Decreto-Lei n.º 40 200

Usando da faculdade conferida pela 2.ª parte do n.º 2.º do artigo 109.º da Constituição, o Governo decreta e eu promulgo, para valer como lei, o seguinte:

Artigo único. É aprovado, para ratificação, o Protocolo relativo a uma emenda à Convenção sobre Aviação Civil Internacional, elaborado em Montreal em 14 de Junho de 1954 e cujos textos, em inglês e na respectiva tradução em português, são os seguintes:

Protocol relating to an amendment to the Convention on International Civil Aviation

The Assembly of the International Civil Aviation Organization,

Having met in its eighth session, at Montreal, on the first day of June, 1954, and

Having considered it desirable to amend the Convention on International Civil Aviation done at Chicago on the seventh day of December, 1944,

Approved, on the fourteenth day of June of the year one thousand nine hundred and fifty-four, in accordance with the provisions of article 94 (*a*) of the Convention aforesaid, the following proposed amendment to the said Convention:

> At the end of article 45 of the Convention, the full stop shall be substituted by a comma, and the following shall be added, namely:
>
> «and otherwise than temporarily by decision of the Assembly, such decision to be taken by the number of votes specified by the Assembly. The number of votes so specified will not be less than three-fifths of the total number of contracting States.»,

Specified, pursuant to the provisions of the said article 94 (*a*) of the said Convention, forty-two as the number of contracting States upon whose ratification the proposed amendment aforesaid shall come into force, and

Resolved that the secretary general of the International Civil Aviation Organization draw up a Protocol, in the English, French and Spanish languages, each of which shall be of equal authenticity, embodying the proposed amendment above mentioned and the matters hereinafter appearing.

Consequently, pursuant to the aforesaid action of the Assembly,

This Protocol shall be signed by the president of the Assembly and its secretary general;

This Protocol shall be open to ratification by any State which has ratified or adhered to the said Convention on International Civil Aviation;

The instruments of ratification shall be deposited with the Internacional Civil Aviation Organization;

This Protocol shall come into force among the States which have ratified it on the date on which the forty-second instrument of ratification is so deposited;

The secretary general shall immediately notify all contracting States of the deposit of each ratification of this Protocol;

The secretary general shall immediately notify all States parties or signatories to the said Convention of the date on which this Protocol comes into force;

With respect to any contracting State ratifying this Protocol after the date aforesaid, the Protocol shall come into force upon deposit of its instrument of ratification with the International Civil Aviation Organization.

In faith whereof, the president and the secretary general of the eighth session of the Assembly of the International Civil Aviation Organization, being authorized thereto by the Assembly, sign this Protocol.

Done at Montreal on the fourteenth day of June of the year one thousand nine hundred and fifty-four in a single document in the English, French and Spanish languages, each of which shall be of equal authenticity. This Protocol shall remain deposited in the archives of the International Civil Aviation Organization; and certified copies thereof shall be transmitted by the secretary general of the Organization to all States parties or signatories to the Convention on International Civil Aviation done at Chicago on the seventh day of December, 1944.

Secretary general of the Assembly.

Protocolo relativo a uma emenda à Convenção sobre Aviação Civil Internacional

A Assembleia da Organização da Aviação Civil Internacional,

Tendo efectuado em Montreal, no dia 1 de Junho de 1954, a sua oitava reunião, e

Tendo considerado desejável introduzir uma emenda na Convenção sobre Aviação Civil Internacional, feita em Chicago, a 7 de Dezembro de 1944,

Aprovou, aos catorze dias do mês de Junho do ano de mil novecentos e cinquenta e quatro, de acordo com as disposições do artigo 94.º, alínea *a*), da Convenção acima mencionada, o projecto de emenda à dita Convenção, cujo texto é o seguinte:

> No fim do artigo 45.º, substituir o ponto final por uma vírgula e acrescentar as seguintes palavras:
>
> «e, não temporàriamente, por decisão da Assembleia, devendo esta decisão obter o número de votos fixado pela Assembleia. O número de votos assim fixado não será inferior a três quintos do número total de Estados contratantes.»,

Determinou, conforme o disposto no referido artigo 94.º, alínea *a*), da citada Convenção, que o projecto de emenda acima mencionado só entrará em vigor depois de ter sido ratificado por quarenta e dois Estados contratantes, e

Decidiu que o secretário-geral da Organização da Aviação Civil Internacional deverá redigir, nas línguas francesa, inglesa e espanhola, cada uma das quais fará igualmente fé, um Protocolo relativo ao dito projecto de emenda e que compreenda as disposições que adiante se indicam.

Por conseguinte, conforme a decisão anteriormente mencionada da Assembleia,

O presente Protocolo será assinado pelo presidente e pelo secretário-geral da Assembleia;

O presente Protocolo ficará aberto para ratificação de qualquer Estado que tenha ratificado a Convenção sobre Aviação Civil Internacional ou tenha aderido à mesma;

Os instrumentos de ratificação serão depositados na Organização da Aviação Civil Internacional;

O presente Protocolo entrará em vigor no dia do depósito do quadragésimo segundo instrumento de ratificação, entre os Estados que o tenham ratificado até essa data;

O secretário-geral notificará imediatamente todos os Estados contratantes do depósito de cada instrumento de ratificação deste Protocolo;

O secretário-geral notificará imediatamente todos os Estados partes ou signatários da Convenção da data da entrada em vigor do presente Protocolo;

O Protocolo entrará em vigor, para qualquer Estado contratante que o ratifique ulteriormente, no dia em que o respectivo instrumento de ratificação for depositado na Organização da Aviação Civil Internacional.

Em fé do que, o presidente e o secretário-geral da oitava reunião da Assembleia da Organização da Aviação Civil Internacional, autorizados para este efeito pela Assembleia, assinam o presente Protocolo.

Feito em Montreal, aos catorze dias do mês de Junho de mil novecentos e cinquenta e quatro, em um só exemplar, nas línguas francesa, inglesa e espanhola, cada uma das quais fará igualmente fé. O presente Protocolo será depositado no arquivo da Organização da Aviação Civil Internacional e o secretário-geral da Organização transmitirá cópias autenticadas a todos os Estados partes ou signatários da Convenção sobre Aviação Civil Internacional feita em Chicago a 7 de Dezembro de 1944.

Protocol relating to certain amendments to the Convention on International Civil Aviation

The Assembly of the International Civil Aviation Organization,

Having met in its eighth session, at Montreal, on the first day of June, 1954, and

Having considered it desirable to amend the Convention on International Civil Aviation done at Chicago on the seventh day of December, 1944,

Approved, on the fourteenth day of June of the year one thousand nine hundred and fifty-four, in accordance with the provisions of article 94 (*a*) of the Convention aforesaid, the following proposed amendments to the said Convention:

> In article 48 (*a*), substitute for the word «annually» the expression «not less than once in three years»;

In article 49 (*e*), substitute for the expression «an annual budget» the expression «annual budgets»; and

In article 61, substitute for the expressions «an annual budget» and «vote the budget» the expressions «annual budgets» and «vote the budgets»,

Specified, pursuant to the provisions of the said article 94 (*a*) of the said Convention, forty-two as the number of contracting States upon whose ratification the proposed amendments aforesaid shall come into force, and

Resolved that the secretary general of the International Civil Aviation Organization draw up a Protocol, in the English, French and Spanish languages, each of which shall be of equal authenticity, embodying the proposed amendments above mentioned and the matters hereinafter appearing.

Para ser presente à Assembleia Nacional.

Protocole concernant un amendement à la Convention relative à l'aviation civile internationale, signé à Rome le 15 septembre 1962.

L'Assemblée de l'Organisation de l'Aviation Civile Internationale,

S'étant réunie à Rome, le 21 août 1962, en sa quatorsième session,

Ayant pris acte du désir général des États contractants d'augmenter le nombre minimum d'États contractants requis pour que la convocation d'une assemblée extraordinaire puisse être demandée et qui est actuellement de dix,

Ayant estimé qu'il convenait de porter ce nombre au cinquième du nombre total des États contractants,

Et ayant estimé nécessaire d'amender à cette fin la Convention relative à l'aviation civile internationale faite à Chicago le 7 décembre 1944,

A adopté, le 15 septembre 1962, conformément aux dispositions de l'alinéa *a*) de l'article 94 de la Convention précitée, le projet d'amendement à ladite Convention dont le texte suit:

> Remplacer la seconde phrase de l'alinéa *a*) de l'article 48 de la Convention par le texte suivant: «Elle peut tenir une session extraordinaire à tout moment sur convocation du Conseil ou sur requête adressée au secrétaire général par un nombre d'États contractants égal au cinquième au moins du nombre total de ces États».

A fixé à 66 le nombre d'États contractants dont la ratification est nécessaire à l'entrée en vigueur dudit amendement, conformément aux dispositions de alinéa *a*) de l'article 94 de ladite Convention et

A décidé que le secrétaire général de l'Organisation de l'Aviation Civile Internationale devra établir en langues française, anglaise et espagnole, chacune faisant égalemente foi, un protocole concernant l'amendement précité et comprenant les dispositions ci-dessous.

En conséquence, conformément à la décision susmentionnée de l'assemblée,

Le présent Protocole a été établi par le secrétaire général de l'Organisation;

Il sera soumis à la ratification de tout État qui a ratifié la Convention relative à l'aviation civile internationale ou y a adhéré;

Les instruments de ratification seront déposés auprès de l'Organisation de l'Aviation Civile Internationale;

Le présent Protocole entrera en vigueur le jour du dépôt du 66ème instrument de ratification à l'égard des États qui l'auront ratifié;

Le secrétaire générale notifiera immédiatement à tous les États contractants la date du dépôt de chaque instrument de ratification dudit Protocole;

Le secrétaire général notifiera immédiatement à tous les États parties à ladite Convention ou qui l'ont signée la date à laquelle ledit Protocole entrera en vigueur;

Le présent Protocole entrera en vigueur, à l'égard de tout État contractant qui l'aura ratifié après la date précitée, dès que cet État aura déposé son instrument de ratification auprès de l'Organisation de l'Aviation Civile Internationale.

En foi de quoi, le président et le secrétaire général de la quatorzième session de l'Assemblée de l'Organisation de l'Aviation Civile Internationale, autorisés à cet effet par l'assemblée, signent le présent Protocole.

Fait à Rome, le 15 september 1962, en un seul exemplaire rédigé en langues française, anglaise et espagnole, chacune faisant également foi. Le présent Protocole restera déposé dans les archives de l'Organisation de l'Aviation Civile Internationale; le secrétaire général de l'Organisation en transmettra des copies conformes à tous les États qui sont parties à la Convention relative à l'aviation civile internationale, mentionnée ci-dessus, ou qui l'ont signée.

Protocolo relativo a uma emenda à Convenção da aviação civil internacional [artigo 48 (a)], assinado em Roma, em 15 de Setembro de 1962.

A assembleia da Organização da Aviação Civil Internacional, Tendo-se reunido em Roma, em 21 de Agosto de 1962, na sua décima quarta sessão,

Tendo em conta o desejo geral dos Estados Contratantes no sentido de ser aumentado o número mínimo requerido de Estados Contratantes para que possa ser pedida a convocação de uma assembleia extraordinária, e que é actualmente de dez,

Considerando que seria conveniente elevar este número até um quinto do número total dos Estados Contratantes,

E considerando necessário, para tal fim, emendar a Convenção relativa à aviação civil internacional assinada em Chicago em 7 de Dezembro de 1944,

Adoptou, em 15 de Setembro de 1962, em conformidade com as disposições da alínea *a*) do artigo 94 da citada Convenção, o projecto de emenda à mesma Convenção cujo texto segue:

> Substituir a segunda frase da alínea *a*) do artigo 48 da Convenção pelo texto seguinte: «A Assembleia poderá ter uma sessão extraordinária em qualquer momento por convocação do Conselho ou mediante pedido dirigido ao secretário-geral por um número de Estados Contratantes igual a um quinto pelo menos do número total dos mesmos Estados».

Fixou em 65 o número de Estados Contratantes cuja ratificação é necessária para a entrada em vigor da citada emenda, em conformidade com as disposições da alínea *a*) do artigo 94 da referida Convenção e

Decidiu que o secretário-geral da Organização da Aviação Civil Internacional deverá estabelecer nas línguas francesa, inglesa e espanhola, fazendo cada uma igualmente fé, um protocolo relativo à emenda anteriormente mencionada que compreende as disposições que a seguir se indicam:

Consequentemente, em conformidade com a mencionada decisão da Assembleia,

Foi estabelecido o presente Protocolo pelo secretário-geral da Organização;

O Protocolo será aberto à ratificação de todo o Estado que tenha ratificado ou aderido à Convenção relativa à aviação civil internacional;

Os instrumentos de ratificação serão depositados junto da Organização da Aviação Civil Internacional,

O presente Protocolo entrará em vigor no dia do depósito do 66.º instrumento de ratificação em relação aos Estados que o tenham ratificado;

O secretário-geral notificará imediatamente a todos os Estados Contratantes a data do depósito de cada instrumento de ratificação do mesmo Protocolo;

O secretário-geral notificará imediatamente todos os Estados partes na mencionada Convenção ou que a assinaram a data em que o mesmo Protocolo entrará em vigor;

O presente Protocolo entrará em vigor, em relação a todo o Estado Contratante que a tenha ratificado depois da data mencionada, a partir do momento em que o mesmo Estado tenha depositado o seu instrumento de ratificação junto da Organização da Aviação Civil Internacional.

Em fé do que, o presidente e o secretário-geral da décima quarta sessão da Assembleia da Organização da Aviação Civil Internacional, autorizados para este efeito pela assembleia, assinaram o presente Protocolo.

Concluído em Roma, a 15 de Setembro de 1962, num só exemplar redigido nas línguas francesa, inglesa e espanhola, fazendo cada uma igualmente fé. O presente Protocolo ficará depositado nos arquivos da Organização da Aviação Civil Internacional; o secretário-geral da Organização transmitirá cópias a todos os Estados partes da Convenção relativa à aviação civil internacional, acima mencionada, ou que a tenham assinado.

Promulgado em 7 de Maio de 1971.

Publique-se.

O Presidente da República, AMÉRICO DEUS RODRIGUES THOMAZ.

Protocole portant amendement à la Convention Relative à l'Aviation Civile Internationale [article 50, a)], signé à New-York le 12 mars 1971.

L'Assemblée de l'Organisation de l'Aviation Civile Internationale,

S'étant réunie à New-York, le 11 mars 1971, en session extraordinaire,

Ayant pris acte du désir général des États contractants d'augmenter le nombre des membres du Conseil,

Ayant jugé qu'il convient de pourvoir le Conseil de trois sièges en plus des six dont il a été pourvu par l'amendement à la Convention relative à l'Aviation civile internationale (Chicago, 1944) adopté le 21 juin 1961 et de porter, de ce fait, leur nombre total à trente,

Ayant jugé nécessaire d'amender à cette fin la Convention relative à l'Aviation civile internationale faite à Chicago le 7 décembre 1944,

A approuvé, le 12 mars 1971, conformément aux dispositions de l'alinéa *a*) de l'article 94 de la Convention précitée, le projet d'amendement à ladite Convention dont le texte suit:

> À l'alinéa *a*) de l'article 50 de la Convention, remplacer la deuxième phrase par: «Il se compose de trente États contractants élus par l'Assemblée.»

A fixé à quatre-vingts le nombre d'États contractants dont la ratification est nécessaire à l'entrée en vigueur dudit amendement, conformément aux dispositions de alinéa *a*) de l'article 94 de la dite Convention, et

A décidé que le secrétaire général de l'Organisation de l'Aviation civile internationale établirait, en langues française, anglaise et espagnole, chacune faisant également foi, un Protocole comportant l'amendement précité et les dispositions ci-dessous.

En conséquence, conformément à la décision susmentionnée de l'Assemblée,

Le présent Protocole a été établi par le secrétaire général de l'Organisation;

Le présent Protocole sera soumis à la ratification de tout État qui a ratifié la Convention relative à l'Aviation civile internationale ou y a adhéré;

Les instruments de ratification seront déposés auprès de l'Organisation de l'Aviation civile internationale;

Le présent Protocole entrera en vigueur, à l'égard des États qui l'auront ratifié, le jour du dépôt du quatre-vingtième instrument de ratification;

Le secrétaire général notifiera immédiatement à tous les États contractants la date du dépôt de chaque instrument de ratification du présent Protocole;

Le secrétaire général notifiera immédiatement à tous les États parties à ladite Convention la date à laquelle le présent Protocole entrera en vigueur;

Le présent Protocole entrera en vigueur, à l'égard de tout État contractant qui l'aura ratifié après la date précitée, dès que cet État aura déposé son instrument de ratification auprès de l'Organisation de l'Aviation civile internationale.

En foi de quoi, le président et le secrétaire général de la dite session extraordinaire de l'Assemblée de l'Organisation de l'Aviation civile internationale, autorisés à cet effet par l'Assemblée, signent le présent Protocole.

Fait à New-York, le 12 mars de l'an 1971, en un seul exemplaire rédigé en langues française, anglaise et espagnole, chacune faisant également foi. Le présent Protocole restera déposé dans les archives de l'Organisation de l'Aviation civile internationale et le secrétaire général de l'Organisation en transmettra des copies conformes à tous les États parties à la Convention relative à l'Aviation civile internationale, faite à Chicago le 7 décembre 1944.

Protocolo de emenda à Convenção da Aviação Civil Internacional [artigo 50.º, a)], concluído em Nova Iorque em 12 de Março de 1971.

A Assembleia da Organização da Aviação Civil Internacional,

Tendo-se reunido em Nova Iorque, em 11 de Março de 1971, em sessão extraordinária;

Tendo tomado nota do desejo geral dos Estados contratantes de aumentar o número de membros do Conselho;

Tendo considerado que convém atribuir ao Conselho mais três lugares além dos seis de que foi dotado pela emenda à Convenção da Aviação Civil Internacional (Chicago, 1944) adoptada em 21 de Junho de 1961, elevando assim o seu número total a trinta;

Tendo considerado necessário emendar, com esta finalidade, a Convenção da Aviação Civil Internacional, concluída em Chicago em 7 de Dezembro de 1944;

Aprovou, em 12 de Março de 1971, em conformidade com as disposições da alínea *a*) do artigo 94.º da Convenção supracitada, o projecto de emenda à dita Convenção, cujo texto segue:

> Na alínea *a*) do artigo 50.º da Convenção, substituir a segunda frase por: «Compõe-se de trinta Estados contratantes eleitos pela Assembleia.»

Fixou em oitenta o número de Estados contratantes cuja ratificação é necessária para a entrada em vigor da dita emenda, em conformidade com as disposições da alínea *a*) do artigo 94.º da dita Convenção; e

Decidiu que o secretário-geral da Organização da Aviação Civil Internacional redigirá, nas línguas francesa, inglesa e espanhola, cada uma fazendo igualmente fé, um Protocolo contendo a emenda supracitada e as disposições que seguem.

Em consequência, de conformidade com a mencionada decisão da Assembleia:

O presente Protocolo foi redigido pelo secretário-geral da Organização;

O presente Protocolo será submetido à ratificação de qualquer Estado que tenha ratificado a Convenção da Aviação Civil Internacional, ou a ele tenha aderido;

Os instrumentos de ratificação serão depositados junto da Organização da Aviação Civil Internacional;

O presente Protocolo entrará em vigor, em relação aos Estados que o tenham ratificado, no dia do depósito do octogésimo instrumento de ratificação;

O secretário-geral notificará imediatamente todos os Estados contratantes da data do depósito de cada instrumento de ratificação do presente Protocolo;

O secretário-geral notificará imediatamente todos os Estados partes na dita Convenção da data em que o presente Protocolo entrará em vigor;

O presente Protocolo entrará em vigor, em relação a qualquer Estado contratante que o tenha ratificado depois da data mencionada, a partir do momento em que tenha depositado o seu instrumento de ratificação junto da Organização da Aviação Civil Internacional.

Em fé do que, o presidente e o secretário-geral da dita sessão extraordinária da Assembleia da Organização da Aviação Civil Internacional, autorizados para este efeito pela Assembleia, assinaram o presente Protocolo.

Concluído em Nova Iorque, em 12 de Março do ano de 1971, num único exemplar, redigido nas línguas francesa, inglesa e espanhola, cada uma fazendo igualmente fé. O presente Protocolo ficará depositado nos arquivos da Organização da Aviação Civil Internacional e o secretário-geral da Organização dele transmitirá cópias conformes a todos os Estados partes na Convenção da Aviação Civil Internacional, concluída em Chicago, em 7 de Dezembro de 1944.

(D.R. n.º 123, I Série, de 26-5-1971)

INTERNATIONAL STANDARDS AND RECOMMENDED PRACTICES

PERSONNEL LICENSING

ANNEX 1

TO THE CONVENTION ON INTERNATIONAL CIVIL AVIATION

EIGHTH EDITION — JULY 1988

APPLICABLE — 16 NOVEMBER 1989

This edition incorporates all amendments adopted by the Council prior to 29 March 1988 and supersedes, on 16 November 1989, all previous editions of Annex 1.

For information regarding the applicability of the Standards and Recommended Practices, *see* Foreword.

INTERNATIONAL CIVIL AVIATION ORGANIZATION

AMENDMENTS

The issue of amendments is announced in the *ICAO Journal* and in the monthly supplements to the *Catalogue of ICAO Publications,* which holders of this publication should consult. These amendments are available free upon request.

TABLE OF CONTENTS

FOREWORD

Historical Background

Standards and Recommended Practices for Personnel Licensing were first adopted by the Council on 14 April 1948 pursuant to the provisions of Article 37 of the Convention on International Civil Aviation (Chicago 1944) and designated as Annex 1 to the Convention. They became effective on 15 September 1948.

Table A shows the origin of subsequent amendments together with a list of the principal subjects involved and the dates on which the Annex and the amendments were adopted by the Council, when they became effective and when they became applicable.

Application of the PEL Standards

The present (Eighth) edition of Annex 1 contains Standards and Recommended Practices adopted by the International Civil Aviation Organization as the minimum standards for personnel licensing. It incorporates all amendments, including Amendment 160.

The Annex thus amended is applicable on 10 November 1994 to all applicants for and, on renewal, to all holders of the licences and ratings specified herein. However, if a licence or rating no longer foreseen in the Eighth Edition of Annex 1 (the senior commercial pilot licence, the flight radio operator licence, the controlled VFR rating and the flight instructor rating for gliders and free balloons), has been issued before 16 November 1989, the issuing State may maintain its validity until 15 November 1994, and such licences and ratings shall be recognized by other States.

The Council has decided that, in principle, amendments affecting existing licensing specifications are applicable to all applicants for, and holders of licences but, in considering their application to existing holders of licences, the assessment, if necessary, by re-examination of the knowledge, experience and proficiency of individual licence holders is left to the discretion of Contracting States.

Action by Contracting States

Notification of differences. The attention of Contracting States is drawn to the obligation imposed by Article 38 of the Convention by which Contracting States are required to notify the Organization of any differences between their national regulations and practices and the International Standards contained in this Annex and any amendments thereto. Contracting States are invited to extend such notification to any differences from the Recommended Practices contained in this Annex and any amendments, when the notification of such differences is important for the safety of air navigation. Further, Contracting States are invited to keep the Organization currently informed of any difference which may subsequently occur, or of the withdrawal of any difference previously notified. A specific request for notification of differences will be sent to Contracting States immediately after the adoption of each amendment to this Annex.

Use of the Annex text in national regulations. The Council, on 13 April 1948, adopted a resolution inviting the attention of Contracting States to the desirability of using in their own national regulations, as far as practicable, the precise language of those ICAO Standards that are of a regulatory character and also of indicating departures from the Standards, including any additional national regulations that were important for the safety or regularity of air navigation. Wherever possible, the provisions of this Annex have been written in such a way as to facilitate incorporation, without major textual changes, into national legislation.

General Information

The expression "licence" used throughout this Annex has the same meaning as the expressions "certificate of competency and license", "license or certificate" and "license" used in the Convention. Similarly the expression "flight crew member" has the same meaning as the expressions "member of the operating crew of an aircraft" and "operating personnel" used in the Convention while the expression "personnel other than flight crew members" includes the expression "mechanical personnel" used in the Convention.

Status of Annex Components

An Annex is made up of the following component parts, not all of which, however, are necessarily found in every Annex; they have the status indicated:

1.— *Material comprising the Annex proper:*

a) Standards and Recommended Practices adopted by the Council under the provisions of the Convention. They are defined as follows:

Standard: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as necessary for the safety or regularity of international air navigation and to which Contracting States will conform in accordance with the Convention; in the event of impossibility of compliance, notification to the Council is compulsory under Article 38.

Recommended Practice: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as desirable in the interest of safety, regularity or efficiency of international air navigation, and to which Contracting States will endeavour to conform in accordance with the Convention.

b) *Appendices* comprising material grouped separately for convenience but forming part of the Standards and Recommended Practices adopted by the Council.

c) *Definitions* of terms used in the Standards and Recommended Practices which are not self-explanatory in that they do not have accepted dictionary meanings. A definition does not have independent status but is an essential part of each Standard and Recommended Practice in which the term is used, since a change in the meaning of the term would affect the specification.

d) *Tables* and *Figures* which add to or illustrate a Standard or Recommended Practice and which are referred to therein, form part of the associated Standard or Recommended Practice and have the same status.

It is to be noted that some Standards in this Annex incorporate, by reference, other specifications having the status of Recommended Practices. In such cases the text of the Recommended Practice becomes part of the Standard.

2.— *Material approved by the Council for publication in association with the Standards and Recommended Practices (SARPs):*

a) *Forewords* comprising historical and explanatory material based on the action of the Council and including an explanation of the obligations of States with regard to the application of the Standards and Recommended Practices ensuing from the Convention and the Resolution of Adoption.

b) *Introductions* comprising explanatory material introduced at the beginning of parts, chapters or sections of the Annex to assist in the understanding of the application of the text.

c) *Notes* included in the text, where appropriate, to give factual information or references bearing on the Standards or Recommended Practices in question, but not constituting part of the Standards or Recommended Practices.

d) *Attachments* comprising material supplementary to the Standards and Recommended Practices, or included as a guide to their application.

Selection of Language

This Annex has been adopted in five languages — English, Arabic, French, Russian and Spanish. Each Contracting State is requested to select one of those texts for the purpose of national implementation and for other effects provided for in the Convention, either through direct use or through translation into its own language, and to notify the Organization accordingly.

Editorial Practices

The following practice has been adhered to in order to indicate at a glance the status of each statement: *Standards* have been printed in light face roman; *Recommended Practices* have been printed in light face italics, the status being indicated by the prefix **Recommendation**; *Notes* have been printed in light face italics, the status being indicated by the prefix *Note*.

It is to be noted that in the English text the following practice has been adhered to when writing the specifications: Standards employ the operative verb "shall" while Recommended Practices employ the operative verb "should".

The units of measurement used in this document are in accordance with the International System of Units (SI) as specified in Annex 5 to the Convention on International Civil Aviation. Where Annex 5 permits the use of non-SI alternative units these are shown in parentheses following the basic units. Where two sets of units are quoted it must not be assumed that the pairs of values are equal and interchangeable. It may, however, be inferred that an equivalent level of safety is achieved when either set of units is used exclusively.

Any reference to a portion of this document which is identified by a number includes all subdivisions of that portion.

158 (7th Edition)	Correspondence and Secretariat, 21st Assembly and Council.	Modifications to existing Standards for medical examiners. New SARPs for assessment of medical fitness. Replacement of Physical and Mental Requirements by Classes of Medical Assessment.	4 May 1982 4 September 1982 25 November 1982
159 (8th Edition)	Second, Third and Fourth Meetings of the Personnel Licensing and Training (PELT) Panel; November 1983, April 1985, May 1986. Air Navigation Commission.	Amendment of SARPs dealing with the licensing of flight crew members. Deletion of the senior commercial pilot licence — aeroplane, the controlled VFR rating, the flight radio operator licence and the flight instructor rating for gliders and free balloons. The dividing line of 5 700 kg maximum take-off mass is replaced by a dividing line based on the crew complement required by certification. All helicopter provisions have the status of Standards. The requirements for the issue of a type rating for aircraft certificated for two-pilot operation are strengthened. The provisions for the issue of each licence and rating have been updated. Flight instruction requirements are established for the private, commercial, glider and free balloon pilot licences and for the instrument and flight instructor ratings.	28 March 1988 31 July 1988 16 November 1989
160	Air Navigation Commission.	Amendment of SARPs for air traffic controllers, aeronautical station operators and flight operations officers.	24 March 1993 26 July 1993 10 November 1994

INTERNATIONAL STANDARDS AND RECOMMENDED PRACTICES

CHAPTER 1. DEFINITIONS AND GENERAL RULES CONCERNING LICENCES

1.1 Definitions

When the following terms are used in the Standards and Recommended Practices for Personnel Licensing, they have the following meanings:

Accredited medical conclusion. The conclusion reached by one or more medical experts acceptable to the Licensing Authority for the purposes of the case concerned, in consultation with flight operations or other experts as necessary.

Aeroplane. A power-driven heavier-than-air aircraft, deriving its lift in flight chiefly from aerodynamic reactions on surfaces which remain fixed under given conditions of flight.

Aircraft. Any machine that can derive support in the atmosphere from the reactions of the air other than the reactions of the air against the earth's surface.

Aircraft avionics. A term designating any electronic device — including its electrical part — for use in an aircraft, including radio, automatic flight control and instrument systems.

Aircraft — category. Classification of aircraft according to specified basic characteristics, e.g. aeroplane, helicopter, glider, free balloon.

Aircraft certificated for single-pilot operation. A type of aircraft which the State of Registry has determined, during the certification process, can be operated safely with a minimum crew of one pilot.

Aircraft — type of. All aircraft of the same basic design including all modifications thereto except those modifications which result in a change in handling or flight characteristics.

Approved maintenance organization. An organization approved by a Contracting State to perform inspection, overhaul, maintenance, repair and/or modification of aircraft or parts thereof and operating under supervision approved by that State.

Note.— Nothing in this definition is intended to preclude that the organization and its supervision be approved by more than one State.

Approved training. Training carried out under special curricula and supervision approved by a Contracting State.

Balloon. A non-power-driven lighter-than-air aircraft.

Note.— For the purposes of this Annex, this definition applies to free balloons.

Certify as airworthy (to). To certify that an aircraft or parts thereof comply with current airworthiness requirements after being inspected, overhauled, repaired, modified or installed.

Co-pilot. A licensed pilot serving in any piloting capacity other than as pilot-in-command but excluding a pilot who is on board the aircraft for the sole purpose of receiving flight instruction.

Dual instruction time. Flight time during which a person is receiving flight instruction from a properly authorized pilot on board the aircraft.

Flight crew member. A licensed crew member charged with duties essential to the operation of an aircraft during flight time.

Flight plan. Specified information provided to air traffic services units, relative to an intended flight or portion of a flight of an aircraft.

Flight procedures trainer. *See* Synthetic flight trainer.

Flight simulator. *See* Synthetic flight trainer.

Flight time. The total time from the moment an aircraft first moves under its own power for the purpose of taking off until the moment it comes to rest at the end of the flight.

Note.— Flight time as here defined is synonymous with the term "block to block" time or "chock to chock" time in general usage which is measured from the time an aircraft moves from the loading point until it stops at the unloading point.

Glider. A non-power-driven heavier-than-air aircraft, deriving its lift in flight chiefly from aerodynamic reactions on surfaces which remain fixed under given conditions of flight.

Glider flight time. The total time occupied in flight, whether being towed or not, from the moment the glider first moves for the purpose of taking off until the moment it comes to rest at the end of the flight.

Helicopter. A heavier-than-air aircraft supported in flight chiefly by the reactions of the air on one or more power-driven rotors on substantially vertical axes.

Instrument flight time. Time during which a pilot is piloting an aircraft solely by reference to instruments and without external reference points.

Instrument ground time. Time during which a pilot is practising, on the ground, simulated instrument flight in a synthetic flight trainer approved by the Licensing Authority.

Instrument time. Instrument flight time or instrument ground time.

Licensing Authority. The Authority designated by a Contracting State as responsible for the licensing of personnel.

Note.— In the provisions of this Annex, the Licensing Authority is deemed to have been given the following responsibilities by the Contracting State:

a) assessment of an applicant's qualifications to hold a licence or rating;

b) issue and endorsement of licences and ratings;

c) designation and authorization of approved persons;

d) approval of training courses;

e) approval of the use of synthetic flight trainers and authorization for their use in gaining the experience or in demonstrating the skill required for the issue of a licence or rating; and

f) validation of licences issued by other Contracting States.

Medical Assessment. The evidence issued by a Contracting State that the licence holder meets specific requirements of medical fitness. It is issued following an evaluation by the Licensing Authority of the report submitted by the designated medical examiner who conducted the examination of the applicant for the licence.

Night. The hours between the end of evening civil twilight and the beginning of morning civil twilight or such other period between sunset and sunrise, as may be prescribed by the appropriate authority.

Note.— Civil twilight ends in the evening when the centre of the sun's disc is 6 degrees below the horizon and begins in the morning when the centre of the sun's disc is 6 degrees below the horizon.

Pilot (to). To manipulate the flight controls of an aircraft during flight time.

Pilot-in-command. The pilot responsible for the operation and safety of the aircraft during flight time.

Rated air traffic controller. An air traffic controller holding a licence and valid ratings appropriate to the privileges to be exercised.

Rating. An authorization entered on or associated with a licence and forming part thereof, stating special conditions, privileges or limitations pertaining to such licence.

Rendering (a licence) valid. The action taken by a Contracting State, as an alternative to issuing its own licence, in accepting a licence issued by any other Contracting State as the equivalent of its own licence.

Sign a maintenance release (to). To certify that the inspection and maintenance work has been completed satisfactorily in accordance with the methods prescribed in the Maintenance Manual by issuing the maintenance release referred to in Annex 6.

Solo flight time. Flight time during which a student pilot is the sole occupant of an aircraft.

Synthetic flight trainer. Any one of the following three types of apparatus in which flight conditions are simulated on the ground:

A flight simulator, which provides an accurate representation of the flight deck of a particular aircraft type to the extent that the mechanical, electrical, electronic, etc. aircraft systems control functions, the normal environment of flight crew members, and the performance and flight characteristics of that type of aircraft are realistically simulated;

A flight procedures trainer, which provides a realistic flight deck environment, and which simulates instrument responses, simple control functions of mechanical, electrical, electronic, etc. aircraft systems, and the performance and flight characteristics of aircraft of a particular class;

A basic instrument flight trainer, which is equipped with appropriate instruments, and which simulates the flight deck environment of an aircraft in flight in instrument flight conditions.

1.2 General rules concerning licences

Note 1.— Although the Convention on International Civil Aviation allocates to the State of Registry certain functions which that State is entitled to discharge, or obligated to discharge, as the case may be, the Assembly recognized, in Resolution A23-13 that the State of Registry may be unable to fulfil its responsibilities adequately in instances where aircraft are leased, chartered or interchanged — in particular without crew — by an operator of another State and that the Convention may not adequately specify the rights and obligations of the State of an operator in such instances until such time as Article 83 bis *of the Convention enters in force. Accordingly, the Council, urged that if, in the above-mentioned instances, the State of Registry finds itself unable to discharge adequately the functions allocated to it by the Convention, it delegates to the State of the Operator, subject to acceptance by the latter State, those functions of the State of Registry that can more adequately be discharged by the State of the Operator. It is understood that pending entry into force of Article 83* bis *of the Convention the foregoing action will only be a matter of practical convenience and will not affect either the provisions of the Chicago Convention prescribing the duties of the State of Registry or any third State.*

Note 2.— International Standards and Recommended Practices are established for licensing the following personnel:

a) Flight crew

— private pilot — aeroplane;

— commercial pilot — aeroplane;

— airline transport pilot — aeroplane;

— private pilot — helicopter;

— commercial pilot — helicopter;

— airline transport pilot — helicopter;

— glider pilot;

— free balloon pilot;

— flight navigator;

— flight engineer.

b) Other personnel

— aircraft maintenance (technician/engineer/mechanic) Type II;

— aircraft maintenance (technician/engineer/mechanic) Type I;

— air traffic controller;

— flight operations officer;

— aeronautical station operator.

1.2.1 Authority to act as a flight crew member

A person shall not act as a flight crew member of an aircraft unless a valid licence is held showing compliance with the specifications of this Annex and appropriate to the duties to be performed by that person. The licence shall have been issued by the State of Registry of that aircraft or by any other Contracting State and rendered valid by the State of Registry of that aircraft.

1.2.2 Method of rendering a licence valid

1.2.2.1 When a Contracting State renders valid a licence issued by another Contracting State, as an alternative to the issuance of its own licence, it shall establish validity by suitable authorization to be carried with the former licence accepting it as the equivalent of the latter. The validity of the authorization shall not extend beyond the period of validity of the licence.

