall be “separated longitudinally by an intervening complete compartment or hold from” goods of class 1 other than division 1.4.
5. This cargo shall not be stowed adjacent to hot areas.

Note: For interpretation of these terms, see section 9.

#### LOADING

1. Prior to loading, the shipper, or their appointed agent, shall provide in writing to the master the characteristics of the cargo and the recommended safe handling procedures for loading and transport of the cargo. As a minimum, the cargo’s contract specifications for moisture content, sulphur content and size shall be stated.
2. This cargo shall be stored for 7 days prior to loading. This substantially reduces the risk of spontaneous combustion in subsequent transport, storage and handling.
3. Before loading this cargo, the master shall ensure the following:
  - 3.1 weather deck enclosures to the cargo space have been inspected to ensure their integrity. Such closures are closed and sealed;
  - 3.2 all electrical cables and components situated in cargo spaces and adjacent enclosed spaces are free from defects. Such cables and electrical components are safe to be used in a flammable and/or dusty atmosphere or positively isolated. The provisions of this clause need not apply to engine-rooms where the engine-room is separated from the cargo space by a gastight bulkhead with no direct access.

4. Smoking and the use of naked flames shall not be permitted in the cargo areas and adjacent spaces and appropriate warning notices shall be posted in conspicuous places. Burning, cutting, chipping, welding or other sources of ignition shall not be permitted in the vicinity of cargo spaces or in other adjacent spaces.
5. This cargo shall not be dropped more than one metre during loading to minimize the production of dust and fines.
6. Individual cargo spaces shall be loaded without interruption, where possible. Hot spots may develop in a cargo space that has been kept open for more than six days (or less in weather over 30°C).
7. Prior to departure, the master shall be satisfied that the surface of the material has been trimmed reasonably level to the boundaries of the cargo space to avoid the formation of gas pockets and to prevent air from permeating the body of the briquettes. Casing leading into the cargo space shall be adequately sealed. The shipper shall ensure that the master receives the necessary cooperation from the loading terminal.
8. Individual cargo spaces shall be closed and sealed as soon as practicable after the cargo has been loaded into each cargo space.

### PRECAUTIONS

1. The ship shall be suitably fitted and carry on board appropriate instruments for measuring the following without requiring entry into the cargo space:
  - .1 concentration of methane in the atmosphere above the cargo and opening cargo space enclosures;
  - .2 concentration of oxygen in the atmosphere above the cargo;
  - .3 concentration of carbon monoxide in the atmosphere above the cargo;
  - .4 pH value of cargo hold bilge samples.These instruments shall be regularly serviced and calibrated. Ship personnel shall be trained in the use of such instruments.
2. It is recommended that means be provided for monitoring the temperature of the cargo in the range of 0°C to 100°C to enable the measurement of temperature of the cargo during the voyage without requiring entry into the cargo space.

### CARRIAGE

1. As far as practicable, any gases which may be emitted from the cargo shall not be allowed to accumulate in adjacent enclosed spaces, such as store-rooms, carpenter's shop, passageways, tunnels, etc. Such spaces shall be adequately ventilated and regularly monitored for methane, oxygen and carbon monoxide.
2. Under no circumstances, except in emergency, shall the hatches be opened or the cargo space be ventilated or entered during the voyage.
3. The atmosphere in the space above the cargo in each cargo space shall be regularly monitored for the concentrations of methane, oxygen and carbon monoxide.
4. The frequency of the monitoring shall be determined based upon the information provided by the shipper and the information obtained through the analysis of the atmosphere in the cargo space. The monitoring shall be conducted at least daily and as close as practical to the same time of day. The results of monitoring shall be recorded. The shipper may request more frequent monitoring, particularly if there is evidence of significant self-heating during the voyage.

5. The following issues shall be taken into account:
  - 5.1 The oxygen level in the sealed cargo space will fall from an initial 21% over a period of days to stabilize at levels of the order of 6 to 15%. If the oxygen level does not fall below 20%, or rapidly increases after an initial fall, it is possible that the cargo space is inadequately sealed and is at risk of spontaneous combustion.
  - 5.2 Carbon monoxide levels will build up to concentrations which fluctuate in the 200 to 2000 parts per million (ppm) range in a safe, well-sealed cargo space. A rapid increase of approximately 1000 ppm in carbon monoxide levels in this cargo over a 24-hour period is a possible indicator of spontaneous combustion, particularly if accompanied by an increase in methane levels.
  - 5.3 The methane composition in briquette cargo is normally low, less than 5 ppm and does not constitute a hazard. However, a sudden and continuing rise in methane levels, to concentrations above 10 ppm, is an indicator of the occurrence of spontaneous combustion in the hold.
  - 5.4 The temperature in this cargo in a well-sealed cargo space normally remains at 5 to 10°C above seawater temperature, the increase being due to normal diurnal breathing of small quantities of air into the cargo space. Checking of the cargo space seals to minimize air leakage is essential. A rapid increase in temperature of approximately 20°C over 24 hours is evidence of spontaneous combustion.
6. Regular hold bilge testing shall be systematically carried out. If the pH monitoring indicates that a corrosion risk exists, the master shall ensure that all bilges are kept dry during the voyage in order to avoid possible accumulation of acids on tanktops and in the bilge system.
7. When the behaviour of the cargo during the voyage differs from that specified in the cargo information, the master shall report such differences to the shipper. Such reports will enable the shipper to maintain records on the behaviour of this cargo, so that the information being provided to the master can be reviewed in the light of the transport experience.
8. When the master is concerned that the cargo is showing any signs of self-heating or spontaneous combustion, such as an increase in the concentration of methane or carbon monoxide or an increase in temperature, as described above, the following actions shall be taken:
  - 8.1 Consult with the ship's agent at the loading port. The company's designated person ashore shall be advised immediately.
  - 8.2 Check the seal of the cargo space and re-seal the cargo space, as necessary.
  - 8.3 Do not enter the cargo space and do not open the hatches, unless the master considers access is necessary for the safety of the ship or safety of life. When any ship's personnel have entered into a cargo space, re-seal the cargo space immediately after the personnel vacate the cargo space.
  - 8.4 Increase the frequency of monitoring the gas composition, and temperature when practicable, of the cargo.
  - 8.5 Send the following information, as soon as possible, to the ship's owner or agent at the loading port to obtain expert advice:
    - .1 the number of cargo spaces involved;
    - .2 monitoring results of the carbon monoxide, methane and oxygen concentrations;
    - .3 if available, temperature of the cargo, location and method used to obtain results;

- .4 the time the gas analyses were taken (monitoring routine);
- .5 the quantity of the cargo in the cargo space(s) involved;
- .6 the description of the cargo as per the shipper's declaration, and any special precautions indicated on the declaration;
- .7 the date of loading, and Estimated Time of Arrival (ETA) at the intended discharge port (which shall be specified); and
- .8 any other comments or observations the master may consider relevant.

## **DISCHARGE**

Prior to, and during, discharge:

1. The cargo space shall be kept closed until just before the commencement of discharge of that space. The cargo may be sprayed with a fine water spray to reduce dust.
2. Personnel shall not enter the cargo space without having tested the atmosphere above the cargo. The personnel entering into a cargo space in which the atmosphere contains oxygen levels below 21% shall wear self-contained breathing apparatus. Carbon dioxide and carbon monoxide gas levels shall also be tested prior to entry into the cargo spaces. The recommended threshold limit value (TLV) for carbon monoxide is 50 ppm.
3. During discharge, attention shall be paid to the cargo for signs of hot spots (i.e. steaming). If a hot spot is detected, the area shall be sprayed with fine water spray and the hot spot shall be removed immediately to prevent spreading. The hot spot cargo shall be spread out on the wharf away from the remainder of the cargo.
4. Prior to suspending the discharge of this cargo for more than eight hours, the hatch covers and all other ventilation for the cargo space shall be closed.

## **PROCEDURES FOR GAS MONITORING OF BROWN COAL BRIQUETTE CARGOES**

### **1 Observations**

1.1 Carbon monoxide monitoring, when conducted in accordance with the following procedures, will provide a reliable early indication of self-heating within this cargo. This allows preventive action to be considered without delay. A sudden rapid rise in carbon monoxide detected within a cargo space, particularly if accompanied by an increase in methane levels, is a conclusive indication that self-heating is taking place.

1.2 All vessels engaged in the carriage of this cargo shall carry on board an instrument for measuring methane, oxygen and carbon monoxide gas concentrations, to enable the monitoring of the atmosphere within the cargo space. This instrument shall be regularly serviced and calibrated in accordance with the manufacturer's instructions. Care shall be exercised in interpreting methane measurements carried out in the low oxygen concentrations often found in unventilated cargo holds. The catalytic sensors normally used for the detection of methane rely on the presence of sufficient oxygen for accurate measurement. This phenomenon does not affect the measurement of carbon monoxide, or measurement of methane by infrared sensor. Further guidance may be obtained from the instrument manufacturer.

## 2 Sampling and measurement procedure

### 2.1 Equipment

2.1.1 An instrument which is capable of measuring methane, oxygen and carbon monoxide concentrations shall be provided on board a ship carrying this cargo. The instrument shall be fitted with an aspirator, flexible connection and a length of spark-proof metal tubing to enable a representative sample to be obtained from within the square of the hatch.

2.1.2 When recommended by the manufacturer, a suitable filter shall be used to protect the instrument against the ingress of moisture. The presence of even a small amount of water will compromise the accuracy of the measurement.

### 2.2 Siting of sampling points

2.2.1 In order to obtain meaningful information about the behaviour of this cargo in a cargo space, gas measurements shall be made via one sample point per cargo space. To ensure flexibility of measurement in adverse weather, however, two sample points shall be provided per cargo space, one on the port side and one on the starboard side of the hatch cover or hatch coaming (refer to diagram of gas sampling point). Measurement from either of these locations is satisfactory.

*Diagram of gas sampling point*

2.2.2 Each sample point shall comprise a hole of diameter approximately 12 mm positioned as near to the top of the hatch coaming as possible. It shall be sealed with a sealing cap to prevent ingress of water and air. It is essential this cap be securely replaced after each measurement to maintain a tight seal.

2.2.3 The provision of any sample point shall not compromise the seaworthiness of the vessel.

### 2.3 *Measurement*

The explanation on procedures for measurement is as follows:

- .1 remove the sealing cap, insert the rigid tube into the sampling point and tighten the integral cap to ensure an adequate seal;
- .2 connect the instrument to the sampling tube;
- .3 draw a sample of the atmosphere through the tube, using the aspirator, until steady readings are obtained;
- .4 log the results on a form which records cargo hold, date and time for each measurement; and
- .5 put back the sealing cap.

Cement is a finely ground powder which becomes almost fluid in nature when aerated or significantly disturbed thereby creating a very minimal angle of repose. After loading is completed de-aeration occurs almost immediately and the product settles into a stable mass. Cement dust can be a major concern during loading and discharge if the vessel is not specially designed as a cement carrier or shore equipment is not fitted with special dust control equipment.

## APPENDIX

### COAL

#### Properties and characteristics

1. Coals may emit methane, a flammable gas. A methane/air mixture containing between 5% and 16% methane constitutes an explosive atmosphere which can be ignited by sparks or naked flame, e.g., electrical or frictional sparks, a match or lighted cigarette. Methane is lighter than air and may, therefore, accumulate in the upper region of the cargo space or other enclosed spaces. If the cargo space boundaries are not tight, methane can seep through into spaces adjacent to the cargo space.
2. Coals may be subject to oxidation, leading to depletion of oxygen and an increase in carbon dioxide or carbon monoxide concentrations in the cargo space. Carbon monoxide is an odourless gas, slightly lighter than air, and has flammable limits in air of 12% to 75% by volume. It is toxic by inhalation with an affinity for blood haemoglobin over 200 times that of oxygen.
3. Some coals may heat spontaneously and the spontaneous heating may lead to spontaneous combustion in the cargo space. Flammable and toxic gases, including carbon monoxide, may be produced.
4. Some coals may be liable to react with water and produce acids which may cause corrosion. Flammable and toxic gases, including hydrogen, may be produced. Hydrogen is an odourless gas, much lighter than air, and has flammable limits in air of 4% to 75% by volume.