Note.— This provision is not intended to preclude the State that issued the licence from extending, by a suitable notification, the period of validity of the licence without necessarily requiring either the physical return of the licence or the appearance of the licence holder before the authorities of that State.

1.2.2.2 **Recommendation.—** *A pilot licence issued by a Contracting State should be rendered valid by other Contracting States for use in private flights.*

Note.— Contracting States which, without formality, render valid a licence issued by another Contracting State for use in private flights are encouraged to notify this facility in their Aeronautical Information Publications.

1.2.3 Privileges of the holder of a licence

A Contracting State shall not permit the holder of a licence to exercise privileges other than those granted by that licence.

1.2.4 Medical fitness

Note 1.— Guidance material is published in the Manual of Civil Aviation Medicine *(Doc 8984).*

Note 2.— To satisfy the licensing requirements of medical fitness for the issue of various types of licences, the applicant must meet certain appropriate medical requirements which are specified as three classes of Medical Assessment. Details are given in 6.2, 6.3, 6.4 and 6.5. To provide the necessary evidence to satisfy the requirements of 1.2.4.1, the Licensing Authority issues the licence holder with the appropriate Medical Assessment, Class 1, Class 2 or Class 3. This can be done in several ways such as a suitably titled separate certificate, a statement on the licence, a national regulation stipulating that the Medical Assessment is an integral part of the licence, etc.

1.2.4.1 An applicant for a licence shall, when applicable, hold a Medical Assessment issued in accordance with the provisions of Chapter 6.

1.2.4.2 The duration of the period of currency of a Medical Assessment shall be in accordance with the provisions of 1.2.5. The period of currency shall begin on the date the Medical Assessment is issued.

1.2.4.3 Except as provided in 1.2.5.2.3, flight crew members or air traffic controllers shall not exercise the privileges of their licence unless they hold a current Medical Assessment appropriate to the licence.

1.2.4.4 Contracting States shall designate medical examiners, qualified and licensed in the practice of medicine, to conduct medical examinations of fitness of applicants for the issue or renewal of the licences or ratings specified in Chapters 2 and 3, and of the appropriate licences specified in Chapter 4.

1.2.4.4.1 Medical examiners shall have had, or shall receive, training in aviation medicine.

1.2.4.4.2 **Recommendation.—** *Medical examiners should acquire practical knowledge and experience of the conditions in which the holders of licences and ratings carry out their duties.*

1.2.4.5 Applicants for licences or ratings for which medical fitness is prescribed shall sign and furnish to the medical examiner a declaration stating whether they have previously undergone such an examination and, if so, with what result.

1.2.4.5.1 Any false declaration to a medical examiner made by an applicant for a licence or rating shall be reported to the Licensing Authority of the issuing State for such action as may be considered appropriate.

1.2.4.6 Having completed the medical examination of an applicant in accordance with Chapter 6, the medical examiner shall submit a signed report to the Licensing Authority, in accordance with its requirements, detailing the results of the examination.

1.2.4.6.1 If the medical examination is carried out by a constituted group of medical examiners, Contracting States shall appoint the head of the group to be responsible for co-ordinating the results of the examination and signing the report.

1.2.4.7 Contracting States shall use the services of physicians experienced in the practice of aviation medicine when it is necessary to evaluate reports submitted to the Licensing Authority by medical examiners.

1.2.4.8 If the medical Standards prescribed in Chapter 6 for a particular licence are not met, the appropriate Medical Assessment shall not be issued or renewed unless the following conditions are fulfilled:

a) accredited medical conclusion indicates that in special circumstances the applicant's failure to meet any requirement, whether numerical or otherwise, is such that exercise of the privileges of the licence applied for is not likely to jeopardize flight safety;

b) relevant ability, skill and experience of the applicant and operational conditions have been given due consideration; and

c) the licence is endorsed with any special limitation or limitations when the safe performance of the licence holder's duties is dependent on compliance with such limitation or limitations.

1.2.5 Validity of licences

1.2.5.1 A Contracting State, having issued a licence, shall ensure that the privileges granted by that licence, or by related ratings, are not exercised unless the holder maintains competency and meets the requirements for recent experience established by that State.

1.2.5.1.1 A Contracting State, having issued a licence, shall ensure that other Contracting States are enabled to be satisfied as to the validity of the licence.

Note 1.— The maintenance of competency of flight crew members, engaged in commercial air transport operations, may be satisfactorily established by demonstration of skill during proficiency flight checks completed in accordance with Annex 6.

Note 2.— Maintenance of competency may be satisfactorily recorded in the operator's records, or in the flight crew member's personal log book or licence.

Note 3.— Flight crew members may, to the extent deemed feasible by the State of Registry, demonstrate their continuing competency in synthetic flight trainers approved by that State.

1.2.5.1.1.1 A Contracting State, having issued before 16 November 1989 under the specifications of the previous (Seventh) edition of this Annex a licence or rating no longer foreseen in the present Annex, shall not extend the validity of such a licence or rating beyond 15 November 1994.

Note.— The licences and ratings no longer foreseen in this edition of Annex 1 are the following: the senior commercial pilot licence, the flight radio operator licence, the controlled VFR rating and the flight instructor rating for gliders and free balloons.

1.2.5.2 Except as provided in 1.2.5.2.1, 1.2.5.2.2 and 1.2.5.2.3, a report of medical fitness obtained in accordance with 1.2.4.5 and 1.2.4.6 shall be submitted at intervals of not greater than:

24 months for the private pilot licence — aeroplane;

12 months for the commercial pilot licence — aeroplane;

12 months for the airline transport pilot licence — aeroplane;

24 months for the private pilot licence — helicopter;

12 months for the commercial pilot licence — helicopter;

12 months for the airline transport pilot licence — helicopter;

24 months for the glider pilot licence;

24 months for the free balloon pilot licence;

12 months for the flight navigator licence;

12 months for the flight engineer licence;

24 months for the air traffic controller licence.

1.2.5.2.1 When the holders of airline transport pilot licences — aeroplane and helicopter have passed their 40th birthday, the 12-month interval specified in 1.2.5.2 shall be reduced to six months.

1.2.5.2.2 **Recommendation.—** *When the holders have passed their 40th birthday, the 24-month interval specified for the private pilot licences — aeroplane and helicopter, glider pilot licence, free balloon pilot licence, and air traffic controller licence should be reduced to 12 months, and the 12-month interval specified for the commercial pilot licences — aeroplane and helicopter should be reduced to six months.*

1.2.5.2.3 *Circumstances in which a medical examination may be deferred.* The prescribed re-examination of a licence holder operating in an area distant from designated medical examination facilities may be deferred at the discretion of the Licensing Authority, provided that such deferment shall only be made as an exception and shall not exceed:

a) a single period of six months in the case of a flight crew member of an aircraft engaged in non-commercial operations;

b) two consecutive periods each of three months in the case of a flight crew member of an aircraft engaged in commercial operations provided that in each case a favourable medical report is obtained after examination by a designated medical examiner of the area concerned, or, in cases where such a designated medical examiner is not available, by a physician legally qualified to practise medicine in that area. A report of the medical examination shall be sent to the Licensing Authority where the licence was issued;

c) in the case of a private pilot, a single period not exceeding 24 months where the medical examination is carried out by an examiner designated under 1.2.4.4 by the Contracting State in which the applicant is temporarily located. A report of the medical examination shall be sent to the Licensing Authority where the licence was issued.

1.2.6 Decrease in medical fitness

1.2.6.1 Licence holders shall not exercise the privileges of their licences and related ratings at any time when they are aware of any decrease in their medical fitness which might render them unable to safely exercise these privileges.

1.2.6.1.1 **Recommendation.—** *Each Contracting State should, as far as practicable, ensure that licence holders do not exercise the privileges of their licences and related ratings during any period in which their medical fitness has, from any cause, decreased to an extent that would have prevented the issue or renewal of their Medical Assessment.*

1.2.7 Approved training

Note.— The qualifications required for the issue of personnel licences can be more readily and speedily acquired by applicants who undergo closely supervised, systematic and continuous courses of training, conforming to a planned syllabus or curriculum. Provision has accordingly been made for some reduction in the experience requirements for the issue of certain licences and ratings prescribed in these Standards and Recommended Practices, in respect of an applicant who has satisfactorily completed a course of approved training.

Approved training shall provide a level of competency at least equal to that provided by the minimum experience requirements for personnel not receiving such approved training.

CHAPTER 2. LICENCES AND RATINGS FOR PILOTS

Note 1.— The present (Eighth) edition of Annex 1 no longer contains specifications for the senior commercial pilot licence — aeroplane and the controlled VFR rating. However, if such a licence or rating has been issued before 16 November 1989, the issuing State may maintain its validity until 15 November 1994.

Note 2.— The privileges for the commercial pilot licences — aeroplane and helicopter, as well as the circumstances in which class and type ratings are required, have been amended from the previous (Seventh) edition of Annex 1. Persons who have been issued with such a licence or rating before 16 November 1989 may be allowed by the issuing State to continue exercising the privileges set forth for these licences or ratings in the Seventh Edition of Annex 1, on international flights until 15 November 1994.

2.1 General rules concerning pilot licences and ratings

2.1.1 General licensing specifications

2.1.1.1 A person shall not act either as pilot-in-command or as co-pilot of an aircraft in any of the following categories unless that person is the holder of a pilot licence issued in accordance with the provisions of this Chapter:

— aeroplane
— helicopter
— glider
— free balloon

2.1.1.2 The category of aircraft shall be included in the title of the licence itself, or endorsed as a category rating on the licence.

2.1.1.2.1 When the holder of a pilot licence seeks a licence for an additional category of aircraft, the Licensing Authority shall either:

a) issue the licence holder with an additional pilot licence for that category of aircraft; or

b) endorse the original licence with the new category rating, subject to the conditions of 2.1.2.

Note.— The requirements for category ratings are given in terms of licensing specifications for pilots and at levels appropriate to the privileges to be granted to the licence holder.

2.1.1.3 An applicant shall, before being issued with any pilot licence or rating, meet such requirements in respect of age, knowledge, experience, flight instruction, skill and medical fitness, as are specified for that licence or rating.

2.1.1.3.1 An applicant for any pilot licence or rating shall demonstrate, in a manner determined by the Licensing Authority, such requirements for knowledge and skill as are specified for that licence or rating.

2.1.2 Category ratings

2.1.2.1 When established, category ratings shall be for categories of aircraft listed in 2.1.1.1.

2.1.2.2 Category ratings shall not be endorsed on a licence when the category is included in the title of the licence itself.

2.1.2.3 Any additional category rating endorsed on a pilot licence shall indicate the level of licensing privileges at which the category rating is granted.

2.1.2.4 The holder of a pilot licence seeking additional category ratings shall meet the requirements of this Annex appropriate to the privileges for which the category rating is sought.

2.1.3 Class and type ratings

2.1.3.1 Class ratings shall be established for aeroplanes certificated for single-pilot operation and shall comprise:

a) single-engine, land;

b) single-engine, sea;

c) multi-engine, land;

d) multi-engine, sea.

Note.— The provisions of this paragraph do not preclude the establishment of other class ratings within this basic structure.

2.1.3.1.1 **Recommendation.—** *Contracting States should consider establishing a class rating for those helicopters certificated for single-pilot operations and which have comparable handling, performance and other characteristics.*

2.1.3.2 Type ratings shall be established for:

a) each type of aircraft certificated for operation with a minimum crew of at least two pilots;

b) each type of helicopter certificated for single-pilot operation except where a class rating has been issued under 2.1.3.1.1; and

c) any type of aircraft whenever considered necessary by the Licensing Authority.

Note.— Requirements for class and type ratings for gliders and free balloons have not been determined.

2.1.3.3 When an applicant demonstrates skill and knowledge for the initial issue of a pilot licence, the category and the ratings appropriate to the class or type of aircraft used in the demonstration shall be entered on the licence.

2.1.4 Circumstances in which class and type ratings are required

2.1.4.1 A Contracting State having issued a pilot licence shall not permit the holder of such licence to act either as pilot-in-command or as co-pilot of an aeroplane or helicopter unless the holder has received authorization as follows:

a) the appropriate class rating specified in 2.1.3.1; or

b) a type rating when required in accordance with the provisions of 2.1.3.2.

2.1.4.1.1 When a type rating is issued limiting the privileges to act as co-pilot, such limitation shall be endorsed on the rating.

2.1.4.2 For the purpose of training, testing, or specific special purpose non-revenue, non-passenger carrying flights, special authorization may be provided in writing to the licence holder by the Licensing Authority in place of issuing the class or type rating in accordance with 2.1.4.1. This authorization shall be limited in validity to the time needed to complete the specific flight.

2.1.5 Requirements for the issue of class and type ratings

2.1.5.1 *Class rating*

The applicant shall have demonstrated a degree of skill appropriate to the licence in an aircraft of the class for which the rating is sought.

2.1.5.2 *Type rating as required by 2.1.3.2 a)*

The applicant shall have:

a) gained, under appropriate supervision, experience in the applicable type of aircraft and/or flight simulator in the following:
   - normal flight procedures and manoeuvres during all phases of flight;
   - abnormal and emergency procedures and manoeuvres in the event of failures and malfunctions of equipment, such as powerplant, systems and airframe;
   - where applicable, instrument procedures, including instrument approach, missed approach and landing procedures under normal, abnormal and emergency conditions, including simulated engine failure;
   - procedures for crew incapacitation and crew co-ordination including allocation of pilot tasks; crew co-operation and use of checklists;

Note.— Attention is called to Recommendation 2.1.8.2 on the qualifications required for pilots giving flight training.

b) demonstrated the skill and knowledge required for the safe operation of the applicable type of aircraft, relevant to the duties of a pilot-in-command or a co-pilot as applicable; and

c) demonstrated, at the airline transport pilot licence level, an extent of knowledge determined by the Licensing Authority on the basis of the requirements specified in 2.5.1.2 or 2.9.1.2, as applicable.

2.1.5.3 *Type rating as required by 2.1.3.2 b) and c)*

The applicant shall have demonstrated the skill and knowledge required for the safe operation of the applicable type of aircraft, relevant to the licensing requirements and piloting functions of the applicant.

2.1.6 Use of synthetic flight trainers for demonstrations of skill

The use of a synthetic flight trainer for performing any manoeuvre required during the demonstration of skill for the issue of a licence or rating shall be approved by the Licensing Authority which shall ensure that the synthetic flight trainer used is appropriate to the task.

2.1.7 Circumstances in which an instrument rating is required

A Contracting State, having issued a pilot licence, shall not permit the holder thereof to act either as pilot-in-command or as co-pilot of an aircraft under instrument flight rules (IFR) unless such holder has received proper authorization from such Contracting State. Proper authorization shall comprise an instrument rating appropriate to the aircraft category.

Note.— The instrument rating is included in the airline transport pilot licence — aeroplane, and the provisions of 2.1.7 do not preclude the issue of a licence having the instrument rating as an integral part thereof.

2.1.8 Circumstances in which authorization to conduct flight instruction is required

2.1.8.1 A Contracting State having issued a pilot licence shall not permit the holder thereof to carry out flight instruction required for the issue of a private pilot licence — aeroplane or helicopter, commercial pilot licence — aeroplane or helicopter, instrument rating — aeroplane or helicopter, or a flight instructor rating appropriate to aeroplanes and helicopters, unless such holder has received proper authorization from such Contracting State. Proper authorization shall comprise:

a) a flight instructor rating on the holder's licence; or

b) the authority to act as an agent of an approved organization authorized by the Licensing Authority to carry out flight instruction; or

c) a specific authorization granted by the Contracting State which issued the licence.

2.1.8.2 **Recommendation.—** *A Contracting State having issued a pilot licence should not permit the holder thereof to carry out flight instruction for the issue of any licence or rating not specified in 2.1.8.1 above unless such holder has received proper authorization from such Contracting State.*

2.1.9 Crediting of flight time

2.1.9.1 A student pilot or the holder of a pilot licence shall be entitled to be credited in full with all solo, dual instruction and pilot-in-command flight time towards the total flight time required for the initial issue of a pilot licence or the issue of a higher grade of pilot licence.

2.1.9.2 The holder of a pilot licence, when acting as co-pilot of an aircraft required to be operated with a co-pilot, shall be entitled to be credited with not more than 50 per cent of the co-pilot flight time towards the total flight time required for a higher grade of pilot licence.

2.1.9.3 The holder of a pilot licence, when acting as co-pilot performing under the supervision of the pilot-in-command the functions and duties of a pilot-in-command, shall be entitled to be credited in full with this flight time towards the total flight time required for a higher grade of pilot licence.

2.1.10 Curtailment of privileges of pilots who have attained their 60th birthday

2.1.10.1 A Contracting State, having issued pilot licences, shall not permit the holders thereof to act as pilot-in-command of an aircraft engaged in scheduled international air services or non-scheduled international air transport operations for remuneration or hire if the licence holders have attained their 60th birthday.

2.1.10.2 **Recommendation.—** *A Contracting State, having issued pilot licences, should not permit the holders thereof to act as co-pilot of an aircraft engaged in scheduled international air services or non-scheduled international air transport operations for remuneration or hire if the licence holders have attained their 60th birthday.*

2.2 Student pilot

2.2.1 A student pilot shall meet requirements prescribed by the Contracting State concerned. In prescribing such requirements, Contracting States shall ensure that the privileges granted would not permit student pilots to constitute a hazard to air navigation.

2.2.2 A student pilot shall not fly solo unless under the supervision of, or with the authority of, an authorized flight instructor.

2.2.2.1 A student pilot shall not fly solo in an aircraft on an international flight unless by special or general arrangement between the Contracting States concerned.

2.2.3 Medical Fitness

A Contracting State shall not permit a student pilot to fly solo unless that student pilot holds a current Class 2 Medical Assessment.

2.3 Private pilot licence — Aeroplane

Note.— The ICAO Training Manual *(Doc 7192), Part B-5, contains guidance material for a course of training for the private pilot licence — aeroplane.*

2.3.1 Requirements for the issue of the licence

2.3.1.1 *Age*

The applicant shall be not less than 17 years of age.

2.3.1.2 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of a private pilot licence — aeroplane, in at least the following subjects:

Air law

a) rules and regulations relevant to the holder of a private pilot licence — aeroplane; rules of the air; appropriate air traffic services practices and procedures;

Aircraft general knowledge

b) principles of operation of aeroplane powerplants, systems and instruments;

c) operating limitations of aeroplanes and powerplants; relevant operational information from the flight manual or other appropriate document;

Flight performance and planning

d) effects of loading and mass distribution on flight characteristics; mass and balance calculations;

e) use and practical application of take-off, landing and other performance data;

f) pre-flight and en-route flight planning appropriate to private operations under VFR; preparation and filing of air traffic services flight plans; appropriate air traffic services procedures; position reporting procedures; altimeter setting procedures; operations in areas of high-density traffic;

Human performance and limitations

g) human performance and limitations relevant to the private pilot — aeroplane;

Meteorology

h) application of elementary aeronautical meteorology; use of, and procedures for obtaining, meteorological information; altimetry;

Navigation

i) practical aspects of air navigation and dead-reckoning techniques; use of aeronautical charts;

Operational procedures

j) use of aeronautical documentation such as AIP, NOTAM, aeronautical codes and abbreviations;

k) appropriate precautionary and emergency procedures, including action to be taken to avoid hazardous weather, wake turbulence and other operating hazards;

Principles of flight

l) principles of flight relating to aeroplanes;

Radiotelephony

m) radiotelephony procedures and phraseology as applied to VFR operations; action to be taken in case of communication failure.

2.3.1.3 *Experience*

2.3.1.3.1 The applicant shall have completed not less than 40 hours of flight time as a pilot of aeroplanes. The Licensing Authority shall determine whether experience as a pilot under instruction in a synthetic flight trainer, which it has approved, is acceptable as part of the total flight time of 40 hours. Credit for such experience shall be limited to a maximum of 5 hours.

2.3.1.3.1.1 When the applicant has flight time as a pilot of aircraft in other categories, the Licensing Authority shall determine whether such experience is acceptable and, if so, the extent to which the flight time requirements of 2.3.1.3.1 can be reduced accordingly.

2.3.1.3.2 The applicant shall have completed in aeroplanes not less than 10 hours of solo flight time under the supervision of an authorized flight instructor, including 5 hours of solo cross-country flight time with at least one cross-country flight totalling not less than 270 km (150 NM) in the course of which full-stop landings at two different aerodromes shall be made.

2.3.1.4 *Flight instruction*

2.3.1.4.1 The applicant shall have received dual instruction in aeroplanes from an authorized flight instructor. The instructor shall ensure that the applicant has operational experience in at least the following areas to the level of performance required for the private pilot:

a) pre-flight operations, including mass and balance determination, aeroplane inspection and servicing;

b) aerodrome and traffic pattern operations, collision avoidance precautions and procedures;

c) control of the aeroplane by external visual reference;

d) flight at critically slow airspeeds; recognition of, and recovery from, incipient and full stalls;

e) flight at critically high airspeeds; recognition of, and recovery from, spiral dives;

f) normal and cross-wind take-offs and landings;

g) maximum performance (short field and obstacle clearance) take-offs; short-field landings;

h) flight by reference solely to instruments, including the completion of a level 180° turn;

i) cross-country flying using visual reference, dead-reckoning and, where available, radio navigation aids;

j) emergency operations, including simulated aeroplane equipment malfunctions; and

k) operations to, from and transitting controlled aerodromes, compliance with air traffic services procedures, radiotelephony procedures and phraseology.

2.3.1.4.2 If the privileges of the licence are to be exercised at night, the applicant shall have received dual instruction in aeroplanes in night flying, including take-offs, landings and navigation.

Note.— The instrument experience specified in 2.3.1.4.1 h) and the night flying experience specified in 2.3.1.4.2 do not entitle the holder of a private pilot licence — aeroplane to pilot aeroplanes under IFR.

2.3.1.5 *Skill*

The applicant shall have demonstrated the ability to perform as pilot-in-command of an aeroplane, the procedures and manoeuvres described in 2.3.1.4 with a degree of competency appropriate to the privileges granted to the holder of a private pilot licence — aeroplane, and to:

a) operate the aeroplane within its limitations;

b) complete all manoeuvres with smoothness and accuracy;

c) exercise good judgement and airmanship;

d) apply aeronautical knowledge; and

e) maintain control of the aeroplane at all times in a manner such that the successful outcome of a procedure or manoeuvre is never seriously in doubt.

2.3.1.6 *Medical fitness*

The applicant shall hold a current Class 2 Medical Assessment.

Note.— Attention is called to 2.6.1.5 on the medical fitness requirements for private pilot licence holders seeking an instrument rating.

2.3.2 Privileges of the holder of the licence and the conditions to be observed in exercising such privileges

2.3.2.1 Subject to compliance with the requirements specified in 1.2.5, 1.2.6 and 2.1, the privileges of the holder of a private pilot licence — aeroplane shall be to act, but not for remuneration, as pilot-in-command or co-pilot of any aeroplane engaged in non-revenue flights.

2.3.2.2 Before exercising the privileges at night, the licence holder shall have complied with the requirements specified in 2.3.1.4.2.

2.4 Commercial pilot licence — Aeroplane

Note.— The ICAO Training Manual *(Doc 7192), Part B-5, contains guidance material for a course of training for the commercial pilot licence — aeroplane.*

2.4.1 Requirements for the issue of the licence

2.4.1.1 *Age*

The applicant shall be not less than 18 years of age.

Note.— Certain privileges of the licence are curtailed by 2.1.10 for licence holders who have attained their 60th birthday.

2.4.1.2 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of a commercial pilot licence — aeroplane, in at least the following subjects:

Air law

a) rules and regulations relevant to the holder of a commercial pilot licence — aeroplane; rules of the air; appropriate air traffic services practices and procedures;

Aircraft general knowledge

b) principles of operation and functioning of aeroplane powerplants, systems and instruments;

c) operating limitations of appropriate aeroplanes and powerplants; relevant operational information from the flight manual or other appropriate document;

d) use and serviceability checks of equipment and systems of appropriate aeroplanes;

e) maintenance procedures for airframes, systems and powerplants of appropriate aeroplanes;

Flight performance and planning

f) effects of loading and mass distribution on aeroplane handling, flight characteristics and performance; mass and balance calculations;

g) use and practical application of take-off, landing and other performance data;

h) pre-flight and en-route flight planning appropriate to operations under VFR; preparation and filing of air traffic services flight plans; appropriate air traffic services procedures; altimeter setting procedures;

Human performance and limitations

i) human performance and limitations relevant to the commercial pilot — aeroplane;

Meteorology

j) interpretation and application of aeronautical meteorological reports, charts and forecasts; use of, and procedures for obtaining, meteorological information, pre-flight and in-flight; altimetry;

k) aeronautical meteorology; climatology of relevant areas in respect of the elements having an effect upon aviation; the movement of pressure systems, the structure of fronts, and the origin and characteristics of significant weather phenomena which affect take-off, en-route and landing conditions; hazardous weather avoidance;

Navigation

l) air navigation, including the use of aeronautical charts, instruments and navigation aids; an understanding of the principles and characteristics of appropriate navigation systems; operation of airborne equipment;

Operational procedures

m) use of aeronautical documentation such as AIP, NOTAM, aeronautical codes and abbreviations;

n) appropriate precautionary and emergency procedures;

o) operational procedures for carriage of freight; potential hazards associated with dangerous goods;

p) requirements and practices for safety briefing to passengers, including precautions to be observed when embarking and disembarking from aeroplanes;

Principles of flight

q) principles of flight relating to aeroplanes;

Radiotelephony

r) radiotelephony procedures and phraseology as applied to VFR operations; action to be taken in case of communication failure.

2.4.1.3 *Experience*

2.4.1.3.1 The applicant shall have completed not less than 200 hours of flight time, or 150 hours if completed during a course of approved training, as a pilot of aeroplanes. The Licensing Authority shall determine whether experience as a pilot under instruction in a synthetic flight trainer, which it has approved, is acceptable as part of the total flight time of 200 hours or 150 hours, as the case may be. Credit for such experience shall be limited to a maximum of 10 hours.

2.4.1.3.1.1 The applicant shall have completed in aeroplanes not less than:

a) 100 hours as pilot-in-command or, in the case of a course of approved training, 70 hours as pilot-in-command;

b) 20 hours of cross-country flight time as pilot-in-command including a cross-country flight totalling not less than 540 km (300 NM) in the course of which full-stop landings at two different aerodromes shall be made;

c) 10 hours of instrument instruction time of which not more than 5 hours may be instrument ground time; and

d) if the privileges of the licence are to be exercised at night, 5 hours of night flight time including 5 take-offs and 5 landings as pilot-in-command.

2.4.1.3.2 When the applicant has flight time as a pilot of aircraft in other categories, the Licensing Authority shall determine whether such experience is acceptable and, if so, the extent to which the flight time requirements of 2.4.1.3.1 can be reduced accordingly.

2.4.1.4 *Flight instruction*

2.4.1.4.1 The applicant shall have received dual instruction in aeroplanes from an authorized flight instructor. The instructor shall ensure that the applicant has operational experience in at least the following areas to the level of performance required for the commercial pilot:

a) pre-flight operations, including mass and balance determination, aeroplane inspection and servicing;

b) aerodrome and traffic pattern operations, collision avoidance precautions and procedures;

c) control of the aeroplane by external visual reference;

d) flight at critically slow airspeeds; spin avoidance; recognition of, and recovery from, incipient and full stalls;

e) flight at critically high airspeeds; recognition of, and recovery from, spiral dives;

f) normal and cross-wind take-offs and landings;

g) maximum performance (short field and obstacle clearance) take-offs; short-field landings;

h) basic flight manoeuvres and recovery from unusual attitudes by reference solely to basic flight instruments;

i) cross-country flying using visual reference, dead-reckoning and radio navigation aids; diversion procedures;

j) abnormal and emergency procedures and manoeuvres; and

k) operations to, from and transitting controlled aerodromes, compliance with air traffic services procedures, radiotelephony procedures and phraseology.

2.4.1.4.2 If the privileges of the licence are to be exercised at night, the applicant shall have received dual instruction in aeroplanes in night flying, including take-offs, landings and navigation.

Note.— The instrument experience specified in 2.4.1.3.1.1 c) and 2.4.1.4.1 h) and the night flying experience specified in 2.4.1.3.1.1 d) and 2.4.1.4.2 do not entitle the holder of a commercial pilot licence — aeroplane to pilot aeroplanes under IFR.

2.4.1.5 *Skill*

The applicant shall have demonstrated the ability to perform as pilot-in-command of an aeroplane, the procedures and manoeuvres described in 2.4.1.4 with a degree of competency appropriate to the privileges granted to the holder of a commercial pilot licence — aeroplane, and to:

a) operate the aeroplane within its limitations;

b) complete all manoeuvres with smoothness and accuracy;

c) exercise good judgement and airmanship;

d) apply aeronautical knowledge; and

e) maintain control of the aeroplane at all times in a manner such that the successful outcome of a procedure or manoeuvre is never seriously in doubt.

2.4.1.6 *Medical fitness*

The applicant shall hold a current Class 1 Medical Assessment.

2.4.2 Privileges of the holder of the licence and the conditions to be observed in exercising such privileges

2.4.2.1 Subject to compliance with the requirements specified in 1.2.5, 1.2.6 and 2.1, the privileges of the holder of a commercial pilot licence — aeroplane shall be:

a) to exercise all the privileges of the holder of a private pilot licence — aeroplane;

b) to act as pilot-in-command in any aeroplane engaged in operations other than commercial air transportation;

c) to act as pilot-in-command in commercial air transportation in any aeroplane certificated for single-pilot operation; and

d) to act as co-pilot in commercial air transportation in aeroplanes required to be operated with a co-pilot.

2.4.2.2 Before exercising the privileges at night, the licence holder shall have complied with the requirements specified in 2.4.1.3.1.1 d) and 2.4.1.4.2.

2.5 Airline transport pilot licence — Aeroplane

2.5.1 Requirements for the issue of the licence

2.5.1.1 *Age*

The applicant shall be not less than 21 years of age.

Note.— Certain privileges of the licence are curtailed by 2.1.10 for licence holders who have attained their 60th birthday.

2.5.1.2 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of an airline transport pilot licence — aeroplane, in at least the following subjects:

Air law

a) rules and regulations relevant to the holder of an airline transport pilot licence — aeroplane; rules of the air; appropriate air traffic services practices and procedures;

Aircraft general knowledge

b) general characteristics and limitations of electrical, hydraulic, pressurization and other aeroplane systems; flight control systems, including autopilot and stability augmentation;

c) principles of operation, handling procedures and operating limitations of aeroplane powerplants; effects of atmospheric conditions on engine performance; relevant operational information from the flight manual or other appropriate document;

d) operating procedures and limitations of appropriate aeroplanes; effects of atmospheric conditions on aeroplane performance;

e) use and serviceability checks of equipment and systems of appropriate aeroplanes;

f) flight instruments; compasses, turning and acceleration errors; gyroscopic instruments, operational limits and precession effects; practices and procedures in the event of malfunctions of various flight instruments;

g) maintenance procedures for airframes, systems and powerplants of appropriate aeroplanes;

Flight performance and planning

h) effects of loading and mass distribution on aeroplane handling, flight characteristics and performance; mass and balance calculations;

i) use and practical application of take-off, landing and other performance data, including procedures for cruise control;

j) pre-flight and en-route operational flight planning; preparation and filing of air traffic services flight plans; appropriate air traffic services procedures; altimeter setting procedures;

Human performance and limitations

k) human performance and limitations relevant to the airline transport pilot — aeroplane;

Meteorology

l) interpretation and application of aeronautical meteorological reports, charts and forecasts; codes and abbreviations; use of, and procedures for obtaining, meteorological information, pre-flight and in-flight; altimetry;

m) aeronautical meteorology; climatology of relevant areas in respect of the elements having an effect upon aviation; the movement of pressure systems; the structure of fronts, and the origin and characteristics of significant weather phenomena which affect take-off, en-route and landing conditions;

n) causes, recognition and effects of engine and airframe icing; frontal zone penetration procedures; hazardous weather avoidance;

o) practical high altitude meteorology, including interpretation and use of weather reports, charts and forecasts; jetstreams;

Navigation

p) air navigation, including the use of aeronautical charts, radio navigation aids and area navigation systems; specific navigation requirements for long-range flights;

q) use, limitation and serviceability of avionics and instruments necessary for the control and navigation of aeroplanes;

r) use, accuracy and reliability of navigation systems used in departure, en-route, approach and landing phases of flight; identification of radio navigation aids;

s) principles and characteristics of self-contained and external-referenced navigation systems; operation of airborne equipment;

Operational procedures

t) interpretation and use of aeronautical documentation such as AIP, NOTAM, aeronautical codes and abbreviations, and instrument procedure charts for departure, en-route, descent and approach;

u) precautionary and emergency procedures; safety practices associated with flight under IFR;

v) operational procedures for carriage of freight and dangerous goods;

w) requirements and practices for safety briefing to passengers, including precautions to be observed when embarking and disembarking from aeroplanes;

Principles of flight

x) principles of flight relating to aeroplanes; sub-sonic aerodynamics; compressibility effects, manoeuvre boundary limits, wing design characteristics, effects of supplementary lift and drag devices; relationships between lift, drag and thrust at various airspeeds and in different flight configurations;

Radiotelephony

y) radiotelephony procedures and phraseology; action to be taken in case of communication failure.

2.5.1.3 *Experience*

2.5.1.3.1 The applicant shall have completed not less than 1 500 hours of flight time as a pilot of aeroplanes. The Licensing Authority shall determine whether experience as a pilot under instruction in a synthetic flight trainer, which it has approved, is acceptable as part of the total flight time of 1 500 hours. Credit for such experience shall be limited to a maximum of 100 hours, of which not more than 25 hours shall have been acquired in a flight procedure trainer or a basic instrument flight trainer.

2.5.1.3.1.1 The applicant shall have completed in aeroplanes not less than:

a) 250 hours, either as pilot-in-command, or made up by not less than 100 hours as pilot-in-command and the necessary additional flight time as co-pilot performing, under the supervision of the pilot-in-command, the duties and functions of a pilot-in-command, provided that the method of supervision employed is acceptable to the Licensing Authority;

b) 200 hours of cross-country flight time, of which not less than 100 hours shall be as pilot-in-command or as co-pilot performing, under the supervision of the pilot-in-command, the duties and functions of a pilot-in-command, provided that the method of supervision employed is acceptable to the Licensing Authority;

c) 75 hours of instrument time, of which not more than 30 hours may be instrument ground time; and

d) 100 hours of night flight as pilot-in-command or as co-pilot.

2.5.1.3.2 When the applicant has flight time as a pilot of aircraft in other categories, the Licensing Authority shall determine whether such experience is acceptable and, if so, the extent to which the flight time requirements of 2.5.1.3.1 can be reduced accordingly.

2.5.1.4 *Flight instruction*

The applicant shall have received the dual flight instruction required for the issue of the commercial pilot licence — aeroplane (2.4.1.4) and for the issue of the instrument rating — aeroplane (2.6.1.3).

2.5.1.5 *Skill*

2.5.1.5.1 The applicant shall have demonstrated the ability to perform, as pilot-in-command of a multi-engined aeroplane required to be operated with a co-pilot, the following procedures and manoeuvres:

a) pre-flight procedures, including the preparation of the operational flight plan and filing of the air traffic services flight plan;

b) normal flight procedures and manoeuvres during all phases of flight;

c) procedures and manoeuvres for IFR operations under normal, abnormal and emergency conditions, including simulated engine failure, and covering at least the following:

— transition to instrument flight on take-off

— standard instrument departures and arrivals

— en-route IFR procedures and navigation

— holding procedures

— instrument approaches to specified minima

— missed approach procedures

— landings from instrument approaches

d) abnormal and emergency procedures and manoeuvres related to failures and malfunctions of equipment, such as powerplant, systems and airframe; and

e) procedures for crew incapacitation and crew co-ordination, including allocation of pilot tasks, crew co-operation and use of checklists.

2.5.1.5.1.1 The applicant shall have demonstrated the ability to perform the procedures and manoeuvres described in 2.5.1.5.1 with a degree of competency appropriate to the privileges granted to the holder of an airline transport pilot licence — aeroplane, and to:

a) operate the aeroplane within its limitations;

b) complete all manoeuvres with smoothness and accuracy;

c) exercise good judgement and airmanship;

d) apply aeronautical knowledge;

e) maintain control of the aeroplane at all times in a manner such that the successful outcome of a procedure or manoeuvre is never in doubt;

f) understand and apply crew co-ordination and incapacitation procedures; and

g) communicate effectively with the other flight crew members.

2.5.1.6 *Medical fitness*

The applicant shall hold a current Class 1 Medical Assessment.

2.5.2 Privileges of the holder of the licence and the conditions to be observed in exercising such privileges

Subject to compliance with the requirements specified in 1.2.5, 1.2.6 and 2.1, the privileges of the holder of an airline transport pilot licence — aeroplane shall be:

a) to exercise all the privileges of the holder of a private and commercial pilot licence — aeroplane and of an instrument rating — aeroplane; and

b) to act as pilot-in-command and co-pilot in aeroplanes in air transportation.

2.6 Instrument rating — Aeroplane

Note.— The ICAO Training Manual *(Doc 7192), Part B-5, contains guidance material for a course of training for the instrument rating — aeroplane.*

2.6.1 Requirements for the issue of the rating

2.6.1.1 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of an instrument rating — aeroplane, in at least the following subjects:

Air law

a) rules and regulations relevant to flight under IFR; related air traffic services practices and procedures;

Aircraft general knowledge

b) use, limitation and serviceability of avionics and instruments necessary for the control and navigation of aeroplanes under IFR and in instrument meteorological conditions; use and limitations of autopilot;

c) compasses, turning and acceleration errors; gyroscopic instruments, operational limits and precession effects; practices and procedures in the event of malfunctions of various flight instruments;

Flight performance and planning

d) pre-flight preparations and checks appropriate to flight under IFR;

e) operational flight planning; preparation and filing of air traffic services flight plans under IFR; altimeter setting procedures;

Human performance and limitations

f) human performance and limitations relevant to instrument flight in aeroplanes;

Meteorology

g) application of aeronautical meteorology; interpretation and use of reports, charts and forecasts; codes and abbreviations; use of, and procedures for obtaining, meteorological information; altimetry;

h) causes, recognition and effects of engine and airframe icing; frontal zone penetration procedures; hazardous weather avoidance;

Navigation

i) practical air navigation using radio navigation aids;

j) use, accuracy and reliability of navigation systems used in departure, en-route, approach and landing phases of flight; identification of radio navigation aids;

Operational procedures

k) interpretation and use of aeronautical documentation such as AIP, NOTAM, aeronautical codes and abbreviations, and instrument procedure charts for departure, en-route, descent and approach;

l) precautionary and emergency procedures; safety practices associated with flight under IFR;

Radiotelephony

m) radiotelephony procedures and phraseology as applied to aircraft operations under IFR; action to be taken in case of communication failure.

2.6.1.2 *Experience*

2.6.1.2.1 The applicant shall hold a private or commercial pilot licence — aeroplane.

2.6.1.2.2 The applicant shall have completed not less than:

a) 50 hours of cross-country flight time as pilot-in-command of aircraft in categories acceptable to the Licensing Authority, of which not less than 10 hours shall be in aeroplanes; and

b) 40 hours of instrument time in aeroplanes or helicopters of which not more than 20 hours, or 30 hours where a flight simulator is used, may be instrument ground time. The ground time shall be under the supervision of an authorized instructor.

2.6.1.3 *Flight instruction*

2.6.1.3.1 The applicant shall have gained not less than 10 hours of the instrument flight time required in 2.6.1.2.2 b) while receiving dual instrument flight instruction in aeroplanes from an authorized flight instructor. The instructor shall ensure that the applicant has operational experience in at least the following areas to the level of performance required for the holder of an instrument rating:

a) pre-flight procedures, including the use of the flight manual or equivalent document, and appropriate air traffic services documents in the preparation of an IFR flight plan;

b) pre-flight inspection, use of checklists, taxiing and pre-take-off checks;

c) procedures and manoeuvres for IFR operation under normal, abnormal and emergency conditions covering at least:

— transition to instrument flight on take-off

— standard instrument departures and arrivals

— en-route IFR procedures

— holding procedures

— instrument approaches to specified minima

— missed approach procedures

— landings from instrument approaches

d) in-flight manoeuvres and particular flight characteristics.

2.6.1.3.2 If the privileges of the instrument rating are to be exercised on multi-engined aeroplanes, the applicant shall have received dual instrument flight instruction in such an aeroplane from an authorized flight instructor. The instructor shall ensure that the applicant has operational experience in the operation of the aeroplane solely by reference to instruments with one engine inoperative or simulated inoperative.

2.6.1.4 *Skill*

2.6.1.4.1 The applicant shall have demonstrated the ability to perform the procedures and manoeuvres described in 2.6.1.3.1 with a degree of competency appropriate to the privileges granted to the holder of an instrument rating — aeroplane, and to:

a) operate the aeroplane within its limitations;

b) complete all manoeuvres with smoothness and accuracy;

c) exercise good judgement and airmanship;

d) apply aeronautical knowledge; and

e) maintain control of the aeroplane at all times in a manner such that the successful outcome of a procedure or manoeuvre is never seriously in doubt.

2.6.1.4.1.1 The applicant shall have demonstrated the ability to operate multi-engined aeroplanes solely by reference to instruments with one engine inoperative, or simulated inoperative, if the privileges of the instrument rating are to be exercised on such aeroplanes.

Note.— Attention is called to 2.1.6 on the use of synthetic flight trainers for demonstrations of skill.

2.6.1.5 *Medical fitness*

2.6.1.5.1 Applicants who hold a private pilot licence shall have established their hearing acuity on the basis of compliance with the hearing requirements for the issue of a Class 1 Medical Assessment.

2.6.1.5.2 **Recommendation.—** *Contracting States should consider requiring the holder of a private pilot licence to comply with the physical and mental, and visual requirements for the issue of a Class 1 Medical Assessment.*

2.6.2 Privileges of the holder of the rating and the conditions to be observed in exercising such privileges

2.6.2.1 Subject to compliance with the requirements specified in 1.2.5, 1.2.6 and 2.1, the privileges of the holder of an instrument rating — aeroplane shall be to pilot aeroplanes under IFR.

2.6.2.2 Before exercising the privileges on multi-engined aeroplanes, the holder of the rating shall have complied with the requirements of 2.6.1.4.1.1.

Note.— Attention is called to 2.10.3 on the exercise of joint privileges of the instrument rating — aeroplane and of the instrument rating — helicopter.

2.7 Private pilot licence — Helicopter

2.7.1 Requirements for the issue of the licence

2.7.1.1 *Age*

The applicant shall be not less than 17 years of age.

2.7.1.2 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of a private pilot licence — helicopter, in at least the following subjects:

Air law

a) rules and regulations relevant to the holder of a private pilot licence — helicopter; rules of the air; appropriate air traffic services practices and procedures;

Aircraft general knowledge

b) principles of operation of helicopter powerplants, transmission (power-trains), systems and instruments;

c) operating limitations of helicopters and powerplants; relevant operational information from the flight manual;

Flight performance and planning

d) effects of loading and mass distribution on flight characteristics; mass and balance calculations;

e) use and practical application of take-off, landing and other performance data;

f) pre-flight and en-route flight planning appropriate to private operations under VFR; preparation and filing of air traffic services flight plans; appropriate air traffic services procedures; position reporting procedures; altimeter setting procedures; operations in areas of high-density traffic;

Human performance and limitations

g) human performance and limitations relevant to the private pilot — helicopter;

Meteorology

h) application of elementary aeronautical meteorology; use of, and procedures for obtaining, meteorological information; altimetry;

Navigation

i) practical aspects of air navigation and dead-reckoning techniques; use of aeronautical charts;

Operational procedures

j) use of aeronautical documentation such as AIP, NOTAM, aeronautical codes and abbreviations;

k) appropriate precautionary and emergency procedures, including action to be taken to avoid hazardous weather and wake turbulence; settling with power, ground resonance, roll-over and other operating hazards;

Principles of flight

l) principles of flight relating to helicopters;

Radiotelephony

m) radiotelephony procedures and phraseology as applied to VFR operations; action to be taken in case of communication failure.

2.7.1.3 *Experience*

2.7.1.3.1 The applicant shall have completed not less than 40 hours of flight time as a pilot of helicopters. The Licensing Authority shall determine whether experience as a pilot under instruction in a synthetic flight trainer, which it has approved, is acceptable as part of the total flight time of 40 hours. Credit for such experience shall be limited to a maximum of 5 hours.

2.7.1.3.1.1 When the applicant has flight time as a pilot of aircraft in other categories, the Licensing Authority shall determine whether such experience is acceptable and, if so, the extent to which the flight time requirements of 2.7.1.3.1 can be reduced accordingly.

2.7.1.3.2 The applicant shall have completed in helicopters not less than 10 hours of solo flight time under the supervision of an authorized flight instructor, including 5 hours of solo cross-country flight time with at least one cross-country flight totalling not less than 180 km (100 NM) in the course of which landings at two different points shall be made.

2.7.1.4 *Flight instruction*

2.7.1.4.1 The applicant shall have received not less than 20 hours of dual instruction time in helicopters from an authorized flight instructor. The instructor shall ensure that the applicant has operational experience in at least the following areas to the level of performance required for the private pilot:

a) pre-flight operations, including mass and balance determination, helicopter inspection and servicing;

b) aerodrome and traffic pattern operations, collision avoidance precautions and procedures;

c) control of the helicopter by external visual reference;

d) recovery at the incipient stage from settling with power; recovery techniques from low-rotor rpm within the normal range of engine rpm;

e) ground manoeuvring and run-ups; hovering; take-offs and landings — normal, out of wind and sloping ground;

f) take-offs and landings with minimum necessary power; maximum performance take-off and landing techniques; restricted site operations; quick stops;

g) cross-country flying using visual reference, dead reckoning and, where available, radio navigation aids, including a flight of at least one hour;

h) emergency operations, including simulated helicopter equipment malfunctions; autorotative approach and landing; and

i) operations to, from and transitting controlled aerodromes, compliance with air traffic services procedures, radiotelephony procedures and phraseology.

2.7.1.4.1.1 **Recommendation.**— *The applicant should have received dual instrument flight instruction from an authorized flight instructor. The instructor should ensure that the applicant has operational experience in flight solely by reference to instruments, including the completion of a level 180° turn, in a suitably instrumented helicopter.*

2.7.1.4.2 If the privileges of the licence are to be exercised at night, the applicant shall have received dual instruction in helicopters in night flying, including take-offs, landings and navigation.

Note.— The instrument experience specified in 2.7.1.4.1.1 and the night flying experience specified in 2.7.1.4.2 do not entitle the holder of a private pilot licence — helicopter to pilot helicopters under IFR.

2.7.1.5 *Skill*

The applicant shall have demonstrated the ability to perform as pilot-in-command of a helicopter, the procedures and manoeuvres described in 2.7.1.4 with a degree of competency appropriate to the privileges granted to the holder of a private pilot licence — helicopter, and to:

a) operate the helicopter within its limitations;

b) complete all manoeuvres with smoothness and accuracy;

c) exercise good judgement and airmanship;

d) apply aeronautical knowledge; and

e) maintain control of the helicopter at all times in a manner such that the successful outcome of a procedure or manoeuvre is never seriously in doubt.

2.7.1.6 *Medical fitness*

The applicant shall hold a current Class 2 Medical Assessment.

Note.— Attention is called to 2.10.1.5 on the medical fitness requirements for private pilot licence holders seeking an instrument rating.

2.7.2 Privileges of the holder of the licence and the conditions to be observed in exercising such privileges

2.7.2.1 Subject to compliance with the requirements specified in 1.2.5, 1.2.6 and 2.1, the privileges of the holder of a private pilot licence — helicopter shall be to act, but not for remuneration, as pilot-in-command or co-pilot of any helicopter engaged in non-revenue flights.

2.7.2.2 Before exercising the privileges at night, the licence holder shall have complied with the requirements specified in 2.7.1.4.2.

2.8 Commercial pilot licence — Helicopter

2.8.1 Requirements for the issue of the licence

2.8.1.1 *Age*

The applicant shall be not less than 18 years of age.

Note.— Certain privileges of the licence are curtailed by 2.1.10 for licence holders who have attained their 60th birthday.

2.8.1.2 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of a commercial pilot licence — helicopter, in at least the following subjects:

Air law

a) rules and regulations relevant to the holder of a commercial pilot licence — helicopter; rules of the air; appropriate air traffic services practices and procedures;

Aircraft general knowledge

b) principles of operation and functioning of helicopter powerplants, transmission (power-trains), systems and instruments;

c) operating limitations of appropriate helicopters and powerplants; relevant operational information from the flight manual;

d) use and serviceability checks of equipment and systems of appropriate helicopters;

e) maintenance procedures for airframes, systems and powerplants of appropriate helicopters;

Flight performance and planning

f) effects of loading and mass distribution, including external loads, on helicopter handling, flight characteristics and performance; mass and balance calculations;

g) use and practical application of take-off, landing and other performance data;

h) pre-flight and en-route flight planning appropriate to operations under VFR; preparation and filing of air traffic services flight plans; appropriate air traffic services procedures; altimeter setting procedures;

Human performance and limitations

i) human performance and limitations relevant to the commercial pilot — helicopter;

Meteorology

j) interpretation and application of aeronautical meteorological reports, charts and forecasts; use of, and procedures for obtaining, meteorological information, pre-flight and in-flight; altimetry;

k) aeronautical meteorology; climatology of relevant areas in respect of the elements having an effect upon aviation; the movement of pressure systems, the structure of fronts, and the origin and characteristics of significant weather phenomena which affect take-off, en-route and landing conditions; hazardous weather avoidance;

Navigation

l) air navigation, including the use of aeronautical charts, instruments and navigation aids; an understanding of the principles and characteristics of appropriate navigation systems; operation of airborne equipment;

Operational procedures

m) use of aeronautical documentation such as AIP, NOTAM, aeronautical codes and abbreviations;

n) appropriate precautionary and emergency procedures; settling with power, ground resonance, roll-over and other operating hazards;

o) operational procedures for carriage of freight, including external loads; potential hazards associated with dangerous goods;

p) requirements and practices for safety briefing to passengers, including precautions to be observed when embarking and disembarking from helicopters;

Principles of flight

q) principles of flight relating to helicopters;

Radiotelephony

r) radiotelephony procedures and phraseology as applied to VFR operations; action to be taken in case of communication failure.

2.8.1.3 *Experience*

2.8.1.3.1 The applicant shall have completed not less than 150 hours of flight time, or 100 hours if completed during a course of approved training, as a pilot of helicopters. The Licensing Authority shall determine whether experience as a pilot under instruction in a synthetic flight trainer, which it has approved, is acceptable as part of the total flight time of 150 hours or 100 hours, as the case may be. Credit for such experience shall be limited to a maximum of 10 hours.

2.8.1.3.1.1 The applicant shall have completed in helicopters not less than:

a) 35 hours as pilot-in-command;

b) 10 hours of cross-country flight time as pilot-in-command including a cross-country flight in the course of which landings at two different points shall be made;

c) 10 hours of instrument instruction time of which not more than 5 hours may be instrument ground time; and

d) if the privileges of the licence are to be exercised at night, 5 hours of night flight time including 5 take-offs and 5 landing patterns as pilot-in-command.

2.8.1.3.2 When the applicant has flight time as a pilot of aircraft in other categories, the Licensing Authority shall determine whether such experience is acceptable and, if so, the extent to which the flight time requirements of 2.8.1.3.1 can be reduced accordingly.

2.8.1.4 *Flight instruction*

2.8.1.4.1 The applicant shall have received dual instruction in helicopters from an authorized flight instructor. The instructor shall ensure that the applicant has operational experience in at least the following areas to the level of performance required for the commercial pilot:

a) pre-flight operations, including mass and balance determination, helicopter inspection and servicing;

b) aerodrome and traffic pattern operations, collision avoidance precautions and procedures;

c) control of the helicopter by external visual reference;

d) recovery at the incipient stage from settling with power; recovery techniques from low-rotor rpm within the normal range of engine rpm;

e) ground manoeuvring and run-ups; hovering; take-offs and landings — normal, out of wind and sloping ground; steep approaches;

f) take-offs and landings with minimum necessary power; maximum performance take-off and landing techniques; restricted site operations; quick stops;

g) hovering out of ground effect; operations with external load, if applicable; flight at high altitude;

h) basic flight manoeuvres and recovery from unusual attitudes by reference solely to basic flight instruments;

i) cross-country flying using visual reference, dead-reckoning and radio navigation aids; diversion procedures;

j) abnormal and emergency procedures, including simulated helicopter equipment malfunctions, autorotative approach and landing; and

k) operations to, from and transitting controlled aerodromes, compliance with air traffic services procedures, radiotelephony procedures and phraseology.

2.8.1.4.2 If the privileges of the licence are to be exercised at night, the applicant shall have received dual instruction in helicopters in night flying, including take-offs, landings and navigation.

Note.— The instrument experience specified in 2.8.1.3.1.1 c) and 2.8.1.4.1 h) and the night flying experience specified in 2.8.1.3.1.1 d) and 2.8.1.4.2 do not entitle the holder of a commercial pilot licence — helicopter to pilot helicopters under IFR.

2.8.1.5 *Skill*

The applicant shall have demonstrated the ability to perform as pilot-in-command of a helicopter, the procedures and manoeuvres described in 2.8.1.4 with a degree of competency appropriate to the privileges granted to the holder of a commercial pilot licence — helicopter, and to:

a) operate the helicopter within its limitations;

b) complete all manoeuvres with smoothness and accuracy;

c) exercise good judgement and airmanship;

d) apply aeronautical knowledge; and

e) maintain control of the helicopter at all times in a manner such that the successful outcome of a procedure or manoeuvre is never seriously in doubt.

2.8.1.6 *Medical fitness*

The applicant shall hold a current Class 1 Medical Assessment.

2.8.2 Privileges of the holder of the licence and the conditions to be observed in exercising such privileges

2.8.2.1 Subject to compliance with the requirements specified in 1.2.5, 1.2.6 and 2.1, the privileges of the holder of a commercial pilot licence — helicopter shall be:

a) to exercise all the privileges of the holder of a private pilot licence — helicopter;

b) to act as pilot-in-command in any helicopter engaged in operations other than commercial air transportation;

c) to act as pilot-in-command in commercial air transportation in any helicopter certificated for single-pilot operation; and

d) to act as co-pilot in commercial air transportation in helicopters required to be operated with a co-pilot.

2.8.2.2 Before exercising the privileges at night, the licence holder shall have complied with the requirements specified in 2.8.1.3.1.1 d) and 2.8.1.4.2.

2.9 Airline transport pilot licence — Helicopter

2.9.1 Requirements for the issue of the licence

2.9.1.1 *Age*

The applicant shall be not less than 21 years of age.

Note.— Certain privileges of the licence are curtailed by 2.1.10 for licence holders who have attained their 60th birthday.

2.9.1.2 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of an airline transport pilot licence — helicopter, in at least the following subjects:

Air law

a) rules and regulations relevant to the holder of an airline transport pilot licence — helicopter; rules of the air; appropriate air traffic services practices and procedures;

Aircraft general knowledge

b) general characteristics and limitations of electrical, hydraulic, and other helicopter systems; flight control systems, including autopilot and stability augmentation;

c) principles of operation, handling procedures and operating limitations of helicopter powerplants; transmission (power-trains); effects of atmospheric conditions on engine performance; relevant operational information from the flight manual;

d) operating procedures and limitations of appropriate helicopters; effects of atmospheric conditions on helicopter performance; relevant operational information from the flight manual;

e) use and serviceability checks of equipment and systems of appropriate helicopters;

f) flight instruments; compasses, turning and acceleration errors; gyroscopic instruments, operational limits and precession effects; practices and procedures in the event of malfunctions of various flight instruments;

g) maintenance procedures for airframes, systems and powerplants of appropriate helicopters;

Flight performance and planning

h) effects of loading and mass distribution, including external loads, on helicopter handling, flight characteristics and performance; mass and balance calculations;

i) use and practical application of take-off, landing and other performance data, including procedures for cruise control;

j) pre-flight and en-route operational flight planning; preparation and filing of air traffic services flight plans; appropriate air traffic services procedures; altimeter setting procedures;

Human performance and limitations

k) human performance and limitations relevant to the airline transport pilot — helicopter;

Meteorology

l) interpretation and application of aeronautical meteorological reports, charts and forecasts; codes and abbreviations; use of, and procedures for obtaining, meteorological information, pre-flight and in-flight; altimetry;

m) aeronautical meteorology; climatology of relevant areas in respect of the elements having an effect upon aviation; the movement of pressure systems, the structure of fronts, and the origin and characteristics of significant weather phenomena which affect take-off, en-route and landing conditions;

n) causes, recognition and effects of engine, airframe and rotor icing; hazardous weather avoidance;

Navigation

o) air navigation, including the use of aeronautical charts, radio navigation aids and area navigation systems; specific navigation requirements for long-range flights;

p) use, limitation and serviceability of avionics and instruments necessary for the control and navigation of helicopters;

q) use, accuracy and reliability of navigation systems; identification of radio navigation aids;

r) principles and characteristics of self-contained and external-referenced navigation systems; operation of airborne equipment;

Operational procedures

s) interpretation and use of aeronautical documentation such as AIP, NOTAM, aeronautical codes and abbreviations;

t) precautionary and emergency procedures; settling with power, ground resonance, retreating blade stall, dynamic roll-over and other operating hazards; safety practices associated with flight under VFR;

u) operational procedures for carriage of freight, including external loads, and dangerous goods;

v) requirements and practices for safety briefing to passengers, including precautions to be observed when embarking and disembarking from helicopters;

Principles of flight

w) principles of flight relating to helicopters;

Radiotelephony

x) radiotelephony procedures and phraseology as applied to VFR operations; action to be taken in case of communication failure.

2.9.1.3 *Experience*

2.9.1.3.1 The applicant shall have completed not less than 1 000 hours of flight time as a pilot of helicopters.

The Licensing Authority shall determine whether experience as a pilot under instruction in a synthetic flight trainer, which it has approved, is acceptable as part of the total flight time of 1 000 hours. Credit for such experience shall be limited to a maximum of 100 hours, of which not more than 25 hours shall have been acquired in a flight procedure trainer or a basic instrument flight trainer.

2.9.1.3.1.1 The applicant shall have completed in helicopters not less than:

a) 250 hours, either as pilot-in-command, or made up by not less than 100 hours as pilot-in-command and the necessary additional flight time as co-pilot performing, under the supervision of the pilot-in-command, the duties and functions of a pilot-in-command, provided that the method of supervision employed is acceptable to the Licensing Authority;

b) 200 hours of cross-country flight time, of which not less than 100 hours shall be as pilot-in-command or as co-pilot performing, under the supervision of the pilot-in-command, the duties and functions of a pilot-in-command, provided that the method of supervision employed is acceptable to the Licensing Authority;

c) 30 hours of instrument time, of which not more than 10 hours may be instrument ground time; and

d) 50 hours of night flight as pilot-in-command or as co-pilot.

2.9.1.3.2 When the applicant has flight time as a pilot of aircraft in other categories, the Licensing Authority shall determine whether such experience is acceptable and, if so, the extent to which the flight time requirements of 2.9.1.3.1 can be reduced accordingly.

2.9.1.4 *Flight instruction*

The applicant shall have received the flight instruction required for the issue of the commercial pilot licence — helicopter (2.8.1.4).

Note.— The instrument time specified in 2.9.1.3.1.1 c) and the night flying time specified in 2.9.1.3.1.1 d) do not entitle the holder of the airline transport pilot licence — helicopter to pilot helicopters under IFR.

2.9.1.5 *Skill*

2.9.1.5.1 The applicant shall have demonstrated the ability to perform, as pilot-in-command of a helicopter required to be operated with a co-pilot, the following procedures and manoeuvres:

a) pre-flight procedures, including the preparation of the operational flight plan and filing of the air traffic services flight plan;

b) normal flight procedures and manoeuvres during all phases of flight;

c) abnormal and emergency procedures and manoeuvres related to failures and malfunctions of equipment, such as powerplant, systems and airframe; and

d) procedures for crew incapacitation and crew co-ordination including allocation of pilot tasks, crew co-operation and use of checklists.

2.9.1.5.1.1 The applicant shall have demonstrated the ability to perform the procedures and manoeuvres described in 2.9.1.5.1 with a degree of competency appropriate to the privileges granted to the holder of an airline transport pilot licence — helicopter, and to:

a) operate the helicopter within its limitations;

b) complete all manoeuvres with smoothness and accuracy;

c) exercise good judgement and airmanship;

d) apply aeronautical knowledge;

e) maintain control of the helicopter at all times in a manner such that the successful outcome of a procedure or manoeuvre is never in doubt;

f) understand and apply crew co-ordination and incapacitation procedures; and

g) communicate effectively with the other flight crew members.

2.9.1.6 *Medical fitness*

The applicant shall hold a current Class 1 Medical Assessment.

2.9.2 Privileges of the holder of the licence and the conditions to be observed in exercising such privileges

Subject to compliance with the requirements specified in 1.2.5, 1.2.6 and 2.1, the privileges of the holder of an airline transport pilot licence — helicopter shall be:

a) to exercise all the privileges of the holder of a private and commercial pilot licence — helicopter; and

b) to act as pilot-in-command and co-pilot in helicopters in air transportation.

2.10 Instrument rating — Helicopter

2.10.1 Requirements for the issue of the rating

2.10.1.1 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of an instrument rating — helicopter, in at least the following subjects:

Air law

a) rules and regulations relevant to flight under IFR; related air traffic services practices and procedures;

Aircraft general knowledge

b) use, limitation and serviceability of avionics and instruments necessary for the control and navigation of helicopters under IFR and in instrument meteorological conditions; use and limitations of autopilot;

c) compasses, turning and acceleration errors; gyroscopic instruments, operational limits and precession effects; practices and procedures in the event of malfunctions of various flight instruments;

Flight performance and planning

d) pre-flight preparations and checks appropriate to flight under IFR;

e) operational flight planning; preparation and filing of air traffic services flight plans under IFR; altimeter setting procedures;

Human performance and limitations

f) human performance and limitations relevant to instrument flight in helicopters;

Meteorology

g) application of aeronautical meteorology; interpretation and use of reports, charts and forecasts; codes and abbreviations; use of, and procedures for obtaining, meteorological information; altimetry;

h) causes, recognition and effects of engine, airframe and rotor icing; frontal zone penetration procedures; hazardous weather avoidance;

Navigation

i) practical air navigation using radio navigation aids;

j) use, accuracy and reliability of navigation systems used in departure, en-route, approach and landing phases of flight; identification of radio navigation aids;

Operational procedures

k) interpretation and use of aeronautical documentation such as AIP, NOTAM, aeronautical codes and abbreviations, and instrument procedure charts for departure, en route, descent and approach;

l) precautionary and emergency procedures; safety practices associated with flight under IFR;

Radiotelephony

m) radiotelephony procedures and phraseology as applied to aircraft operations under IFR; action to be taken in case of communication failure.

2.10.1.2 *Experience*

2.10.1.2.1 The applicant shall hold a private, commercial or airline transport pilot licence — helicopter.

2.10.1.2.2 The applicant shall have completed not less than:

a) 50 hours of cross-country flight time as pilot-in-command of aircraft in categories acceptable to the Licensing Authority, of which not less than 10 hours shall be in helicopters; and

b) 40 hours of instrument time in helicopters or aeroplanes of which not more than 20 hours, or 30 hours where a flight simulator is used, may be instrument ground time. The ground time shall be under the supervision of an authorized instructor.

2.10.1.3 *Flight instruction*

The applicant shall have gained not less than 10 hours of the instrument flight time required in 2.10.1.2.2 b) while receiving dual instrument flight instruction in helicopters from an authorized flight instructor. The instructor shall ensure that the applicant has operational experience in at least the following areas and to the level of performance required for the holder of an instrument rating:

a) pre-flight procedures, including the use of the flight manual or equivalent document, and appropriate air traffic services documents in the preparation of an IFR flight plan;

b) pre-flight inspection, use of checklists, taxiing and pre-take-off checks;

c) procedures and manoeuvres for IFR operation under normal, abnormal and emergency conditions covering at least:

— transition to instrument flight on take-off

— standard instrument departures and arrivals

— en-route IFR procedures

— holding procedures

— instrument approaches to specified minima

— missed approach procedures

— landings from instrument approaches

d) in-flight manoeuvres and particular flight characteristics; and

e) if appropriate, operation of a multi-engined helicopter solely by reference to instruments with one engine inoperative or simulated inoperative.

2.10.1.4 *Skill*

The applicant shall have demonstrated the ability to perform the procedures and manoeuvres specified in 2.10.1.3 with a degree of competency appropriate to the privileges granted to the holder of an instrument rating — helicopter, and to:

a) operate the helicopter within its limitations;

b) complete all manoeuvres with smoothness and accuracy;

c) exercise good judgement and airmanship;

d) apply aeronautical knowledge; and

e) maintain control of the helicopter at all times in a manner such that the successful outcome of a procedure or manoeuvre is never seriously in doubt.

Note.— Attention is called to 2.1.6 on the use of synthetic flight trainers for demonstrations of skill.

2.10.1.5 *Medical fitness*

2.10.1.5.1 Applicants who hold a private pilot licence shall have established their hearing acuity on the basis of compliance with the hearing requirements for the issue of a Class 1 Medical Assessment.

2.10.1.5.2 **Recommendation.**— *Contracting States should consider requiring the holder of a private pilot licence to comply with the physical and mental, and visual requirements for the issue of a Class 1 Medical Assessment.*

2.10.2 Privileges of the holder of the rating and the conditions to be observed in exercising such privileges

Subject to compliance with the requirements specified in 1.2.5, 1.2.6 and 2.1, the privileges of the holder of an instrument rating — helicopter shall be to pilot helicopters under IFR.

2.10.3 Exercise of joint privileges of the instrument rating — aeroplane and the instrument rating — helicopter

The privileges given in 2.6.2 and 2.10.2 may be conferred by a single instrument rating in lieu of issuing separate instrument ratings for aeroplanes and helicopters provided that the requirements for the issue of both ratings, as specified in 2.6 and 2.10, have been met.

2.11 Flight instructor rating appropriate to aeroplanes and helicopters

2.11.1 Requirements for the issue of the rating

2.11.1.1 *Knowledge*

The applicant shall have met the knowledge requirements for the issue of a commercial pilot licence as specified in 2.4.1.2 or 2.8.1.2 as appropriate. In addition, the applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of a flight instructor rating, in at least the following areas:

a) techniques of applied instruction;

b) assessment of student performance in those subjects in which ground instruction is given;

c) the learning process;

d) elements of effective teaching;

e) student evaluation and testing, training philosophies;

f) training programme development;

g) lesson planning;

h) classroom instructional techniques;

i) use of training aids;

j) analysis and correction of student errors;

k) human performance and limitations relevant to flight instruction; and

l) hazards involved in simulating system failures and malfunctions in the aircraft.

2.11.1.2 *Experience*

The applicant shall have met the experience requirements for the issue of a commercial pilot licence as specified in 2.4.1.3 or 2.8.1.3, as appropriate.

2.11.1.3 *Flight instruction*

The applicant shall, under the supervision of a flight instructor accepted by the Licensing Authority for that purpose:

a) have received instruction in flight instructional techniques including demonstration, student practices, recognition and correction of common student errors; and

b) have practised instructional techniques in those flight manoeuvres and procedures in which it is intended to provide flight instruction.

2.11.1.4 *Skill*

The applicant shall have demonstrated, in the category of aircraft for which flight instructor privileges are sought, the ability to instruct in those areas in which flight instruction is to be given, including pre-flight, post-flight and ground instruction as appropriate.

2.11.2 Privileges of the holder of the rating and the conditions to be observed in exercising such privileges

Subject to compliance with the requirements specified in 1.2.5 and 2.1, the privileges of the holder of a flight instructor rating shall be:

a) to supervise solo flights by student pilots; and

b) to carry out flight instruction for the issue of a private pilot licence, a commercial pilot licence, an instrument rating, and a flight instructor rating

provided that the flight instructor:

1) holds at least the licence and rating for which instruction is being given, in the appropriate aircraft category;

2) holds the licence and rating necessary to act as the pilot-in-command of the aircraft on which the instruction is given; and

3) has the flight instructor privileges granted entered on the licence.

2.12 Glider pilot licence

2.12.1 Requirements for the issue of the licence

2.12.1.1 *Age*

The applicant shall be not less than 16 years of age.

2.12.1.2 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of a glider pilot licence, in at least the following subjects:

Air law

a) rules and regulations relevant to the holder of a glider pilot licence; rules of the air; appropriate air traffic services practices and procedures;

Aircraft general knowledge

b) principles of operation of glider systems and instruments;

c) operating limitations of gliders; relevant operational information from the flight manual or other appropriate document;

Flight performance and planning

d) effects of loading and mass distribution on flight characteristics; mass and balance considerations;

e) use and practical application of launching, landing and other performance data;

f) pre-flight and en-route flight planning appropriate to operations under VFR; appropriate air traffic services procedures; altimeter setting procedures; operations in areas of high-density traffic;

Human performance and limitations

g) human performance and limitations relevant to the glider pilot;

Meteorology

h) application of elementary aeronautical meteorology; use of, and procedures for obtaining, meteorological information; altimetry;

Navigation

i) practical aspects of air navigation and dead-reckoning techniques; use of aeronautical charts;

Operational procedures

j) use of aeronautical documentation such as AIP, NOTAM, aeronautical codes and abbreviations;

k) different launch methods and associated procedures;

l) appropriate precautionary and emergency procedures, including action to be taken to avoid hazardous weather and wake turbulence and other operating hazards;

Principles of flight

m) principles of flight relating to gliders.

2.12.1.2.1 **Recommendation.**— *The applicant should have demonstrated a level of knowledge appropriate to the privileges to be granted to the holder of a glider pilot licence, in radiotelephony procedures and phraseology as appropriate to VFR operations and on action to be taken in case of communication failure.*

2.12.1.3 *Experience*

2.12.1.3.1 The applicant shall have completed not less than six hours of flight time as a pilot of gliders including two hours' solo flight time during which not less than 20 launches and landings have been performed.

2.12.1.3.1.1 When the applicant has flight time as a pilot of aeroplanes, the Licensing Authority shall determine whether such experience is acceptable and, if so, the extent to which the flight time requirements of 2.12.1.3.1 can be reduced accordingly.

2.12.1.3.2 The applicant shall have gained, under appropriate supervision, operational experience in gliders in at least the following areas:

a) pre-flight operations, including glider assembly and inspection;

b) techniques and procedures for the launching method used, including appropriate airspeed limitations, emergency procedures and signals used;

c) traffic pattern operations, collision avoidance precautions and procedures;

d) control of the glider by external visual reference;

e) flight throughout the flight envelope;

f) recognition of, and recovery from, incipient and full stalls and spiral dives;

g) normal and cross-wind launches, approaches and landings;

h) cross-country flying using visual reference and dead-reckoning;

i) emergency procedures.

2.12.1.4 *Skill*

The applicant shall have demonstrated the ability to perform as pilot-in-command of a glider, the procedures and manoeuvres described in 2.12.1.3.2 with a degree of competency appropriate to the privileges granted to the holder of a glider pilot licence, and to:

a) operate the glider within its limitations;

b) complete all manoeuvres with smoothness and accuracy;

c) exercise good judgement and airmanship;

d) apply aeronautical knowledge; and

e) maintain control of the glider at all times in a manner such that the successful outcome of a procedure or manoeuvre is never seriously in doubt.

2.12.1.5 *Medical fitness*

The applicant shall hold a current Class 2 Medical Assessment.

2.12.2 Privileges of the holder of the licence and the conditions to be observed in exercising such privileges

2.12.2.1 Subject to compliance with the requirements specified in 1.2.5, 1.2.6 and 2.1, the privileges of the holder of a glider pilot licence shall be to act as pilot-in-command of any glider provided the licence holder has operational experience in the launching method used.

2.12.2.2 **Recommendation.**— *If passengers are to be carried, the licence holder should have completed not less than 10 hours of flight time as a pilot of gliders.*

2.13 Free balloon pilot licence

Note.— The provisions of the free balloon pilot licence apply to free balloons using hot air or gas.

2.13.1 Requirements for the issue of the licence

2.13.1.1 *Age*

The applicant shall be not less than 16 years of age.

2.13.1.2 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of a free balloon pilot licence, in at least the following subjects:

Air law

a) rules and regulations relevant to the holder of a free balloon pilot licence; rules of the air; appropriate air traffic services practices and procedures;

Aircraft general knowledge

b) principles of operation of free balloon systems and instruments;

c) operating limitations of free balloons; relevant operational information from the flight manual or other appropriate document;

d) physical properties and practical application of gases used in free balloons;

Flight performance and planning

e) effects of loading on flight characteristics; mass calculations;

f) use and practical application of launching, landing and other performance data, including the effect of temperature;

g) pre-flight and en-route flight planning appropriate to operations under VFR; appropriate air traffic services procedures; altimeter setting procedures; operations in areas of high-density traffic;

Human performance and limitations

h) human performance and limitations relevant to the free balloon pilot;

Meteorology

i) application of elementary aeronautical meteorology; use of, and procedures for obtaining, meteorological information; altimetry;

Navigation

j) practical aspects of air navigation and dead-reckoning techniques; use of aeronautical charts;

Operational procedures

k) use of aeronautical documentation such as AIP, NOTAM, aeronautical codes and abbreviations;

l) appropriate precautionary and emergency procedures, including action to be taken to avoid hazardous weather, wake turbulence and other operating hazards;

Principles of flight

m) principles of flight relating to free balloons.