#### Segregation and stowage requirements

1. Unless expressly provided otherwise, boundaries of cargo spaces where this cargo is carried shall be resistant to fire and liquids.
2. This cargo shall be “separated from” goods of classes 1 (division 1.4), 2, 3, 4 and 5 in packaged form (see IMDG Code) and “separated from” solid bulk materials of classes 4 and 5.1.
3. Stowage of goods of class 5.1 in packaged form or solid bulk materials of class 5.1 above or below this cargo shall be prohibited.
4. The master shall ensure that this cargo is not stowed adjacent to hot areas.
5. This cargo shall be “separated longitudinally by an intervening complete compartment or hold from” goods of class 1 other than division 1.4.

Note: For interpretation of these terms, see section 9.

#### General requirements for all types of these cargoes

1. Prior to loading, the shipper or his appointed agent shall provide in writing to the master the characteristics of the cargo and the recommended safe handling procedures for loading and transport of the cargo. As a minimum, the cargo’s contract specifications for moisture content, sulphur content and size shall be stated, and especially whether the cargo may be liable to emit methane or self-heat.
2. Before loading, the master shall ensure the following:
  - 2.1 All cargo spaces and bilge wells are clean and dry. Any residue of waste material or previous cargo is removed, including removable cargo battens; and

- 2.2 All electrical cables and components situated in cargo spaces and adjacent enclosed spaces are free from defects. Such cables and electrical components are safe for use in an explosive atmosphere or positively isolated. The provisions of this clause need not apply to engine-rooms where the engine-room is separated from the cargo space by a gastight bulkhead with no direct access.
3. The ship shall be suitably fitted and carry on board appropriate instruments for measuring the following without requiring entry in the cargo space:
  - .1 concentration of methane in the atmosphere;
  - .2 concentration of oxygen in the atmosphere;
  - .3 concentration of carbon monoxide in the atmosphere; and
  - .4 pH value of cargo space bilge samples.
4. These instruments shall be regularly serviced and calibrated. Ship personnel shall be trained in the use of such instruments. Details of gas measurement procedures are given at the end of this appendix.
5. It is recommended that means be provided for measuring the temperature of the cargo in the range 0°C to 100°C to enable the measurement of temperature of the cargo while being loaded and during voyage without requiring entry into the cargo space.
6. Smoking and the use of naked flames shall not be permitted in the cargo areas and adjacent spaces and appropriate warning notices shall be posted in conspicuous places. Burning, cutting, chipping, welding or other sources of ignition shall not be permitted in the vicinity of cargo spaces or in other adjacent spaces, unless the space has been properly ventilated and the methane gas measurements indicate it is safe to do so.
7. Prior to departure, the master shall be satisfied that the surface of the material has been trimmed reasonably level to the boundaries of the cargo space to avoid the formation of gas pockets and to prevent air from permeating the body of the briquettes. Casings leading into the cargo space shall be adequately sealed. The shipper shall ensure that the master receives the necessary co-operation from the loading terminal.
8. The atmosphere in the space above the cargo in each space shall be regularly monitored for the concentration of methane, oxygen and carbon monoxide. Details of gas monitoring procedures are given at the end of this appendix. The results of monitoring shall be recorded. The frequency of the monitoring shall be determined based upon the information provided by the shipper and the information obtained through the analysis of the atmosphere in the cargo space.
9. Unless expressly provided otherwise, surface ventilation shall be conducted in all cargo spaces carrying this cargo for the first 24 hours after departure from the loading port. During this period, the atmosphere in the cargo spaces shall be monitored once from one sample point per cargo space and for the purpose of the gas monitoring, the ventilation shall be stopped for an appropriate period prior to the gas monitoring.
10. When the methane concentrations monitored within 24 hours after departure are at an acceptably low level, the ventilation openings shall be closed and the atmosphere in the cargo spaces shall be monitored. When the methane concentrations monitored within 24 hours after departure are not at an acceptably low level, surface ventilation shall be maintained, except for an appropriate period for gas monitoring, and the atmosphere in the cargo spaces shall be monitored. This procedure shall be followed until the methane concentrations become acceptably low level. In any event, the atmosphere in the cargo spaces shall be monitored on a daily basis.
11. When significant concentrations of methane are subsequently observed in unventilated cargo spaces, the appropriate special precautions for coals emitting methane shall apply.

12. The master shall ensure, as far as practicable, that any gases which may be emitted from this cargo do not accumulate in adjacent enclosed spaces.
13. The master shall ensure that enclosed working spaces such as storerooms, carpenter's shop, passageways, tunnels, etc., are regularly monitored for the presence of methane, oxygen and carbon monoxide. Such spaces shall be adequately ventilated.
14. Regular hold bilge testing shall be systematically carried out during voyage carrying this cargo. If the pH monitoring indicates that a corrosion risk exists, bilges shall be frequently pumped out during the voyage in order to avoid possible accumulation of acids on tanktops and in the bilge system.
15. If the behaviour of the cargo during the voyage differs from that specified in the cargo declaration, the master shall report such differences to the shipper. Such reports will enable the shipper to maintain records on the behaviour of the coal cargoes, so that the information provided to the master can be reviewed in the light of transport experience.

## Special precautions

### 1 *Coals emitting methane*

When the shipper has informed that the cargo is liable to emit methane or analysis of the atmosphere in the cargo space indicates the presence of methane in excess of 20% of the Lower Explosion Limit (LEL), the following additional precautions shall be taken:

- .1 Adequate surface ventilation shall be maintained, except for an appropriate period for the purpose of gas monitoring.
- .2 Care shall be taken to remove any accumulated gases prior to operation of the hatch covers or other openings for any reason, including discharging. Care shall be taken to operate hatch covers of the cargo spaces and other openings to avoid creating sparks. Smoking and the use of naked flame shall be prohibited.
- .3 Personnel shall not be permitted to enter the cargo space or enclosed adjacent spaces unless the space has been ventilated and the atmosphere tested and found to be gas-free and to have sufficient oxygen to support life. Notwithstanding these provisions, emergency entry into the cargo space may be permitted without ventilation, testing the atmosphere or the both, provided that the entry into the cargo space is undertaken only by trained personnel wearing self-contained breathing apparatus under the supervision of a responsible officer and special precautions are observed to ensure that no source of ignition is carried into the space.
- .4 The master shall ensure that enclosed working spaces such as storerooms, carpenter's shops, passageways, tunnels, etc., are regularly monitored for the presence of methane. Such spaces shall be adequately ventilated and, in the case of mechanical ventilation, only equipment safe for use in an explosive atmosphere shall be used.

### 2 *Self-heating coals*

When the shipper informed that the cargo is likely to self-heat or analysis of the atmosphere in the cargo space indicates an increasing concentration of carbon monoxide, then the following additional precautions shall be taken:

- .1 The cargo spaces shall be closed immediately after completion of loading in each cargo space. The hatch covers may also be additionally sealed with a suitable sealing tape. Only natural surface ventilation shall be permitted and ventilation shall be limited to the absolute minimum time necessary to remove methane which may have accumulated.

- .2 Personnel shall not enter the cargo space during voyage, unless they are wearing self-contained breathing apparatus and access is critical to safety of life and the safety of the ship.
- .3 Prior to loading, temperature of this cargo shall be monitored. This cargo shall only be accepted for loading when the temperature of the cargo is not higher than 55°C.
- .4 When the carbon monoxide level is increasing steadily, a potential self-heating may be developing. In such a case, the cargo space shall be completely closed and all ventilation ceased, and the master shall seek expert advice immediately. Water shall not be used for cooling material or fighting coal cargo fires at sea, but may be used for cooling the boundaries of the cargo space.
- .5 When the carbon monoxide level in any cargo space reaches 50 ppm or exhibits a steady rise over three consecutive days, a self-heating condition may be developing and the master shall inform the shipper and the company of, at least, the following information if an accurate assessment of the situation is to be achieved:
  - .1 identity of the cargo spaces involved; monitoring results covering carbon monoxide, methane and oxygen concentrations;
  - .2 if available, temperature of the cargo, location and method used to obtain results;
  - .3 time gas sample taken (monitoring routine);
  - .4 time ventilators opened/closed;
  - .5 quantity of coal in hold(s) involved;
  - .6 type of coal as per cargo information, and any special precautions indicated on information;
  - .7 date loaded, and ETA at intended discharge port (which shall be specified); and
  - .8 comments or observations from the ship's master.

### **3 Gravity fed self-unloading bulk carrier**

3.1 A gravity fed self-unloading bulk carrier means a vessel that has gravity fed systems from the bottom of cargo holds, using gates that may be opened or closed to feed the cargo onto conveyor belts. Such belts run in fore and aft direction underneath the holds; from there the cargo is carried by means of conveyor systems to the deck and discharged onto shore with a self-unloading boom that can extend over the shore and has a conveyor belt. This is not applicable for the vessels with unloading systems such as cranes and grabs.

3.2 When this cargo is carried on a gravity fed self-unloading bulk carrier, the following requirements of this appendix need not apply:

- paragraph 1 of “Segregation and stowage requirements”; and
- paragraph 9 of “General requirements for all types of these cargoes”.

### **3.3 Loaded voyage procedures for atmospheric monitoring of cargoes**

#### **3.3.1 Bulk coal cargo safety procedures**

3.3.1.1 These requirements apply when these cargoes are to be carried on a gravity fed self-unloading bulk carrier. It is recommended that a document, such as a flow chart, describing cargo operations and carriage procedures for these cargoes be provided to the ship by the vessel's operator.

### **3.4 Ventilation**

3.4.1 When ventilating, it shall be ensured that excess air does not ingress excessively into the body of the cargo of coal as this may eventually promote self-heating.

3.4.2 Due to the presence of non-airtight unloading gates at the bottom of the cargo hoppers just above the tunnels, the following methods of ventilation shall be used:

- if methane is detected in the tunnel, it shall be “positive pressure” ventilated (more supply than exhaust in the tunnels to remove methane gas); and
- if carbon monoxide is detected in the tunnel, it shall be “negative pressure” ventilated (more exhaust than supply in the tunnels to remove carbon monoxide). The release of carbon monoxide may be an indication of self-heating.

## **Procedures for gas monitoring of coal cargoes**

### **1 Observations**

1.1 Carbon monoxide monitoring, when conducted in accordance with the following procedures, will provide a reliable early indication of self-heating within this cargo. This allows preventive action to be considered without delay.

A steady rise in the level of carbon monoxide detected within a cargo space is a conclusive indication that self-heating is taking place.

1.2 All vessels engaged in the carriage of this cargo shall carry on board an instrument for measuring methane, oxygen and carbon monoxide gas concentrations, to enable the monitoring of the atmosphere within the cargo space. This instrument shall be regularly serviced and calibrated in accordance with the manufacturer’s instructions. Care shall be exercised in interpreting methane measurements carried out in the low oxygen concentrations often found in unventilated cargo holds. The catalytic sensors normally used for the detection of methane rely on the presence of sufficient oxygen for accurate measurement. This phenomenon does not affect the measurement of carbon monoxide, or measurement of methane by infrared sensor. Further guidance may be obtained from the instrument manufacturer.

### **2 Sampling and measurement procedure**

#### **2.1 Equipment**

2.1.1 An instrument which is capable of measuring methane, oxygen and carbon monoxide concentrations shall be provided on board a ship carrying this cargo. The instrument shall be fitted with an aspirator, flexible connection and a length of spark-proof metal tubing to enable a representative sample to be obtained from within the square of the hatch.

2.1.2 When recommended by the manufacturer, a suitable filter shall be used to protect the instrument against the ingress of moisture. The presence of even a small amount of moisture will compromise the accuracy of the measurement.

## 2.2 *Siting of sampling points*

2.2.1 In order to obtain meaningful information about the behaviour of this cargo in a cargo space, gas measurements shall be made via one sample point per cargo space. To ensure flexibility of measurement in adverse weather two sample points shall be provided per cargo space, one on the port side and one on the starboard side of the hatch cover or hatch coaming. (Refer to the diagram of gas sampling point.) Measurement from either of these locations is satisfactory.

*Diagram of gas sampling point*

2.2.2 Each sample point shall comprise a hole of diameter approximately 12 mm positioned as near to the top of the hatch coaming as possible. It shall be sealed with a sealing cap to prevent ingress of water and air. It is essential that this cap is securely replaced after each measurement to maintain a tight seal.

2.2.3 The provisions of any sample point shall not compromise the seaworthiness of the vessel.

## 2.3 *Measurement*

The explanation on procedures for measurement is as follows:

- .1 remove the sealing cap, insert the spark-proof metal tube into the sampling point and tighten the collar to ensure an adequate seal;
- .2 connect the instrument to the sampling tube;
- .3 draw a sample of the atmosphere through the tube, using the aspirator, until steady readings are obtained;

- .4 log the results on a form which records cargo space, date and time for each measurement; and
- .5 put back the sealing cap.