2.13.1.2.1 **Recommendation.—** *The applicant should have demonstrated a level of knowledge appropriate to the privileges to be granted to the holder of a free balloon pilot licence, in radiotelephony procedures and phraseology as appropriate to VFR operations and on action to be taken in case of communication failure.*

2.13.1.3 *Experience*

2.13.1.3.1 The applicant shall have completed not less than 16 hours of flight time as a pilot of free balloons including at least eight launches and ascents of which one must be solo.

2.13.1.3.2 The applicant shall have gained, under appropriate supervision, operational experience in free balloons in at least the following areas:

a) pre-flight operations, including balloon assembly, rigging, inflation, mooring and inspection;

b) techniques and procedures for the launching and ascent, including appropriate limitations, emergency procedures and signals used;

c) collision avoidance precautions;

d) control of a free balloon by external visual reference;

e) recognition of, and recovery from, rapid descents;

f) cross-country flying using visual reference and dead-reckoning;

g) approaches and landings, including ground handling;

h) emergency procedures.

2.13.1.3.3 If the privileges of the licence are to be exercised at night, the applicant shall have gained, under appropriate supervision, operational experience in free balloons in night flying.

2.13.1.4 *Skill*

The applicant shall have demonstrated the ability to perform as pilot-in-command of a free balloon, the procedures and manoeuvres described in 2.13.1.3.2 with a degree of competency appropriate to the privileges granted to the holder of a free balloon pilot licence, and to:

a) operate the free balloon within its limitations;

b) complete all manoeuvres with smoothness and accuracy;

c) exercise good judgement and airmanship;

d) apply aeronautical knowledge; and

e) maintain control of the free balloon at all times in a manner such that the successful outcome of a procedure or manoeuvre is never seriously in doubt.

2.13.1.5 *Medical fitness*

The applicant shall hold a current Class 2 Medical Assessment.

2.13.2 Privileges of the holder of the licence and the conditions to be observed in exercising such privileges

2.13.2.1 Subject to compliance with the requirements specified in 1.2.5, 1.2.6 and 2.1, the privileges of the holder of a free balloon pilot licence shall be to act as pilot-in-command of any free balloon provided that the licence holder has operational experience in hot air or gas balloons as appropriate.

2.13.2.2 Before exercising the privileges at night, the licence holder shall have complied with the requirements specified in 2.13.1.3.3.

CHAPTER 3. LICENCES FOR FLIGHT CREW MEMBERS OTHER THAN LICENCES FOR PILOTS

Note.— The present (Eighth) edition of Annex 1 no longer contains specifications for the flight radio operator licence. However, if such a licence has been issued before 16 November 1989, the issuing State may maintain its validity until 15 November 1994.

3.1 General rules concerning flight navigator and flight engineer licences

3.1.1 An applicant shall, before being issued with a flight navigator licence or a flight engineer licence, meet such requirements in respect of age, knowledge, experience, skill and medical fitness as are specified for those licences.

3.1.1.1 An applicant for a flight navigator licence or a flight engineer licence shall demonstrate such requirements for knowledge and skill as are specified for those licences, in a manner determined by the Licensing Authority.

3.2 Flight navigator licence

3.2.1 Requirements for the issue of the licence

3.2.1.1 *Age*

The applicant shall be not less than 18 years of age.

3.2.1.2 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of a flight navigator licence, in at least the following subjects:

Air law

a) rules and regulations relevant to the holder of a flight navigator licence; appropriate air traffic services practices and procedures;

Flight performance and planning

b) effects of loading and mass distribution on aircraft performance;

c) use of take-off, landing and other performance data including procedures for cruise control;

d) pre-flight and en-route operational flight planning; preparation and filing of air traffic services flight plans; appropriate air traffic services procedures; altimeter setting procedures;

Human performance and limitations

e) human performance and limitations relevant to the flight navigator;

Meteorology

f) interpretation and practical application of aeronautical meteorological reports, charts and forecasts; codes and abbreviations; use of, and procedures for obtaining, meteorological information, pre-flight and in-flight; altimetry;

g) aeronautical meteorology; climatology of relevant areas in respect of the elements having an effect upon aviation; the movement of pressure systems; the structure of fronts, and the origin and characteristics of significant weather phenomena which affect take-off, en-route and landing conditions;

Navigation

h) dead-reckoning, pressure-pattern and celestial navigation procedures; the use of aeronautical charts, radio navigation aids and area navigation systems; specific navigation requirements for long-range flights;

i) use, limitation and serviceability of avionics and instruments necessary for the navigation of the aircraft;

j) use, accuracy and reliability of navigation systems used in departure, en-route and approach phases of flight; identification of radio navigation aids;

k) principles, characteristics and use of self-contained and external-referenced navigation systems; operation of airborne equipment;

l) the celestial sphere including the movement of heavenly bodies and their selection and identification for the purpose of observation and reduction of sights;

calibration of sextants; the completion of navigation documentation;

m) definitions, units and formulae used in air navigation;

Operational procedures

n) interpretation and use of aeronautical documentation such as AIP, NOTAM, aeronautical codes, abbreviations, and instrument procedure charts for departure, en-route, descent and approach;

Principles of flight

o) principles of flight;

Radiotelephony

p) radiotelephony procedures and phraseology.

3.2.1.3 *Experience*

3.2.1.3.1 The applicant shall have completed in the performance of the duties of a flight navigator, not less than 200 hours of flight time acceptable to the Licensing Authority, in aircraft engaged in cross-country flights, including not less than 30 hours by night.

3.2.1.3.1.1 When the applicant has flight time as a pilot, the Licensing Authority shall determine whether such experience is acceptable and, if so, the extent to which the flight time requirements of 3.2.1.3.1 can be reduced accordingly.

3.2.1.3.2 The applicant shall produce evidence of having satisfactorily determined the aircraft's position in flight, and used that information to navigate the aircraft, as follows:

a) by night — not less than 25 times by celestial observations; and

b) by day — not less than 25 times by celestial observations in conjunction with self-contained or external-referenced navigation systems.

3.2.1.4 *Skill*

The applicant shall have demonstrated the ability to perform as flight navigator of an aircraft with a degree of competency appropriate to the privileges granted to the holder of a flight navigator licence, and to:

a) exercise good judgement and airmanship;

b) apply aeronautical knowledge;

c) perform all duties as part of an integrated crew; and

d) communicate effectively with the other flight crew members.

3.2.1.5 *Medical fitness*

The applicant shall hold a current Class 1 Medical Assessment.

3.2.2 Privileges of the holder of the licence and the conditions to be observed in exercising such privileges

Subject to compliance with the requirements specified in 1.2.5 and 1.2.6, the privileges of the holder of a flight navigator licence shall be to act as flight navigator of any aircraft.

3.3 Flight engineer licence

3.3.1 Requirements for the issue of the licence

3.3.1.1 *Age*

The applicant shall be not less than 18 years of age.

3.3.1.2 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of a flight engineer licence, in at least the following subjects:

Air law

a) rules and regulations relevant to the holder of a flight engineer licence; rules and regulations governing the operation of civil aircraft pertinent to the duties of a flight engineer;

Aircraft general knowledge

b) basic principles of powerplants, gas turbines and/or piston engines; characteristics of fuels, fuel systems including fuel control; lubricants and lubrication systems; afterburners and injection systems, function and operation of engine ignition and starter systems;

c) principles of operation, handling procedures and operating limitations of aircraft powerplants; effects of atmospheric conditions on engine performance;

d) airframes, flight controls, structures, wheel assemblies, brakes and anti-skid units, corrosion and fatigue life; identification of structural damage and defects;

e) ice and rain protection systems;

f) pressurization and air-conditioning systems, oxygen systems;

g) hydraulic and pneumatic systems;

h) basic electrical theory, electric systems (AC and DC), aircraft wiring systems, bonding and screening;

i) principles of operation of instruments, compasses, auto-pilots, radio communication equipment, radio and radar navigation aids, flight management systems, displays and avionics;

j) limitations of appropriate aircraft;

k) fire protection, detection, suppression and extinguishing systems;

l) use and serviceability checks of equipment and systems of appropriate aircraft;

Flight performance and planning

m) effects of loading and mass distribution on aircraft handling, flight characteristics and performance; mass and balance calculations;

n) use and practical application of performance data including procedures for cruise control;

Human performance and limitations

o) human performance and limitations relevant to the flight engineer;

Operational procedures

p) principles of maintenance, procedures for the maintenance of airworthiness, defect reporting, pre-flight inspections, precautionary procedures for fuelling and use of external power; installed equipment and cabin systems;

q) normal, abnormal and emergency procedures;

r) operational procedures for carriage of freight and dangerous goods;

Principles of flight

s) fundamentals of aerodynamics;

Radiotelephony

t) radiotelephony procedures and phraseology.

3.3.1.2.1 **Recommendation.—** *The applicant should have demonstrated a level of knowledge appropriate to the privileges granted to the holder of a flight engineer licence in at least the following subjects:*

16/11/89

a) fundamentals of navigation; principles and operation of self-contained systems; and

b) operational aspects of meteorology.

3.3.1.3 *Experience*

3.3.1.3.1 The applicant shall have completed, under the supervision of a person accepted by the Licensing Authority for that purpose, not less than 100 hours of flight time in the performance of the duties of a flight engineer. The Licensing Authority shall determine whether experience as a flight engineer in a flight simulator, which it has approved, is acceptable as part of the total flight time of 100 hours. Credit for such experience shall be limited to a maximum of 50 hours.

3.3.1.3.1.1 When the applicant has flight time as a pilot, the Licensing Authority shall determine whether such experience is acceptable and, if so, the extent to which the flight time requirements of 3.3.1.3.1 can be reduced accordingly.

3.3.1.3.2 The applicant shall have operational experience in the performance of the duties of a flight engineer, under the supervision of a flight engineer accepted by the Licensing Authority for that purpose, in at least the following areas:

a) *Normal procedures*

— pre-flight inspections
— fuelling procedures, fuel management
— inspection of maintenance documents
— normal flight deck procedures during all phases of flight
— crew co-ordination and procedures in case of crew incapacitation
— defect reporting

b) *Abnormal and alternate (standby) procedures*

— recognition of abnormal functioning of aircraft systems
— use of abnormal and alternate (standby) procedures

c) *Emergency procedures*

— recognition of emergency conditions
— use of appropriate emergency procedures

3.3.1.4 *Skill*

The applicant shall have demonstrated the ability to perform as flight engineer of an aircraft, the duties and procedures described in 3.3.1.3.2 with a degree of competency appropriate to the privileges granted to the holder of a flight engineer licence, and to:

a) use aircraft systems within the aircraft's capabilities and limitations;

b) exercise good judgement and airmanship;

c) apply aeronautical knowledge;

d) perform all the duties as part of an integrated crew with the successful outcome never in doubt; and

e) communicate effectively with the other flight crew members.

3.3.1.4.1 The use of a synthetic flight trainer for performing any of the procedures required during the demonstration of skill described in 3.3.1.4 shall be approved by the Licensing Authority, which shall ensure that the synthetic flight trainer is appropriate to the task.

3.3.1.5 *Medical fitness*

The applicant shall hold a current Class 1 Medical Assessment.

3.3.2 Privileges of the holder of the licence and the conditions to be observed in exercising such privileges

3.3.2.1 Subject to compliance with the requirements specified in 1.2.5 and 1.2.6, the privileges of the holder of a flight engineer licence shall be to act as flight engineer of any type of aircraft on which the holder has demonstrated a level of knowledge and skill, as determined by the Licensing Authority on the basis of those requirements specified in 3.3.1.2 and 3.3.1.4 which are applicable to the safe operation of that type of aircraft.

3.3.2.2 The types of aircraft on which the holder of a flight engineer licence is authorized to exercise the privileges of that licence, shall be either entered on the licence or recorded elsewhere in a manner acceptable to the Licensing Authority.

3.4 Flight radiotelephone operator

Note 1.— Where the knowledge and skill of an applicant have been established as satisfactory in respect of the certification requirements for the radiotelephone operator's restricted certificate specified in the general radio regulations annexed to the International Telecommunication Convention and the applicant has met the requirements that are pertinent to the operation of the radiotelephone on board an aircraft, a Contracting State may endorse a licence already held by the applicant (as provided for in 5.1.1 XIII) or issue a separate licence as appropriate.

Note 2.— Skill and knowledge requirements on radiotelephony procedures and phraseology have been developed as an integral part of all pilot aeroplane and helicopter licences.

CHAPTER 4. LICENCES AND RATINGS FOR PERSONNEL OTHER THAN FLIGHT CREW MEMBERS

4.1 General rules concerning licences and ratings for personnel other than flight crew members

4.1.1 An applicant shall, before being issued with any licence or rating for personnel other than flight crew members, meet such requirements in respect of age, knowledge, experience and where appropriate, medical fitness and skill, as are specified for that licence or rating.

4.1.2 An applicant, for any licence or rating for personnel other than flight crew members, shall demonstrate, in a manner determined by the Licensing Authority, such requirements in respect of knowledge and skill as are specified for that licence or rating.

4.2 Aircraft maintenance (technician/engineer/mechanic) Type II

Note 1.— The terms in brackets are given as acceptable additions to the title of the licence. Each Contracting State is expected to use in its own regulations the one it prefers.

Note 2.— The following specifications allow for the issue of an aircraft maintenance Type II licence, granting privileges with respect to the maintenance of aircraft in their entirety or restricted to such parts of the aircraft as are entered in the licence.

4.2.1 Requirements for the issue of the licence

4.2.1.1 *Age*

The applicant shall be not less than 18 years of age.

4.2.1.2 *Knowledge*

The applicant shall satisfy the Licensing Authority as to knowledge of:

a) the regulations pertinent to the duties of an aircraft maintenance Type II licence holder; and

b) the assembly, functioning, inspection, servicing, maintenance and principles of construction of whichever of the following are appropriate to the privileges to be granted:

1) aircraft in their entirety;

2) airframes;

3) aircraft powerplants including their accessories;

4) aircraft systems including their components;

5) aircraft instruments; and

6) aircraft avionics.

4.2.1.3 *Experience*

The applicant shall have had the following experience in the inspection, servicing and maintenance of aircraft or its components:

a) for the issue of a licence with privileges for signing a Maintenance Release (Certificate of Safety for Flight), at least:

1) three years; or

2) two years if the applicant has satisfactorily completed an approved training course which will provide an equivalent level of practical experience; and

b) for the issue of a licence with privileges restricted in accordance with 4.2.2.2 b) or c), a period of time that will enable a level of competency equivalent to that required in a) to be attained, provided that this is not less than:

1) two years; or

2) such a period as the State considers necessary to provide an equivalent level of practical experience to applicants who have satisfactorily completed an approved training course.

4.2.1.4 *Skill*

The applicant shall have demonstrated the ability to perform those functions applicable to the privileges to be granted.

4.2.2 Privileges of the holder of the licence and the conditions to be observed in exercising such privileges

4.2.2.1 Subject to compliance with the requirements specified in 4.2.2.2, the privileges of the holder of an aircraft maintenance Type II licence shall be:

a) for a licence conferring privileges with respect to aircraft in their entirety:

— to certify the aircraft as airworthy after a minor repair, authorized minor modification or installation of a previously approved powerplant, accessory, instrument, and/or item of equipment, and to sign a Maintenance Release (Certificate of Safety for Flight) following inspection, maintenance operations and/or routine servicing; and

b) for a licence conferring privileges restricted in accordance with 4.2.2.2 b) or c):

— to certify as airworthy such parts of aircraft as are entered on the licence, after an inspection, a minor repair or authorized minor modification.

4.2.2.2 The privileges of the holder of an aircraft maintenance Type II licence specified in 4.2.2.1 shall be exercised only:

a) in respect of such aircraft as are entered on the licence in their entirety either specifically or under broad categories; or

b) in respect of such airframes and powerplants and aircraft systems or components as are entered on the licence either specifically or under broad categories; and/or

c) in respect of such aircraft avionic systems or components as are entered on the licence either specifically or under broad categories;

d) provided that the holder has become familiar with all pertinent and current information relating to the maintenance and airworthiness of the particular type of aircraft for which the holder is signing a Maintenance Release (Certificate of Safety for Flight) or such airframe, powerplant, aircraft component, aircraft system and aircraft avionic system or component which the holder is certifying as being airworthy; and

e) on condition that, within the preceding 24 months, either the holder has exercised the appropriate privileges of the holder of an aircraft maintenance Type II licence for not less than six months, or has satisfied the Licensing Authority of the ability to meet the standards prescribed for the issue of a licence with the appropriate privileges.

4.2.3 Vesting of privileges in an approved maintenance organization

The Standards in 4.2.1 and 4.2.2 apply to the granting of licences to individuals. Where, as an alternative to this method, privileges equivalent to those in 4.2.2.1 are vested in an approved maintenance organization, the Contracting State shall ensure by the requirements it imposes for approval of the organization that an equivalent level of competency is maintained. In such an approved maintenance organization the Contracting State shall ensure that the privilege of signing a maintenance release is restricted to individuals who have knowledge and experience equivalent to that of 4.2.1.2 and 4.2.1.3.

4.3 Aircraft maintenance (technician/engineer/mechanic) Type I

Note 1.— The terms in brackets are given as acceptable additions to the title of the licence. Each Contracting State is expected to use in its own regulations the one it prefers.

Note 2.— The following specifications allow for the issue of an aircraft maintenance Type I licence granting privileges with respect to overhaul, authorized repair or authorized modification of aircraft in their entirety or restricted to such parts of the aircraft as are entered in the licence.

4.3.1 Requirements for the issue of the licence

4.3.1.1 *Age*

The applicant shall be not less than 21 years of age.

4.3.1.2 *Knowledge*

The applicant shall satisfy the Licensing Authority as to knowledge of:

a) the regulations pertinent to the duties of an aircraft maintenance Type I licence holder;

b) the assembly, functioning, inspection, and principles of construction of whichever of the following are appropriate to the privileges to be granted:

1) aircraft in their entirety;

2) airframes;

3) aircraft powerplants including their accessories;

4) aircraft systems including their components;

5) aircraft instruments; and

6) aircraft avionics; and

c) methods and procedures for inspection and approval of the repair, overhaul and functional testing of whichever of the following are appropriate to the privileges to be granted:

1) aircraft in their entirety;

2) airframes;

3) aircraft powerplants including their respective components, accessories, instruments and items of equipment and installation thereof;

4) aircraft systems including their components;

5) aircraft instruments; and

6) aircraft avionics.

4.3.1.3 *Experience*

The applicant shall have had the following experience in the inspection, overhaul, authorized repair and approved modification of aircraft or its parts:

a) for the issue of a licence with privileges for certifying the airworthiness of aircraft, at least:

1) five years; or

2) three years if the applicant has satisfactorily completed an approved training course that will give an equivalent level of practical experience; and

b) for the issue of a licence with privileges restricted in accordance with 4.3.2.2 b), a period of time that will enable a level of competency equivalent to that given in a) to be attained, provided that this is not less than:

1) three years; or

2) such a period as the State considers necessary to give an equivalent level of practical experience to applicants who have satisfactorily completed an approved training course.

Note.— Appropriate experience gained as the holder of a Type II licence may be taken into consideration when satisfying the experience requirements for the issue of a Type I licence.

4.3.1.4 *Skill*

The applicant shall have demonstrated the ability to perform those functions applicable to the privileges to be granted.

4.3.2 Privileges of the holder of the licence and the conditions to be observed in exercising such privileges

4.3.2.1 Subject to compliance with the requirements specified in 4.3.2.2, the privileges of the holder of an aircraft maintenance Type I licence shall be:

a) for a licence conferring privileges with respect to aircraft, in their entirety:

— to certify as airworthy any overhaul, authorized repair or authorized modification of an aircraft, airframe or powerplant including their respective accessories, instruments, items of equipment and aircraft avionics and installation thereof; provided that such overhauls, repairs and/or modifications incorporate the fitment only of approved parts and components; and

b) for a licence conferring privileges restricted in accordance with 4.3.2.2 b):

— to certify as airworthy such parts of aircraft as are entered on the licence, after overhaul, authorized repair or authorized modifications, including the fitment of approved parts and components.

Note.— These privileges do not include the privilege of signing a Maintenance Release (Certificate of Safety for Flight) except as provided in 4.3.3.

4.3.2.2 The privileges of the holder of an aircraft maintenance Type I licence specified in 4.3.2.1 shall be exercised only:

a) in respect of such operations and such aircraft as are entered on the licence in their entirety, either specifically or under broad categories; or

b) in respect of such operations and such airframes, powerplants, aircraft systems or components and aircraft avionics systems or components as are entered on the licence either specifically or under broad categories;

c) provided that the holder has become familiar with all pertinent and current information relating to the airworthiness of the particular type of aircraft, airframe, powerplant, aircraft system or component and aircraft avionics which the holder certifies as airworthy after overhaul, authorized repair, or authorized modification; and

d) on condition that within the preceding 24 months, either the holder has exercised the appropriate privileges of the holder of an aircraft maintenance Type I licence for not less than six months, or has satisfied the Licensing Authority of the ability to meet the standards prescribed for the issue of a licence with the appropriate privileges.

4.3.3 Exercise of joint privileges of Type I and Type II licences

The privileges given in 4.2.2.1 and 4.3.2.1 may be conferred by a single licence in lieu of issuing separate Type I and Type II licences provided that the requirements for the issue of these licences, as specified in 4.2.1 and 4.3.1 have been met. The privileges so granted shall be exercised in accordance with the conditions stated in 4.2.2.2 and 4.3.2.2.

4.3.4 Vesting of privileges in an approved maintenance organization

The Standards in 4.3.1 and 4.3.2 apply to the granting of licences to individuals. Where, as an alternative to this method, privileges equivalent to those in 4.3.2.1 are vested in an approved maintenance organization, the Contracting State shall ensure by the requirements it imposes for approval of the organization that an equivalent level of competency is maintained.

4.4 Air traffic controller licence

4.4.1 Requirements for the issue of the licence

Before issuing an air traffic controller licence, a Contracting State shall require the applicant to meet the requirements of 4.4.1 and the requirements of at least one of the ratings set out in 4.5. Unlicensed State employees may operate as air traffic controllers on condition that they meet the same requirements.

4.4.1.1 *Age*

The applicant shall be not less than 21 years of age.

4.4.1.2 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the holder of an air traffic controller licence, in at least the following subjects:

Air law

a) rules and regulations relevant to the air traffic controller;

Air traffic control equipment

b) principles, use and limitations of equipment used in air traffic control;

General knowledge

c) principles of flight; principles of operation and functioning of aircraft, powerplants and systems; aircraft performances relevant to air traffic control operations;

Human performance and limitations

d) human performance and limitations relevant to air traffic control;

Language

e) the language or languages nationally designated for use in air traffic control and ability to speak such language or languages without accent or impediment which would adversely affect radio communication;

Meteorology

f) aeronautical meteorology; use and appreciation of meteorological documentation and information; origin and characteristics of weather phenomena affecting flight operations and safety; altimetry;

Navigation

g) principles of air navigation; principle, limitation and accuracy of navigation systems and visual aids; and

Operational procedures

h) air traffic control, communication, radiotelephony and phraseology procedures (routine, non routine and emergency); use of the relevant aeronautical documentation; safety practices associated with flight.

4.4.1.3 *Experience*

The applicant shall have completed an approved training course and not less than three months' satisfactory service engaged in the actual control of air traffic under the supervision of an appropriately rated air traffic controller. The experience requirements specified for air traffic controller ratings in 4.5 may be credited as part of the experience specified in this paragraph.

4.4.1.4 *Medical fitness*

The applicant shall hold a current Class 3 Medical Assessment.

4.5 Air traffic controller ratings

4.5.1 Categories of air traffic controller ratings

4.5.1.1 Air traffic controller ratings shall comprise the following categories:

a) aerodrome control rating;

b) approach control rating;

c) approach radar control rating;

d) approach precision radar control rating;

e) area control rating; and

f) area radar control rating.

Note.— The World Meteorological Organization has specified requirements for personnel making meteorological observations which apply to air traffic controllers providing such a service.

4.5.2 Requirements for air traffic controller ratings

4.5.2.1 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted, in at least the following subjects in so far as they affect the area of responsibility:

a) *aerodrome control rating:*

1) aerodrome layout; physical characteristics and visual aids;

2) airspace structure;

3) applicable rules, procedures and source of information;

4) air navigation facilities;

5) air traffic control equipment and its use;

6) terrain and prominent landmarks;

7) characteristics of air traffic;

8) weather phenomena; and

9) emergency and search and rescue plans;

b) *approach control and area control ratings:*

1) airspace structure;

2) applicable rules, procedures and source of information:

3) air navigation facilities;

4) air traffic control equipment and its use;

5) terrain and prominent landmarks;

6) characteristics of air traffic and traffic flow;

7) weather phenomena; and

8) emergency and search and rescue plans; and

c) *approach radar, approach precision radar and area radar control ratings:* The applicant shall meet the requirements specified in b) in so far as they affect the area of responsibility, and shall have demonstrated a level of knowledge appropriate to the privileges granted, in at least the following additional subjects:

1) principles, use and limitations of radar, other surveillance systems and associated equipment; and

2) procedures for the provision of approach, precision approach or area radar control services, as appropriate, including procedures to ensure appropriate terrain clearance.

4.5.2.2 *Experience*

4.5.2.2.1 The applicant shall have:

a) satisfactorily completed an approved training course;

b) provided, satisfactorily, under the supervision of an appropriately rated air traffic controller:

1) *aerodrome control rating:* an aerodrome control service, for a period of not less than 90 hours or one month, whichever is greater, at the unit for which the rating is sought;

2) *approach, approach radar, area or area radar control rating:* the control service for which the rating is sought, for a period of not less than 180 hours or three months, whichever is greater, at the unit for which the rating is sought; and

3) *approach precision radar control rating:* not less than 200 precision approaches of which not more than 100 shall have been carried out on a radar simulator approved for that purpose by the Licensing Authority. Not less than 50 of those precision approaches shall have been carried out at the unit and on the equipment for which the rating is sought; and

c) if the privileges of the approach radar control rating include surveillance radar approach duties, the experience shall include not less than 25 plan position indicator (PPI) approaches on the surveillance equipment of the type in use at the unit for which the rating is sought and under the supervision of an appropriately rated approach radar controller.

4.5.2.2.2 The experience specified in 4.5.2.2.1 b) shall have been completed within the 6-month period immediately preceding application.

4.5.2.2.3 When the applicant already holds an air traffic controller rating in another category, or the same rating for another unit, the Licensing Authority shall determine whether the experience requirement of 4.5.2.2 can be reduced, and if so, to what extent.

4.5.2.3 *Skill*

The applicant shall have demonstrated, at a level appropriate to the privileges being granted, the skill, judgement and performance required to provide a safe, orderly and expeditious control service.

4.5.2.4 *Concurrent issuance of two air traffic controller ratings*

When two air traffic controller ratings are sought concurrently, the Licensing Authority shall determine the applicable requirements on the basis of the requirements for each rating. These requirements shall not be less than those of the more demanding rating.

4.5.3 Privileges of the holder of the air traffic controller rating(s) and the conditions to be observed in exercising such privileges

4.5.3.1 Subject to compliance with the requirements specified in 1.2.5 and 1.2.6, the privileges of the holder of an air traffic controller licence endorsed with one or more of the undermentioned ratings shall be:

a) *aerodrome control rating:* to provide or to supervise the provision of aerodrome control service for the aerodrome for which the licence holder is rated;

b) *approach control rating:* to provide or to supervise the provision of approach control service for the aerodrome or aerodromes for which the licence holder is rated, within the airspace or portion thereof, under the jurisdiction of the unit providing approach control service;

c) *approach radar control rating:* to provide and/or supervise the provision of approach control service with the use of radar or other surveillance systems for the aerodrome or aerodromes for which the licence holder is rated, within the airspace or portion thereof, under the jurisdiction of the unit providing approach control service;

 1) subject to compliance with the provisions of 4.5.2.2.1 c), the privileges shall include the provision of surveillance radar approaches;

d) *approach precision radar control rating:* to provide and/ or supervise the provision of precision approach radar service at the aerodrome for which the licence holder is rated;

e) *area control rating:* to provide and/or supervise the provision of area control service within the control area or portion thereof, for which the licence holder is rated; and

f) *area radar control rating:* to provide and/or supervise the provision of area control service with the use of radar, within the control area or portion thereof, for which the licence holder is rated.

4.5.3.2 Before exercising the privileges indicated in 4.5.3.1, the licence holder shall be familiar with all pertinent and current information.

4.5.3.3 A Contracting State having issued an air traffic controller licence shall not permit the holder thereof to carry out instruction in an operational environment unless such holder has received proper authorization from such Contracting State.

4.5.3.4 *Validity of ratings*

A rating shall become invalid when an air traffic controller has ceased to exercise the privileges of the rating for a period determined by the Licensing Authority. That period shall not exceed six months. A rating shall remain invalid until the controller's ability to exercise the privileges of the rating has been re-established.

4.6 Flight operations officer/flight dispatcher licence

4.6.1 Requirements for the issue of the licence

4.6.1.1 *Age*

The applicant shall be not less than 21 years of age.

4.6.1.2 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of a flight operations officer licence, in at least the following subjects:

Air law

a) rules and regulations relevant to the holder of a flight operations officer licence; appropriate air traffic services practices and procedures;

Aircraft general knowledge

b) principles of operation of aeroplane powerplants, systems and instruments;

c) operating limitations of aeroplanes and powerplants;

d) minimum equipment list;

Flight performance calculation and planning procedures

e) effects of loading and mass distribution on aircraft performance and flight characteristics; mass and balance calculations;

f) operational flight planning; fuel consumption and endurance calculations; alternate airport selection procedures; en-route cruise control; extended range operation;

g) preparation and filing of air traffic services flight plans;

h) basic principles of computer-assisted planning systems;

Meteorology

i) aeronautical meteorology; the movement of pressure systems; the structure of fronts, and the origin and characteristics of signifiant weather phenomena which affect take-off, en-route and landing conditions;

j) interpretation and application of aeronautical meteorological reports, charts and forecasts; codes and abbreviations; use of, and procedures for obtaining, meteorological information;

Navigation

k) principles of air navigation with particular reference to instrument flight;

Operational procedures

l) use of aeronautical documentation;

m) operational procedures for the carriage of freight and dangerous goods;

n) procedures relating to aircraft accidents and incidents; emergency flight procedures;

o) procedures relating to unlawful interference and sabotage of aircraft;

Principles of flight

p) principles of flight relating to the appropriate category of aircraft; and

Radiocommunication

q) procedures for communicating with aircraft and relevant ground stations.

4.6.1.3 *Experience*

4.6.1.3.1 The applicant shall have gained the following experience:

a) a total of two years' service in any one or in any combination of the capacities specified in 1) to 3) inclusive, provided that in any combination of experience the period serviced in any capacity shall be at least one year:

1) a flight crew member in air transportation; or

2) a meteorologist in an organization dispatching aircraft in air transportation; or

3) an air traffic controller; or a technical supervisor of flight operations officers or air transportation flight operations systems;

or

b) at least one year as an assistant in the dispatching of air transport;

or

c) have satisfactorily completed a course of approved training.

4.6.1.3.2 The applicant shall have served under the supervision of a flight operations officer for at least 90 working days within the six months immediately preceding the application.

4.6.1.4 *Skill*

The applicant shall have demonstrated the ability to:

a) make an accurate and operationally acceptable weather analysis from a series of daily weather maps and weather reports; provide an operationally valid briefing on weather conditions prevailing in the general neighbourhood of a specific air route; forecast weather trends pertinent to air transportation with particular reference to destination and alternates;

b) determine the optimum flight path for a given segment, and create accurate manual and/or computer generated flight plans; and

c) provide operating supervision and all other assistance to a flight in actual or simulated adverse weather conditions, as appropriate to the duties of the holder of a flight operations officer licence.

4.6.2 Privileges of the holder of the licence and the conditions to be observed in exercising such privileges

Subject to compliance with the requirements specified in 1.2.5, the privileges of the holder of a flight operations officer licence shall be to serve in that capacity with responsibility for each area for which the applicant meets the requirements specified in Annex 6.

4.7 Aeronautical station operator licence

Note.— This licence is not intended for personnel providing Aerodrome Flight Information Service (AFIS). Guidance on the qualifications to be met by these personnel *can be found in ICAO Circular 211,* Aerodrome Flight Information Service (AFIS).

4.7.1 Requirements for the issue of the licence

4.7.1.1 Before issuing an aeronautical station operator licence, a Contracting State shall require the applicant to meet the requirements of 4.7.1. Unlicensed individuals may operate as aeronautical station operators on the condition that the State from which they operate ensures that they meet the same requirements.

4.7.1.2 *Age*

The applicant shall be not less than 18 years of age.

4.7.1.3 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the holder of an aeronautical station operator, in at least the following subjects:

General knowledge

a) air traffic services provided within the State;

Language

b) the language or languages nationally designated for use in air-ground communications and ability to speak such language or languages without accent or impediment which would adversely affect radio communication;

Operational procedures

c) radiotelephony procedures; phraseology; telecommunication network;

Rules and regulations

d) rules and regulations applicable to the aeronautical station operator; and

Telecommunication equipment

e) principles, use and limitations of telecommunication equipment in an aeronautical station.

4.7.1.4 *Experience*

4.7.1.4.1 The applicant shall have:

a) satisfactorily completed an approved training course within the 12-month period immediately preceding application, and have served satisfactorily under a qualified aeronautical station operator for not less than two months; or

b) satisfactorily served under a qualified aeronautical station operator for not less than six months during the 12-month period immediately preceding application.

4.7.1.5 *Skill*

The applicant shall demonstrate, or have demonstrated, competency in:

a) operating the telecommunication equipment in use; and

b) transmitting and receiving radiotelephony messages with efficiency and accuracy.

4.7.2 Privileges of the aeronautical station operator and the conditions to be observed in exercising such privileges

4.7.2.1 Subject to compliance with the requirements specified in 1.2.5, the privileges of the holder of an aeronautical station operator licence shall be to act as an operator in an aeronautical station. Before exercising the privileges of the licence, the holder shall be familiar with all pertinent and current information regarding the types of equipment and operating procedures used at that aeronautical station.

CHAPTER 5. SPECIFICATIONS FOR PERSONNEL LICENCES

5.1 Personnel licences issued by a Contracting State in accordance with the relevant provisions of this Annex shall conform to the following specifications:

5.1.1 Detail

The following details shall appear on the licence:

I) Name of State (in bold type);

II) Title of licence (in very bold type);

III) Serial number of the licence, in arabic numerals, given by the authority issuing the licence;

IV) Name of holder in full (in roman alphabet also if script of national language is other than roman);

V) Address of holder;

VI) Nationality of holder;

VII) Signature of holder;

VIII) Authority and, where necessary, conditions under which the licence is issued;

IX) Certification concerning validity and authorization for holder to exercise privileges appropriate to licence;

X) Signature of officer issuing the licence and the date of such issue;

XI) Seal or stamp of authority issuing the licence;

XII) Ratings, e.g., category, class, type of aircraft, airframe, aerodrome control, etc.;

XIII) Remarks, i.e., special endorsements relating to limitations and endorsements for privileges;

XIV) Any other details desired by the State issuing the licence.

5.1.2 Material

First quality paper or other suitable material shall be used and the items mentioned in 5.1.1 shown clearly thereon.

5.1.3 Colour

5.1.3.1 Where the same coloured material is used for all licences issued by a Contracting State, that colour shall be white.

5.1.3.2 Where licences issued by a Contracting State carry a distinguishing colour marking, the colours shall be as follows:

a) private pilot — aeroplane	— light brown
b) commercial pilot — aeroplane	— light blue
c) airline transport pilot — aeroplane	— dark green
d) private pilot — helicopter	— light grey
e) commercial pilot — helicopter	— dark grey
f) airline transport pilot — helicopter	— two or more dark grey stripes on white background
g) glider pilot	— pink
h) free balloon pilot	— violet
i) flight navigator	— red
j) flight engineer	— brown
k) aircraft maintenance (technician/engineer/mechanic) Type II	— maroon
l) aircraft maintenance (technician/engineer/mechanic) Type I	— maroon
m) air traffic controller	— yellow
n) flight operations officer	— light green
o) aeronautical station operator	— two or more orange stripes on white background

5.1.4 Language

Licences shall be issued in the national language with a translation of items I), II), VI), IX), XII), XIII) and XIV) as indicated in 5.1.1 in English, French, Russian or Spanish where the national language is other than one of these.

5.1.5 Arrangement of items

Item headings on the licence shall be uniformly numbered in roman numerals as indicated in 5.1.1, so that on any licence the number will, under any arrangement, refer to the same item heading.

Note.— Item headings may be arranged in such order as may best suit the convenience of the Contracting State issuing the licence.

CHAPTER 6. MEDICAL PROVISIONS FOR LICENSING

Note 1.— Guidance material to assist Licensing Authorities and medical examiners is published separately in the current edition of the ICAO Manual of Civil Aviation Medicine *(Doc 8984).*

Note 2.— The Standards and Recommended Practices established in this Chapter cannot, on their own, be sufficiently detailed to cover all possible individual situations. Of necessity many decisions relating to the evaluation of medical fitness must be left to the judgement and discretion of the individual designated medical examiner. The evaluation must, therefore, be based on a medical examination conducted throughout in accordance with the high standards of medical practice. Due regard must be given to the privileges granted by the licence applied for or held by the applicant for the Medical Assessment, and the conditions under which the licence holder is going to exercise those privileges in carrying out assigned duties.

Note 3.— Attention is called to the administrative clause in 1.2.4.8 dealing with accredited medical conclusion.

6.1 Medical Assessments — General

6.1.1 Classes of Medical Assessment

Three classes of Medical Assessment shall be established as follows:

a) Class 1 Medical Assessment;

applies to applicants for, and holders of:

— commercial pilot licences — aeroplane and helicopter
— airline transport pilot licences — aeroplane and helicopter
— flight navigator licences
— flight engineer licences

b) Class 2 Medical Assessment;

applies to applicants for, and holders of:

— private pilot licences — aeroplane and helicopter
— glider pilot licences
— free balloon pilot licences

c) Class 3 Medical Assessment;

applies to applicants for, and holders of:

— air traffic controller licences.

6.1.2 The applicant for a Medical Assessment shall provide the medical examiner with a personally certified statement of medical facts concerning personal, familial and hereditary history. The applicant shall be made aware of the necessity for giving a statement that is as complete and accurate as the applicant's knowledge permits, and any false statement shall be dealt with in accordance with 1.2.4.5.1.

6.1.3 The medical examiner shall report to the Licensing Authority any individual case where, in the examiner's judgement, an applicant's failure to meet any requirement, whether numerical or otherwise, is such that exercise of the privileges of the licence being applied for, or held, is not likely to jeopardize flight safety (1.2.4.8).

6.1.4 The requirements to be met for the renewal of a Medical Assessment are the same as those for the initial assessment except where otherwise specifically stated.

Note.— The intervals between routine medical examinations for the purpose of renewing Medical Assessments are specified in 1.2.5.2.

6.2 Requirements for Medical Assessments

6.2.1 General

An applicant for a Medical Assessment issued in accordance with the terms of 1.2.4.1 shall undergo a medical examination based on the following requirements:

a) physical and mental;

b) visual and colour perception; and

c) hearing.

6.2.2 Physical and mental requirements

An applicant for any class of Medical Assessment shall be required to be free from:

a) any abnormality, congenital or acquired, or

b) any active, latent, acute or chronic disability, or

c) any wound, injury or sequelae from operation,

such as would entail a degree of functional incapacity which is likely to interfere with the safe operation of an aircraft or with the safe performance of duties.

6.2.3 Visual requirements

The methods in use for the measurement of visual acuity are likely to lead to differing evaluations. To achieve uniformity, therefore, Contracting States shall ensure that equivalence in the evaluation of methods be obtained.

6.2.3.1 **Recommendation.—** *The following should be adopted for tests of visual acuity:*

a) For a visual acuity test in a lighted room a test illumination level of approximately 50 lx, normally corresponding to a brightness of 30 cd per square metre should be adopted. The light level of the room should be approximately one-fifth of the test illumination level.

b) For a visual acuity test in a darkened, or semi-darkened room, a test illumination level of approximately 15 lx, normally corresponding to a brightness of 10 cd per square metre should be adopted.

c) Visual acuity should be measured by means of a series of optotypes of Landolt, or similar optotypes, placed at a distance of 6 m from the candidate, or 5 m as appropriate to the method of testing adopted.

6.2.4 Colour perception requirements

Contracting States shall use such methods of examination as will guarantee reliable testing of colour perception.

6.2.4.1 The applicant shall be required to demonstrate the ability to perceive readily those colours the perception of which is necessary for the safe performance of duties.

6.2.4.2 The applicant shall be tested for the ability to correctly identify a series of pseudoisochromatic plates (tables) in daylight or in artificial light of the same colour temperature such as that provided by Illuminant "C" or "D" as specified by the International Commission on Illumination (ICI).

6.2.4.2.1 **Recommendation.—** *An applicant obtaining a satisfactory score as prescribed by the Licensing Authority should be assessed as fit. An applicant failing to obtain a satisfactory score in such a test may nevertheless be assessed as fit provided the applicant is able to readily and correctly identify aviation coloured lights displayed by means of a recognized colour perception lantern.*

16/11/89

6.2.5 Hearing requirements

Hearing requirements are established in addition to the ear examinations conducted during the medical examination for the physical and mental requirements.

6.2.5.1 The applicant shall be required to be free from any hearing defect which would interfere with the safe performance of duties in exercising the privileges of the licence.

Note 1.— The reference zero for calibration of puretone audiometers used for applying 6.3.4.1 and 6.5.4.1 is that of the International Organization for Standardization (ISO) Recommendation R389, 1964.

Note 2.— The frequency composition of the background noise referred to in 6.3.4.1 a) and 6.5.4.1 a) is defined only to the extent that the frequency range 600 to 4 800 Hz is adequately represented.

Note 3.— In the choice of speech material, aviationtype material is not to be used exclusively for the above tests. Lists of phonetically-balanced words in use by a number of Contracting States have given satisfactory results.

Note 4.— A quiet room for the purposes of testing the hearing requirements is a room in which the intensity of the background noise is less than 50 dB when measured on "slow" response of an "A"-weighted sound level meter.

Note 5.— For the purposes of hearing requirements the sound level of an average conversational voice at point of output ranges from 85 to 95 dB.

6.3 Class 1 Medical Assessment

6.3.1 Assessment issue and renewal

6.3.1.1 An applicant for a commercial pilot licence — aeroplane or helicopter, an airline transport pilot licence — aeroplane or helicopter, a flight engineer licence or a flight navigator licence, shall undergo an initial medical examination for the issue of a Class 1 Medical Assessment.

6.3.1.2 Except where otherwise stated in this section, holders of commercial pilot licences — aeroplane or helicopter, airline transport pilot licences — aeroplane or helicopter, flight engineer licences or flight navigator licences, shall have their Class 1 Medical Assessments renewed at intervals not exceeding those specified in 1.2.5.2.

6.3.1.3 When the Licensing Authority is satisfied that the requirements of this section and the general provisions of 6.1 and 6.2 have been met, a Class 1 Medical Assessment shall be issued to the applicant.

6.3.2 Physical and mental requirements

The medical examination shall be based on the following requirements.

6.3.2.1 The applicant shall not suffer from any disease or disability which could render that applicant likely to become suddenly unable either to operate an aircraft safely or to perform assigned duties safely.

6.3.2.2 The applicant shall have no established medical history or clinical diagnosis of:

a) a psychosis;

b) alcoholism;

c) drug dependence;

d) any personality disorder, particularly if severe enough to have repeatedly resulted in overt acts;

e) a mental abnormality, or neurosis of a significant degree;

such as might render the applicant unable to safely exercise the privileges of the licence applied for or held, unless accredited medical conclusion indicates that in special circumstances, the applicant's failure to meet the requirement is such that exercise of the privileges of the licence applied for is not likely to jeopardize flight safety.

6.3.2.2.1 **Recommendation.—** *The applicant should have no established medical history or clinical diagnosis of any mental abnormality, personality disorder or neurosis which, according to accredited medical conclusion, makes it likely that within two years of the examination the applicant will be unable to safely exercise the privileges of the licence or rating applied for or held.*

Note.— A history of acute toxic psychosis need not be regarded as disqualifying, provided that the applicant has suffered no permanent impairment.

6.3.2.3 The applicant shall have no established medical history or clinical diagnosis of any of the following:

a) a progressive or non-progressive disease of the nervous system, the effects of which, according to accredited medical conclusion, are likely to interfere with the safe exercise of the applicant's licence and rating privileges;

b) epilepsy;

c) any disturbance of consciousness without satisfactory medical explanation of cause.

6.3.2.4 Cases of head injury, the effects of which, according to accredited medical conclusion, are likely to interfere with the safe exercise of the applicant's licence and rating privileges shall be assessed as unfit.

6.3.2.5 The applicant shall not possess any abnormality of the heart, congenital or acquired, which is likely to interfere with the safe exercise of the applicant's licence and rating privileges. A history of proven myocardial infarction shall be disqualifying.

Note.— Such commonly occurring conditions as respiratory arrhythmia, occasional extrasystoles which disappear on exercise, increase of pulse rate from excitement or exercise, or a slow pulse not associated with auriculoventricular dissociation may be regarded as being within "normal" limits.

6.3.2.5.1 Electrocardiography shall form part of the heart examination for the first issue of a licence and shall be included in re-examinations of applicants between the ages of 30 and 40 no less frequently than every two years, and thereafter no less frequently than annually.

Note 1.— The purpose of routine electrocardiography is case finding. It does not provide sufficient evidence to justify disqualification without further thorough cardiovascular investigation.

Note 2.— Guidance on resting and exercise electrocardiography is published in the Manual of Civil Aviation Medicine.

6.3.2.6 The systolic and diastolic blood pressures shall be within normal limits.

Note 1.— The use of drugs for control of high blood pressure is disqualifying except for those drugs, the use of which, according to accredited medical conclusion, is compatible with the safe exercise of the applicant's licence and rating privileges.

Note 2.— Extensive guidance on the subject is published in the Manual of Civil Aviation Medicine.

6.3.2.7 There shall be no significant functional nor structural abnormality of the circulatory tree.

6.3.2.8 There shall be no acute disability of the lungs nor any active disease of the structures of the lungs, mediastinum or pleura. Radiography shall form a part of the medical examination in all doubtful clinical cases.

6.3.2.8.1 **Recommendation.—** *Radiography should form a part of the initial chest examination and should be repeated periodically thereafter.*

6.3.2.9 Any extensive mutilation of the chest wall with collapse of the thoracic cage and sequelae of surgical procedures resulting in decreased respiratory efficiency at altitude shall be assessed as unfit.

6.3.2.10 **Recommendation.—** *Cases of pulmonary emphysema should be assessed as unfit if the condition is causing symptoms.*

6.3.2.11 Cases of active pulmonary tuberculosis, duly diagnosed, shall be assessed as unfit. Cases of quiescent or healed lesions which are known to be tuberculous, or are presumably tuberculous in origin, may be assessed as fit.

Note 1.— Guidance material on assessment of respiratory diseases is published in the Manual of Civil Aviation Medicine.·

Note 2.— Guidance material on hazards of medications is published in the Manual of Civil Aviation Medicine.

6.3.2.12 Cases of disabling disease with important impairment of function of the gastrointestinal tract or its adnexae shall be assessed as unfit.

6.3.2.13 The applicant shall be required to be completely free from those hernias that might give rise to incapacitating symptoms.

6.3.2.14 Any sequelae of disease or surgical intervention on any part of the digestive tract or its adnexae, likely to cause incapacity in flight, in particular any obstructions due to stricture or compression shall be assessed as unfit.

6.3.2.14.1 **Recommendation.—** *An applicant who has undergone a major surgical operation on the biliary passages or the digestive tract or its adnexae, which has involved a total or partial excision or a diversion of any of these organs should be assessed as unfit until such time as the medical authority designated for the purpose by the Contracting State and having access to the details of the operation concerned considers that the effects of the operation are not likely to cause incapacity in the air.*

6.3.2.15 Cases of metabolic, nutritional or endocrine disorders likely to interfere with the safe exercise of the applicant's licence and rating privileges shall be assessed as unfit.

6.3.2.16 Proven cases of diabetes mellitus shown to be satisfactorily controlled without the use of any anti-diabetic drug, may be assessed as fit.

6.3.2.17 Cases of severe and moderate enlargement of the spleen persistently below the costal margin shall be assessed as unfit.

6.3.2.18 Cases of significant localized and generalized enlargement of the lymphatic glands and of diseases of the blood shall be assessed as unfit, except in cases where accredited medical conclusion indicates that the condition is not likely to affect the safe exercise of the applicant's licence and rating privileges.

6.3.2.18.1 **Recommendation.—** *Possession of the sickle cell trait should not be a reason for disqualification unless there is positive medical evidence to the contrary.*

6.3.2.18.2 **Recommendation.—** *Cases in 6.3.2.18 due to a transient condition should be assessed as only temporarily unfit.*

6.3.2.19 Cases presenting any signs of organic disease of the kidney shall be assessed as unfit; those due to a transient condition may be assessed as temporarily unfit. The urine shall contain no abnormal element considered by the medical examiner to be of pathological significance. Cases of affections of the urinary passages and of the genital organs shall be assessed as unfit; those due to a transient condition may be assessed as temporarily unfit.

6.3.2.20 Any sequelae of disease or surgical procedures on the kidneys and the urinary tract likely to cause incapacity, in particular any obstructions due to stricture or compression, shall be assessed as unfit. Compensated nephrectomy without hypertension or uraemia may be assessed as fit.

6.3.2.20.1 **Recommendation.—** *An applicant who has undergone a major surgical operation on the urinary system which has involved a total or partial excision or a diversion of any of its organs should be assessed as unfit until such time as the medical authority designated for the purpose by the Contracting State and having access to the details of the operation concerned considers that the effects of the operation are not likely to cause incapacity in the air.*

6.3.2.21 An applicant for the first issue of a licence who has a personal history of syphilis shall be required to furnish evidence, satisfactory to the medical examiner, that the applicant has undergone adequate treatment.

6.3.2.22 Applicants who have a history of severe menstrual disturbances that have proved unamenable to treatment and that are likely to interfere with the safe exercise of the applicant's licence and rating privileges shall be assessed as unfit.

6.3.2.22.1 **Recommendation.—** *Applicants who have undergone gynaecological operations should be considered individually.*

6.3.2.23 Pregnancy shall be a cause of temporary unfitness.

6.3.2.23.1 **Recommendation.—** *In the absence of significant abnormalities, accredited medical conclusion may indicate fitness during the middle months of pregnancy.*

6.3.2.24 Following confinement or termination of pregnancy, the applicant shall not be permitted to exercise the privileges of her licence until she has undergone re-examination and has been assessed as fit.

6.3.2.25 Any active disease of the bones, joints, muscles or tendons and all serious functional sequelae of congenital or acquired disease shall be assessed as unfit. Functional after-effects of lesion affecting the bones, joints, muscles or tendons and certain anatomical defects compatible with the safe exercise of the applicant's licence and rating privileges may be assessed as fit.

6.3.2.26 **There shall be:**

a) no active pathological process, acute or chronic, of the internal ear or of the middle ear;

b) no unhealed (unclosed) perforation of the tympanic membranes. A single dry perforation need not render the applicant unfit. Licences shall not be issued or renewed in these circumstances unless the appropriate hearing requirements in 6.3.4 are complied with;

c) no permanent obstruction of the Eustachian tubes;

d) no permanent disturbances of the vestibular apparatus. Transient conditions may be assessed as temporarily unfit.

Note.— The details of the hearing requirements are set out in 6.3.4.

6.3.2.27 There shall be free nasal air entry on both sides. There shall be no serious malformation nor serious, acute or chronic affection of the buccal cavity or upper respiratory tract. Cases of speech defects and stuttering shall be assessed as unfit.

6.3.3 Visual requirements

The medical examination shall be based on the following requirements.

6.3.3.1 The function of the eyes and their adnexae shall be normal. There shall be no active pathological condition, acute or chronic, of either eye or adnexae which is likely to interfere with its proper function to an extent that would interfere with the safe exercise of the applicant's licence and rating privileges.

6.3.3.2 The applicant shall be required to have normal fields of vision.

6.3.3.3 The applicant shall be required to have a distant visual acuity of not less than 6/9 (20/30, 0.7) in each eye separately, with or without the use of correcting lenses. Where this standard of visual acuity can be obtained only with correcting lenses, the applicant may be assessed as fit provided that:

a) the applicant possesses a visual acuity without correction in each eye separately, not less than 6/60 (20/200, 0.1) or the refractive error falls within the range of ±3 dioptres (equivalent spherical error);

b) such correcting lenses are worn when exercising the privileges of the licence or rating applied for or held; and

c) a spare set of suitable correcting lenses shall be readily available when exercising the privileges of the applicant's licence.

Note 1.— 6.3.3.3 c) is the subject of Standards in Annex 6, Part I.

Note 2.— An applicant accepted as meeting those provisions of 6.3.3.3 a) which refer to refractive error is deemed to continue to do so unless there is reason to suspect otherwise, in which case refraction is repeated at the discretion of the Licensing Authority. The uncorrected visual acuity is measured and recorded at each re-examination. Conditions which indicate a need to redetermine the refractive error include: a refractive state close to the limit of acceptability, a substantial decrease in the uncorrected visual acuity, and the occurrence of eye disease, eye injury or eye surgery.

6.3.3.4 The applicant shall have the ability to read the N5 chart or its equivalent at a distance selected by that applicant in the range of 30 to 50 cm and the ability to read the N14 chart or its equivalent at a distance of 100 cm. If this requirement is met only by the use of correcting lenses, the applicant may be assessed as fit provided that such lenses are available for immediate use when exercising the privileges of the licence. No more than one pair of correcting lenses shall be used in demonstrating compliance with this visual requirement. Single-vision near correction shall not be acceptable.

Note 1.— N5 and N14 refer to "Times Roman" type-face.

Note 2.— An applicant who needs correction to meet this requirement will require "lookover", bifocal or perhaps trifocal lenses in order to read the instruments and a chart or manual held in the hand, and also to make use of distant vision through the windscreen without removing the lenses. Single-vision near correction (full lenses of one power only, appropriate to reading) significantly reduces distant visual acuity. Whenever there is a requirement to obtain or renew correcting lenses, an applicant is expected to advise the refractionist of reading distances for the visual flight deck tasks relevant to the types of aircraft in which the applicant is likely to function.

6.3.3.4.1 **Recommendation.—** *An applicant should have a near point of accommodation of 30 cm while wearing the correcting lenses, if any, required by 6.3.3.3.*

An applicant who does not meet this provision may nevertheless be assessed as fit if able to produce evidence, satisfactory to the Licensing Authority, of having been fitted with correction for near and intermediate-range vision, or of not requiring such correction at present. Such an applicant should be required to wear the correction needed for near and intermediate-range vision, in addition to any correction required by 6.3.3.3, while exercising the privileges of the licence.

6.3.4 Hearing requirements

The medical examination shall be based on the following requirements.

6.3.4.1 The applicant, tested on a pure-tone audiometer at first issue of licence, not less than once every five years up to the age of 40 years, and thereafter not less than once every three years, shall not have a hearing loss, in either ear separately, of more than 35 dB at any of the frequencies 500, 1 000 or 2 000 Hz, or more than 50 dB at 3 000 Hz. However, an applicant with a hearing loss greater than the above may be declared fit provided that:

a) the applicant has a hearing performance in each ear separately equivalent to that of a normal person, against a background noise that will simulate the masking properties of flight deck noise upon speech and beacon signals; and

b) the applicant has the ability to hear an average conversational voice in a quiet room, using both ears, at a distance of 2 m from the examiner, with the back turned to the examiner.

6.3.4.1.1 Alternatively, other methods providing equivalent results to those specified in 6.3.4.1 shall be used.

6.4 Class 2 Medical Assessment

6.4.1 Assessment issue and renewal

6.4.1.1 An applicant for a private pilot licence — aeroplane or helicopter, a glider pilot licence or a free balloon pilot licence shall undergo an initial medical examination for the issue of a Class 2 Medical Assessment.

6.4.1.2 Except where otherwise stated in this section, holders of private pilot licences — aeroplane or helicopter, glider pilot licences or free balloon pilot licences, shall have their Class 2 Medical Assessments renewed at intervals not exceeding those specified in 1.2.5.2.

6.4.1.3 When the Licensing Authority is satisfied that the requirements of this section and the general provisions of 6.1 and 6.2 have been met, a Class 2 Medical Assessment shall be issued to the applicant.

6.4.2 Physical and mental requirements

The medical examination shall be based on the following requirements.

6.4.2.1 The applicant shall not suffer from any disease or disability which could render that applicant likely to become suddenly unable either to operate an aircraft safely or to perform assigned duties safely.

6.4.2.2 The applicant shall have no established medical history or clinical diagnosis of:

a) a psychosis;

b) alcoholism;

c) drug dependence;

d) any personality disorder, particularly if severe enough to have repeatedly resulted in overt acts;

e) a mental abnormality, or neurosis of a significant degree;

such as might render the applicant unable to safely exercise the privileges of the licence applied for or held, unless accredited medical conclusion indicates that in special circumstances, the applicant's failure to meet the requirement is such that exercise of the privileges of the licence applied for is not likely to jeopardize flight safety.

6.4.2.2.1 **Recommendation.—** *The applicant should have no established medical history or clinical diagnosis of any mental abnormality, personality disorder or neurosis which, according to accredited medical conclusion, makes it likely that within two years of the examination the applicant will be unable to safely exercise the privileges of the licence or rating applied for or held.*

Note.— A history of acute toxic psychosis need not be regarded as disqualifying, provided that the applicant has suffered no permanent impairment.

6.4.2.3 The applicant shall have no established medical history or clinical diagnosis of any of the following:

a) a progressive or non-progressive disease of the nervous system, the effects of which, according to accredited medical conclusion, are likely to interfere with the safe exercise of the applicant's licence and rating privileges;

b) epilepsy;

c) any disturbance of consciousness without satisfactory medical explanation of cause.

6.4.2.4 Cases of head injury, the effects of which, according to accredited medical conclusion, are likely to interfere with the safe exercise of the applicant's licence and rating privileges shall be assessed as unfit.

6.4.2.5 The applicant shall not possess any abnormality of the heart, congenital or acquired, which is likely to interfere with the safe exercise of the applicant's licence and rating privileges. A history of proven myocardial infarction shall be disqualifying.

Note.— Such commonly occurring conditions as respiratory arrhythmia, occasional extrasystoles which disappear on exercise, increase of pulse rate from excitement or exercise, or a slow pulse not associated with auriculoventricular dissociation may be regarded as being within "normal" limits.

6.4.2.5.1 **Recommendation.—** *Electrocardiography should form part of the heart examination for the first issue of a licence, at the first re-examination after the age of 40 and thereafter no less frequently than every five years, and in re-examinations in all doubtful cases.*

Note 1.— The purpose of routine electrocardiography is case finding. It does not provide sufficient evidence to justify disqualification without further thorough cardiovascular investigation.

Note 2.— Guidance on resting and exercise electrocardiography is published in the Manual of Civil Aviation Medicine.

6.4.2.6 The systolic and diastolic blood pressures shall be within normal limits.

Note 1.— The use of drugs for control of high blood pressure is disqualifying except for those drugs, the use of which, according to accredited medical conclusion, is compatible with the safe exercise of the applicant's licence and rating privileges.

Note 2.— Extensive guidance on the subject is published in the Manual of Civil Aviation Medicine.

6.4.2.7 There shall be no significant functional nor structural abnormality of the circulatory tree. The presence of varicosities does not necessarily entail unfitness.

6.4.2.8 There shall be no acute disability of the lungs nor any active disease of the structures of the lungs, mediastinum or pleura. Radiography shall form a part of the medical examination in all doubtful clinical cases.

6.4.2.8.1 **Recommendation.—** *Radiography should form a part of the initial chest examination and should be repeated periodically thereafter.*

6.4.2.9 Any extensive mutilation of the chest wall with collapse of the thoracic cage and sequelae of surgical procedures resulting in decreased respiratory efficiency at altitude shall be assessed as unfit.

6.4.2.10 **Recommendation.—** *Cases of pulmonary emphysema should be assessed as unfit only if the condition is causing symptoms.*

6.4.2.11 Cases of active pulmonary tuberculosis, duly diagnosed, shall be assessed as unfit. Cases of quiescent or healed lesions which are known to be tuberculous, or are presumably tuberculous in origin, may be assessed as fit.

Note 1.— Guidance material on assessment of respiratory diseases is published in the Manual of Civil Aviation Medicine.

Note 2.— Guidance material on hazards of medications is published in the Manual of Civil Aviation Medicine.

6.4.2.12 Cases of disabling disease with important impairment of function of the gastrointestinal tract or its adnexae shall be assessed as unfit.

6.4.2.13 The applicant shall be required to be completely free from those hernias that might give rise to incapacitating symptoms.

6.4.2.14 Any sequelae of disease or surgical intervention on any part of the digestive tract or its adnexae, likely to cause incapacity in flight, in particular any obstructions due to stricture or compression shall be assessed as unfit.

6.4.2.14.1 **Recommendation.—** *An applicant who has undergone a major surgical operation on the biliary passages or the digestive tract or its adnexae, which has involved a total or partial excision or a diversion of any of these organs should be assessed as unfit until such time as the medical authority designated for the purpose by the Contracting State and having access to the details of the operation concerned considers that the effects of the operation are not likely to cause incapacity in the air.*

6.4.2.15 Cases of metabolic, nutritional or endocrine disorders likely to interfere with the safe exercise of the applicant's licence and rating privileges shall be assessed as unfit.

6.4.2.16 Proven cases of diabetes mellitus shown to be satisfactorily controlled without the use of any antidiabetic drug, may be assessed as fit. The use of antidiabetic drugs for the control of diabetes mellitus is disqualifying except for those oral drugs administered under conditions permitting appropriate medical supervision and control and which, according to accredited medical conclusion, are compatible with the safe exercise of the applicant's licence and rating privileges.

6.4.2.17 Cases of significant localized and generalized enlargement of the lymphatic glands and of diseases of the blood shall be assessed as unfit, except in cases where accredited medical conclusion indicates that the condition is not likely to affect the safe exercise of the applicant's licence and rating privileges.

6.4.2.17.1 **Recommendation.—** *Possession of the sickle cell trait should not be a reason for disqualification unless there is positive medical evidence to the contrary.*

6.4.2.17.2 **Recommendation.—** *Cases in 6.4.2.17 due to a transient condition should be assessed as only temporarily unfit.*

6.4.2.18 Cases presenting any signs of organic disease of the kidney shall be assessed as unfit; those due to a transient condition may be assessed as temporarily unfit. The urine shall contain no abnormal element considered by the medical examiner to be of pathological significance. Cases of affections of the urinary passages and of the genital organs shall be assessed as unfit; those due to a transient condition may be assessed as temporarily unfit.

6.4.2.19 Any sequelae of disease or surgical procedures on the kidneys and the urinary tract likely to cause incapacity, in particular any obstructions due to stricture or compression, shall be assessed as unfit. Compensated nephrectomy without hypertension or uraemia may be assessed as fit.

6.4.2.19.1 **Recommendation.—** *An applicant who has undergone a major surgical operation on the urinary system which has involved a total or partial excision or a diversion of any of its organs should be assessed as unfit until such time as the medical authority designated for the purpose by the Contracting State and having access to the details of the operation concerned considers that the effects of the operation are not likely to cause incapacity in the air.*

6.4.2.20 An applicant for the first issue of a licence who has a personal history of syphilis shall be required to furnish evidence, satisfactory to the medical examiner, that the applicant has undergone adequate treatment.

6.4.2.21 Applicants who have a history of severe menstrual disturbances that have proved unamenable to treatment and that are likely to interfere with the safe exercise of the applicant's licence and rating privileges shall be assessed as unfit.

6.4.2.21.1 **Recommendation.—** *Applicants who have undergone gynaecological operations should be considered individually.*

6.4.2.22 Pregnancy shall be a cause of temporary unfitness.

6.4.2.22.1 **Recommendation.—** *In the absence of any significant abnormalities, accredited medical conclusion may indicate fitness during the middle months of pregnancy.*

6.4.2.23 Following confinement or termination of pregnancy, the applicant shall not be permitted to exercise the privileges of her licence until she has undergone re-examination and has been assessed as fit.

6.4.2.24 Any active disease of the bones, joints, muscles or tendons and all serious functional sequelae of congenital or acquired disease shall be assessed as unfit. Certain qualifying functional after-effects of lesion affecting the bones, joints, muscles or tendons and certain anatomical defects compatible with the safe exercise of the applicant's licence and rating privileges may be assessed as fit.

6.4.2.25 There shall be:

a) no active pathological process, acute or chronic, of the internal ear or of the middle ear;

b) no permanent disturbances of the vestibular apparatus. Transient conditions may be assessed as temporarily unfit.

Note.— The details of the hearing requirements are set out in 6.4.4.

6.4.2.26 There shall be no serious malformation nor serious, acute or chronic affection of the buccal cavity or upper respiratory tract.

6.4.3 Visual requirements

The medical examination shall be based on the following requirements.

6.4.3.1 The function of the eyes and their adnexae shall be normal. There shall be no active pathological condition, acute or chronic, of either eye or adnexae which is likely to interfere with its proper function to an extent that would interfere with the safe exercise of the applicant's licence and rating privileges.

6.4.3.2 The applicant shall be required to have normal fields of vision.

6.4.3.3 The applicant shall be required to have a distant visual acuity of not less than 6/12 (20/40, 0.5) in each eye separately, with or without the use of correcting lenses. Where this standard of visual acuity can be obtained only with correcting lenses, the applicant may be assessed as fit provided that:

a) such correcting lenses are worn when exercising the privileges of the licence or rating applied for or held; and

b) a spare set of suitable correcting lenses shall be readily available when exercising the privileges of the applicant's licence.

6.4.3.3.1 **Recommendation.**— *If the visual acuity required by 6.4.3.3 is obtained only by the use of correcting lenses and the uncorrected visual acuity in either eye is less than 6/60 (20/200, 0.1), applicants whose refractive error in each eye falls within the range of ±5 dioptres (equivalent spherical error) may be assessed as fit. Applicants whose refractive error in either eye falls outside the range of ±5 dioptres (equivalent spherical error) may however be accepted as fit according to accredited medical conclusion.*

Note.— An applicant accepted as meeting these provisions is deemed to continue to do so unless there is reason to suspect otherwise, in which case refraction is repeated at the discretion of the Licensing Authority. The uncorrected visual acuity is measured and recorded at each re-examination. Conditions which indicate a need to redetermine the refractive error include: a refractive state close to the limit of acceptability, a substantial decrease in the uncorrected visual acuity, and the occurrence of eye disease, eye injury or eye surgery.

6.4.3.4 The applicant shall have the ability to read the N5 chart or its equivalent at a distance selected by that applicant in the range of 30 to 50 cm. If this requirement is met only by the use of correcting lenses, the applicant may be assessed as fit provided that such lenses are available for immediate use when exercising the privileges of the licence. No more than one pair of correcting lenses shall be used in demonstrating compliance with this visual requirement. Single-vision near correction shall not be acceptable.

Note 1.— Single-vision near correction (full lenses of one power only, appropriate to reading) significantly reduces distant visual acuity.

Note 2.— Whenever there is a requirement to obtain or renew correcting lenses, an applicant is expected to advise the refractionist of the reading distances for the visual flight deck tasks relevant to the types of aircraft in which the applicant is likely to function.

6.4.4 Hearing requirements

The medical examination shall be based on the following requirements.

6.4.4.1 The applicant shall be able to hear an average conversational voice in a quiet room, using both ears, at a distance of 2 m from the examiner, with the back turned to the examiner.

6.5 Class 3 Medical Assessment

6.5.1 Assessment issue and renewal

6.5.1.1 An applicant for an air traffic controller licence shall undergo an initial medical examination for the issue of a Class 3 Medical Assessment.

6.5.1.2 Except where otherwise stated in this section, holders of air traffic controller licences shall have their Class 3 Medical Assessments renewed at intervals not exceeding those specified in 1.2.5.2.

6.5.1.3 When the Licensing Authority is satisfied that the requirements of this section and the general provisions of 6.1 and 6.2 have been met, a Class 3 Medical Assessment shall be issued to the applicant.

6.5.2 Physical and mental requirements

The medical examination shall be based on the following requirements.

6.5.2.1 The applicant shall not suffer from any disease or disability which could render that applicant likely to become suddenly unable to perform duties safely.

6.5.2.2 The applicant shall have no established medical history or clinical diagnosis of:

a) a psychosis;

b) alcoholism;

c) drug dependence;

d) any personality disorder, particularly if severe enough to have repeatedly resulted in overt acts;

e) a mental abnormality, or neurosis of a significant degree;

such as might render the applicant unable to safely exercise the privileges of the licence applied for or held, unless accredited medical conclusion indicates that in special circumstances, the applicant's failure to meet the requirement is such that exercise of the privileges of the licence applied for is not likely to jeopardize flight safety.

6.5.2.2.1 **Recommendation.**— *The applicant should have no established medical history or clinical diagnosis of any mental abnormality, personality disorder or neurosis which, according to accredited medical conclusion, makes it likely that within two years of the examination the applicant will be unable to safely exercise the privileges of the licence or rating applied for or held.*

Note.— A history of acute toxic psychosis need not be regarded as disqualifying, provided that the applicant has suffered no permanent impairment.

6.5.2.3 The applicant shall have no established medical history or clinical diagnosis of any of the following:

a) a progressive or non-progressive disease of the nervous system, the effects of which, according to accredited medical conclusion, are likely to interfere with the safe exercise of the applicant's licence and rating privileges;

b) epilepsy;

c) any disturbance of consciousness without satisfactory medical explanation of cause.

6.5.2.4 Cases of head injury, the effects of which, according to accredited medical conclusion, are likely to interfere with the safe exercise of the applicant's licence privileges shall be assessed as unfit.

6.5.2.5 The applicant shall not possess any abnormality of the heart, congenital or acquired, which is likely to interfere with the safe exercise of the applicant's licence privileges. An applicant indicated by accredited medical conclusion to have made a satisfactory recovery from myocardial infarction may be assessed as fit.

Note.— Such commonly occurring conditions as respiratory arrhythmia, occasional extrasystoles which disappear on exercise, increase of pulse rate from excitement or exercise, or a slow pulse not associated with auriculoventricular dissociation may be regarded as being within "normal" limits.

6.5.2.5.1 **Recommendation.—** *Electrocardiography should form part of the heart examination for the first issue of a licence, at the first re-examination after the age of 40 and thereafter no less frequently than every five years, and in re-examinations in all doubtful cases.*

Note 1.— The purpose of routine electrocardiography is case finding. It does not provide sufficient evidence to justify disqualification without further thorough cardiovascular investigation.

Note 2.— Guidance on resting and exercise electrocardiography is published in the Manual of Civil Aviation Medicine.

6.5.2.6 The systolic and diastolic blood pressures shall be within normal limits.

Note 1.— The use of drugs for control of high blood pressure is disqualifying except for those drugs, the use of which, according to accredited medical conclusion, is compatible with the safe exercise of the applicant's licence privileges.

Note 2.— Extensive guidance on the subject is published in the Manual of Civil Aviation Medicine.

6.5.2.7 There shall be no significant functional nor structural abnormality of the circulatory tree. The presence of varicosities does not necessarily entail unfitness.

6.5.2.8 There shall be no acute disability of the lungs nor any active disease of the structures of the lungs, mediastinum or pleura. Radiography shall form a part of the medical examination in all doubtful clinical cases.

6.5.2.8.1 **Recommendation.—** *Radiography should form a part of the initial chest examination and should be repeated periodically thereafter.*

6.5.2.9 **Recommendation.—** *Cases of pulmonary emphysema should be assessed as unfit only if the condition is causing symptoms.*

6.5.2.10 Cases of active pulmonary tuberculosis, duly diagnosed, shall be assessed as unfit. Cases of quiescent or healed lesions which are known to be tuberculous, or are presumably tuberculous in origin, may be assessed as fit.

Note 1.— Guidance material on assessment of respiratory diseases is published in the Manual of Civil Aviation Medicine.

Note 2.— Guidance material on hazards of medications is published in the Manual of Civil Aviation Medicine.

6.5.2.11 Cases of disabling disease with important impairment of function of the gastrointestinal tract or its adnexae shall be assessed as unfit.

6.5.2.12 The applicant shall be required to be completely free from those hernias that might give rise to incapacitating symptoms.