#### **2.4 Measurement strategy**

The identification of incipient self-heating from measurement of gas concentrations is more readily achieved under unventilated conditions. This is not always desirable because of the possibility of the accumulation of methane to dangerous concentrations. This is primarily, but not exclusively, a problem in the early stages of a voyage. Therefore it is recommended that cargo spaces are initially ventilated until measured methane concentrations are at an acceptably low level.

#### **2.5 Measurement in unventilated holds**

Under normal conditions one measurement per day is sufficient as a precautionary measure. However, if carbon monoxide levels are higher than 30 ppm then the frequency shall be increased to at least twice a day at suitably spaced intervals. Any additional results shall be logged.

#### **2.6 Measurement in ventilated holds**

2.6.1 If the presence of methane is such that the ventilators are required to remain open, then a different procedure shall be applied to enable the onset of any incipient self-heating to be detected.

2.6.2 To obtain meaningful data the ventilators shall be closed for a period before the measurements are taken. This period may be chosen to suit the operational requirements of the vessel, but it is recommended that it is not less than four hours. It is vital in the interests of data interpretation that the shutdown time is constant whichever time period is selected. These measurements shall be taken on a daily basis.

#### **2.7 Measurement in cargo and self-unloading spaces of gravity fed self-unloading bulk carrier**

##### **2.7.1 Measurement in unventilated cargo and self-unloading spaces**

2.7.1.1 When the shipper has declared that the coal cargo has or may have self-heating characteristics, the holds shall not be ventilated unless otherwise specified in this section.

2.7.1.2 Under normal conditions one measurement per day is sufficient as a precautionary measure. If carbon monoxide levels are higher than 30 ppm then the frequency of measurements shall be increased to at least twice daily, at suitable intervals. Any additional results shall be logged.

2.7.1.3 If the carbon monoxide level in any hold indicates a steady rise or reaches 50 ppm a self-heating condition may be developing and the owners of the vessel shall be notified as outlined in the procedures. Above this level, the vessel shall operate on “negative pressure” ventilation, in order to reduce the amount of carbon monoxide. Regular monitoring of carbon monoxide levels shall continue.

2.7.1.4 Persons entering cargo or unloading spaces with carbon monoxide levels higher than 30 ppm shall not do so without self-contained breathing apparatus.

## 2.7.2 Measurement in ventilated cargo and self-unloading spaces

2.7.2.1 If the presence of methane is indicated by monitor, and such that ventilation is required, then a different procedure shall be applied to enable the onset of any possible self-heating to be detected. “Positive pressure” or “through ventilation” shall be operated to remove the methane.

2.7.2.2 To obtain meaningful data the ventilators and/or ventilation shall be closed for a period before measurements are taken. This period may be chosen to suit the operational requirements of the vessel, but it is recommended that it is not less than four hours. It is vital in the interests of data interpretation that the shutdown time is constant whichever time period is selected. These measurements shall be taken on a daily basis. If the carbon monoxide results exhibit a steady rise, or exceed 50 ppm on any day, the owner shall be notified.

2.7.2.3 In addition the following points shall be considered:

- at no time shall ventilation be shut down when crew members are in the self-unloading spaces;
- special fire-fighting equipment and/or procedures may be necessary for the vessel; and
- establish specific crew training for gravity fed self-unloading bulk carriers.

**HAZARD**

Temporary increase in temperature of about 30°C due to self-heating may be expected after material handling in bulk. The material may slowly evolve hydrogen after contact with water (notably saline water). Hydrogen is a flammable gas that can form an explosive mixture when mixed with air in concentration above 4% by volume. It is liable to cause oxygen depletion in cargo spaces. This cargo is non-combustible or has a low fire-risk.

**STOWAGE & SEGREGATION**

“Separated from” goods of class 1 (division 1.4S), 2, 3, 4 and 5 and class 8 acids in packaged form (see IMDG Code).

“Separated from” solid bulk materials of classes 4 and 5.

“Separated longitudinally by an intervening complete compartment or hold from” goods of class 1 other than division 1.4S.

Boundaries of compartments where this cargo is carried shall be resistant to fire and passage of liquid.

**HOLD CLEANLINESS**

The cargo spaces shall be clean, dry and free from salt and residues of previous cargoes. Prior to loading, wooden fixtures such as battens, loose dunnage, debris and combustible materials shall be removed.

## **WEATHER PRECAUTIONS**

This cargo shall be kept as dry as practicable during loading and the voyage. Open storage is acceptable prior to loading. This cargo shall not be loaded onto ships or transferred between ships or barges during precipitation. During loading of this cargo all non-working hatches of the cargo spaces into which this cargo is loaded or to be loaded shall be kept closed. Only when weather permits may non-working hatch covers be left open for a minimum of 1 hour after completion of each pour to allow cooling after cargo handling in bulk.

## **LOADING**

Prior to loading this cargo, the shipper shall provide the master with a certificate issued by a competent person recognized by the National Administration of the port of loading stating that the cargo, at the time of loading, is suitable for shipment and that it conforms with the requirements of this Code; that the quantity of fines and small particles (up to 6.35 mm in size) is no more than 5% by weight; the moisture content is less than 1.0% and the temperature does not exceed 65°C.

This cargo shall not be loaded when the temperature is in excess of 65°C, if its moisture content is in excess of 1.0% or if the quantity of fines and small particles (up to 6.35 mm in size) exceeds 5% by weight.

Appropriate precautions shall be taken during loading in order to have a cargo composed of essentially whole briquettes. The cargo shall be loaded in such a way so as to minimize breakage of briquettes and the additional generation of fines and small particles and concentration of fines in any area of the cargo. The addition of fines and particles less than 6.35 mm or dust in homogenous cargoes of briquettes shall be prohibited.

Trim in accordance with the relevant provisions required under sections 4 and 5 of the Code. Due consideration shall be given to evenly spreading the cargo across the tanktop to minimize the concentration of fines.

The cargo temperature shall be monitored during loading and recorded in a log detailing the temperature for each lot of cargo loaded, a copy of which shall be provided to the master. After loading, a certificate, confirming that throughout the whole consignment the fines and small particles (under 6.35 mm in size) are less than 5% by weight, shall be issued by a competent person recognized by the National Administration of the port of loading.

## **PRECAUTIONS**

The carrier's nominated technical persons or other representatives shall have reasonable access to stockpiles and loading installations for inspection.

Shippers shall provide comprehensive information on the cargo and safety procedures to be followed in the event of emergency. The shipper may also provide advice in amplification of this Code but the advice shall not be contrary thereto in respect of safety.

Where practicable, ballast tanks adjacent to the cargo spaces containing this cargo, other than double-bottom tanks, shall be kept empty. Weather deck closures and hatch covers shall be inspected and tested to ensure integrity and weather tightness which shall be maintained throughout the voyage.

Appropriate precautions shall be taken to protect machinery, equipment and accommodation spaces from the dust of the cargo. Radars and exposed radio communication equipment of the ship shall be protected from the dust of this cargo. Bilge wells of the cargo spaces shall be clean, dry and protected from ingress of the cargo using non-combustible material. Persons who may be exposed to the dust of the cargo shall wear protective clothing, goggles or other equivalent dust eye-protection and dust filter masks, as necessary.

During handling of this cargo “NO SMOKING” signs shall be posted on decks and in areas adjacent to cargo spaces, and no naked lights shall be permitted in these areas.

Cargo spaces containing this cargo and adjacent spaces may become oxygen-depleted. Flammable gas may also build up in these spaces. All precautions shall be taken upon entering the cargo and adjacent spaces.

#### **VENTILATION**

Surface ventilation only, either natural or mechanical, shall be conducted, as necessary, during the voyage for this cargo. On no account shall air be directed into the body of the cargo. When mechanical ventilation is used, the fans shall be certified as explosion-proof and shall prevent any spark generation thereby avoiding the possibility of ignition of hydrogen air mixture. Suitable wire mesh guards shall be fitted over inlet and outlet ventilation openings. Ventilation shall be such that escaping gases cannot enter living quarters in hazardous concentrations.

#### **CARRIAGE**

For quantitative measurements of hydrogen, a suitable detector shall be on board while this cargo is carried. The detector shall be suitable for use in an oxygen depleted atmosphere and of a type certified safe for use in an explosive atmosphere. The concentrations of hydrogen in the cargo spaces carrying this cargo shall be measured regularly during the voyage, and the results of the measurements shall be recorded and kept on board for a minimum of two years. When the monitored hydrogen concentration is higher than 1% (> 25% LEL) by volume, appropriate safety precautions shall be taken in accordance with those procedures provided by the shipper in case of emergency. If in doubt, expert advice shall be sought.

Bilge wells shall be checked regularly for the presence of water. If water is found, it shall be removed by pumping or draining the bilge wells.

Temperature of the cargo shall be taken regularly during the voyage and a record kept on board for a minimum of two years. If the temperature in the cargo space exceeds 65°C, appropriate safety precautions shall be taken in accordance with the procedures provided by the shipper in case of emergency. If in doubt, expert advice shall be sought.

#### **DISCHARGE**

The hydrogen concentration in the cargo space shall be measured immediately before any opening action of the hatch covers. If the hydrogen concentration is greater than 1% (> 25% LEL) by volume, all appropriate safety precautions in conformity with the procedures provided by the shipper or the recommendations of the competent authority shall be taken. If in doubt, expert advice shall be sought.

During discharge, a fine spray of fresh water may be applied to this cargo for dust control only when the cargo will be stored in an open area. It is not recommended to apply a fine spray of fresh water to this cargo when it will be stored in an enclosed space or is to be transhipped.

#### **CLEAN-UP**

Accumulations of dust from this cargo on deck or in proximity to cargo spaces shall be removed as quickly as possible. Consideration shall be given to carefully cleaning exposed radio communications equipment to which dust from the cargo might adhere, such as radar, radio aerials, VHF installations, AIS and GPS. Hosing with seawater should be avoided.

##### **MEDICAL FIRST AID**

Refer to the Medical First Aid Guide (MFAG), as amended.

**DIRECT REDUCED IRON (B)****Lumps, pellets, cold-moulded briquettes****DESCRIPTION**

Direct reduced iron (DRI) (B) is a highly porous, black/grey metallic material formed by the reduction (removal of oxygen) of iron oxide at temperatures below the fusion point of iron. Cold-moulded briquettes are defined as those which have been moulded at a temperature less than 650°C or which have a density of less than 5,000 kg/m<sup>3</sup>. Fines and small particles under 6.35 mm in size shall not exceed 5% by weight.

**CHARACTERISTICS**

ANGLE OF REPOSE	BULK DENSITY (kg/m <sup>3</sup> )	STOWAGE FACTOR (m <sup>3</sup> /t)
Not applicable	1750 to 2000	0.5 to 0.57
SIZE	CLASS	GROUP
Lumps and pellets: Average particle size 6.35 mm to 25 mm. Cold-moulded briquettes: Approximate maximum dimensions 35 mm to 40 mm. Fines and small particles under 6.35 mm up to 5% by weight.	MHB	B

**HAZARD**

Temporary increase in temperature of about 30°C due to self-heating may be expected after material handling in bulk.

There is a risk of overheating, fire and explosion during transport. This cargo reacts with air and with fresh water or seawater to produce heat and hydrogen. Hydrogen is a flammable gas that can form an explosive mixture when mixed with air in concentrations above 4% by volume. The reactivity of this cargo depends upon the origin of the ore, the process and temperature of reduction, and the subsequent ageing procedures. Cargo heating may generate very high temperatures that are sufficient to ignite the cargo. Build-up of fines may also lead to self-heating, auto-ignition and explosion. Oxygen in cargo spaces and enclosed spaces may be depleted.

**STOWAGE & SEGREGATION**

“Separated from” goods of classes 1 (division 1.4S), 2, 3, 4 and 5, and class 8 acids in packaged form (See IMDG Code).

“Separated from” solid bulk materials of classes 4 and 5.

Goods of class 1, other than division 1.4S, shall not be carried in the same ship.

Boundaries of compartments where this cargo is carried shall be resistant to fire and passage of liquid.

**HOLD CLEANLINESS**

The cargo spaces shall be clean, dry and free from salt and residues of previous cargoes. Prior to loading, wooden fixtures such as battens, loose dunnage, debris and combustible materials shall be removed.