6.5.2.13 Any sequelae of disease or surgical intervention on any part of the digestive tract or its adnexae, liable to cause incapacity, in particular any obstructions due to stricture or compression shall be assessed as unfit.

6.5.2.14 Cases of metabolic, nutritional or endocrine disorders likely to interfere with the safe exercise of the applicant's licence privileges shall be assessed as unfit.

6.5.2.15 Proven cases of diabetes mellitus shown to be satisfactorily controlled without the use of any anti-diabetic drug, may be assessed as fit. The use of anti-diabetic drugs for the control of diabetes mellitus is disqualifying except for those oral drugs administered under conditions permitting appropriate medical supervision and control and which, according to accredited medical conclusion, are compatible with the safe exercise of the applicant's licence privileges.

6.5.2.16 Cases of significant localized and generalized enlargement of the lymphatic glands and of diseases of the blood shall be assessed as unfit, except in cases where accredited medical conclusion indicates that the condition is not likely to affect the safe exercise of the applicant's licence privileges.

6.5.2.16.1 **Recommendation.**— *Cases in 6.5.2.16 due to a transient condition should be assessed as only temporarily unfit.*

6.5.2.17 Cases presenting any signs of organic disease of the kidney shall be assessed as unfit; those due to a transient condition may be assessed as temporarily unfit. The urine shall contain no abnormal element considered by the medical examiner to be of pathological significance. Cases of affections of the urinary passages and of the genital organs shall be assessed as unfit; those due to a transient condition may be assessed as temporarily unfit.

6.5.2.18 Any sequelae of disease or surgical procedures on the kidneys and the urinary tract liable to cause incapacity, in particular any obstructions due to stricture or compression, shall be assessed as unfit. Compensated nephrectomy without hypertension or uraemia may be assessed as fit.

6.5.2.19 An applicant for the first issue of a licence who has a personal history of syphilis shall be required to furnish evidence, satisfactory to the medical examiner, that the applicant has undergone adequate treatment.

6.5.2.20 Applicants who have a history of severe menstrual disturbances that have proved unamenable to treatment and that are likely to interfere with the safe exercise of the applicant's licence privileges shall be assessed as unfit.

6.5.2.21 Any active disease of the bones, joints, muscles or tendons and all serious functional sequelae of congenital or acquired disease shall be assessed as unfit. Functional after-effects of lesion affecting the bones, joints, muscles or tendons and certain anatomical defects compatible with the safe exercise of the applicant's licence privileges may be assessed as fit.

6.5.2.22 There shall be:

a) no active pathological process, acute or chronic, of the internal ear or of the middle ear;

b) no permanent disturbances of the vestibular apparatus. Transient conditions may be assessed as temporarily unfit.

Note.— The details of the hearing requirements are set out in 6.5.4.

6.5.2.23 There shall be no serious malformation nor serious, acute or chronic affection of the buccal cavity or upper respiratory tract. Cases of speech defects and stuttering shall be assessed as unfit.

6.5.3 Visual requirements

The medical examination shall be based on the following requirements.

6.5.3.1 The function of the eyes and their adnexae shall be normal. There shall be no active pathological condition, acute or chronic, of either eye or adnexae which is likely to interfere with its proper function to an extent that would interfere with the safe exercise of the applicant's licence privileges.

6.5.3.2 The applicant shall be required to have normal fields of vision.

6.5.3.3 The applicant shall be required to have a distant visual acuity of not less than 6/9 (20/30, 0.7) in each eye separately, with or without the use of correcting lenses. Where this standard of visual acuity can be obtained only with correcting lenses, the applicant may be assessed as fit provided that:

a) the applicant possesses a visual acuity without correction in each eye separately, not less than 6/60 (20/200, 0.1) or the refractive error falls within the range of ±3 dioptres (equivalent spherical error);

b) such correcting lenses are worn when exercising the privileges of the licence or rating applied for or held; and

c) a spare set of suitable correcting lenses shall be readily available when exercising the privileges of the applicant's licence.

Note.— An applicant accepted as meeting those provisions of 6.5.3.3. a) which refer to refractive error is deemed to continue to do so unless there is reason to suspect otherwise, in which case refraction is repeated at the discretion of the Licensing Authority. The uncorrected visual acuity is measured and recorded at each re-examination. Conditions which indicate a need to redetermine the refractive error include: a refractive state close to the limit of acceptability, a substantial decrease in the uncorrected visual acuity, and the occurrence of eye disease, eye injury or eye surgery.

6.5.3.4 The applicant shall have the ability to read the N5 chart or its equivalent at a distance selected by that applicant in the range of 30 to 50 cm and the ability to read the N14 chart or its equivalent at a distance of 100 cm. If this requirement is met only by the use of correcting lenses, the applicant may be assessed as fit provided that such lenses are available for immediate use when exercising the privileges of the licence. No more than one pair of correcting lenses shall be used in demonstrating compliance with this visual requirement.

Note 1.— N5 and N14 refer to "Times Roman" type-face.

Note 2.— Single-vision near correction may be acceptable for certain air traffic control duties. However, it should be realized that single-vision near correction (full lenses of one power only, appropriate to reading) significantly reduces distant visual acuity. Whenever there is a requirement to obtain or renew correcting lenses, an applicant is expected to advise the refractionist of reading distances for the air traffic duties the applicant is likely to perform.

6.5.3.4.1 **Recommendation.—** *An applicant should have a near point of accommodation of 30 cm while wearing the correcting lenses, if any, required by 6.5.3.3. An applicant who does not meet this provision may nevertheless be assessed as fit if able to produce evidence, satisfactory to the Licensing Authority, of having been fitted with correction for near and intermediate-range vision, or of not requiring such correction at present. Such an applicant should be required to wear the correction needed for near and intermediate-range vision, in addition to any correction required by 6.5.3.3, while exercising the privileges of the licence.*

6.5.4 Hearing requirements

The medical examination shall be based on the following requirements.

6.5.4.1 The applicant, tested on a pure-tone audiometer at first issue of licence, not less than once every five years up to the age of 40 years, and thereafter not less than once every three years, shall not have a hearing loss, in either ear separately, of more than 35 dB at any of the frequencies 500, 1 000 or 2 000 Hz, or more than 50 dB at 3 000 Hz. However, an applicant with a hearing loss greater than the above may be declared fit provided that:

a) the applicant has a hearing performance in each ear separately equivalent to that of a normal person, against a background noise that will simulate that experienced in a typical air traffic control working environment; and

b) the applicant has the ability to hear an average conversational voice in a quiet room, using both ears, at a distance of 2 m from the examiner, with the back turned to the examiner.

6.5.4.1.1 Alternatively, other methcds providing equivalent results to those specified in 6.5.4.1 shall be used.

ATTACHMENT TO ANNEX 1

Editorial Note: This attachment reproduces in a four-column format the Standards and Recommended Practices contained in 2.3 to 2.10.2 inclusive (pilot licences and instrument ratings for aeroplanes and helicopters). The presentation makes it easier for the reader to compare the provisions of the various levels of licences and the instrument rating within the same category of aircraft.

2.3 Private pilot licence — Aeroplane

Note.— The ICAO Training Manual (Doc 7192), Part B-5, contains guidance material for a course of training for the private pilot licence — aeroplane.

2.3.1 Requirements for the issue of the licence

2.3.1.1 *Age*

The applicant shall be not less than 17 years of age.

2.3.1.2 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of a private pilot licence — aeroplane, in at least the following subjects:

Air law

a) rules and regulations relevant to the holder of a private pilot licence — aeroplane; rules of the air; appropriate air traffic services practices and procedures;

Aircraft general knowledge

b) principles of operation of aeroplane powerplants, systems and instruments;

c) operating limitations of aeroplanes and powerplants; relevant operational information from the flight manual or other appropriate document;

2.4 Commercial pilot licence — Aeroplane

Note.— The ICAO Training Manual (Doc 7192), Part B-5, contains guidance material for a course of training for the commercial pilot licence — aeroplane.

2.4.1 Requirements for the issue of the licence

2.4.1.1 *Age*

The applicant shall be not less than 18 years of age.

Note.— Certain privileges of the licence are curtailed by 2.1.10 for licence holders who have attained their 60th birthday.

2.4.1.2 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of a commercial pilot licence — aeroplane, in at least the following subjects:

Air law

a) rules and regulations relevant to the holder of a commercial pilot licence — aeroplane; rules of the air; appropriate air traffic services practices and procedures;

Aircraft general knowledge

b) principles of operation and functioning of aeroplane powerplants, systems and instruments;

c) operating limitations of appropriate aeroplanes and powerplants; relevant operational information from the flight manual or other appropriate document;

2.5 Airline transport pilot licence — Aeroplane

2.5.1 Requirements for the issue of the licence

2.5.1.1 *Age*

The applicant shall be not less than 21 years of age.

Note.— Certain privileges of the licence are curtailed by 2.1.10 for licence holders who have attained their 60th birthday.

2.5.1.2 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of an airline transport pilot licence — aeroplane, in at least the following subjects:

Air law

a) rules and regulations relevant to the holder of an airline transport pilot licence — aeroplane; rules of the air; appropriate air traffic services practices and procedures;

Aircraft general knowledge

b) general characteristics and limitations of electrical, hydraulic, pressurization and other aeroplane systems; flight control systems, including autopilot and stability augmentation;

c) principles of operation, handling procedures and operating limitations of aeroplane powerplants; effects of atmospheric conditions on engine performance; relevant operational information from the flight manual or other appropriate document;

d) operating procedures and limitations of appropriate aeroplanes; effects of atmospheric conditions on aeroplane performance;

2.6 Instrument rating — Aeroplane

Note.— The ICAO Training Manual (Doc 7192), Part B-5, contains guidance material for a course of training for the instrument rating — aeroplane.

2.6.1 Requirements for the issue of the rating

2.6.1.1 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of an instrument rating — aeroplane, in at least the following subjects:

Air law

a) rules and regulations relevant to flight under IFR; related air traffic services practices and procedures;

Aircraft general knowledge

b) use, limitation and serviceability of avionics and instruments necessary for the control and navigation of aeroplanes under IFR and in instrument meteorological conditions; use and limitations of autopilot;

16/11/89

2.3 Private pilot licence — Aeroplane	2.4 Commercial pilot licence — Aeroplane	2.5 Airline transport pilot licence — Aeroplane	2.6 Instrument rating — Aeroplane
	d) use and serviceability checks of equipment and systems of appropriate aeroplanes;	e) use and serviceability checks of equipment and systems of appropriate aeroplanes;

Meteorology	*Meteorology*	*Meteorology*	*Meteorology*
h) application of elementary aeronautical meteorology; use of, and procedures for obtaining, meteorological information; altimetry;	j) interpretation and application of aeronautical meteorological reports, charts and forecasts; use of, and procedures for obtaining, meteorological information, pre-flight and in-flight; altimetry;	l) interpretation and application of aeronautical meteorological reports, charts and forecasts; codes and abbreviations; use of, and procedures for obtaining, meteorological information, pre-flight and in-flight; altimetry;	g) application of aeronautical meteorology; interpretation and use of reports, charts and forecasts; codes and abbreviations; use of, and procedures for obtaining, meteorological information; altimetry;
	k) aeronautical meteorology; climatology of relevant areas in respect of the elements having an effect upon aviation; the movement of pressure systems, the structure of fronts, and the origin and characteristics of significant weather phenomena which affect take-off, en-route and landing conditions; hazardous weather avoidance;	m) aeronautical meteorology; climatology of relevant areas in respect of the elements having an effect upon aviation; the movement of pressure systems; the structure of fronts, and the origin and characteristics of significant weather phenomena which affect take-off, en-route and landing conditions;	

		n) causes, recognition and effects of engine and airframe icing; frontal zone penetration procedures; hazardous weather avoidance;	h) causes, recognition and effects of engine and airframe icing; frontal zone penetration procedures; hazardous weather avoidance;
		o) practical high altitude meteorology, including interpretation and use of weather reports, charts and forecasts; jetstreams;	
Navigation	*Navigation*	*Navigation*	*Navigation*
i) practical aspects of air navigation and dead-reckoning techniques; use of aeronautical charts;	l) air navigation, including the use of aeronautical charts, instruments and navigation aids; an understanding of the principles and characteristics of appropriate navigation systems; operation of airborne equipment;	p) air navigation, including the use of aeronautical charts, radio navigation aids and area navigation systems; specific navigation requirements for long-range flights;	i) practical air navigation using radio navigation aids;
		q) use, limitation and serviceability of avionics and instruments necessary for the control and navigation of aeroplanes;	
		r) use, accuracy and reliability of navigation systems used in departure, en-route, approach and landing phases of flight; identification of radio navigation aids;	j) use, accuracy and reliability of navigation systems used in departure, en-route, approach and landing phases of flight; identification of radio navigation aids;
		s) principles and characteristics of self-contained and external-referenced navigation systems; operation of airborne equipment;	
Operational procedures	*Operational procedures*	*Operational procedures*	*Operational procedures*
j) use of aeronautical documentation such as AIP, NOTAM, aeronautical codes and abbreviations;	m) use of aeronautical documentation such as AIP, NOTAM, aeronautical codes and abbreviations;	t) interpretation and use of aeronautical documentation such as AIP, NOTAM, aeronautical codes and abbreviations, and instrument procedure charts for departure, en-route, descent and approach;	k) interpretation and use of aeronautical documentation such as AIP, NOTAM, aeronautical codes and abbreviations, and instrument procedure charts for departure, en-route, descent and approach;
k) appropriate precautionary and emergency procedures, including action to be taken to avoid hazardous weather, wake turbulence and other operating hazards;	n) appropriate precautionary and emergency procedures;	u) precautionary and emergency procedures; safety practices associated with flight under IFR;	l) precautionary and emergency procedures; safety practices associated with flight under IFR;
	o) operational procedures for carriage of freight; potential hazards associated with dangerous goods;	v) operational procedures for carriage of freight and dangerous goods;	
	p) requirements and practices for safety briefing to passengers, including precautions to be observed when embarking and disembarking from aeroplanes;	w) requirements and practices for safety briefing to passengers, including precautions to be observed when embarking and disembarking from aeroplanes;	

Private pilot licence — Aeroplane (cont.)	Commercial pilot licence — Aeroplane (cont.)	Airline transport pilot licence — Aeroplane (cont.)	Instrument rating — Aeroplane (cont.)
Principles of flight	*Principles of flight*	*Principles of flight*	
l) principles of flight relating to aeroplanes;	q) principles of flight relating to aeroplanes;	x) principles of flight relating to aeroplanes; sub-sonic aerodynamics; compressibility effects, manoeuvre boundary limits, wing design characteristics, effects of supplementary lift and drag devices; relationships between lift, drag and thrust at various airspeeds and in different flight configurations;	
Radiotelephony	*Radiotelephony*	*Radiotelephony*	*Radiotelephony*
m) radiotelephony procedures and phraseology as applied to VFR operations; action to be taken in case of communication failure.	r) radiotelephony procedures and phraseology as applied to VFR operations; action to be taken in case of communication failure.	y) radiotelephony procedures and phraseology; action to be taken in case of communication failure.	m) radiotelephony procedures and phraseology as applied to aircraft operations under IFR; action to be taken in case of communication failure.
2.3.1.3 *Experience*	2.4.1.3 *Experience*	2.5.1.3 *Experience*	2.6.1.2 *Experience*
2.3.1.3.1 The applicant shall have completed not less than 40 hours of flight time as a pilot of aeroplanes. The Licensing Authority shall determine whether experience as a pilot under instruction in a synthetic flight trainer, which it has approved, is acceptable as part of the total flight time of 40 hours. Credit for such experience shall be limited to a maximum of 5 hours.	2.4.1.3.1 The applicant shall have completed not less than 200 hours of flight time, or 150 hours if completed during a course of approved training, as a pilot of aeroplanes. The Licensing Authority shall determine whether experience as a pilot under instruction in a synthetic flight trainer, which it has approved, is acceptable as part of the total flight time of 200 hours or 150 hours, as the case may be. Credit for such experience shall be limited to a maximum of 10 hours.	2.5.1.3.1 The applicant shall have completed not less than 1 500 hours of flight time as a pilot of aeroplanes. The Licensing Authority shall determine whether experience as a pilot under instruction in a synthetic flight trainer, which it has approved, is acceptable as part of the total flight time of 1 500 hours. Credit for such experience shall be limited to a maximum of 100 hours, of which not more than 25 hours shall have been acquired in a flight procedure trainer or a basic instrument flight trainer.	2.6.1.2.1 The applicant shall hold a private or commercial pilot licence — aeroplane.
2.3.1.3.1.1 When the applicant has flight time as a pilot of aircraft in other categories, the Licensing Authority shall determine whether such experience is acceptable and, if so, the extent to which the flight time requirements of 2.3.1.3.1 can be reduced accordingly.			
2.3.1.3.2 The applicant shall have completed in aeroplanes not less than 10 hours of solo flight time under the supervision of an authorized flight instructor, including 5 hours of solo cross-country flight time with at least one cross-country flight totalling not less than 270 km (150 NM) in the course of which full-stop landings at two different aerodromes shall be made.	2.4.1.3.1.1 The applicant shall have completed in aeroplanes not less than: a) 100 hours as pilot-in-command or, in the case of a course of approved training, 70 hours as pilot-in-command;	2.5.1.3.1.1 The applicant shall have completed in aeroplanes not less than: a) 250 hours, either as pilot-in-command, or made up by not less than 100 hours as pilot-in-command and the necessary additional flight time as co-pilot performing, under the supervision of the pilot-in-command, the duties and functions of a pilot-in-command, provided that the method of supervision employed is acceptable to the Licensing Authority;	2.6.1.2.2 The applicant shall have completed not less than:

2.3.1.4 *Flight instruction*

2.3.1.4.1 The applicant shall have received dual instruction in aeroplanes from an authorized flight instructor. The instructor shall ensure that the applicant has operational experience in at least the following areas to the level of performance required for the private pilot:

a) pre-flight operations, including mass and balance determination, aeroplane inspection and servicing;

b) aerodrome and traffic pattern operations, collision avoidance precautions and procedures;

c) control of the aeroplane by external visual reference;

b) 20 hours of cross-country flight time as pilot-in-command including a cross-country flight totalling not less than 540 km (300 NM) in the course of which full-stop landings at two different aerodromes shall be made;

c) 10 hours of instrument instruction time of which not more than 5 hours may be instrument ground time; and

d) if the privileges of the licence are to be exercised at night, 5 hours of night flight time including 5 take-offs and 5 landings as pilot-in-command.

2.4.1.3.2 When the applicant has flight time as a pilot of aircraft in other categories, the Licensing Authority shall determine whether such experience is acceptable and, if so, the extent to which the flight time requirements of 2.4.1.3.1 can be reduced accordingly.

2.4.1.4 *Flight instruction*

2.4.1.4.1 The applicant shall have received dual instruction in aeroplanes from an authorized flight instructor. The instructor shall ensure that the applicant has operational experience in at least the following areas to the level of performance required for the commercial pilot:

a) pre-flight operations, including mass and balance determination, aeroplane inspection and servicing;

b) aerodrome and traffic pattern operations, collision avoidance precautions and procedures;

c) control of the aeroplane by external visual reference;

b) 200 hours of cross-country flight time, of which not less than 100 hours shall be as pilot-in-command or as co-pilot performing, under the supervision of the pilot-in-command, the duties and functions of a pilot-in-command, provided that the method of supervision employed is acceptable to the Licensing Authority;

c) 75 hours of instrument time, of which not more than 30 hours may be instrument ground time; and

d) 100 hours of night flight as pilot-in-command or as co-pilot.

2.5.1.3.2 When the applicant has flight time as a pilot of aircraft in other categories, the Licensing Authority shall determine whether such experience is acceptable and, if so, the extent to which the flight time requirements of 2.5.1.3.1 can be reduced accordingly.

2.5.1.4 *Flight instruction*

The applicant shall have received the dual flight instruction required for the issue of the commercial pilot licence — aeroplane (2.4.1.4) and for the issue of the instrument rating — aeroplane (2.6.1.3).

a) 50 hours of cross-country flight time as pilot-in-command of aircraft in categories acceptable to the Licensing Authority, of which not less than 10 hours shall be in aeroplanes; and

b) 40 hours of instrument time in aeroplanes or helicopters of which not more than 20 hours, or 30 hours where a flight simulator is used, may be instrument ground time. The ground time shall be under the supervision of an authorized instructor.

2.6.1.3 *Flight instruction*

2.6.1.3.1 The applicant shall have gained not less than 10 hours of the instrument flight time required in 2.6.1.2.2 b) while receiving dual instrument flight instruction in aeroplanes from an authorized flight instructor. The instructor shall ensure that the applicant has operational experience in at least the following areas to the level of performance required for the holder of an instrument rating:

a) pre-flight procedures, including the use of the flight manual or equivalent document, and appropriate air traffic services documents in the preparation of an IFR flight plan;

b) pre-flight inspection, use of checklists, taxiing and pre-take-off checks;

c) procedures and manoeuvres for IFR operation under normal, abnormal and emergency conditions covering at least:

Private pilot licence — Aeroplane (cont.)

d) flight at critically slow airspeeds; recognition of, and recovery from, incipient and full stalls;

e) flight at critically high airspeeds; recognition of, and recovery from, spiral dives;

f) normal and cross-wind take-offs and landings;

g) maximum performance (short field and obstacle clearance) take-offs; short-field landings;

h) flight by reference solely to instruments, including the completion of a level 180° turn;

i) cross-country flying using visual reference, dead-reckoning and, where available, radio navigation aids;

j) emergency operations, including simulated aeroplane equipment malfunctions; and

k) operations to, from and transitting controlled aerodromes, compliance with air traffic services procedures, radiotelephony procedures and phraseology.

2.3.1.4.2 If the privileges of the licence are to be exercised at night, the applicant shall have received dual instruction in aeroplanes in night flying, including take-offs, landings and navigation.

Note.— The instrument experience specified in 2.3.1.4.1 h) and the night flying experience specified in 2.3.1.4.2 do not entitle the holder of a private pilot licence — aeroplane to pilot aeroplanes under IFR.

2.3.1.5 *Skill*

Commercial pilot licence — Aeroplane (cont.)

d) flight at critically slow airspeeds; spin avoidance; recognition of, and recovery from, incipient and full stalls;

e) flight at critically high airspeeds; recognition of, and recovery from, spiral dives;

f) normal and cross-wind take-offs and landings;

g) maximum performance (short field and obstacle clearance) take-offs; short-field landings;

h) basic flight manoeuvres and recovery from unusual attitudes by reference solely to basic flight instruments;

i) cross-country flying using visual reference, dead-reckoning and radio navigation aids; diversion procedures;

j) abnormal and emergency procedures and manoeuvres; and

k) operations to, from and transitting controlled aerodromes, compliance with air traffic services procedures, radiotelephony procedures and phraseology.

2.4.1.4.2 If the privileges of the licence are to be exercised at night, the applicant shall have received dual instruction in aeroplanes in night flying, including take-offs, landings and navigation.

Note.— The instrument experience specified in 2.4.1.3.1.1 c) and 2.4.1.4.1 h) and the night flying experience specified in 2.4.1.3.1.1 d) and 2.4.1.4.2 do not entitle the holder of a commercial pilot licence — aeroplane to pilot aeroplanes under IFR.

2.4.1.5 *Skill*

Airline transport pilot licence — Aeroplane (cont.)

2.5.1.5 *Skill*

2.5.1.5.1 The applicant shall have demonstrated the ability to perform, as pilot-in-command of a multi-engined aeroplane required to be operated with a co-pilot, the following procedures and manoeuvres:

a) pre-flight procedures, including the preparation of the operational flight plan and filing of the air traffic services flight plan;

Instrument rating — Aeroplane (cont.)

— transition to instrument flight on take-off

— standard instrument departures and arrivals

— en-route IFR procedures

— holding procedures

— instrument approaches to specified minima

— missed approach procedures

— landings from instrument approaches

d) in-flight manoeuvres and particular flight characteristics.

2.6.1.3.2 If the privileges of the instrument rating are to be exercised on multi-engined aeroplanes, the applicant shall have received dual instrument flight instruction in such an aeroplane from an authorized flight instructor. The instructor shall ensure that the applicant has operational experience in the operation of the aeroplane solely by reference to instruments with one engine inoperative or simulated inoperative.

2.6.1.4 *Skill*

The applicant shall have demonstrated the ability to perform as pilot-in-command of an aeroplane, the procedures and manoeuvres described in 2.3.1.4 with a degree of competency appropriate to the privileges granted to the holder of a private pilot licence — aeroplane, and to:

a) operate the aeroplane within its limitations;

b) complete all manoeuvres with smoothness and accuracy;

c) exercise good judgement and airmanship;

d) apply aeronautical knowledge; and

The applicant shall have demonstrated the ability to perform as pilot-in-command of an aeroplane, the procedures and manoeuvres described in 2.4.1.4 with a degree of competency appropriate to the privileges granted to the holder of a commercial pilot licence — aeroplane, and to:

a) operate the aeroplane within its limitations;

b) complete all manoeuvres with smoothness and accuracy;

c) exercise good judgement and airmanship;

d) apply aeronautical knowledge; and

b) normal flight procedures and manoeuvres during all phases of flight;

c) procedures and manoeuvres for IFR operations under normal, abnormal and emergency conditions, including simulated engine failure, and covering at least the following:

— transition to instrument flight on take-off

— standard instrument departures and arrivals

— en-route IFR procedures and navigation

— holding procedures

— instrument approaches to specified minima

— missed approach procedures

— landings from instrument approaches

d) abnormal and emergency procedures and manoeuvres related to failures and malfunctions of equipment, such as powerplant, systems and airframe; and

e) procedures for crew incapacitation and crew co-ordination, including allocation of pilot tasks, crew co-operation and use of checklists.

2.5.1.5.1.1 The applicant shall have demonstrated the ability to perform the procedures and manoeuvres described in 2.5.1.5.1 with a degree of competency appropriate to the privileges granted to the holder of an airline transport pilot licence — aeroplane, and to:

a) operate the aeroplane within its limitations;

b) complete all manoeuvres with smoothness and accuracy;

c) exercise good judgement and airmanship;

d) apply aeronautical knowledge;

2.6.1.4.1 The applicant shall have demonstrated the ability to perform the procedures and manoeuvres described in 2.6.1.3.1 with a degree of competency appropriate to the privileges granted to the holder of an instrument rating — aeroplane, and to:

a) operate the aeroplane within its limitations;

b) complete all manoeuvres with smoothness and accuracy;

c) exercise good judgement and airmanship;

d) apply aeronautical knowledge; and

Private pilot licence — Aeroplane (cont.)	Commercial pilot licence — Aeroplane (cont.)	Airline transport pilot licence — Aeroplane (cont.)	Instrument rating — Aeroplane (cont.)
e) maintain control of the aeroplane at all times in a manner such that the successful outcome of a procedure or manoeuvre is never seriously in doubt.	e) maintain control of the aeroplane at all times in a manner such that the successful outcome of a procedure or manoeuvre is never seriously in doubt.	e) maintain control of the aeroplane at all times in a manner such that the successful outcome of a procedure or manoeuvre is never in doubt; f) understand and apply crew co-ordination and incapacitation procedures; and g) communicate effectively with the other flight crew members.	e) maintain control of the aeroplane at all times in a manner such that the successful outcome of a procedure or manoeuvre is never seriously in doubt.
			2.6.1.4.1.1 The applicant shall have demonstrated the ability to operate multi-engined aeroplanes solely by reference to instruments with one engine inoperative, or simulated inoperative, if the privileges of the instrument rating are to be exercised on such aeroplanes. *Note.— Attention is called to 2.1.6 on the use of synthetic flight trainers for demonstrations of skill.*
2.3.1.6 *Medical fitness* The applicant shall hold a current Class 2 Medical Assessment. *Note.— Attention is called to 2.6.1.5 on the medical fitness requirements for private pilot licence holders seeking an instrument rating.*	2.4.1.6 *Medical fitness* The applicant shall hold a current Class 1 Medical Assessment.	2.5.1.6 *Medical fitness* The applicant shall hold a current Class 1 Medical Assessment.	2.6.1.5 *Medical fitness* 2.6.1.5.1 Applicants who hold a private pilot licence shall have established their hearing acuity on the basis of compliance with the hearing requirements for the issue of a Class 1 Medical Assessment. 2.6.1.5.2 **Recommendation.**— *Contracting States should consider requiring the holder of a private pilot licence to comply with the physical and mental, and visual requirements for the issue of a Class 1 Medical Assessment.*
2.3.2 Privileges of the holder of the licence and the conditions to be observed in exercising such privileges 2.3.2.1 Subject to compliance with the requirements specified in 1.2.5, 1.2.6 and 2.1, the privileges of the holder of a private pilot licence — aeroplane shall be to act, but not for remuneration, as pilot-in-command or co-pilot of any aeroplane engaged in non-revenue flights.	2.4.2 Privileges of the holder of the licence and the conditions to be observed in exercising such privileges 2.4.2.1 Subject to compliance with the requirements specified in 1.2.5, 1.2.6 and 2.1, the privileges of the holder of a commercial pilot licence — aeroplane shall be: a) to exercise all the privileges of the holder of a private pilot licence — aeroplane; b) to act as pilot-in-command in any aeroplane engaged in operations other than commercial air transportation;	2.5.2 Privileges of the holder of the licence and the conditions to be observed in exercising such privileges Subject to compliance with the requirements specified in 1.2.5, 1.2.6 and 2.1, the privileges of the holder of an airline transport pilot licence — aeroplane shall be: a) to exercise all the privileges of the holder of a private and commercial pilot licence — aeroplane and of an instrument rating — aeroplane; and b) to act as pilot-in-command and co-pilot in aeroplanes in air transportation.	2.6.2 Privileges of the holder of the rating and the conditions to be observed in exercising such privileges 2.6.2.1 Subject to compliance with the requirements specified in 1.2.5, 1.2.6 and 2.1, the privileges of the holder of an instrument rating — aeroplane shall be to pilot aeroplanes under IFR. 2.6.2.2 Before exercising the privileges on multi-engined aeroplanes, the holder of the rating shall have complied with the requirements of 2.6.1.4.1.1. *Note.— Attention is called to 2.10.3 on the exercise of joint privileges of the*

2.3.2.2 Before exercising the privileges at night, the licence holder shall have complied with the requirements specified in 2.3.1.4.2.

2.7 Private pilot licence — Helicopter

2.7.1 Requirements for the issue of the licence

2.7.1.1 *Age*

The applicant shall be not less than 17 years of age.

2.7.1.2 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of a private pilot licence — helicopter, in at least the following subjects:

Air law

a) rules and regulations relevant to the holder of a private pilot licence — helicopter; rules of the air; appropriate air traffic services practices and procedures;

Aircraft general knowledge

b) principles of operation of helicopter powerplants, transmission (power-trains), systems and instruments;

c) to act as pilot-in-command in commercial air transportation in any aeroplane certificated for single-pilot operation; and

d) to act as co-pilot in commercial air transportation in aeroplanes required to be operated with a co-pilot.

2.4.2.2 Before exercising the privileges at night, the licence holder shall have complied with the requirements specified in 2.4.1.3.1.1 d) and 2.4.1.4.2.

2.8 Commercial pilot licence — Helicopter

2.8.1 Requirements for the issue of the licence

2.8.1.1 *Age*

The applicant shall be not less than 18 years of age.

Note.— Certain privileges of the licence are curtailed by 2.1.10 for licence holders who have attained their 60th birthday.

2.8.1.2 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of a commercial pilot licence — helicopter, in at least the following subjects:

Air law

a) rules and regulations relevant to the holder of a commercial pilot licence — helicopter; rules of the air; appropriate air traffic services practices and procedures;

Aircraft general knowledge

b) principles of operation and functioning of helicopter powerplants, transmission (power-trains), systems and instruments;

2.9 Airline transport pilot licence — Helicopter

2.9.1 Requirements for the issue of the licence

2.9.1.1 *Age*

The applicant shall be not less than 21 years of age.

Note.— Certain privileges of the licence are curtailed by 2.1.10 for licence holders who have attained their 60th birthday.

2.9.1.2 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of an airline transport pilot licence — helicopter, in at least the following subjects:

Air law

a) rules and regulations relevant to the holder of an airline transport pilot licence — helicopter; rules of the air; appropriate air traffic services practices and procedures;

Aircraft general knowledge

b) general characteristics and limitations of electrical, hydraulic, and other helicopter systems; flight control systems, including autopilot and stability augmentation;

instrument rating — aeroplane and of the instrument rating — helicopter.

2.10 Instrument rating — Helicopter

2.10.1 Requirements for the issue of the rating

2.10.1.1 *Knowledge*

The applicant shall have demonstrated a level of knowledge appropriate to the privileges granted to the holder of an instrument rating — helicopter, in at least the following subjects:

Air law

a) rules and regulations relevant to flight under IFR; related air traffic services practices and procedures;

Aircraft general knowledge

b) use, limitation and serviceability of avionics and instruments necessary for the control and navigation of helicopters under IFR and in instrument meteorological conditions; use and limitations of autopilot;

Private pilot licence — Helicopter (cont.)	Commercial pilot licence — Helicopter (cont.)	Airline transport pilot licence — Helicopter (cont.)	Instrument rating — Helicopter (cont.)
k) appropriate precautionary and emergency procedures, including action to be taken to avoid hazardous weather and wake turbulence; settling with power, ground resonance, roll-over and other operating hazards;	n) appropriate precautionary and emergency procedures; settling with power, ground resonance, roll-over and other operating hazards;	t) precautionary and emergency procedures; settling with power, ground resonance, retreating blade stall, dynamic roll-over and other operating hazards; safety practices associated with flight under VFR;	l) precautionary and emergency procedures; safety practices associated with flight under IFR;
	o) operational procedures for carriage of freight, including external loads; potential hazards associated with dangerous goods;	u) operational procedures for carriage of freight, including external loads, and dangerous goods;	
	p) requirements and practices for safety briefing to passengers, including precautions to be observed when embarking and disembarking from helicopters;	v) requirements and practices for safety briefing to passengers, including precautions to be observed when embarking and disembarking from helicopters;	
Principles of flight	*Principles of flight*	*Principles of flight*	
l) principles of flight relating to helicopters;	q) principles of flight relating to helicopters;	w) principles of flight relating to helicopters;	
Radiotelephony	*Radiotelephony*	*Radiotelephony*	*Radiotelephony*
m) radiotelephony procedures and phraseology as applied to VFR operations; action to be taken in case of communication failure.	r) radiotelephony procedures and phraseology as applied to VFR operations; action to be taken in case of communication failure.	x) radiotelephony procedures and phraseology as applied to VFR operations; action to be taken in case of communication failure.	m) radiotelephony procedures and phraseology as applied to aircraft operations under IFR; action to be taken in case of communication failure.
2.7.1.3 *Experience*	2.8.1.3 *Experience*	2.9.1.3 *Experience*	2.10.1.2 *Experience*
2.7.1.3.1 The applicant shall have completed not less than 40 hours of flight time as a pilot of helicopters. The Licensing Authority shall determine whether experience as a pilot under instruction in a synthetic flight trainer, which it has approved, is acceptable as part of the total flight time of 40 hours. Credit for such experience shall be limited to a maximum of 5 hours.	2.8.1.3.1 The applicant shall have completed not less than 150 hours of flight time, or 100 hours if completed during a course of approved training, as a pilot of helicopters. The Licensing Authority shall determine whether experience as a pilot under instruction in a synthetic flight trainer, which it has approved, is acceptable as part of the total flight time of 150 hours or 100 hours, as the case may be. Credit for such experience shall be limited to a maximum of 10 hours.	2.9.1.3.1 The applicant shall have completed not less than 1 000 hours of flight time as a pilot of helicopters. The Licensing Authority shall determine whether experience as a pilot under instruction in a synthetic flight trainer, which it has approved, is acceptable as part of the total flight time of 1 000 hours. Credit for such experience shall be limited to a maximum of 100 hours, of which not more than 25 hours shall have been acquired in a flight procedure trainer or a basic instrument flight trainer.	2.10.1.2.1 The applicant shall hold a private, commercial or airline transport pilot licence — helicopter.
2.7.1.3.1.1 When the applicant has flight time as a pilot of aircraft in other categories, the Licensing Authority shall determine whether such experience is acceptable and, if so, the extent to which the flight time requirements of 2.7.1.3.1 can be reduced accordingly.			

2.7.1.3.2 The applicant shall have completed in helicopters not less than 10 hours of solo flight time under the supervision of an authorized flight instructor, including 5 hours of solo cross-country flight time with at least one cross-country flight totalling not less than 180 km (100 NM) in the course of which landings at two different points shall be made.