**WEATHER PRECAUTIONS**

The cargo shall be kept dry at all times during storage, before and during loading, and during transportation. The cargo shall not be loaded onto ships, or transferred between ships or barges, during precipitation. During loading of this cargo, all non-working hatches of cargo spaces into which this cargo is loaded, or is to be loaded, shall be kept closed.

**LOADING**

Prior to loading, the terminal shall ensure that the conveyor belts used for loading this cargo contain no accumulation of water or other substances. Each time cargo operations are commenced or restarted, particularly after rain or washing down, any loading belt shall be operated empty and not over a ship's cargo space.

Prior to loading, an ultrasonic test or another equivalent method with a suitable instrument shall be conducted to ensure weather tightness of the hatch covers and closing arrangements and all readings shall confirm weather tightness.

Prior to loading this cargo, the shipper shall provide the master with a certificate issued by a competent person recognized by the National Administration of the port of loading stating that the cargo, at the time of loading, is suitable for shipment, and that it conforms with the requirements of this Code; that the quantity of fines and small particles is no more than 5% by weight; that the moisture content is less than 0.3%; and that the temperature does not exceed 65°C. This certificate shall state the date of manufacture for each lot of cargo to be loaded in order to meet the loading criteria in regards to ageing and material temperature.

The cargo shall not be accepted for loading when its temperature is in excess of 65°C or if its moisture content is in excess of 0.3% or if the quantity of fines and small particles exceeds 5% by weight. Any cargo that has been wetted, or is known to have been wetted, shall not be loaded into any cargo space.

Prior to loading, provision shall be made to introduce a dry, inert gas at tanktop level so that the inert gas purges the air from the cargo and fills the free volume above. Nitrogen is preferred for this purpose. All vents, accesses and other openings such as coaming drains that could allow the inert atmosphere to be lost from cargo spaces carrying this cargo shall be closed and sealed.

The cargo shall be loaded in such a way as to minimize both the breakage of the cold-moulded briquettes, pellets, lumps and the additional generation of fines and the concentrating of fines in any area of the cargo. This cargo shall be homogenous with no added waste. The addition of DRI particles, fines or dust in this cargo shall be prohibited.

Due consideration shall be given to evenly spreading the cargo across the tanktop to minimize the concentration of fines. Trim in accordance with the relevant provisions required under sections 4 and 5 of the Code.

The cargo temperature and moisture shall be monitored during loading and recorded in a log detailing the temperature and moisture for each lot of cargo loaded, a copy of which shall be provided to the master. After loading, a certificate shall be issued by a competent person recognized by the National Administration of the port of loading confirming that throughout the whole consignment fines and small particles (under 6.35 mm size) are less than 5% by weight, that the moisture content has not exceeded 0.3% and the temperature does not exceed 65°C.

On completion of loading of a cargo space, it shall be immediately closed and sealed. Sufficient inert gas shall then be introduced to achieve an oxygen concentration less than 5% throughout the cargo space.

### **PRECAUTIONS**

Due consideration shall be given to the possibility of moisture inside the cargo pile in order to avoid loading of wet cargo or a wet part of the cargo recognizing that the bottom of the pile can be wet even though the surface of cargo pile looks dry. The carrier's nominated technical persons or other representatives shall have reasonable access to stockpiles and loading installations for inspection.

Prior to shipment, the cargo shall be aged for at least 3 days, or treated with an air-passivation technique, or another equivalent method, that reduces the reactivity to the same level as the aged product. Such aging process shall be approved by the competent authority that shall also provide a certificate to that effect.

Shippers shall provide comprehensive information on the cargo and safety procedures to be followed in the event of emergency. This advice may be an amplification of this Code, but shall not be contrary thereto in respect of safety.

Where practicable, ballast tanks adjacent to the cargo spaces containing this cargo, other than double-bottom tanks, shall be kept empty. Weather tightness shall be maintained throughout the voyage. Bilge wells of the cargo spaces shall be clean, dry and protected from ingress of the cargo using non-combustible material.

Due consideration shall be given to protecting equipment, machinery and accommodation spaces from the dust of the cargo. Radars and exposed radio communication equipment of ships which carry this cargo shall be protected from the dust of this cargo. Persons who may be exposed to the dust of the cargo shall wear protective clothing, goggles or other equivalent dust eye-protection and dust filter masks, as necessary.

During any handling of this cargo "NO SMOKING" signs shall be posted on decks and in areas adjacent to cargo spaces, and no naked lights shall be permitted in these areas. Smoking, burning, cutting, chipping, grinding or other sources of ignition shall not be allowed in the vicinity of cargo spaces containing this cargo at any time.

Cargo spaces containing this cargo and adjacent spaces may become oxygen-depleted. Flammable gas may also build up in these spaces. All precautions shall be taken when entering the cargo spaces.

The ship shall be provided with the means to ensure that the requirement of this Code to maintain the oxygen concentration below 5% can be achieved throughout the voyage. The ship's fixed CO<sub>2</sub> fire-fighting system shall not be used for this purpose. Consideration shall be given to providing the vessel with the means to top up the cargo spaces with additional supplies of inert gas taking into account the duration of the voyage.

The ship shall be provided with the means for reliably measuring the temperatures at several points within the stow, and determining the concentrations of hydrogen and oxygen in the cargo space atmosphere on voyage whilst minimizing as far as practicable the loss of the inert atmosphere.

Any cargo that has already been loaded into a cargo space and which subsequently becomes wetted, or in which reactions have started, shall be discharged without delay.

The ship shall not sail until the master and a competent person recognized by the National Administration of the port of loading are satisfied:

- .1 that all loaded cargo spaces are correctly sealed and inerted;
- .2 that the temperature of the cargo has stabilized at all measuring points and that the temperature does not exceed 65°C; and
- .3 that at the end of the inerting process, the concentration of hydrogen in the free space of the holds has stabilized and does not exceed 0.2% by volume.

#### **VENTILATION**

The cargo spaces carrying this cargo shall remain tightly sealed and the inert condition maintained during the voyage.

#### **CARRIAGE**

For quantitative measurements of hydrogen and oxygen, suitable detectors shall be on board while this cargo is carried. The detectors shall be suitable for use in an oxygen-depleted atmosphere and of a type certified safe for use in explosive atmospheres. The concentrations of hydrogen and oxygen in the cargo spaces carrying this cargo shall be measured at regular intervals during voyage, and the results of the measurements shall be recorded and kept on board for a minimum of two years.

The oxygen concentration in the cargo spaces carrying this cargo shall be maintained at less than 5% throughout the duration of the voyage. When the monitored hydrogen concentration is higher than 1% (> 25% LEL) by volume, appropriate safety precautions shall be taken in accordance with those procedures provided by the shipper in the event of emergency. If in doubt, expert advice shall be sought.

Cargo temperatures shall be taken at regular intervals during voyage and the results of the measurements shall be recorded and kept on board for a minimum of two years. If the temperature in the cargo space exceeds 65°C, appropriate safety precautions shall be taken in accordance with the procedures provided by the shipper in the event of emergency. If in doubt, expert advice shall be sought.

Bilge wells shall be checked regularly for the presence of water. If water is found, it shall be removed by pumping or draining the bilge wells. Consideration shall be given to increasing the frequency of cargo monitoring following periods of bad weather. All measurements shall be taken so as to minimize as far as practicable the loss of inert gas from the cargo spaces.

#### **DISCHARGE**

The hydrogen concentration in the cargo space shall be measured immediately before any opening action of the hatch covers. If the hydrogen concentration is greater than 1% (> 25% LEL) by volume, all appropriate safety precautions in conformity with the procedures provided by the shipper or the recommendations of the competent authority shall be taken. If in doubt, expert advice shall be sought.

During precipitation, all cargo operations shall be suspended and holds containing cargo shall be closed. Monitoring for hydrogen in those holds containing cargo shall be resumed.

#### **CLEAN-UP**

Accumulations of dust from this cargo on deck or in proximity to cargo spaces shall be removed as quickly as possible. Hosing with seawater should be avoided. Consideration shall be given to carefully cleaning exposed radio communications equipment to which dust from the cargo might adhere, such as radar, radio aerials, VHF installations, AIS and GPS.

**EMERGENCY PROCEDURES****SPECIAL EMERGENCY EQUIPMENT TO BE CARRIED**

**EMERGENCY PROCEDURES**

Nil

**EMERGENCY ACTION IN THE EVENT OF FIRE**

In the event of emergency, the specific procedures provided by the shipper should be consulted and followed, as appropriate.

**Do not use CO<sub>2</sub>. Do not use water. Do not use steam.**

Batten down and reinstate the inert atmosphere using supplies or equipment if available on board. Increase the frequency of monitoring. If temperature and/or hydrogen concentration steadily rise, seek expert advice as quickly as possible.

If the temperature in the cargo space exceeds 120°C, the ship should make for the nearest appropriate port to discharge the cargo affected. Preparations should be made for grab discharge.

If additional nitrogen gas is available, the use of this gas will assist in keeping the oxygen concentration down and may contain the fire and prevent an explosive atmosphere if hydrogen is produced.

Flooding with water of the affected cargo hold should only be contemplated as a last resort, always taking the stability and strength of the ship into account.

**MEDICAL FIRST AID**

Refer to the Medical First Aid Guide (MFAG), as amended.

## METAL SULPHIDE CONCENTRATES

(See also Mineral Concentrates schedule)

### DESCRIPTION

Mineral concentrates are refined ores in which the valuable components have been enriched by eliminating the bulk of waste materials. Generally the particle size is small although agglomerates sometimes exist in concentrates which have not been freshly produced.

The most common concentrates in this category are: zinc concentrates, lead concentrates, copper concentrates and low grade middling concentrates.

### CHARACTERISTICS

ANGLE OF REPOSE	BULK DENSITY (kg/m <sup>3</sup> )	STOWAGE FACTOR (m <sup>3</sup> /t)
Not applicable	1790 to 3230	0.31 to 0.56
SIZE	CLASS	GROUP
Various	MHB	A and B

### HAZARD

Some sulphide concentrates are liable to oxidation and may have a tendency to self-heat, with associated oxygen depletion and emission of toxic fumes. Some materials may present corrosion problems.

When a Metal Sulphide Concentrate is considered as presenting a low fire-risk, the carriage of such cargo on a ship not fitted with a fixed gas fire extinguishing system should be subject to the Administration's authorization as provided by SOLAS regulation II-2/10.7.1.4.

### STOWAGE & SEGREGATION

Unless determined by the competent authority, segregation as required for class 4.2 materials. "Separated from" foodstuffs and all class 8 acids.

### HOLD CLEANLINESS

Clean and dry as relevant to the hazards of the cargo.

### WEATHER PRECAUTIONS

When a cargo is carried in a ship other than specially constructed or fitted cargo ship complying with the requirements in subsection 7.3.2 of this Code, the following provisions shall be complied with:

- .1 the moisture content of the cargo shall be kept less than its TML during voyage;
- .2 unless expressly provided otherwise in this individual schedule, the cargo shall not be handled during precipitation;
- .3 unless expressly provided otherwise in this individual schedule, during handling of the cargo, all non-working hatches of the cargo spaces into which the cargo is loaded or to be loaded shall be closed;
- .4 the cargo may be handled during precipitation provided that the actual moisture content of the cargo is sufficiently less than its TML so that the actual moisture content is not liable to be increased beyond the TML by the precipitation; and
- .5 the cargo in a cargo space may be discharged during precipitation provided that the total amount of the cargo in the cargo space is to be discharged in the port.

**LOADING**

This cargo shall be trimmed to ensure that the height difference between peaks and troughs does not exceed 5% of the ship's breadth and that the cargo slopes uniformly from the hatch boundaries to the bulkheads and no shearing faces remain to collapse during voyage, in particular on smaller ships, i.e. 100 m long or less.

As the density of the cargo is extremely high, the tanktop may be overstressed unless the cargo is evenly spread across the tanktop to equalize the weight distribution. Due consideration shall be paid to ensure that the tanktop is not overstressed during the voyage and during loading by a pile of the cargo.

**PRECAUTIONS**

Entry into the cargo space for this cargo shall not be permitted until the cargo space has been ventilated and the atmosphere tested for concentration of oxygen. Appropriate precautions shall be taken to protect machinery and accommodation spaces from the dust of the cargo. Bilge wells of the cargo spaces shall be protected from ingress of the cargo. Due consideration shall be paid to protect equipment from the dust of the cargo. Persons who may be exposed to the dust of the cargo shall wear goggles or other equivalent dust eye-protection and dust filter masks. Those persons shall wear protective clothing, as necessary.

**VENTILATION**

The cargo spaces carrying this cargo shall not be ventilated during voyage.

**CARRIAGE**

The appearance of the surface of this cargo shall be checked regularly during voyage. If free water above the cargo or fluid state of the cargo is observed during voyage, the master shall take appropriate actions to prevent cargo shifting and potential capsize of the ship, and give consideration to seeking emergency entry into a place of refuge. For quantitative measurements of oxygen and toxic fumes liable to be evolved by the cargo, suitable detectors for each gas and fume or combination of these shall be on board while this cargo is carried. The detectors shall be suitable for use in an atmosphere without oxygen. The concentrations of these gases in the cargo spaces carrying this cargo shall be measured regularly, during voyage, and the results of the measurements shall be recorded and kept on board.

**DISCHARGE**

No special requirements.

**CLEAN-UP**

No special requirements.

**EMERGENCY PROCEDURES****SPECIAL EMERGENCY EQUIPMENT TO BE CARRIED**

Self-contained breathing apparatus.

**EMERGENCY PROCEDURES**

Wear self-contained breathing apparatus.

**EMERGENCY ACTION IN THE EVENT OF FIRE**

Batten down; use ship's fixed fire-fighting installation.  
Exclusion of air may be sufficient to control the fire. **Do not use water.**

**MEDICAL FIRST AID**

Refer to the Medical First Aid Guide (MFAG), as amended.

**REMARKS**

Fire may be indicated by the smell of sulphur dioxide.

**PEAT MOSS****DESCRIPTION**

Surface mined from mires, bogs, fens, muskeg and swamps. Types include moss peat, sedge peat and grass peat. Physical properties depend on organic matter, water and air content, botanical decomposition and degree of decomposition.

May range from a highly fibrous cohesive mass of plant remains which when squeezed in its natural state exudes clear to slightly coloured water, to a well decomposed, largely amorphous material with little or no separation of liquid from solids when squeezed.

Typically air-dried peat has low density, high compressibility and high water content; in its natural state it can hold 90 percent or more of water by weight of water when saturated.

## APPENDIX

### SCRAP METAL

Handling of this cargo varies from magnets to spider grabs, depending usually on the size of material. This cargo may include articles from the size of car bodies to fine metal turnings (swarf). The weight of individual pieces will also vary greatly, ranging from heavy machinery to tin cans.

#### **Loading**

Before loading, the cargo spaces shall be prepared as per general loading practice and any areas liable to be damaged by falling cargo shall be protected with dunnage. This includes decks and coamings in way of the material's path to the cargo spaces. Removing the ship's side rails may be advisable.

A layer of this cargo shall be carefully placed over the tanktop in the square to cushion any fall out. Magnet and grab drivers shall be instructed not to release their loads too high above the pile.

The usual method of loading is to form a pile along the ship's centre line and use the slope to roll material into the ends and sides. Every effort must be made to work the wings and ends to evenly distribute the weight. If this is not done, the light high volume pieces will roll to the wings and the small heavy pieces will concentrate in the square.

When pumping the bilge wells, the master shall be aware of that a certain amount of dirt and oil can be expected from old machinery. Broken glass and sharp jagged edges may be present and care shall be taken by personnel working near scrap.

Before hatches are closed, the cargo spaces shall be checked that no sharp projections could pierce the ship's side.

**HAZARD**

In contact with water may evolve hydrogen, a flammable gas that may form explosive mixtures with air and may, under similar conditions produce phosphine and arsine, which are highly toxic gases.

Cargo is liable to reduce oxygen content in a cargo space.

This cargo is non-combustible or has a low fire-risk.

**STOWAGE & SEGREGATION**

**LOADING**

Trim in accordance with the relevant provisions required under sections 4 and 5 of the Code.

As the density of the cargo is extremely high, the tanktop may be overstressed unless the cargo is evenly spread across the tanktop to equalize the weight distribution. Due consideration shall be paid to ensure that tanktop is not overstressed during voyage and during loading by a pile of the cargo.

**PRECAUTIONS**

The manufacturer or the shipper shall provide the master with a certificate stating that, after manufacture, the cargo was stored under cover, but exposed to open air for not less than three days prior to shipment. Electrical fittings and cables shall be in good condition and properly safeguarded against short circuits and sparking. Where a bulkhead is required to be suitable for segregation purposes, cable and conduit penetrations of the decks and bulkheads shall be sealed against the passage of gas and vapour. Whenever practicable, ventilation systems for the living quarters shall be shut down or screened and air condition systems shall be placed on recirculation during loading and discharge of this cargo, in order to minimize the entry of dust into living quarters or other interior spaces of the ship. Precautions shall be taken to minimize the extent to which dust of this cargo may come in contact with moving parts of deck machinery and external navigation aids such as navigation lights.

Entry of personnel into enclosed spaces shall not be permitted until tests have been carried out and it has been established that the oxygen content has been restored to a normal level throughout the space and that no toxic gas is present, unless adequate ventilation and air circulation throughout the free space above the material has been effected.

Prohibition of smoking in dangerous areas shall be enforced, and clearly legible “NO SMOKING” signs shall be displayed.

Electrical fittings and cables shall be in good condition and properly safeguarded against short circuits and sparking. Where a bulkhead is required to be suitable for segregation purposes, cable and conduit penetrations of the decks and bulkheads shall be sealed against the passage of gas and vapour.

Ventilation systems shall be shut down or screened and air condition systems, if any, placed on recirculation during loading or discharge, in order to minimize the entry of dust into living quarters or other interior spaces of the ship.

Precautions shall be taken to minimize the extent to which dust may come in contact with moving parts of deck machinery and external navigation aids (e.g., navigation lights).

**VENTILATION**

Mechanical surface ventilation shall be conducted during the voyage, as necessary, for the cargo spaces carrying this cargo.

The detector shall be suitable for use in an atmosphere without oxygen and of certified safe type for use in explosive atmosphere. The concentrations of these gases in the cargo spaces carrying this cargo shall be measured regularly, during voyage, and the results of the measurements shall be recorded and kept on board.

Not applicable	900 to 1350	0.74 to 1.11
SIZE	CLASS	GROUP
Approx. 1 mm to 10 mm	Not applicable	C

**HAZARD**

This cargo is non-combustible or has a low fire risk. If involved in a fire, cargo may generate harmful gases.

When handled and shipped in accordance with the provisions of the schedule, this cargo poses no corrosion or dust hazards for human tissue or vessel.

**STOWAGE & SEGREGATION**

“Separated from” strong oxidizers, such as fluorine, chlorine, chlorates, nitrates (nitric acid), peroxides, liquid oxygen, permanganates, dichromates or the like.

**HOLD CLEANLINESS**

Clean and dry as relevant to the hazards of the cargo. Holds shall not be washed with seawater.

**WEATHER PRECAUTIONS**

No special requirements.

**LOADING**

Trim in accordance with the relevant provisions required under sections 4 and 5 of the Code. Appropriate precautions shall be taken to minimize impact, abrasion and crushing when handling to prevent dust from forming. Standard application of surfactants inhibits airborne dust from forming.

**PRECAUTIONS**

Protect machinery, accommodations and equipment from small particles or any dust if formed. Persons involved in cargo handling shall wear protective clothing, goggles and dust filter masks. Holds including trimming plates and tanktops shall be treated with effective, commercially available protective coating or lime-washed to avoid any potential corrosive reaction between sulphur, water and steel. Upper sections shall have a sound coating of paint. Hatches shall be sealed tightly.

**VENTILATION**

Surface ventilation only, either natural or mechanical, shall be conducted, as necessary, during the voyage for this cargo.

**CARRIAGE**

As a fine spray of fresh water or surfactant is added during loading, bilges shall be sounded and pumped out as necessary throughout the voyage.

**DISCHARGE**

Appropriate safety precautions shall be taken when entering the cargo spaces, particularly in the area of the bottom layers of sulphur in ships hold, taking into account the recommendations developed by the Organization.

Appropriate precautions shall be taken to minimize impact, abrasion and crushing when handling to prevent dust from forming.

**CLEAN-UP**

Persons involved in clean-up shall wear hard hats, protective goggles, long-sleeve shirts, long pants, and impervious gloves. Use of approved respirators shall be considered. Holds shall be thoroughly washed using only fresh water following discharge.

Appropriate safety precautions shall be taken when entering the cargo spaces, taking into account the recommendations developed by the Organization.<sup>†</sup>

**SULPHUR UN 1350**  
**(crushed lump and coarse grained)**

**Note: Fine grained sulphur (flowers of sulphur) shall not be transported in bulk.**

**LOADING**

Trim in accordance with the relevant provisions required under sections 4 and 5 of the Code.

**PRECAUTIONS**

When this cargo is involved in a fire, a toxic, very irritating and suffocating gas is evolved. This cargo forms explosive and sensitive mixtures with most oxidizing material. ## WOOD PELLETS

### DESCRIPTION

The Wood Pellets are light blond to chocolate brown in colour; very hard and cannot be easily squashed. Wood Pellets have a typical specific density between 1,100 to 1,700 kg/m<sup>3</sup> and a bulk density of 600 to 750 kg/m<sup>3</sup>. Wood Pellets are made of sawdust, planer shavings and other wood waste such as bark coming out of the lumber manufacturing processes. Normally there are no additives or binders blended into the pellet, unless specified. The raw material is fragmented, dried and extruded into pellet form. The raw material is compressed approximately 3.5 times and the finished Wood Pellets typically have a moisture content of 4 to 8%. Wood Pellets are used as a fuel in district heating and electrical power generation as well as a fuel for small space heaters such as stoves and fireplaces.

Wood Pellets are also used as animal bedding due to the absorption characteristics. Such Wood Pellets typically have a moisture content of 8 to 10%.

### HAZARD

Shipments may be subject to oxidation leading to depletion of oxygen and increase of carbon monoxide and carbon dioxide in cargo and communicating spaces.

Swelling if exposed to moisture. Wood Pellets may ferment over time if moisture content is over 15% leading to generation of asphyxiating and flammable gases which may cause spontaneous combustion.

Handling of Wood Pellets may cause dust to develop. Risk of explosion at high dust concentration.

## APPENDIX 2

### LABORATORY TEST PROCEDURES, ASSOCIATED APPARATUS AND STANDARDS

#### 1 Test procedures for materials which may liquefy and associated apparatus

Three methods of testing for the transportable moisture limit are currently in general use:

- .1 flow table test;
- .2 penetration test;
- .3 Proctor/Fagerberg test.

As each method has its advantages, the selection of the test method should be determined by local practices or by the appropriate authorities.

##### 1.1 *Flow table test procedure*

###### 1.1.1 *Scope*

The flow table is generally suitable for mineral concentrates or other fine material with a maximum grain size of 1 mm. It may also be applicable to materials with a maximum grain size up to 7 mm. It will not be suitable for materials coarser than this and may also not give satisfactory results for some materials with high clay content. If the flow table test is not suitable for the material in question, the procedures to be adopted should be those approved by the authority of the port State.

The test described below provides for determination of:

- .1 the moisture content of a sample of cargo, hereinafter referred to as the test material;
- .2 the flow moisture point (FMP) of the test material under impact or cyclic forces of the flow table apparatus; and
- .3 the transportable moisture limit of the test material.

### 1.1.2 Apparatus (see figure 1.1.2)

- .1 Standard flow table and frame (ASTM Designation (C230-68) – see 3).

**Figure 1.1.2 – Flow table and accessory apparatus**

- .2 Flow table mounting (ASTM Designation (C230-68) – see 3).
- .3 Mould (ASTM Designation (C230-68) – see 3).
- .4 Tamper (see figure 1.1.2.4): the required tamping pressure may be achieved by using calibrated, spring-loaded tampers (examples are included in figure 1.1.2.4) or some other suitable design of tamper that allows a controlled pressure to be applied via a 30 mm diameter tamper head.
- .5 Scales and weights (ASTM Designation (C109-73) – see 3) and suitable sample containers.
- .6 Glass graduated measuring cylinder and burette having capacities of 100-200 ml and 10 ml, respectively.
- .7 A hemispherical mixing bowl approximately 30 cm diameter, rubber gloves and drying dishes or pans. Alternatively, an automatic mixer of similar capacity can be used for the mixing operations. In this case, care should be exercised to ensure that the use of such a mechanical mixer does not reduce the particle size or consistency of the test material.
- .8 A drying oven with controlled temperature up to approximately 110°C. This oven should be without air circulation.