2.7.1.4 *Flight instruction*

2.7.1.4.1 The applicant shall have received not less than 20 hours of dual instruction time in helicopters from an authorized flight instructor. The instructor shall ensure that the applicant has operational experience in at least the following areas to the level of performance required for the private pilot:

2.8.1.3.1.1 The applicant shall have completed in helicopters not less than:

a) 35 hours as pilot-in-command;

b) 10 hours of cross-country flight time as pilot-in-command including a cross-country flight in the course of which landings at two different points shall be made;

c) 10 hours of instrument instruction time of which not more than 5 hours may be instrument ground time; and

d) if the privileges of the licence are to be exercised at night, 5 hours of night flight time including 5 take-offs and 5 landing patterns as pilot-in-command.

2.8.1.3.2 When the applicant has flight time as a pilot of aircraft in other categories, the Licensing Authority shall determine whether such experience is acceptable and, if so, the extent to which the flight time requirements of 2.8.1.3.1 can be reduced accordingly.

2.8.1.4 *Flight instruction*

2.8.1.4.1 The applicant shall have received dual instruction in helicopters from an authorized flight instructor. The instructor shall ensure that the applicant has operational experience in at least the following areas to the level of performance required for the commercial pilot:

2.9.1.3.1.1 The applicant shall have completed in helicopters not less than:

a) 250 hours, either as pilot-in-command, or made up by not less than 100 hours as pilot-in-command and the necessary additional flight time as co-pilot performing, under the supervision of the pilot-in-command, the duties and functions of a pilot-in-command, provided that the method of supervision employed is acceptable to the Licensing Authority;

b) 200 hours of cross-country flight time, of which not less than 100 hours shall be as pilot-in-command or as co-pilot performing, under the supervision of the pilot-in-command, the duties and functions of a pilot-in-command, provided that the method of supervision employed is acceptable to the Licensing Authority;

c) 30 hours of instrument time, of which not more than 10 hours may be instrument ground time; and

d) 50 hours of night flight as pilot-in-command or as co-pilot.

2.9.1.3.2 When the applicant has flight time as a pilot of aircraft in other categories, the Licensing Authority shall determine whether such experience is acceptable and, if so, the extent to which the flight time requirements of 2.9.1.3.1 can be reduced accordingly.

2.9.1.4 *Flight instruction*

The applicant shall have received the flight instruction required for the issue of the commercial pilot licence — helicopter (2.8.1.4).

Note.— The instrument time specified in 2.9.1.3.1.1 c) and the night flying time specified in 2.9.1.3.1.1 d) do not entitle the holder of the airline transport pilot licence — helicopter to pilot helicopters under IFR.

2.10.1.2.2 The applicant shall have completed not less than:

a) 50 hours of cross-country flight time as pilot-in-command of aircraft in categories acceptable to the Licensing Authority, of which not less than 10 hours shall be in helicopters; and

b) 40 hours of instrument time in helicopters or aeroplanes of which not more than 20 hours, or 30 hours where a flight simulator is used, may be instrument ground time. The ground time shall be under the supervision of an authorized instructor.

2.10.1.3 *Flight instruction*

The applicant shall have gained not less than 10 hours of the instrument flight time required in 2.10.1.2.2 b) while receiving dual instrument flight instruction in helicopters from an authorized flight instructor. The instructor shall ensure that the applicant has operational experience in at least the following areas and to the level of performance required for the holder of an instrument rating:

Private pilot licence — Helicopter (cont.)

a) pre-flight operations, including mass and balance determination, helicopter inspection and servicing;

b) aerodrome and traffic pattern operations, collision avoidance precautions and procedures;

c) control of the helicopter by external visual reference;

d) recovery at the incipient stage from settling with power; recovery techniques from low-rotor rpm within the normal range of engine rpm;

e) ground manoeuvring and run-ups; hovering; take-offs and landings — normal, out of wind and sloping ground;

f) take-offs and landings with minimum necessary power; maximum performance take-off and landing techniques; restricted site operations; quick stops;

g) cross-country flying using visual reference, dead reckoning and, where available, radio navigation aids, including a flight of at least one hour;

h) emergency operations, including simulated helicopter equipment malfunctions; autorotative approach and landing; and

i) operations to, from and transitting controlled aerodromes, compliance with air traffic services procedures, radiotelephony procedures and phraseology.

2.7.1.4.1.1 **Recommendation.—** *The applicant should have received dual instrument flight instruction from an authorized flight instructor. The instructor should ensure that the applicant has operational experience in flight solely by reference to instruments, including the completion of a level 180° turn, in a suitably instrumented helicopter.*

Commercial pilot licence — Helicopter (cont.)

a) pre-flight operations, including mass and balance determination, helicopter inspection and servicing;

b) aerodrome and traffic pattern operations, collision avoidance precautions and procedures;

c) control of the helicopter by external visual reference;

d) recovery at the incipient stage from settling with power; recovery techniques from low-rotor rpm within the normal range of engine rpm;

e) ground manoeuvring and run-ups; hovering; take-offs and landings — normal, out of wind and sloping ground; steep approaches;

f) take-offs and landings with minimum necessary power; maximum performance take-off and landing techniques; restricted site operations; quick stops;

g) hovering out of ground effect; operations with external load, if applicable; flight at high altitude;

h) basic flight manoeuvres and recovery from unusual attitudes by reference solely to basic flight instruments;

i) cross-country flying using visual reference, dead-reckoning and radio navigation aids; diversion procedures;

j) abnormal and emergency procedures, including simulated helicopter equipment malfunctions, autorotative approach and landing; and

k) operations to, from and transitting controlled aerodromes, compliance with air traffic services procedures, radiotelephony procedures and phraseology.

Airline transport pilot licence — Helicopter (cont.)

Instrument rating — Helicopter (cont.)

a) **pre-flight procedures, including the use of the flight manual or equivalent document, and appropriate air traffic services documents in the preparation of an IFR flight plan;**

b) **pre-flight inspection, use of checklists, taxiing and pre-take-off checks;**

c) **procedures and manoeuvres for IFR operation under normal, abnormal and emergency conditions covering at least:**

— transition to instrument flight on take-off

— standard instrument departures and arrivals

— en-route IFR procedures

— holding procedures

— instrument approaches to specified minima

— missed approach procedures

— landings from instrument approaches

d) **in-flight manoeuvres and particular flight characteristics; and**

e) **if appropriate, operation of a multi-engined helicopter solely by reference to instruments with one engine inoperative or simulated inoperative.**

2.7.1.4.2 If the privileges of the licence are to be exercised at night, the applicant shall have received dual instruction in helicopters in night flying, including take-offs, landings and navigation.

Note.— The instrument experience specified in 2.7.1.4.1.1 and the night flying experience specified in 2.7.1.4.2 do not entitle the holder of a private pilot licence — helicopter to pilot helicopters under IFR.

2.7.1.5 *Skill*

The applicant shall have demonstrated the ability to perform as pilot-in-command of a helicopter, the procedures and manoeuvres described in 2.7.1.4 with a degree of competency appropriate to the privileges granted to the holder of a private pilot licence — helicopter, and to:

a) operate the helicopter within its limitations;

b) complete all manoeuvres with smoothness and accuracy;

c) exercise good judgement and airmanship;

d) apply aeronautical knowledge; and

2.8.1.4.2 If the privileges of the licence are to be exercised at night, the applicant shall have received dual instruction in helicopters in night flying, including take-offs, landings and navigation.

Note.— The instrument experience specified in 2.8.1.3.1.1 c) and 2.8.1.4.1 h) and the night flying experience specified in 2.8.1.3.1.1 d) and 2.8.1.4.2 do not entitle the holder of a commercial pilot licence — helicopter to pilot helicopters under IFR.

2.8.1.5 *Skill*

The applicant shall have demonstrated the ability to perform as pilot-in-command of a helicopter, the procedures and manoeuvres described in 2.8.1.4 with a degree of competency appropriate to the privileges granted to the holder of a commercial pilot licence — helicopter, and to:

a) operate the helicopter within its limitations;

b) complete all manoeuvres with smoothness and accuracy;

c) exercise good judgement and airmanship;

d) apply aeronautical knowledge; and

2.9.1.5 *Skill*

2.9.1.5.1 The applicant shall have demonstrated the ability to perform, as pilot-in-command of a helicopter required to be operated with a co-pilot, the following procedures and manoeuvres:

a) pre-flight procedures, including the preparation of the operational flight plan and filing of the air traffic services flight plan;

b) normal flight procedures and manoeuvres during all phases of flight;

c) abnormal and emergency procedures and manoeuvres related to failures and malfunctions of equipment, such as powerplant, systems and airframe; and

d) procedures for crew incapacitation and crew co-ordination including allocation of pilot tasks, crew co-operation and use of checklists.

2.9.1.5.1.1 The applicant shall have demonstrated the ability to perform the procedures and manoeuvres described in 2.9.1.5.1 with a degree of competency appropriate to the privileges granted to the holder of an airline transport pilot licence — helicopter, and to:

a) operate the helicopter within its limitations;

b) complete all manoeuvres with smoothness and accuracy;

c) exercise good judgement and airmanship;

d) apply aeronautical knowledge;

2.10.1.4 *Skill*

The applicant shall have demonstrated the ability to perform the procedures and manoeuvres specified in 2.10.1.3 with a degree of competency appropriate to the privileges granted to the holder of an instrument rating — helicopter, and to:

a) operate the helicopter within its limitations;

b) complete all manoeuvres with smoothness and accuracy;

c) exercise good judgement and airmanship;

d) apply aeronautical knowledge; and

Private pilot licence — Helicopter (cont.)	Commercial pilot licence — Helicopter (cont.)	Airline transport pilot licence — Helicopter (cont.)	Instrument rating — Helicopter (cont.)
e) maintain control of the helicopter at all times in a manner such that the successful outcome of a procedure or manoeuvre is never seriously in doubt.	e) maintain control of the helicopter at all times in a manner such that the successful outcome of a procedure or manoeuvre is never seriously in doubt.	e) maintain control of the helicopter at all times in a manner such that the successful outcome of a procedure or manoeuvre is never in doubt; f) understand and apply crew co-ordination and incapacitation procedures; and g) communicate effectively with the other flight crew members.	e) maintain control of the helicopter at all times in a manner such that the successful outcome of a procedure or manoeuvre is never seriously in doubt. *Note.— Attention is called to 2.1.6 on the use of synthetic flight trainers for demonstrations of skill.*
2.7.1.6 *Medical fitness* The applicant shall hold a current Class 2 Medical Assessment. *Note.— Attention is called to 2.10.1.5 on the medical fitness requirements for private pilot licence holders seeking an instrument rating.*	2.8.1.6 *Medical fitness* The applicant shall hold a current Class 1 Medical Assessment.	2.9.1.6 *Medical fitness* The applicant shall hold a current Class 1 Medical Assessment.	2.10.1.5 *Medical fitness* 2.10.1.5.1 Applicants who hold a private pilot licence shall have established their hearing acuity on the basis of compliance with the hearing requirements for the issue of a Class 1 Medical Assessment. 2.10.1.5.2 **Recommendation.—** *Contracting States should consider requiring the holder of a private pilot licence to comply with the physical and mental, and visual requirements for the issue of a Class 1 Medical Assessment.*
2.7.2 Privileges of the holder of the licence and the conditions to be observed in exercising such privileges 2.7.2.1 Subject to compliance with the requirements specified in 1.2.5, 1.2.6 and 2.1, the privileges of the holder of a private pilot licence — helicopter shall be to act, but not for remuneration, as pilot-in-command or co-pilot of any helicopter engaged in non-revenue flights.	2.8.2 Privileges of the holder of the licence and the conditions to be observed in exercising such privileges 2.8.2.1 Subject to compliance with the requirements specified in 1.2.5, 1.2.6 and 2.1, the privileges of the holder of a commercial pilot licence — helicopter shall be: a) to exercise all the privileges of the holder of a private pilot licence — helicopter; b) to act as pilot-in-command in any helicopter engaged in operations other than commercial air transportation; c) to act as pilot-in-command in commercial air transportation in any helicopter certificated for single-pilot operation; and	2.9.2 Privileges of the holder of the licence and the conditions to be observed in exercising such privileges Subject to compliance with the requirements specified in 1.2.5, 1.2.6 and 2.1, the privileges of the holder of an airline transport pilot licence — helicopter shall be: a) to exercise all the privileges of the holder of a private and commercial pilot licence — helicopter; and b) to act as pilot-in-command and co-pilot in helicopters in air transportation.	2.10.2 Privileges of the holder of the rating and the conditions to be observed in exercising such privileges Subject to compliance with the requirements specified in 1.2.5, 1.2.6 and 2.1, the privileges of the holder of an instrument rating helicopter shall be to pilot helicopters under IFR.

2.7.2.2 Before exercising the privileges at night, the licence holder shall have complied with the requirements specified in 2.7.1.4.2.

d) to act as co-pilot in commercial air transportation in helicopters required to be operated with a co-pilot.

2.8.2.2 Before exercising the privileges at night, the licence holder shall have complied with the requirements specified in 2.8.1.3.1.1 d) and 2.8.1.4.2.

— END —

Transmittal Note

SUPPLEMENT TO

ANNEX 1 — PERSONNEL LICENSING

(Eighth Edition)

1. The attached Supplement supersedes all previous Supplements to Annex 1 and includes differences notified by Contracting States up to 19 July 1995.

2. This Supplement should be inserted at the end of Annex 1, Eighth Edition. Additional differences and revised comments received from Contracting States will be issued at intervals as amendments to this Supplement.

SUPPLEMENT TO ANNEX 1 — EIGHTH EDITION

PERSONNEL LICENSING

Differences between the national regulations and practices of States and the corresponding International Standards contained in Annex 1, as notified to ICAO in accordance with Article 38 of the *Convention on International Civil Aviation* and the Council's resolution of 21 November 1950.

JULY 1995

CHAPTER 1

1.2.5.2 Twelve months for the private pilot — aeroplane licence, glider pilot licence and private pilot — helicopter licence.

CHAPTER 2

2.1.10.1 Change of legislation in progress.

2.1.10.2* Change of legislation in progress.

2.3.2.1 Subject to compliance with the requirements specified in 1.2.5, 1.2.6 and 2.1, the privileges of the holder of a private pilot licence — should be to act, but not for remuneration:

a) As pilot-in-command of any aeroplane not operated for remuneration. For the carriage of passengers by day he shall have completed 25 hours as pilot from the date on which he obtained his licence and have been checked by a qualified instructor in a flight test lasting at least 30 minutes with three landings.

b) Before undertaking a local night flight he shall have satisfactorily attended a course of approved training for the local night flight rating, which includes:

1) ten hours of instrument flight training or five hours of instrument flight training under hood and five hours of instrument ground training, and

2) ten hours of local night flying, of which five hours shall be dual and five hours solo.

2.4.1.3.1 Satisfactory completion of a course of approved training for the commercial pilot licence plus the following experience:

Not less than 200 flying hours from the date on which he obtained the private pilot — aeroplane licence, including:

— 100 hours as pilot on local flights, 50 hours of which may be as glider pilot.
— 80 hours as pilot on cross-country flights, including not less than one flight of 500 km with two full-stop landings at different points along the route.
— 10 hours of instrument flying (under hood) or five hours of instrument flying (under hood) and five hours of instrument ground training.
— 10 hours of night flying, of which five hours dual and five hours instrument ground training.

2.5.1.3.1 Not less than 1 200 hours flying from the date on which he obtained the private pilot — aeroplane licence, as follows:

a) 1 200 hours flying as pilot or 700 hours as pilot and 500 hours as co-pilot in aircraft which require a co-pilot.

b) of the total quoted in a) above, not less than 100 hours of night flying as pilot, of which not less than 25 hours of cross-country flying.

c) 90 hours of instrument flying, of which 25 hours of flight under actual instrument conditions.

d) at least 200 hours of cross-country flying as pilot.

e) The totals quoted in b), c) and d) above may be accomplished as co-pilot, provided the times are equivalent to the requirement of 1 200 flying hours, with not less than 300 hours as co-pilot.

2.13 Not issued.

CHAPTER 3

3.3.1.3.1 Not less than 50 hours flying under instruction in aircraft which require a flight engineer, under the supervision of a person in possession of a flight engineer licence.

---

* Recommended Practice

CHAPTER 4

4.2 and 4.3 An aircraft maintenance mechanic licence is issued on successful completion of a three-year approved training course. Subsequently, three categories of rating are granted in accordance with the duly certified experience of the holder; these ratings authorize him to carry out the following duties:

— Category "A": Inspection and major maintenance of aircraft up to 5 700 kg, their powerplants, equipment and accessories and the issue of the relevant certificates, the work being carried out in aeronautical workshops approved for the relevant category.

  Not less than two years of certified experience as holder of the relevant licence are required to obtain this rating.

— Category "B": Inspection and major maintenance of aircraft weighing more than 5 700 kg and their powerplants, equipment and accessories and the issue of the relevant certificates.

  Not less than one year of certified experience, as holder of the Category "A" rating, for aircraft weighing more than 5 700 kg is required to obtain this rating.

— Category "C": Inspection and major maintenance of aircraft weighing more than 5 700 kg and their powerplants, equipment and accessories and the issue of the relevant certificates.

  Not less than two years of certified experience, as holder of a Category "B" rating, for aircraft weighing more than 5 700 kg is required to obtain this rating.

4.7 Not issued. 19/7/95

AUSTRALIA

CHAPTER 1

1.2.5.2 Interval between medical examinations.
Under age 40:
class 2 = 48 months
Under age 40:
class 1 = 12 months
classes 2 and 3 = 24 months

CHAPTER 2

2.1.10 The following over age 60 requirements apply to the holders of Commercial Pilot Licence — Aeroplane, Helicopter, Gyroplane, Airship and Air Transport Pilot Licence — Aeroplane, Helicopter:

1. A pilot who is at least 60 years old must not fly as pilot in command of an aircraft:
   a) that is engaged in commercial operations; and
   b) that is carrying passengers.
2. Paragraph 1 above does not apply to a pilot if:
   a) the pilot flies an aircraft:
      i) that is fitted with fully functioning dual controls; and
      ii) that has an operating crew that includes a qualified pilot who is not the pilot in command; or
   b) in the case of a pilot who is less than 65 years old — within the period of one year immediately before the day of the proposed flight, the pilot has satisfactorily completed an aircraft proficiency check; or
   c) in the case of a pilot who is at least 65 years old — within the period of six months immediately before the day of the proposed flight, the pilot has satisfactorily completed an aircraft proficiency check.

"Qualified pilot" means a pilot who:

a) holds a command endorsement (type rating) for the aircraft; and 19/7/95

b) if an activity for which a flight crew rating is required is to be carried out during the flight — holds a flight crew rating, or grade of flight crew rating, that authorises him or her to carry out the activity as pilot in command of the aircraft; and

c) either:

i) is less than 60 years old; or

ii) satisfies the requirements of paragraph 2. b) or c).

CHAPTER 4

4.1.1.1 Australian Civil Aviation Regulation 31(4)(a) specifies a minimum age of 21 years.

CHAPTER 6

6.1.1 b) Class 2 medical assessment. Does not apply to glider pilots.

6.2.3.1* Visual Acuity Test. Illumination Levels. Not specified in Australia regulations.

6.2.4.2.1* Colour Perception. Candidates failing pseudiosochromatic plates and colour perception lantern may be given dispensation in class 2, and class 1 commercial level but no higher.

6.2.5.1 Note 3. Choice of speech. Not specified.

6.3.2.5.1 Electrocardiograph on issue and at specified intervals. Not required for class 2.

6.3.2.8.1* Routine chest radiography. Not required.

6.3.2.9 Chest deformities, tuberculosis and emphysema. Not specifically mentioned in Australian regulations.

6.3.2.10* Chest deformities, tuberculosis and emphysema. Not specifically mentioned in Australian regulations.

6.3.2.11 Chest deformities, tuberculosis and emphysema. Not specifically mentioned in Australian regulations.

6.3.2.13 Hernias. Not specifically mentioned.

6.3.2.18 Reticulo-endothelial system. Candidates must not suffer from immune deficiencies likely to interfere with safe operations.

6.3.2.21 Requirement for evidence of satisfactory treatment of syphilis. Not specifically mentioned.

6.3.2.23.1* Pregnancy. No specified period of unfitness.

6.3.2.26 Unhealed perforation of tympanic membrane. Not specifically mentioned.

6.3.2.27 Free nasal air passages. Not specifically mentioned.
Speech defects and stuttering. Not specifically mentioned.

6.3.3.3 Visual acuity. Testing of uncorrected visual acuity at renewal examination is not mandatory if visual correction is worn and tested.

Minimum corrected visual acuity. Classes 1 and 3 = 6/9 each eye and 6/6 binocular, class 2 = 6/12 each eye and 6/9 binocular.

A class 2 applicant who has 6/6 vision in one eye, but whose other eye cannot be corrected to 6/12, may be licensed under waiver.

Refractive error limits are waived if suitable correction is worn.

6.3.4.1.1 Practical hearing test after failing audiogram and speech test.

Available for classes 1 and 3, not required for class 2.

---

* Recommended Practice

BARBADOS

CHAPTER 4

4.4.1.1	The minimum age for the issue of an air traffic controller's licence is 18 years.	19/7/95

BELGIUM

CHAPTER 4	The licences listed in this chapter are not issued in Belgium.	19/7/95

CANADA

CHAPTER 1

1.2	Canada does not issue flight radio operator, flight operations officer or aeronautical station operator licences.
Note 2	In addition, Canada issues Private Pilot Licence — Gyroplane, PPL Ultra-light aeroplane and CPL — Ultra-light aeroplane.
b)	Canada does not issue flight operations officer or aeronautical station operator licences.
1.2.4.1	Canadian medical assessment is recorded on a document entitled a Licence Validation Certificate. Until otherwise advised, Category 3 shall be equivalent to ICAO Class 2 Medical Assessment and Category 2 shall be equivalent to ICAO Class 3 Medical Assessment.
1.2.5.1.1.1	Canada intends to continue to issue the flight instructor rating for gliders and free balloons after November 15, 1994.
1.2.5.2	60 months for the glider pilot licence. 12 months for the air traffic controller licence.

CHAPTER 2

2.1.3.1.1*	Canada does not anticipate establishing a class rating for helicopters.
2.1.4.1.1	Canadian type ratings do not indicate the capacity (pilot or co-pilot).
2.1.10	Canada does not curtail privileges of pilots who have attained their 60th birthday.
2.1.10.1	Canada does not curtail privileges of pilots who have attained their 60th birthday.
2.1.10.2*	Canada does not curtail privileges of pilots who have attained their 60th birthday.
2.3.1.3.1	Canada requires applicants to complete not less than 45 hours flight time of which 5 hours must be instrument time.
2.4.1.3.1	Canada requires 200 hours flight time for CPL-A and does not make concession for approved courses.
2.4.1.3.1.1 c)	Canada requires 20 hours dual instrument flight time of which 10 hours may be instrument ground time.
d)	Canada requires 10 hours night flight time (5 hours dual, 5 hours solo) including 10 take-offs and 10 landings.
2.6.1.2.2 a)	Canada requires applicant to have 150 hours pilot-in-command flight time.
2.6.1.5.1	Holders of instrument ratings do not require Class 1 Medical Assessment.
2.6.1.5.2*	Holders of instrument ratings do not require Class 1 Medical Assessment.

* Recommended Practice

2.7.1.3	45 hours of flight time.
2.7.1.3.1	Canada requires applicants to complete not less than 45 hours of flight time of which 5 hours must be instrument time.
2.8.1.3.1	Canada requires applicants to have completed not less than 100 hours flight time and does not make concessions for approved courses.
2.9	Canada does not issue Airline Transport Pilot Licence (ATPL) — Helicopter.
2.10.1.2.2	Canada requires the applicant to have 150 hours pilot-in-command flight time.
2.10.1.5.1	Holders of instrument ratings do not require Class 1 Medical Assessment.
2.10.1.5.2*	Holders of instrument ratings do not require Class 1 Medical Assessment.
2.12.1.3.1	Canada requires the applicant to have 3 hours of flight time with at least 20 solo take-offs and landings.

CHAPTER 3

3.2.1.1	The applicant shall be not less than 21 years of age.
3.2.1.3.1	Canada requires the applicant to have not less than 50 hours cross-country by night.
3.2.1.5	Canada requires applicant to have Category 1 or 2 medical.
3.3	Not issued.
3.3.1.5	Canada requires applicant to have Category 1 or 2 medical.

CHAPTER 4

4.3.1.1	The applicant shall not be less than 19 years of age.
4.3.1.4	Category 1 or 2 medical.
4.4	Not issued.
4.5	Not issued.
4.6	Not issued.

CHAPTER 6

6.3.2.2 d)	Any personality disorder, particularly if severe enough to have provoked any significant overt act.
6.3.3.3 a)	Canadian regulations require that the applicant possess a visual acuity without correction in each eye separately, of not less than 6/60 (20/200, 0.1) or the refractive error falls within the range of ±3.5 dioptres (equivalent spherical error).
6.3.4.1	The applicant shall be tested on a pure-tone audiometer at the initial examination for a medical Category 1 and at the first medical examination after age 55, unless tested satisfactorily during the five years preceding these dates.
6.4.2.2 d)	Any personality disorder, particularly if severe enough to have provoked any significant overt act.
6.4.2.22.1	In the event of completely normal pregnancy, the applicant may be considered fit up to the end of the seventh month of pregnancy provided there is not physical obstruction to the safe operation of an aircraft.
6.5.4.1	The applicant shall be tested on a pure-tone audiometer at the initial examination for a medical Category 2 and at the first medical examination after age 55, unless tested satisfactorily during the five years preceding these dates.

19/7/95

Côte d'Ivoire

CHAPTER 1

1.2.5.1.1.1 Pilots issued with the Senior Commercial Pilot Licence in Côte d'Ivoire will be allowed to exercise the privileges of their licence up to 31 March 1995, after which date the new regulations related to the suppression of the licence will be in force.

19/7/95

Czech Republic

CHAPTER 1

1.2 Cabin attendants are licensed with a valid licence for a 24 month interval.

1.2.1 We have additional subparagraph with concrete specifications who can be as licensed member of Czechoslovak Civil Aviation.

1.2.5.2 We have a shorter interval 12 months for the air traffic controller licence:

- in national regulations we have additional licences
- pilot ULA interval 24 months
- cabin attendant — interval 24 months until their 40th birthday and for next activity shall be reduced to 12 months
- aircraft maintenance technician Type I interval 36 months (in case, he will participate in testing flights).

CHAPTER 2

2.1.2.1 We have additional subparagraph for ULA, balloons

2.3.1.1 The applicant shall be not less than 18 years of age.

2.5.1.3.1.1 We have additional subparagraph:

- 500 hours as pilot of a two-engined aeroplane

2.7.1.1 The applicant shall be not less than 18 years of age.

CHAPTER 3

3.3.1.1 The applicant shall be not less than 21 years of age.

We have additional functions — instructor and inspector.

19/7/95

Denmark

CHAPTER 2

2.3.1.6 Defective colour perception acceptable. Licences will be endorsed accordingly.

2.7.1.6 Defective colour perception acceptable. Licences will be endorsed accordingly.

2.12.1.5 Defective colour perception acceptable. Licences will be endorsed accordingly.

2.13.1.5 Defective colour perception acceptable. Licences will be endorsed accordingly.

CHAPTER 4

4.3 Not issued.

4.7 Not issued. The duties are performed by State employees meeting Annex 1 Standards.

19/7/95

EGYPT

CHAPTER 4

4.5.1.1 d) With the exception of approach precision radar control rating, all other ratings exist.

19/7/95

FRANCE

CHAPTER 2

2.1.5.2 Given the stringent requirements it has set for an airline transport pilot licence, France demands only that applicants for a type rating on a two-pilot aircraft possess those elements of the APL knowledge requirements that the Authority has determined are necessary for the performance of their duties aboard the aircraft type in question.

2.1.10 France does not curtail the privileges of pilots who have attained their 60th birthday. A bill calling for strict application of ICAO Standards and Recommended Practices is to be presented to parliament in the fall of 1994.

2.4.1.2 i) There is thus far no examination for human performance and limitations. Training and examination programmes in this field have been developed and are being adopted. They will be implemented gradually over the period 1995-1998, and will include specific training programmes in the airlines.

2.5.1.2 k) There is thus far no examination for human performance and limitations. Training and examination programmes in this field have been developed and are being adopted. They will be implemented gradually over the period 1995-1998, and will include specific training programmes in the airlines.

2.6.1.1 f) There is thus far no examination for human performance and limitations. Training and examination programmes in this field have been developed and are being adopted. They will be implemented gradually over the period 1995-1998, and will include specific training programmes in the airlines.

2.6.1.5.1 France does not require that private pilot licence holders applying for an aeroplane or helicopter instrument rating meet the Class 1 hearing requirement.

2.8.1.2 i) There is thus far no examination for human performance and limitations. Training and examination programmes in this field have been developed and are being adopted. They will be implemented gradually over the period 1995-1998, and will include specific training programmes in the airlines.

2.9.1.2 k) There is thus far no examination for human performance and limitations. Training and examination programmes in this field have been developed and are being adopted. They will be implemented gradually over the period 1995-1998, and will include specific training programmes in the airlines.

2.10.1.1 f) There is thus far no examination for human performance and limitations. Training and examination programmes in this field have been developed and are being adopted. They will be implemented gradually over the period 1995-1998, and will include specific training programmes in the airlines.

2.10.1.5.1 France does not require that private pilot licence holders applying for an aeroplane or helicopter instrument rating meet the Class 1 hearing requirement.

2.11.1 k) There is thus far no examination for human performance and limitations. Training and examination programmes in this field have been developed and are being adopted. They will be implemented gradually over the period 1995-1998, and will include specific training programmes in the airlines.

CHAPTER 4

4.2 France does not issue individual licences to maintenance technicians/mechanics. The authority issues certificates to maintenance organizations that comply with the standards and procedures contained in the regulations.

4.3 France does not issue individual licences to maintenance technicians/mechanics. The authority issues certificates to maintenance organizations that comply with the standards and procedures contained in the regulations.

4.6 France does not issue a flight operations officer licence. France has adopted a method of operational supervision that meets the specifications of Annex 6 and does not require flight operations officers to hold licences issued by the State.

19/7/95

GERMANY

CHAPTER 2

2.1.10.1 The German Order on the Operation of Aircraft provides for a regulation which merely recommends the aircraft operators not to employ crew members who have attained their 60th birthday.

CHAPTER 4

4.4.1 According to the German regulations, an air traffic controller licence will be issued to an applicant without any controller rating after having passed the final theoretical and practical checks. This initial controller licence will permit the applicant to operate as air traffic controller under supervision only and the licence will expire after 12 months if the applicant has not acquired at least one controller rating.

19/7/95

GREECE

CHAPTER 4

4.4.1.4 Implemented only for applicants for initial issue or renewal of an aerodrome control rating.

CHAPTER 6

6.1.1. c) Implemented only for applicants for the initial issue or renewal of an aerodrome control rating.

6.2.2 Cases of brain tumours (benign or malignant), even if they have been surgically removed, shall be assessed as unfit.

6.2.3 The correction of visual acuity may be by glasses or contact lenses.

6.3.2.5 A by-pass surgical operation or a history of proven coronary insufficiency (angina pectoris) that may be reasonably expected to lead to myocardial infarction shall be disqualifying.

6.3.3 The applicant shall be required to have heterophoria no more than Hyper 1 pd, Eso 10 pd.

6.5.1 Implemented only for applicants for initial issue or renewal of an aerodrome rating.

19/7/95

IRAN, ISLAMIC REPUBLIC OF

CHAPTER 2

2.1.10.1 Any pilot (in-command or co-pilot) of aircraft engaged in scheduled international air services or non-scheduled air transport operations for remuneration or hire if he has attained his 60th birthday could continue to act as pilot-in-command or co-pilot until the age of 61 provided that:

1) he undergoes a medical check at least every four months;
2) the other pilot operating in the same flight is less than 60 years of age;
3) the waiver is cancelled if any operational, physical or mental problem occurs.

19/7/95

IRELAND

CHAPTER 4

4.4.1.1 Air traffic controller shall be not less than 20 years of age.

Applicants for a licence for radar ratings are required to be not less than 21 years of age.

19/7/95

JORDAN

CHAPTER 2

2.1.10 In connection with the curtailment of privileges of pilots who have attained their 60th birthday, the Jordanian Civil Aviation Regulations have been amended as follows:

Commercial pilot privileges and limitations:

a) The holder of a commercial pilot certificate:

1) may act as pilot-in-command of an aircraft carrying persons or property for compensation or hire, provided he shall not after his 60th birthday act as pilot-in-command, or second in command of an aircraft whose:

i) maximum seating capacity exceeds 40 passengers; or

ii) maximum payload exceeds 5 000 kg;

2) shall not at any time after his 65th birthday act as pilot-in-command or second in command (co-pilot) of any aircraft for compensation or hire;

3) may give instruction in free balloon if he holds a free balloon class rating.

General privileges and limitations:

The holder of an airline transport pilot certificate shall not at any time after the age of 60 years act as pilot-in-command of any aircraft for the purpose of hire or compensation if its:

i) maximum seating capacity exceeds 40 seats; or

ii) maximum authorized pay load exceeds 5 000 kg;

The holder of an airline transport pilot certificate shall not at any time after the age of 65 years act as pilot-in-command or second in command of any aircraft for the purpose of compensation or hire.

19/7/95

LUXEMBOURG

CHAPTER 2

2.1.10 Luxembourg does not apply the Annex 1 Standards and Recommended Practices regarding the curtailment of privileges of pilots who have attained their 60th birthday.

Foreign licences are accepted through validation, that is, by issuing a certificate authorizing an individual to pilot aircraft registered in Luxembourg and falling within the categories indicated on the original licence.

There is no age limit.

As long as the original licence has not been withdrawn, the holder can pilot aircraft that fall within the categories described on the licence and are registered in Luxembourg.

19/7/95

MALAYSIA

CHAPTER 2

2.1.5.2 c) Implementation date deferred to 2 August 1996.

19/7/95

NAMIBIA

CHAPTER 4

4.4.1.3 The applicant shall have completed an approved training course and not less than three months' satisfactory service engaged in the actual control of air traffic under the supervision of an appropriately rated air traffic controller with five years experience.

4.5.2.2.1 The applicant shall have:

a) satisfactorily completed an approved training course;

b) provided, satisfactorily, under the supervision of an appropriately rated air traffic controller with five years experience.

19/7/95

NEPAL

CHAPTER 2

2.4.2.1 c) To act as pilot-in-command in commercial air transportation in any aeroplane having a maximum certificated take-off weight of 5 700 kg or less.

19/7/95

NETHERLANDS, KINGDOM OF THE

CHAPTER 4

4.4 Not issued. Duties are performed by State employees meeting Annex 1 Standards.

4.5 Not issued. Duties are performed by State employees meeting Annex 1 Standards.

4.6 Not issued. Duties are performed by State employees meeting Annex 1 Standards.

CHAPTER 6 All Recommendations are applied as Standards.

19/7/95

NORWAY

CHAPTER 1

1.2.5.2 For private pilots under the age of 40, the interval is 60 months, between 40-50 years the interval is 24 months and for private pilots above 50 years the interval is 12 months.

CHAPTER 2

2.1.2 Not issued. The Norwegian CAA has granted the organization "Norsk Aero Klubb" the permission to issue certain documents which entitle the holder to act as crew member on gliders and free balloons in Norwegian airspace.

2.1.3 Not issued. The Norwegian CAA has granted the organization "Norsk Aero Klubb" the permission to issue certain documents which entitle the holder to act as crew member on gliders and free balloons in Norwegian airspace.

CHAPTER 3

3.2 Not issued in Norway.

3.3 Flight engineer licence is issued according to the Standards of Annex 1, 7th edition.

19/7/95

CHAPTER 4

4.3.1.2 b) 1) Not required. Type I licence for complete aircraft is not issued.

c) 1) Not required. Type I licence for complete aircraft is not issued in Norway.

4.4 Air Traffic Controllers in Norway are unlicensed state employees. The Standards of Annex 1, however, apply.

4.5 Not issued in Norway.

19/7/95

PAKISTAN

CHAPTER 4

4.4 Licences to air traffic controllers are not issued.

CHAPTER 2

2.1.10.1 The age limit for captain of an aeroplane is 63 and for the co-pilot the age limit is 65.

2.1.10.2 The age limit for captain of an aeroplane is 63 and for the co-pilot the age limit is 65.

19/7/95

REPUBLIC OF KOREA

CHAPTER 4

4.4.1.3

1) The applicant shall have recently completed not less than 12 months' satisfactory service as pilot or flight navigator; or

2) completed not less than nine months' satisfactory service engaged in actual control of air traffic under the supervision of an appropriately rated air traffic controller; or

3) satisfactory completed an approved training course and not less than three months' satisfactory service engaged in the actual control of air traffic under the supervision of an appropriately rated air traffic controller.