**Figure 1.1.2.4 – Examples of spring-loaded tampers**

### 1.1.3 Temperature and humidity

It is preferable to work in a room where the samples will be protected from excessive temperatures, air currents and humidity variations. All phases of the material preparation and testing procedure should be accomplished in a reasonable space of time to minimize moisture losses and, in any event, within the day of commencement. Where possible, sample containers should be covered with plastic film or other suitable cover.

### 1.1.4 Procedure

The quantity of material required for a flow moisture test will vary according to the specific gravity of the material to be tested. It will range from approximately 2 kg for coal to 3 kg for mineral concentrates. It should be collected as a representative sample of the cargo being shipped. Experience has shown that more accurate test results will be obtained by ensuring that the moisture content of the test sample is increased rather than decreased towards the FMP.

Consequently, it is recommended that a preliminary flow moisture test should be conducted, generally in accordance with the following, to indicate the condition of the test sample, i.e. the quantity of water and the rate at which it is to be added or whether the sample should be air-dried to reduce its moisture content before commencing the main flow moisture test.

#### 1.1.4.1 Preparation of the test sample

The representative sample of test material is placed in the mixing bowl and thoroughly mixed. Three subsamples (A), (B) and (C) are removed from the mixing bowl as follows: about one fifth of the sample (A) should be immediately weighed and placed in the drying oven to determine the moisture content of the sample “as received”. Two further subsamples, each of about two fifths of the gross weight, should then be taken, one (B) for the preliminary FMP test and the other (C) for the main FMP determination:

- .1 *Filling the mould.* The mould is placed on the centre of the flow table and filled in three stages with the material from the mixing bowl. The first charge, after tamping, should aim to fill the mould to approximately one third of its depth. The quantity of sample required to achieve this will vary from one material to another, but can readily be established after some experience has been gained of the packing characteristics of the material being tested.

The second charge, after tamping, should fill the mould to about two thirds of its depth and the third and final charge, after tamping, should reach to just below the top of the mould (see figure 1.1.4.2).

- .2 *Tamping procedure.* The aim of tamping is to attain a degree of compaction similar to that prevailing at the bottom of a shipboard cargo of the material being tested. The correct pressure to be applied is calculated from:

$$\begin{aligned} \text{Tamping pressure (Pa)} &= \text{Bulk density of cargo (kg/m}^3\text{)} \\ &\quad \times \text{Maximum depth of cargo (m)} \\ &\quad \times \text{Gravity acceleration (m/s}^2\text{)} \end{aligned}$$

Bulk density can be measured by a single test, using the Proctor C apparatus described in ASTM Standard D-698 or JIS-A-1210, on a sample of the cargo at the proposed moisture content of loading.

When calculating the tamping pressure, if no information concerning cargo depth is available the maximum likely depth should be used.

Alternatively, the pressure may be estimated from table 1.1.4.1.

The number of tamping actions (applying the correct, steady pressure each time) should be about 35 for the bottom layer, 25 for the middle and 20 for the top layer, tamping successively over the area completely to the edges of the sample to achieve a uniformly flat surface for each layer.

- .3 *Removal of the mould.* The mould is tapped on its side until it becomes loose, leaving the sample in the shape of a truncated cone on the table.

Table 1.1.4.1

Typical cargo	Bulk density (kg/m <sup>3</sup> )	Maximum cargo depth			
		2 m	5 m	10 m	20 m
		← Tamper pressure (kPa) →			
Coal	1000	20 (1.4)	50 (3.5)	100 (7.1)	200 (14.1)
	2000	40 (2.8)	100 (7.1)	200 (14.1)	400 (28.3)
Metal ore	3000	60 (4.2)	150 (10.6)	300 (21.2)	600 (42.4)
Iron ore conc.	4000	80 (5.7)	200 (14.1)	400 (28.3)	800 (56.5)
Lead ore conc.	5000	100 (7.1)	250 (17.7)	500 (35.3)	1000 (70.7)
(values in parenthesis are equivalent kgf when applied via a 30 mm diameter tamper head)					

## 1.1.4.2 The preliminary flow moisture test:

- .1 Immediately after removing the mould, the flow table is raised and dropped up to 50 times through a height of 12.5 mm at a rate of 25 times per minute. If the material is below the FMP, it usually crumbles and bumps off in fragments with successive drops of the table (see figure 1.1.4-3).
- .2 At this stage, the flow table is stopped and the material returned to the mixing bowl, where 5-10 ml of water, or possibly more, is sprinkled over the surface and thoroughly mixed into the material, either with rubber-gloved fingers or an automatic mixer.

The mould is again filled and the flow table is operated as described in 1.1.4.2.1 for up to 50 drops. If a flow state is not developed, the process is repeated with further additions of water until a flow state has been reached.

- .3 *Identification of a flow state.* The impacting action of the flow table causes the grains to rearrange themselves to produce compaction of the mass. As a result, the fixed volume of moisture contained in the material at any given level increases as a percentage of the total volume. A flow state is considered to have been reached when the moisture content and compaction of the sample produce a level of saturation such that plastic deformation occurs. At this stage, the moulded sides of the sample may deform, giving a convex or concave profile (see figure 1.1.4-4).

With repeated action of the flow table, the sample continues to slump and to flow outwards. In certain materials, cracks may also develop on the top surface. Cracking, with the appearance of free moisture, is not, however, an indication of development of a flow state. In most cases, measurement of the deformation is helpful in deciding whether or not plastic flow has occurred. A template which, for example, will indicate an increase in diameter of up to 3 mm in any part of the cone is a useful guide for this purpose. Some additional observations may be useful. For example: when the (increasing) moisture content is approaching the FMP, the sample cone begins to show a tendency to stick to the mould. Further, when the sample is pushed off the table, the sample may leave tracks (stripes) of moisture on the table. If such stripes are seen, the moisture content may be above the FMP: the absence of tracks (stripes) is not necessarily an indication of being below the FMP.

Measuring the diameter of the cone, at the base or at half height, will always be useful. By addition of water in increments of 0.4% to 0.5% and applying 25 drops of the flow table, the first diameter increase will generally be between 1 and 5 mm and after a further increment of water the base diameter will have expanded by between 5 and 10 mm.

- .4 As an alternative to the procedure described above, for many concentrates a fast way of finding the approximate FMP is as follows:

When the moisture content is definitely beyond the FMP, measure the diameter after 25 drops, repeat the test after adding a further increment of water, measure the diameter and draw a diagram as illustrated in figure 1.1.4-1, showing increase in diameter plotted against moisture content. A straight line drawn through the two points will cross the moisture content axis close to the FMP.

Having completed the preliminary FMP test, the sample for the main test is adjusted to the required level of moisture content (about 1% to 2%) below the flow point.

#### 1.1.4.3 Main flow moisture test

When a flow state has been reached in the preliminary test, the moisture content of sub-sample (C) is adjusted to about 1% to 2% less than the last value which did not cause flow in the preliminary test (this is suggested simply to avoid starting the main test too close to the FMP and then having to waste time air-drying it and starting again). The final test is then carried out on this adjusted sample in the same manner as for the preliminary test, but in this case with the addition of water in increments of no more than 0.5% of the mass of the test material (the lower the “preliminary” FMP, the smaller the increments should be). After each stage, the whole moulded sample should be placed in a container, weighed immediately and retained for moisture determination if required. This will be necessary if the sample flowed or if the next, slightly wetter, sample flows. If not required it may be returned to the mixing bowl.

When a flow state has been reached, the moisture content should be determined on two samples, one with moisture content just above the FMP and the other with moisture content just below the FMP. The difference between the two values should then be 0.5% or less, and the FMP is taken as the mean of these two values.

#### 1.1.4.4 Determination of moisture content

##### *Introduction*

It should be noted that, for many materials, there are recognized international and national methods for determining moisture content. These methods, or ones that have been established to give equivalent results, should be followed.

## Concentrates and similar materials

It is clearly important that the samples should be dried to a constant mass. In practice, this is ascertained after a suitable drying period at 105°C by weighing the sample successively with an interval of several hours elapsing. If the mass remains constant, drying has been completed, whereas if the mass is still decreasing, drying should be continued.

The length of the drying period depends upon many variables, such as the disposition of the material in the oven, the type of container used, the particle size, the rate of heat transfer, etc. It may be that a period of five hours is ample for one concentrate sample, whereas it is not sufficient for another. Sulphide concentrates tend to oxidize, and therefore the use of drying ovens with air circulation systems is not recommended for these materials, nor should the test sample be left in the drying oven for more than four hours.

### Coal

The recommended methods for determination of the moisture content are those described in ISO 589-1974, “Hard Coal – Determination of Total Moisture”. This method, or ones that have been established to give equivalent results, should be followed.

*Calculation of moisture content, FMP and transportable moisture limit:*

Taking  $m_1$  as the exact mass of the subsample “as received” (see 1.1.4.1),

Taking  $m_2$  as the exact mass of the “as received” subsample, after drying,

Taking  $m_3$  as the exact mass of the sample just above the flow state (see 1.1.4.3),

Taking  $m_4$  as the exact mass of the sample just above the flow state, after drying,

Taking  $m_5$  as the exact mass of the sample just below the flow state (see 1.1.4.3),

Taking  $m_6$  as the exact mass of the sample just below the flow state, after drying,

Then:

- .1 The moisture content of the concentrate “as received” is:

$$\frac{(m_1 - m_2)}{m_1} \times 100, \text{ in per cent} \quad (1.1.4.4.1)$$

- .2 The FMP of the material is:

$$\frac{\frac{(m_3 - m_4)}{m_3} + \frac{m_5 - m_6}{m_5}}{2} \times 100, \text{ in per cent} \quad (1.1.4.4.2)$$

- .3 The transportable moisture limit of the material is 90% of the FMP.

## Peat Moss

For all Peat Moss, determine the bulk density, using either the ASTM or CEN (20 litres) method.

Peat should be above or below 90kg/cubic metre on a dry weight basis in order to obtain the correct TML.

As indicated in 1.1.1, the following should be determined:

- .1 the moisture content of a sample of cargo (MC);
- .2 the flow moisture point (FMP);
- .3 the transportable moisture limit (TML). The TML will be determined as follows:
  - .3.1 for peat with a bulk density of greater than 90 kg/cubic metre on a dry weight is 85% of the FMP; and
  - .3.2 for peat with a bulk density of 90 kg/cubic metre or less on a dry weight, the TML is 90% of the FMP.

### 1.2 Penetration test procedure

The penetration test constitutes a procedure whereby a material in a cylindrical vessel is vibrated. The flow moisture point is determined on the basis of the penetration depth of an indicator.

#### 1.2.1 Scope

- .1 The penetration test is generally suitable for mineral concentrates, similar materials, and coals up to a top size of 25 mm.
- .2 In this procedure, the sample, in a cylindrical vessel, is subjected to vertical vibration of  $2g \text{ rms} \pm 10\%$  ( $g$  = gravity acceleration) for 6 minutes. When the penetration depth of a bit put on the surface exceeds 50 mm, it is judged that the sample contains a moisture greater than the flow moisture point.
- .3 This procedure consists of a preliminary test to get an approximate value of the flow moisture point and a main test to determine the accurate flow moisture point. When the approximate value of the flow moisture point is known, the preliminary test can be omitted.
- .4 The room where the samples are tested should be prepared as mentioned in 1.1.3.

#### 1.2.2 Apparatus (see figure 1.2.2)

- .1 The test apparatus consists of:
  - .1 a vibrating table;

- .2 cylindrical vessels;
  - .3 indicators (penetration bits and a holder);
  - .4 a tamper (see 1.1.2.4); and
  - .5 ancillary equipment (see 1.1.2.5 to .8).
- .2 The vibrator (see figure 1.2.2.2), with a table on which a cylindrical vessel can be clamped, should be capable of exciting a mass of 30 kg at a frequency of either 50 Hz or 60 Hz with an acceleration of 3g rms or more, and it can be controlled to adjust the acceleration level.
- .3 Dimensions of cylindrical vessels (see figures 1.2.2.3-1 and 1.2.2.3-2) are as follows:

Cylinder size	Inner diameter	Depth	Wall thickness
small	146 mm	202 mm	9.6 mm or more
large	194 mm	252 mm	10.3 mm or more

The vessels should be made of reasonably rigid, non-magnetic, impermeable and lightweight material such as acrylics or vinyl chloride.

The small cylindrical vessel is selected for the materials having a maximum particle size of 10 mm or less. The large cylindrical vessel is for those having a maximum particle size of 25 mm or less.

- .4 Penetration bits (see figure 1.2.2.4) are made of brass. The mass of the bit for coal should be adjusted to 88 g (5 kPa), and that for concentrates to 177 g (10 kPa). When the sample contains coarse particles, it is recommended that two bits of the same pressure are put on the surface to avoid misjudgment.
- .5 A holder (see figure 1.2.2.5) should be made to guide the rod of a bit with minimum friction to the centre of a cylindrical vessel. When two bits are used, they should be positioned in accordance with figure 1.2.2.
- .6 A cylindrical vessel and penetration indicators should be selected in accordance with the nature and condition of the test sample, viz. size of particles and bulk density.

### 1.2.3 Procedure

#### 1.2.3.1 Preparation of the test sample and the vibrating table:

- .1 The quantity of the sample required is approximately six times or more the capacity of the selected cylindrical vessel. The amount of representative test sample with which each container is filled should be as follows: approximately 1,700 cm<sup>3</sup> for the small container, and 4,700 cm<sup>3</sup> for the large container.
- .2 Mix the sample well and divide into three approximately equal sub-samples, namely (A), (B) and (C). The sub-sample (A) should be immediately weighed and placed in the drying oven to determine the moisture content of the sample “as received”.  
  
The sub-samples (B) and (C) are used for the preliminary test and the main test, respectively.
- .3 The vibration level of the vibrating table should be calibrated, using an acceleration meter, prior to carrying out testing. The acceleration of the table should be adjusted to 2g rms  $\pm$  10% with a container filled with a sample mounted on the table.

#### 1.2.3.2 Preliminary flow moisture test

This test is intended to measure quickly the approximate flow moisture point, using sub-sample (B). Water is added in increments after every penetration test. When a flow state has been reached, the moisture content of the sample just above the flow state is measured. The moisture content of the sample just below the flow state can be calculated by deducting the increment of water last added from the gross mass of the sample.

- .1 Fill the appropriate cylindrical vessel with sub-sample (B) in four distinct stages and tamp after the addition of each layer using a specified tamper. Tamp to a pressure denoted in 1.1.4.1 for mineral concentrates or to 40 kPa for coals, and apply the pressure evenly over the whole surface area of the material until a uniformly flat surface is obtained.
- .2 Place the penetration bit on the surface of the material through the holder.
- .3 Operate the vibrator at a frequency of 50 Hz or 60 Hz with an acceleration of 2g rms  $\pm$  10% for 6 minutes. If necessary, the acceleration level should be checked by referring to the output of the acceleration meter attached to the vibrating table.
- .4 After 6 minutes of vibration, read the depth of penetration.

- .5 When the depth of penetration is less than 50 mm, it is judged that liquefaction did not take place. Then:
  - .1 Remove the material from the cylindrical vessel and replace in the mixing bowl with the remainder of the sample.
  - .2 Mix well and weigh the contents of the mixing bowl.
  - .3 Sprinkle an increment of water of not more than 1% of the mass of the material in the bowl and mix well.
  - .4 Repeat the procedure described in 1.2.3.2.1 to 1.2.3.2.5.
- .6 When the depth of penetration is greater than 50 mm, it is judged that liquefaction took place. Then:
  - .1 Remove the material from the cylindrical vessel and replace in the mixing bowl.
  - .2 Measure the moisture content in accordance with the procedure described in 1.1.4.4.
  - .3 Calculate the moisture content of the sample just below the flow moisture point on the basis of the amount of water added.
- .7 If the penetration depth in the first attempt exceeds 50 mm, i.e. the sample as received liquefied, mix sub-samples (B) and (C) and dry at room temperature to reduce the moisture. Then, divide the material into two sub-samples (B) and (C), and repeat the preliminary test.

#### 1.2.3.3 The main flow moisture test

- .1 On the basis of the preliminary test, the main test should be carried out to determine the flow moisture point more accurately.
- .2 Adjust the moisture content of the sub-sample (C) to the last value, which did not cause flow in the preliminary flow moisture test.
- .3 The first test of the main flow moisture test is carried out on this adjusted sample in the same manner as described in 1.2.3.2. In this case, however, the addition of water in increments should not be more than 0.5% of the mass of the test material.
- .4 When the approximate value of the flow moisture point is known in advance, the moisture content of the sub-sample (C) is adjusted to approximately 90% of this value.
- .5 When a flow state has been reached, the flow moisture point is determined as described in 1.1.4.3.

### 1.3 *Proctor/Fagerberg test procedure*

#### 1.3.1 *Scope*

- .1 Test method for both fine and relatively coarse-grained ore concentrates or similar materials up to a top size of 5 mm. This method should not be used for coal or other porous materials.
- .2 Before the Proctor/Fagerberg test is applied to coarser materials with a top size greater than 5 mm, an extensive investigation for adoption and improvement is required.
- .3 The transportable moisture limit (TML) of a cargo is taken as equal to the critical moisture content at 70% degree of saturation according to the Proctor/Fagerberg method test.

#### 1.3.2 *Proctor/Fagerberg test equipment*

- .1 The Proctor apparatus (see figure 1.3.2) consists of a cylindrical iron mould with a removable extension piece (the compaction cylinder) and a compaction tool guided by a pipe open at its lower end (the compaction hammer).
- .2 Scales and weights (see 3.2) and suitable sample containers.
- .3 A drying oven with a controlled temperature interval from 100°C to maximum 105°C. This oven should be without air circulation.
- .4 A suitable mixer. Care should be taken to ensure that the use of the mixer does not reduce the particle size or consistency of the test material.
- .5 Equipment to determine the density of the solid material, for example a pycnometer.

#### 1.3.3 Temperature and humidity (see 1.1.3)

#### 1.3.4 *Procedure*

- .1 *Establishment of a complete compaction curve.* A representative sample according to a relevant standard (see section 4.7, page 20) of the test material is dried at a temperature of approximately 100°C. The total quantity of the test material should be at least three times as big as required for the complete test sequence. Compaction tests are executed for five to ten different moisture contents (five to ten separate tests). The samples are adjusted in order that dry to almost saturated (plastic) samples are obtained. The required quantity per compaction test is about 2000 cm<sup>3</sup>.

**Figure 1.3.2 – Proctor apparatus**

**Figure 1.3.4.2**

At each compaction test a suitable amount of water is added to the sample of the dried test material and mixed thoroughly for 5 minutes. Approximately one fifth of the mixed sample is filled into the mould and levelled and then the increment is tamped uniformly over the surface of the increment. Tamping is executed by dropping the hammer 25 times through the guide pipe, 0.2 m each time. The performance is repeated for all five layers. When the last layer has been tamped the extension piece is removed and the sample is levelled off along the brim of the mould. When the weight of the cylinder with the tamped sample has been determined, the cylinder is emptied, the sample is dried and the weight is determined.

The test then is repeated for the other samples with different moisture contents.

.2 *Definitions and data for calculations (see figure 1.3.4.2)*

- empty cylinder, mass in grams: A
  - cylinder with tamped sample, mass in grams: B
  - wet sample, mass in grams: C
- $$C = B - A$$
- dry sample, mass in grams: D
  - water, mass in grams (equivalent to volume in cm<sup>3</sup>): E

$$E = C - D$$

Volume of cylinder: 1000 cm<sup>3</sup>

.3 *Calculation of main characteristics*

- density of solid material, g/cm<sup>3</sup> (t/m<sup>3</sup>): d
- dry bulk density, g/cm<sup>3</sup> (t/m<sup>3</sup>):  $\gamma$

$$\gamma = \frac{D}{1000}$$

- net water content, volume %:  $e_v$

$$e_v = \frac{E}{D} \times 100 \times d$$

- void ratio: e (volume of voids divided by volume of solids)

$$e = \frac{1000 - D}{D} = \frac{d}{\lambda} = - 1$$

- degree of saturation, percentage by volume: S

$$S = \frac{e_v}{e}$$

- gross water content, percentage by mass:  $W^1$

$$W^1 = \frac{E}{C} \times 100$$

- net water content, percentage by mass:  $W$

$$W = \frac{E}{D} \times 100$$

#### .4 Presentation of the compaction tests

For each compaction test the calculated void ratio ( $e$ ) value is plotted as the ordinate in a diagram with net water content ( $e_v$ ) and degree of saturation ( $S$ ) as the respective abscissa parameters.

**Figure 1.3.4.5**

#### .5 Compaction curve

The test sequence results in a specific compaction curve (see figure 1.3.4.5).

The critical moisture content is indicated by the intersection of the compaction curve and the line  $S = 70\%$  degree of saturation. The transportable moisture limit (TML) is the critical moisture content.

## 2 Test procedures to determine the angle of repose and associated apparatus

### 2.1 *Determination of angle of repose of fine-grained materials (size less than 10 mm): “tilting box test”. For use in laboratory or port of loading*

#### 2.1.1 *Scope*

The test provides for the determination of the angle of repose of fine-grained non-cohesive materials (size less than 10 mm). The results so obtained may be used when interpreting sections 5 and 6 of this Code for the materials in question.

#### 2.1.2 *Definition*

The angle of repose obtained by this test is the angle formed between the horizontal and the top of the testbox when the material in the box just begins to slide in bulk.

#### 2.1.3 *Principle of test*

When measuring the angle of repose by this method, the material surface should initially be level and parallel to the testbox base. The box is tilted without vibration and tilted without vibration and tilting is stopped when the product just begins to slide in bulk.

#### 2.1.4 *Apparatus (see figure 2.1.4)*

Apparatus is as follows:

- .1 A framework, on top of which is attached an open box. Attachment of the box to the frame is by means of a shaft passing through bearings affixed to both the frame and the end of the box, enabling the box to be subjected to a controlled tilt.
- .2 The dimensions of the box are 600 mm long, 400 mm wide and 200 mm high.
- .3 To prevent sliding of the material along the bottom of the box during tilting, a tightly fitting grating (openings 30 mm x 30 mm x 25 mm) is placed on the bottom of the box before filling.
- .4 Tilting of the box is effected by a hydraulic cylinder fitted between the frame and the bottom of the box. Other means may be used to obtain the required tilting but in all cases vibration must be eliminated.
- .5 To pressurize the hydraulic cylinder, a hydropneumatic accumulator may be used, pressurized by air or gas at a pressure of about 5 kp/cm<sup>2</sup>.
- .6 The rate of tilting should be approximately 0.3°/s.
- .7 Range of tilt should be at least 50°.

**Figure 2.1.4 – Basic sketch of tilting box**

- .8 A protractor is fitted to the end of the shaft. One lever of the protractor is fitted so that it may be screw-adjusted to the horizontal.
- .9 The protractor should measure the angle of the top of the box to the horizontal to within an accuracy of  $0.5^\circ$ .
- .10 A spirit level or some other levelling device should be available to zero the protractor.

### 2.1.5 *Procedure*

The box is filled with the material to be tested by pouring it slowly and carefully from the lowest practical height into the box in order to obtain uniformity of loading.

The excess material is scraped off with the aid of a straight edge, inclined at about 45° towards the direction of scraping.

The tilting system is then activated and stopped when the material just begins to slide in bulk.

The angle of the top of the box to the horizontal is measured by the protractor and recorded.

### 2.1.6 *Evaluation*

The angle of repose is calculated as the mean of three measurements and is reported to within half a degree.

**Notes:** Preferably the test should be carried out with three independent samples.

Care should be taken to ensure that the shaft is adjusted to be horizontal before testing.

## 2.2 *Alternative or shipboard test method to be used for the determination of the angle of repose when the tilting box is not available*

### 2.2.1 *Definition*

According to this method the angle of repose is the angle between the cone slope and the horizontal measured at half height.

### 2.2.2 *Principle of test*

To determine the angle of repose, a quantity of the material to be tested is poured very carefully out of a flask onto a sheet of rough-textured paper, in such a way that a symmetrical cone is formed.

### 2.2.3 *Equipment*

The necessary equipment to carry out this test is as follows:

- a horizontal table free from vibrations;
- a sheet of rough-textured paper onto which the material should be poured;
- a protractor; and
- a 3-litre conical flask.

#### 2.2.4 Procedure

Put the sheet of paper on the table. Split 10l of the material to be tested into three sub-samples and test each in the following way:

Pour two thirds of the sub-sample (i.e. 2 l) onto the sheet, producing a starting cone. The remainder of this sub-sample is then poured very carefully from a height of a few millimetres on top of the cone. Care should be taken that the cone will be built up symmetrically. This may be achieved by revolving the flask slowly close around the top of the cone when pouring.

When measuring, care should be taken that the protractor does not touch the cone; otherwise this may result in sliding of the material and spoil the test.

The angle has to be measured at four places around the cone, about 90 degrees apart.

This test should be repeated on the other two sub-samples.

#### 2.2.5 Calculations

The angle of repose is taken as the mean of the 12 measurements and is reported to half a degree. This figure can be converted to the tilting box value as follows:

$$a_t = a_s + 3^\circ \quad (2.2.5)$$

Where  $a_t$  = angle of repose according to the tilting box test

$a_s$  = angle of repose according to the survey test

A stable gasket cork pad, ½ inch (13 mm) thick and approximately 4 inches (102 mm) square, shall be inserted under each corner of the pedestal. The flow table shall be checked frequently for levelness of the table top, stability of the pedestal, and tightness of the bolts and nuts in the table base and the pedestal plate. (A torque of 20 lb ft (27 Nm) is recommended when tightening those fastenings.)

3.1.2.3 The table top, after the frame has been mounted on the pedestal, shall be level along two diameters at right angles to each other, in both the raised and lowered positions.

### 3.1.3 *Flow table lubrication*

3.1.3.1 The vertical shaft of the table shall be kept clean and shall be lightly lubricated with a light oil (SAE-10). Oil shall not be present between the contact faces of the table top and the supporting frame. Oil on the cam face will lessen wear and promote smoothness of operation. The table should be raised and permitted to drop a dozen or more times just prior to use if it has not been operated for some time.

### 3.1.4 *Mould*

3.1.4.1 The mould for casting the flow specimen shall be of cast bronze or brass, constructed as shown in figure 3. The Rockwell hardness number of the metal shall be not less than HRB 25. ## 4 Trough test for determination of the self-sustaining exothermic decomposition of fertilizers containing nitrates

### 4.1 Definition

A fertilizer capable of self-sustaining decomposition is defined as one in which decomposition initiated in a localized area will spread throughout the mass. The tendency of a fertilizer offered for transport to undergo this type of decomposition can be determined by means of the trough test. In this test localized decomposition is initiated in a bed of the fertilizer to be contained in a horizontally mounted trough. The amount of propagation, after removal of the initiating heat source, of decomposition through the mass is measured.

- A Steel plate (150 x 150 mm and 1 to 3 mm thick)
- B Gas burners (e.g., Teclu or Bunsen)
- C Heat shield (2 mm thick)
- D Stand (e.g., made from 15 mm wide, 2 mm thick steel bar)
- E Gauze trough (150 x 150 x 500 mm)

**Figure 4-1 – Gauze trough with support and burners**

## 4.2 Apparatus and materials

The apparatus (figure 4-1) consists of a trough of internal dimensions 150 mm x 150 mm x 500 mm, open at the top. The trough is constructed of square-meshed gauze (preferably stainless steel) with a mesh width of about 1.5 mm and a wire thickness of 1.0 mm supported on a frame made from, for example, 15 mm wide, 2 mm thick steel bars. The gauze at each end of the trough may be replaced by 1.5 mm thick, 150 mm x 150 mm stainless steel plates. The trough should be rested on a suitable support. Fertilizers with a particle size distribution such that a significant amount falls through the mesh of the trough should be tested in a trough of smaller mesh gauze, or alternatively in a trough lined with gauze of a smaller mesh. During initiation sufficient heat should be provided and maintained to establish a uniform decomposition front. Two alternative heating methods are recommended, *viz*:

- A Aluminium or stainless steel sheathing (thickness 3 mm)
- B Insulating plate (thickness 5 mm)
- C Aluminium foil or stainless steel plate (thickness 3 mm)
- D Position of heating device in trough

**Figure 4-2 – Electrical heating device (capacity 250 W)**

### 4.2.1 Electrical heating

An electrical heating element (capacity 250 W) enclosed in a stainless steel box is placed inside and at one end of the trough (figure 4-2). The dimensions of the stainless steel box are 145 mm x 145 mm x 10 mm, and the wall thickness is 3 mm. The side of the box which is not in contact with the fertilizer should be protected with a heat shield (insulation plate 5 mm thick). The heating side of the box may be protected with aluminium foil or a stainless steel plate.

#### 4.2.2 *Gas burners*

A steel plate (thickness 1 mm to 3 mm) is placed inside one end of the trough and in contact with the wire gauze (figure 4-1). The plate is heated by means of two burners which are fixed to the trough support and are capable of maintaining the plate at temperatures between 400°C and 600°C, i.e. dull red heat.

4.2.3 To prevent heat transport along the outside of the trough, a heat shield consisting of a steel plate (2 mm thick) should be installed at about 50 mm from the end of the trough where the heating takes place.

4.2.4 The life of the apparatus may be prolonged if it is constructed of stainless steel throughout. This is particularly important in the case of the gauze trough.

4.2.5 Propagation may be measured using thermocouples in the substance and recording the time at which a sudden temperature rise occurs as the reaction front reaches the thermocouple.

### 4.3 *Procedure*

4.3.1 The apparatus should be set up under a fume hood to remove toxic decomposition gases or in an open area where the fumes can be readily dispersed. Although there is no explosion risk, when performing the test it is advisable to have a protective shield, e.g., of suitable transparent plastics, between the observer and the apparatus.

4.3.2 The trough is filled with the fertilizer in the form to be offered for shipment and decomposition is initiated at one end, either electrically or by means of gas burners as described above. Heating should be continued until decomposition of the fertilizer is well established and propagation of the front (over approximately 30 mm to 50 mm) has been observed. In the case of products with high thermal stability, it may be necessary to continue heating for two hours. If fertilizers show a tendency to melt, the heating should be done with care, i.e. using a small flame.

4.3.3 About 20 minutes after the heating has been discontinued, the position of the decomposition front is noted. The position of the reaction front can be determined by difference in colour, e.g., brown (undecomposed fertilizer) to white (decomposed fertilizer), or by the temperature indicated by adjacent pairs of thermocouples which bracket the reaction front. The rate of propagation may be determined by observation and timing or from thermocouple records. It should be noted whether there is no propagation after heating is discontinued or whether propagation occurs throughout the substance.

### 4.4 *Test criteria and method of assessing results*

4.4.1 If propagation of the decomposition continues throughout the substance the fertilizer is considered capable of showing self-sustaining decomposition.

4.4.2 If propagation does not continue throughout the substance, the fertilizer is considered to be free from the hazard of self-sustaining decomposition.

## 5 Description of the Test of Resistance to Detonation

### 5.1 Principle

5.1.1 The test sample is confined in a steel tube and subjected to detonation shock from an explosive booster charge. Propagation of the detonation is determined from the degree of compression of lead cylinders on which the tube rests horizontally during the test.

### 5.2 Sample preparation

5.2.1 The test must be carried out on a representative sample of cargo. Before being tested for resistance to detonation, the whole mass of the sample is to be thermally cycled five times between 25°C and 50°C ( $\pm 1^\circ\text{C}$ ) in sealed tubes. The sample shall be maintained at the extreme temperatures, measured at the centre of the sample, for at least 1 hour during each thermal cycle and at 20°C ( $\pm 3^\circ\text{C}$ ) after complete cycling until tested.

### 5.3 Materials

Seamless steel tube to ISO 65-1981-Heavy or equivalent

Tube length	1,000 mm
Nominal external diameter	114 mm
Nominal wall thickness	5 to 6.5 mm

Bottom plate (160 x 160 mm) of good weldable quality, thickness 5 to 6 mm to be butt-welded to one end of the tube around the entire circumference.

Initiation system and booster

Electrical blasting cap or detonating cord with non-metallic sleeve (10 to 13 g/m).

Compressed pellet of secondary explosive, such as hexogen/wax 95/5 or tetryl, with a central recess to take the detonator.

500  $\pm$  1 gramme plastic explosive containing 83 to 86 % penthrite, formed into a cylinder in a cardboard or plastic tube. Detonation velocity 7,300 to 7,700 m/s.

Six witness cylinders of refined, cast lead for detecting detonation.

50 mm diameter x 100 mm high, refined lead of at least 99.5% purity.

### 5.4 Procedure

Test Temperature: 15 to 20°C. Figures 1 and 2 show the test arrangement.

Fill the tube about one-third of its height with the test sample and drop it 10 cm vertically five times on the floor. Improve the compression by striking the side wall with a hammer between drops. A further addition shall be made such that, after compaction or by raising and dropping the tube 20 times and a total of 20 intermittent hammer blows, the charge fills the tube to a distance of 70 mm from its orifice.

Insert the plastic explosive into the tube and press it down with a wooden die. Place the compressed pallet centrally in the recess within the plastic explosive. Close it with a wooden disc so that it remains in contact with the test sample. Lay the test tube horizontally on the 6 lead cylinders placed at 150 mm intervals (centric), with the centre of the last cylinder 75 mm from the bottom plate, on a firm, level, solid surface that is resistant to deformation or displacement. Insert the electrical blasting cap or the detonating cord.

Ensure that all necessary safety precautions are taken, connect and detonate the explosive.

Record, for each of the lead cylinders, the degree of compression expressed as a percentage of the original height of 100 mm. For oblique compression, the deformation is taken as the average of the maximum and minimum deformation.

### **5.5 Results**

The test is to be carried out twice. If in each test one or more of the supporting lead cylinders are crushed by less than 5%, the sample is deemed to satisfy the resistance to detonation requirements.

## 6 Self-heating test for charcoal

### 6.1 Apparatus

6.1.1 *Oven.* A laboratory oven fitted with internal air circulation and capable of being controlled at  $140^{\circ}\text{C} \pm 2^{\circ}\text{C}$ .

6.1.2 *Wire mesh cube.* Construct an open-top cube, 100 mm side, from phosphor bronze gauze 18,000 mesh per square centimetre (350 x 350 mesh). Insert it inside a slightly larger, well-fitting cube, made of phosphor bronze gauze 11 mesh per square centimetre (8 x 8 mesh). Fit the outer cube with a handle or hooks so that it can be suspended from above.

6.1.3 *Temperature measurement.* A suitable system to measure and record the temperature of the oven and in the centre of the cube. “Chromel-alumel” thermocouples, made from 0.27 mm diameter wire, are suitable for measuring the temperature range expected.

### 6.2 Procedure

6.2.1 Fill the cube with carbon and tap down gently, adding carbon until the cube is full. Suspend the sample in the centre of the oven which has been preheated to  $140^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . Insert one of the thermocouples in the centre of the sample and the other between the cube and the oven wall. Maintain the temperature of the oven at  $140^{\circ}\text{C} \pm 2^{\circ}\text{C}$  for 12 hours and record the oven temperature and the sample temperature.

### 6.3 Results

6.3.1 Non-activated carbon, non-activated charcoal, carbon black and lamp black fail the test if the temperature at any time during the 12 hours exceeded  $200^{\circ}\text{C}$ .

6.3.2 Activated carbon and activated charcoal fail the test if the temperature at any time during the 12 hours exceeded  $400^{\circ}\text{C}$ .

**APPENDIX 3****PROPERTIES OF SOLID BULK CARGOES****1 Non-cohesive cargoes**

AMMONIUM NITRATE BASED FERTILIZERS  
AMMONIUM SULPHATE  
BORAX, ANHYDROUS  
CALCIUM NITRATE FERTILIZER  
CASTOR BEANS  
DIAMMONIUM PHOSPHATE  
MONOAMMONIUM PHOSPHATE  
POTASSIUM CHLORIDE  
POTASH  
POTASSIUM NITRATE  
POTASSIUM SULPHATE  
SODIUM NITRATE  
SODIUM NITRATE AND POTASSIUM NITRATE MIXTURE  
SUPERPHOSPHATE  
UREA

1.2 Prior to completion of loading, the angle of repose of the materials to be loaded should be determined (see section 6) so as to determine which provisions of this Code relating to trimming apply (see section 5).

1.3 All cargoes, other than those listed in this appendix, are cohesive and the use of the angle of repose is, therefore, not appropriate. Cargoes not listed should be treated as cohesive until otherwise shown.

**2 Cargoes which may liquefy**

2.1 Many fine-particled cargoes if possessing a sufficiently high moisture content are liable to flow. Thus any damp or wet cargo containing a proportion of fine particles should be tested for flow characteristics prior to loading.

**3 Precautions for the cargoes which may possess a chemical hazard**

3.1 In circumstances where consultation with the competent authority is required prior to shipment of dry bulk cargoes, it is equally important to consult authorities at the port of loading and discharge concerning requirements which may be in force.

3.2 Where required, the Medical First Aid Guide for Use in Accidents Involving Dangerous Goods (MFAG) should be consulted prior to loading.