4.6.1.3 The applicant shall, during the three years immediately preceding the date of his application, have completed two years service in any one or in any combination of the capacities specified in a) to e) inclusive, provided that in any combination of experience the period served in any one of these capacities shall not be less than one year:

1) a pilot member of the crew in air transportation; or

2) a flight navigator in air transportation; or

3) a radio operator in air transportation; or

4) a meteorologist in an organization dispatching aircraft in air transportation; or

5) an air traffic controller, or a technical supervisor or flight operations officers or air transportation flight operations systems;

or

The applicant shall have served as an assistant in the dispatching of air transport for not less than one year within the two years immediately preceding the date of his application;

or

The applicant shall have satisfactorily completed an approved training course.

19/7/95

CHAPTER 1

1.2, Note 2 Russian civil aviation specialists are, depending on the level of theoretical training, practical skills and working experience, issued with licences with the corresponding grade being given:

- — pilots (Grades 3, 2 and 1);
- — flight navigators (Grades 3, 2 and 1);
- — flight engineers (flight mechanics) (Grades 3, 2 and 1);
- — flight radio operators (Grades 3, 2 and 1);
- — traffic controllers (Grades 3, 2 and 1);
- — engineers (technicians) (Grades 3, 2 and 1).

Grade 1 is the highest.

In addition licences are issued to flight attendants, flight operators and parachute service instructors.

The pilot (Grade 1) licence is issued to pilots (Grade 2) provided that established requirements are met and professional knowledge and skills are verified.

1.2.5.2.1 The 12-month interval is not reduced for pilots over 40.

CHAPTER 2

2.1.9.1 When licences are issued or a higher grade is given to pilots, account is taken of the following flying experience:

- — the total accident-free flight time, irrespective of the capacity (pilot-in-command or co-pilot) in which the pilot acted;
- — the total solo flight time as pilot-in-command;
- — the solo flight time as pilot-in-command at night.

2.1.9.2 When licences are issued or a higher grade is given to pilots, account is taken of the following flying experience:

- — the total accident-free flight time, irrespective of the capacity (pilot-in-command or co-pilot) in which the pilot acted;
- — the total solo flight time as pilot-in-command;
- — the solo flight time as pilot-in-command at night.

2.1.9.3 When licences are issued or a higher grade is given to pilots, account is taken of the following flying experience:

- — the total accident-free flight time, irrespective of the capacity (pilot-in-command or co-pilot) in which the pilot acted;
- — the total solo flight time as pilot-in-command;
- — the solo flight time as pilot-in-command at night.

2.1.10 An age limit does not restrict the holder of a licence when acting as the pilot-in-command or co-pilot.

2.4 This corresponds to the pilot Grade 3 licence which is given after completion of flying school. The requirements concerning age, knowledge, experience and skills are no lower than the requirements for the issue of a commercial pilot licence. A rating as to the grade of licence and type and class of aircraft is entered on the licence.

2.5 This corresponds to the classification of pilot Grade 2. Ratings as to the grade given (grade 2) and the type and class of aircraft are entered on the pilot licence. For pilot Grade 1 licence, the requirements concerning experience exceed the requirements for the issue of the airline transport pilot licence.

2.5.1.1 The minimum age is 18 years.

CHAPTER 3

3.2.1.3.1 The applicant, having completed an approved flight navigator training programme at an educational establishment, receives the flight navigator licence.

3.3.1.3.1 The applicant, having completed an approved flight engineer training programme, receives the flight engineer licence.

3.4 Provision is made for the issue of a flight radio operator licence. The requirements for the issue of the licence correspond to the requirements of 3.3 of Annex 1 (Seventh Edition).

A flight radiotelephone operator licence is not issued.

19/7/95

SOUTH AFRICA

CHAPTER 2

2.1.10 The Civil Aviation Authority of the Republic of South Africa shall not permit the holder of a pilot licence, which it has issued, who has attained the age of 60 years, to act as pilot-in-command or co-pilot, as appropriate, of an aircraft engaged in scheduled international air services or non-scheduled international transport operations for remuneration or hire except:

— as a member of a multi-pilot crew and provided that:

— such holder is the only pilot in the flight crew who has attained age 60; and
— the aircraft is fitted with dual controls.

Such pilots shall not act as pilot of an aircraft engaged on scheduled international air services or non-scheduled air transport operations after attaining their 65th birthday.

19/7/95

SPAIN

CHAPTER 1

1.2.5.1.1 The senior commercial pilot licence and the flight radio operator licence will remain in force in Spain beyond 15 November 1994 under the same conditions and with the same privileges as prior to that date.

19/7/95

THAILAND

CHAPTER 4

4.2.1.1 Age. Not less than 22 years of age.

4.2.1.3 Experience.

a) for the issue of a licence with privileges for signing a Maintenance Release (Certificate of Safety for Flight), at least:

1) four years; or

2) one year if the applicant has satisfactorily completed an approved training course which will provide an equivalent level of practical experience.

4.3.1.1 Age. Not less than 22 years of age.

4.3.1.3 Experience.

a) for the issue of a licence with privileges for certifying the airworthiness of aircraft, at least:

1) five years; or

2) two years of the applicant has satisfactorily completed an approved training course that will give an equivalent level of practical experience.

19/7/95

TURKEY

CHAPTER 2

2.1.10 The 63rd birthday rather than the 60th shall be applied.

19/7/95

UNITED KINGDOM

CHAPTER 2

2.1.5.2 c) Holders of a pilot's licence issued by the United Kingdom Civil Aviation Authority may continue, until 2 August 1996, to act as co-pilot of two pilot certificated aircraft without having demonstrated, at airline transport pilot licence level, an extent of knowledge determined by the Licensing Authority.

2.1.10 The United Kingdom has issued an exemption to the Air Navigation Order allowing public transport operations on any weight of aircraft up to the age of 65. The regulation is similar to that proposed within JAR-FCL, but we have added the proviso that the 60-64 year old pilot may not have an "as or with co-pilot limitation" for aircraft above 20 tonnes in weight. It naturally remains a multi-crew operation with the other pilot being under age 60.

CHAPTER 4

4.4.1.1 Minimum age is 20 for aerodrome control, approach control or area control rating, 21 for other ratings.

4.6 No issue of flight operations officer/flight dispatcher licences.

19/7/95

UNITED STATES

CHAPTER 1

1.2.5.2 Persons performing airline transport pilot duties must be medically examined at 6-month intervals, regardless of age or type of aircraft.

Persons performing air traffic control tower duties must be medically examined at 12-month intervals, regardless of age.

1.2.5.2.1 Persons performing airline transport pilot duties must be medically examined at 6-month intervals, regardless of age or type of aircraft.

1.2.5.2.2* Persons performing air traffic control tower duties must be medically examined at 12-month intervals, regardless of age.

CHAPTER 2

2.1.3.2 b) Type ratings for small helicopters (5 700 kg or less) are required for air transport pilot privileges and class ratings are required for all grades of certificates.

2.1.4.1 Not applied to co-pilots.

2.1.4.1.1 Not applied to co-pilots.

2.1.5.2 b) Not applied to co-pilots.

2.1.9 An applicant for an airline transport pilot certificate with an aeroplane rating may credit toward the total flight time requirement all flight time served as co-pilot in aeroplanes required to have more than one pilot by their approved aircraft flight manual or airworthiness certificate. Flight time served as co-pilot of an aeroplane performing the duties and functions of a pilot-in-command under the supervision pilot-in-command may be credited towards the 250 hours of pilot-in-command flight time required for an airline transport pilot certificate with an aeroplane rating (if the aircraft or the operating rule requires a co-pilot).

* Recommended Practice

19/7/95

2.3.1.3.1 If the applicant has satisfactorily completed an approved training course, 35 hours of flight time are required.

2.5.1.5.1 There is no requirement for an applicant to demonstrate skills in a multi-engine aeroplane required to be operated with a co-pilot. Skill demonstration may be performed in a single-engine aircraft or in a small multi-engine aircraft requiring only one pilot. Certificate may be issued with single-engine land or sea class rating, as appropriate.

2.7.1.4.1 Fifteen hours must be flight instruction in helicopters.

2.9.1.3.1.1 Two hundred hours in helicopters, of which 75 hours must be as pilot-in-command.

2.12.1.5 The applicant must certify that he has no known defects that make him unable to pilot a glider. He is not required to hold a medical certificate.

2.13.1.3.1 Ten hours in free balloons and six flight.

2.13.1.3.3 There is no night requirement.

2.13.1.5 The applicant must certify that he has no known defects that make him unable to pilot a balloon. He is not required to hold a medical certificate.

CHAPTER 3

3.3.1.1 Flight engineers must be at least 21 years of age.

CHAPTER 4

4.4.1.1 To be eligible for an air traffic control tower operator certificate, a person must be at least 18 years of age.

4.4.1.3 Each applicant for a facility rating at any air traffic control tower must have satisfactorily served as an air traffic control tower operator at that control tower without a facility rating for at least 6 months, or as an air traffic control tower operator with a facility rating at a different control tower for at least 6 months before the date he applies for the rating. However, an applicant who is a member of an Armed Force of the United States meets these requirements if he has satisfactorily served as an air traffic control tower operator for at least 6 months.

4.4.1.4 No person may act as an air traffic control tower operator in connection with civil aircraft unless he holds at least a second class medical certificate. Exception to this is an individual employed by the Federal Aviation Administration or on active duty with the Department of the Air Force, Army, Navy or Coast Guard.

4.5.2.2.1 b) 1) Six months.

2) Six months.

3) The United States does not specify a minimum number of precision approaches to be completed prior to receiving a rating.

c) The United States does not specify a minimum number of precision approaches to be completed prior to receiving a rating.

4.6.1.1 The applicant must be at least 23 years of age.

4.6.1.2 The United States requires applicants to pass a written test.

CHAPTER 6

6.3.2.5.1 Except for duties requiring an airline transport pilot certificate, electrocardiography is not required. For duties requiring an airline transport pilot certificate, an applicant who has passed his or her 35th birthday, but not the 40th birthday, must submit an electrocardiogram on the first examination after the 35th birthday and annually after the 40th birthday.

6.3.2.8.1* No radiography required.

6.3.2.23 Pregnancy does not prohibit the issue of a medical certificate.

6.3.3.3 Applicants who must wear correcting lenses will not require testing for refractive error.

6.4.2.5.1* No electrocardiography required.

6.4.2.8.1* No radiography required.

6.4.2.22 Pregnancy does not prohibit the issue of a medical certificate.

---

* Recommended Practice

19/7/95

URUGUAY

CHAPTER 2

2.1.10 The age limit for airline pilots and co-pilots is set at 63 and 65 years respectively.

19/7/95

INTERNATIONAL STANDARDS

RULES OF THE AIR

ANNEX 2

TO THE CONVENTION ON INTERNATIONAL CIVIL AVIATION

NINTH EDITION — JULY 1990

This edition incorporates all amendments adopted by the Council prior to 13 March 1990 and supersedes, on 14 November 1991, all previous editions of Annex 2.

For information regarding the application of the Standards, *see* Foreword.

INTERNATIONAL CIVIL AVIATION ORGANIZATION

AMENDMENTS

The issue of amendments is announced regularly in the *ICAO Journal* and in the monthly *Supplement to the Catalogue of ICAO Publications*, which holders of this publication should consult. The space below is provided to keep a record of such amendments.

TABLE OF CONTENTS

FOREWORD

Historical background

In October 1945, the Rules of the Air and Air Traffic Control (RAC) Division at its first session made recommendations for Standards, Practices and Procedures for the Rules of the Air. These were reviewed by the then Air Navigation Committee and approved by the Council on 25 February 1946. They were published as "Recommendations for Standards, Practices and Procedures — Rules of the Air" in the first part of Doc 2010, published in February 1946.

The RAC Division, at its second session in December 1946-January 1947, reviewed Doc 2010 and proposed Standards and Recommended Practices for the Rules of the Air. These were adopted by the Council as Standards and Recommended Practices relating to Rules of the Air on 15 April 1948, pursuant to Article 37 of the Convention on International Civil Aviation (Chicago, 1944) and designated as Annex 2 to the Convention with the title "International Standards and Recommended Practices — Rules of the Air". They became effective on 15 September 1948.

On 27 November 1951, the Council adopted a complete new text of the Annex, which no longer contained Recommended Practices. The Standards of the amended Annex 2 (Amendment 1) became effective on 1 April 1952 and applicable on 1 September 1952.

Table A shows the origin of subsequent amendments together with a list of the principal subjects involved and the dates on which the amendments were adopted by the Council, when they became effective and when they became applicable.

Applicability

The Standards in this document, together with the Standards and Recommended Practices of Annex 11, govern the application of the "Procedures for Air Navigation Services — Rules of the Air and Air Traffic Services" and the "Regional Supplementary Procedures — Rules of the Air and Air Traffic Services", in which latter document will be found subsidiary procedures of regional application.

Flight over the high seas. It should be noted that the Council resolved, in adopting Annex 2 in April 1948 and Amendment 1 to the said Annex in November 1951, that the Annex constitutes *Rules relating to the flight and manoeuvre of aircraft* within the meaning of Article 12 of the Convention. Over the high seas, therefore, these rules apply without exception.

On 15 November 1972, when adopting Amendment 14 to Annex 2 relating to authority over aircraft operating over the high seas, the Council emphasized that the Amendment was intended solely to improve safety of flight and to ensure adequate provision of air traffic services over the high seas. The Amendment in no way affects the legal jurisdiction of States of Registry over their aircraft or the responsibility of Contracting States under Article 12 of the Convention for enforcing the Rules of the Air.

Action by Contracting States

Notification of differences. The attention of Contracting States is drawn to the obligation imposed by Article 38 of the Convention by which Contracting States are required to notify the Organization of any differences between their national regulations and practices and the International Standards contained in this Annex and any amendments thereto. Contracting States are invited to keep the Organization currently informed of any differences which may subsequently occur, or of the withdrawal of any differences previously notified. Contracting States are also invited to notify the Organization of any differences between their national regulations and practices and the special recommendations contained in Attachment A to this Annex. A specific request for notification of differences will be sent to Contracting States immediately after the adoption of each amendment to this Annex.

Attention of States is also drawn to the provisions of Annex 15 related to the publication of differences between thei national regulations and practices and the related ICAO Standards and Recommended Practices through the Aeronautical Information Service, in addition to the obligation of States under Article 38 of the Convention.

Promulgation of information. Information relating to the applicability of national rules and procedures, and changes thereto, established according to the Standards specified in this Annex shall be notified in accordance with Annex 15.

Use of the text of the Annex in national regulations. The Council, on 13 April 1948, adopted a resolution inviting the attention of Contracting States to the desirability of using in their own national regulations, as far as practicable, the precise language of those ICAO Standards that are of a regulatory character and also of indicating departures from the Standards, including any additional national regulations that were important for the safety or regularity of air navigation. Wherever possible, the provisions of this Annex have been written in such a way as would facilitate incorporation, without major textual changes, into national legislation.

Status of Annex components

An Annex is made up of the following component parts, not all of which, however, are necessarily found in every Annex; they have the status indicated:

1. — *Material comprising the Annex proper:*

a) Standards and Recommended Practices adopted by the Council under the provisions of the Convention. They are defined as follows:

Standard. Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as necessary for the safety or regularity of international air navigation and to which Contracting States will conform in accordance with the Convention; in the event of impossibility of compliance, notification to the Council is compulsory under Article 38.

Recommended Practice. Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as desirable in the interests of safety, regularity or efficiency of international air navigation, and to which Contracting States will endeavour to conform in accordance with the Convention.

b) *Appendices* comprising material grouped separately for convenience but forming part of the Standards and Recommended Practices adopted by the Council.

c) *Definitions* of terms used in the Standards and Recommended Practices which are not self-explanatory in that they do not have accepted dictionary meanings. A definition does not have an independent status but is an essential part of each Standard and Recommended Practice in which the term is used, since a change in the meaning of the term would affect the specification.

d) *Tables* and *Figures* which add to or illustrate a Standard or Recommended Practice and which are referred to therein, form part of the associated Standard or Recommended Practice and have the same status.

2. — *Material approved by the Council for publication in association with the Standards and Recommended Practices:*

a) *Forewords* comprising historical and explanatory material based on the action of the Council and including an explanation of the obligations of States with regard to the application of the Standards and Recommended Practices ensuing from the Convention and the Resolution of Adoption.

b) *Introductions* comprising explanatory material introduced at the beginning of parts, chapters or sections of the Annex to assist in the understanding of the application of the text.

c) *Notes* included in the text, where appropriate, to give factual information or references bearing on the Standards or Recommended Practices in question, but not constituting part of the Standards or Recommended Practices.

d) *Attachments* comprising material supplementary to the Standards and Recommended Practices, or included as a guide to their application.

Selection of language

This Annex has been adopted in five languages — English, Arabic, French, Russian and Spanish. Each Contracting State is requested to select one of those texts for the purpose of national implementation and for other effects provided for in the Convention, either through direct use or through translation into its own national language, and to notify the Organization accordingly.

Editorial practices

The following practice has been adhered to in order to indicate at a glance the status of each statement: *Standards* have been printed in light face roman; *Notes* have been printed in light face italics, the status being indicated by the prefix *Note.* There are no *Recommended Practices* in Annex 2.

The units of measurement used in this document are in accordance with the International System of Units (SI) as specified in Annex 5 to the Convention on International Civil Aviation. Where Annex 5 permits the use of non-SI alternative units these are shown in parentheses following the basic units. Where two sets of units are quoted it must not be assumed that the pairs of values are equal and interchangeable. It may, however, be inferred that an equivalent level of safety is achieved when either set of units is used exclusively.

Any reference to a portion of this document which is identified by a number includes all subdivisions of the portion.

INTERNATIONAL STANDARDS

CHAPTER 1. DEFINITIONS

Note.— Throughout the text of this document the term "service" is used as an abstract noun to designate functions, or service rendered; the term "unit" is used to designate a collective body performing a service.

When the following terms are used in the International Standards for Rules of the Air, they have the following meanings:

Acrobatic flight. Manoeuvres intentionally performed by an aircraft involving an abrupt change in its attitude, an abnormal attitude, or an abnormal variation in speed.

Advisory airspace. An airspace of defined dimensions, or designated route, within which air traffic advisory service is available.

Advisory route. A designated route along which air traffic advisory service is available.

Aerodrome. A defined area on land or water (including any buildings, installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of aircraft.

Aerodrome control service. Air traffic control service for aerodrome traffic.

Aerodrome control tower. A unit established to provide air traffic control service to aerodrome traffic.

Aerodrome traffic. All traffic on the manoeuvring area of an aerodrome and all aircraft flying in the vicinity of an aerodrome.

Note.— An aircraft is in the vicinity of an aerodrome when it is in, entering or leaving an aerodrome traffic circuit.

Aerodrome traffic zone. An airspace of defined dimensions established around an aerodrome for the protection of aerodrome traffic.

Aeronautical Information Publication. A publication issued by or with the authority of a State and containing aeronautical information of a lasting character essential to air navigation.

Aeronautical station. A land station in the aeronautical mobile service. In certain instances, an aeronautical station may be located, for example, on board ship or on a platform at sea.

Aeroplane. A power-driven heavier-than-air aircraft, deriving its lift in flight chiefly from aerodynamic reactions on surfaces which remain fixed under given conditions of flight.

Aircraft. Any machine that can derive support in the atmosphere from the reactions of the air other than the reactions of the air against the earth's surface.

Air-ground control radio station. An aeronautical telecommunication station having primary responsibility for handling communications pertaining to the operation and control of aircraft in a given area.

Air-taxiing. Movement of a helicopter/VTOL above the surface of an aerodrome, normally in ground effect and at a ground speed normally less than 37 km/h (20 kt).

Note.— The actual height may vary, and some helicopters may require air-taxiing above 8 m (25 ft) AGL to reduce ground effect turbulence or provide clearance for cargo slingloads.

Air traffic. All aircraft in flight or operating on the manoeuvring area of an aerodrome.

Air traffic advisory service. A service provided within advisory airspace to ensure separation, in so far as practical, between aircraft which are operating on IFR flight plans.

Air traffic control clearance. Authorization for an aircraft to proceed under conditions specified by an air traffic control unit.

Note 1.— For convenience, the term "air traffic control clearance" is frequently abbreviated to "clearance" when used in appropriate contexts.

Note 2.— The abbreviated term "clearance" may be prefixed by the words "taxi", "take-off", "departure", "en route", "approach" or "landing" to indicate the particular portion of flight to which the air traffic control clearance relates.

Air traffic control service. A service provided for the purpose of:

a) preventing collisions:

1) between aircraft, and

2) on the manoeuvring area between aircraft and obstructions, and

b) expediting and maintaining an orderly flow of air traffic.

Air traffic control unit. A generic term meaning variously, area control centre, approach control office or aerodrome control tower.

Air traffic service. A generic term meaning variously, flight information service, alerting service, air traffic advisory service, air traffic control service (area control service, approach control service or aerodrome control service).

Air traffic services airspaces. Airspaces of defined dimensions, alphabetically designated, within which specific types of flights may operate and for which air traffic services and rules of operation are specified.

Note.— ATS airspaces are classified as Class A to G.

Air traffic services reporting office. A unit established for the purpose of receiving reports concerning air traffic services and flight plans submitted before departure.

Note.— An air traffic services reporting office may be established as a separate unit or combined with an existing unit, such as another air traffic services unit, or a unit of the aeronautical information service.

Air traffic services unit. A generic term meaning variously, air traffic control unit, flight information centre or air traffic services reporting office.

Airborne collision avoidance system (ACAS). An aircraft system based on secondary surveillance radar (SSR) transponder signals which operates independently of ground-based equipment to provide advice to the pilot on potential conflicting aircraft that are equipped with SSR transponders.

Airway. A control area or portion thereof established in the form of a corridor equipped with radio navigation aids.

Alerting service. A service provided to notify appropriate organizations regarding aircraft in need of search and rescue aid, and assist such organizations as required.

Alternate aerodrome. An aerodrome to which an aircraft may proceed when it becomes either impossible or inadvisable to proceed to or to land at the aerodrome of intended landing. Alternate aerodromes include the following:

Take-off alternate. An alternate aerodrome at which an aircraft can land should this become necessary shortly after take-off and it is not possible to use the aerodrome of departure.

En-route alternate. An aerodrome at which an aircraft would be able to land after experiencing an abnormal or emergency condition while en route.

Destination alternate. An alternate aerodrome to which an aircraft may proceed should it become impossible or inadvisable to land at the aerodrome of intended landing.

Note.— The aerodrome from which a flight departs may also be an en-route or a destination alternate aerodrome for that flight.

Altitude. The vertical distance of a level, a point or an object considered as a point, measured from mean sea level (MSL).

Approach control office. A unit established to provide air traffic control service to controlled flights arriving at, or departing from, one or more aerodromes.

Approach control service. Air traffic control service for arriving or departing controlled flights.

Appropriate ATS authority. The relevant authority designated by the State responsible for providing air traffic services in the airspace concerned.

Appropriate authority.

a) Regarding flight over the high seas: The relevant authority of the State of Registry.

b) Regarding flight other than over the high seas: The relevant authority of the State having sovereignty over the territory being overflown.

Apron. A defined area, on a land aerodrome, intended to accommodate aircraft for purposes of loading or unloading passengers, mail or cargo, fuelling, parking or maintenance.

Area control centre. A unit established to provide air traffic control service to controlled flights in control areas under its jurisdiction.

Area control service. Air traffic control service for controlled flights in control areas.

ATS route. A specified route designed for channelling the flow of traffic as necessary for the provision of air traffic services.

Note.— The term "ATS route", is used to mean variously, airway, advisory route, controlled or uncontrolled route, arrival or departure route, etc.

Ceiling. The height above the ground or water of the base of the lowest layer of cloud below 6 000 metres (20 000 feet) covering more than half the sky.

Change-over point. The point at which an aircraft navigating on an ATS route segment defined by reference to very high frequency omnidirectional radio ranges is expected to transfer its primary navigational reference from the facility behind the aircraft to the next facility ahead of the aircraft.

Note.— Change-over points are established to provide the optimum balance in respect of signal strength and quality between facilities at all levels to be used and to ensure a common source of azimuth guidance for all aircraft operating along the same portion of a route segment.

Clearance limit. The point to which an aircraft is granted an air traffic control clearance.

Control area. A controlled airspace extending upwards from a specified limit above the earth.

Controlled aerodrome. An aerodrome at which air traffic control service is provided to aerodrome traffic.

Note.— The term "controlled aerodrome" indicates that air traffic control service is provided to aerodrome traffic but does not necessarily imply that a control zone exists.

Controlled airspace. An airspace of defined dimensions within which air traffic control service is provided to IFR flights and to VFR flights in accordance with the airspace classification.

Note.— Controlled airspace is a generic term which covers ATS airspace Classes A, B, C, D and E.

Controlled flight. Any flight which is subject to an air traffic control clearance.

Control zone. A controlled airspace extending upwards from the surface of the earth to a specified upper limit.

Cruise climb. An aeroplane cruising technique resulting in a net increase in altitude as the aeroplane mass decreases.

Cruising level. A level maintained during a significant portion of a flight.

Current flight plan. The flight plan, including changes, if any, brought about by subsequent clearances.

Danger area. An airspace of defined dimensions within which activities dangerous to the flight of aircraft may exist at specified times.

Estimated off-block time. The estimated time at which the aircraft will commence movement associated with departure.

Estimated time of arrival. For IFR flights, the time at which it is estimated that the aircraft will arrive over that designated point, defined by reference to navigation aids, from which it is intended that an instrument approach procedure will be commenced, or, if no navigation aid is associated with the aerodrome, the time at which the aircraft will arrive over the aerodrome. For VFR flights, the time at which it is estimated that the aircraft will arrive over the aerodrome.

Expected approach time. The time at which ATC expects that an arriving aircraft, following a delay, will leave the holding point to complete its approach for a landing.

Note.— The actual time of leaving the holding point will depend upon the approach clearance.

Filed flight plan. The flight plan as filed with an ATS unit by the pilot or a designated representative, without any subsequent changes.

Flight crew member. A licensed crew member charged with duties essential to the operation of an aircraft during flight time.

Flight information centre. A unit established to provide flight information service and alerting service.

Flight information region. An airspace of defined dimensions within which flight information service and alerting service are provided.

Flight information service. A service provided for the purpose of giving advice and information useful for the safe and efficient conduct of flights.

Flight level. A surface of constant atmospheric pressure which is related to a specific pressure datum, 1 013.2 hectopascals (hPa) and is separated from other such surfaces by specific pressure intervals.

Note 1.— A pressure type altimeter calibrated in accordance with the Standard Atmosphere:

a) when set to a QNH altimeter setting, will indicate altitude;

b) when set to a QFE altimeter setting, will indicate height above the QFE reference datum;

c) when set to a pressure of 1 013.2 hectopascals (hPa) may be used to indicate flight levels.

Note 2.— The terms "height" and "altitude" used in Note 1 above, indicate altimetric rather than geometric heights and altitudes.

Flight plan. Specified information provided to air traffic services units, relative to an intended flight or portion of a flight of an aircraft.

Flight status. An indication of whether a given aircraft requires special handling by air traffic services units or not.

Flight visibility. The visibility forward from the cockpit of an aircraft in flight.

Ground visibility. The visibility at an aerodrome, as reported by an accredited observer.

Heading. The direction in which the longitudinal axis of an aircraft is pointed, usually expressed in degrees from North (true, magnetic, compass or grid).

Height. The vertical distance of a level, a point or an object considered as a point, measured from a specified datum.

IFR. The symbol used to designate the instrument flight rules.

IFR flight. A flight conducted in accordance with the instrument flight rules.

IMC. The symbol used to designate instrument meteorological conditions.

Instrument approach procedure. A series of predetermined manoeuvres by reference to flight instruments with specified protection from obstacles from the initial approach fix, or where applicable, from the beginning of a defined arrival route to a point from which a landing can be completed and thereafter, if a landing is not completed, to a position at which holding or en-route obstacle clearance criteria apply.

Instrument meteorological conditions. Meteorological conditions expressed in terms of visibility, distance from cloud, and ceiling, less than the minima specified for visual meteorological conditions.

Note.— The specified minima for visual meteorological conditions are contained in Chapter 4.

Landing area. That part of a movement area intended for the landing or take-off of aircraft.

Level. A generic term relating to the vertical position of an aircraft in flight and meaning variously, height, altitude or flight level.

Manoeuvring area. That part of an aerodrome to be used for the take-off, landing and taxiing of aircraft, excluding aprons.

Movement area. That part of an aerodrome to be used for the take-off, landing and taxiing of aircraft, consisting of the manoeuvring area and the apron(s).

Pilot-in-command. The pilot responsible for the operation and safety of the aircraft during flight time.

Pressure-altitude. An atmospheric pressure expressed in terms of altitude which corresponds to that pressure in the Standard Atmosphere.*

Prohibited area. An airspace of defined dimensions, above the land areas or territorial waters of a State, within which the flight of aircraft is prohibited.

Repetitive flight plan (RPL). A flight plan related to a series of frequently recurring, regularly operated individual flights with identical basic features, submitted by an operator for retention and repetitive use by ATS units.

Reporting point. A specified geographical location in relation to which the position of an aircraft can be reported.

Restricted area. An airspace of defined dimensions, above the land areas or territorial waters of a State, within which the flight of aircraft is restricted in accordance with certain specified conditions.

Runway. A defined rectangular area on a land aerodrome prepared for the landing and take-off of aircraft.

Signal area. An area on an aerodrome used for the display of ground signals.

Special VFR flight. A VFR flight cleared by air traffic control to operate within a control zone in meteorological conditions below VMC.

Taxiing. Movement of an aircraft on the surface of an aerodrome under its own power, excluding take-off and landing.

Taxiway. A defined path on a land aerodrome established for the taxiing of aircraft and intended to provide a link between one part of the aerodrome and another; including:

a) *Aircraft stand taxilane.* A portion of an apron designated as a taxiway and intended to provide access to aircraft stands only.

b) *Apron taxiway.* A portion of a taxiway system located on an apron and intended to provide a through taxi route across the apron.

c) *Rapid exit taxiway.* A taxiway connected to a runway at an acute angle and designed to allow landing aeroplanes to turn off at higher speeds than are achieved on other exit taxiways and thereby minimizing runway occupancy times.

Terminal control area. A control area normally established at the confluence of ATS routes in the vicinity of one or more major aerodromes.

Total estimated elapsed time. For IFR flights, the estimated time required from take-off to arrive over that designated point, defined by reference to navigation aids, from which it is intended that an instrument approach procedure will be commenced, or, if no navigation aid is associated with the destination aerodrome, to arrive over the destination aerodrome. For VFR flights, the estimated time required from take-off to arrive over the destination aerodrome.

Track. The projection on the earth's surface of the path of an aircraft, the direction of which path at any point is usually expressed in degrees from North (true, magnetic or grid).

Traffic avoidance advice. Advice provided by an air traffic services unit specifying manoeuvres to assist a pilot to avoid a collision.

Traffic information. Information issued by an air traffic services unit to alert a pilot to other known or observed air traffic which may be in proximity to the position or intended route of flight and to help the pilot avoid a collision.

Transition altitude. The altitude at or below which the vertical position of an aircraft is controlled by reference to altitudes.

Unmanned free balloon. A non-power-driven, unmanned, lighter-than-air aircraft in free flight.

Note.— Unmanned free balloons are classified as heavy, medium or light in accordance with specifications contained in Appendix 4.

VFR. The symbol used to designate the visual flight rules.

VFR flight. A flight conducted in accordance with the visual flight rules.

Visibility. The ability, as determined by atmospheric conditions and expressed in units of distance, to see and identify prominent unlighted objects by day and prominent lighted objects by night.

Visual meteorological conditions. Meteorological conditions expressed in terms of visibility, distance from cloud, and ceiling equal to or better than specified minima.

Note.— The specified minima are contained in Chapter 4.

VMC. The symbol used to designate visual meteorological conditions.

* As defined in Annex 8.

CHAPTER 2. APPLICABILITY OF THE RULES OF THE AIR

2.1 Territorial application of the rules of the air

2.1.1 The rules of the air shall apply to aircraft bearing the nationality and registration marks of a Contracting State, wherever they may be, to the extent that they do not conflict with the rules published by the State having jurisdiction over the territory overflown.

Note.— The Council of the International Civil Aviation Organization resolved, in adopting Annex 2 in April 1948 and Amendment 1 to the said Annex in November 1951, that the Annex constitutes Rules relating to the flight and manoeuvre of aircraft *within the meaning of Article 12 of the Convention. Over the high seas, therefore, these rules apply without exception.*

2.1.2 If, and so long as, a Contracting State has not notified the International Civil Aviation Organization to the contrary, it shall be deemed, as regards aircraft of its registration, to have agreed as follows:

For purposes of flight over those parts of the high seas where a Contracting State has accepted, pursuant to a regional air navigation agreement, the responsibility of providing air traffic services, the "appropriate ATS authority" referred to in this Annex is the relevant authority designated by the State responsible for providing those services.

Note.— The phrase "regional air navigation agreement" refers to an agreement approved by the Council of ICAO normally on the advice of a Regional Air Navigation Meeting.

2.2 Compliance with the rules of the air

The operation of an aircraft either in flight or on the movement area of an aerodrome shall be in compliance with the general rules and, in addition, when in flight, either with:

a) the visual flight rules, or

b) the instrument flight rules.

Note 1.— Information relevant to the services provided to aircraft operating in accordance with both visual flight rules and instrument flight rules in the seven ATS airspace classes is contained in 2.6.1 and 2.6.3 of Annex 11.

Note 2.— A pilot may elect to fly in accordance with instrument flight rules in visual meteorological conditions or may be required to do so by the appropriate ATS authority.

2.3 Responsibility for compliance with the rules of the air

2.3.1 Responsibility of pilot-in-command

The pilot-in-command of an aircraft shall, whether manipulating the controls or not, be responsible for the operation of the aircraft in accordance with the rules of the air, except that the pilot-in-command may depart from these rules in circumstances that render such departure absolutely necessary in the interests of safety.

2.3.2 Pre-flight action

Before beginning a flight, the pilot-in-command of an aircraft shall become familiar with all available information appropriate to the intended operation. Pre-flight action for flights away from the vicinity of an aerodrome, and for all IFR flights, shall include a careful study of available current weather reports and forecasts, taking into consideration fuel requirements and an alternative course of action if the flight cannot be completed as planned.

2.4 Authority of pilot-in-command of an aircraft

The pilot-in-command of an aircraft shall have final authority as to the disposition of the aircraft while in command.

2.5 Use of intoxicating liquor, narcotics or drugs

No person shall pilot an aircraft, or act as a flight crew member of an aircraft, while under the influence of intoxicating liquor or any narcotic or drug, by reason of which that person's capacity to act is impaired.

CHAPTER 3. GENERAL RULES

3.1 Protection of persons and property

3.1.1 Negligent or reckless operation of aircraft

An aircraft shall not be operated in a negligent or reckless manner so as to endanger life or property of others.

3.1.2 Minimum heights

Except when necessary for take-off or landing, or except by permission from the appropriate authority, aircraft shall not be flown over the congested areas of cities, towns or settlements or over an open-air assembly of persons, unless at such a height as will permit, in the event of an emergency arising, a landing to be made without undue hazard to persons or property on the surface.

Note.— See 4.6 for minimum heights for VFR flights and 5.1.2 for minimum levels for IFR flights.

3.1.3 Cruising levels

The cruising levels at which a flight or a portion of a flight is to be conducted shall be in terms of:

a) flight levels, for flights at or above the lowest usable flight level or, where applicable, above the transition altitude;

b) altitudes, for flights below the lowest usable flight level or, where applicable, at or below the transition altitude.

Note.— The system of flight levels is prescribed in the Procedures for Air Navigation Services — Aircraft Operations *(Doc 8168).*

3.1.4 Dropping or spraying

Nothing shall be dropped or sprayed from an aircraft in flight except under conditions prescribed by the appropriate authority and as indicated by relevant information, advice and/or clearance from the appropriate air traffic services unit.

3.1.5 Towing

No aircraft or other object shall be towed by an aircraft, except in accordance with requirements prescribed by the appropriate authority and as indicated by relevant information, advice and/or clearance from the appropriate air traffic services unit.

3.1.6 Parachute descents

Parachute descents, other than emergency descents, shall not be made except under conditions prescribed by the appropriate authority and as indicated by relevant information, advice and/or clearance from the appropriate air traffic services unit.

3.1.7 Acrobatic flight

No aircraft shall be flown acrobatically except under conditions prescribed by the appropriate authority and as indicated by relevant information, advice and/or clearance from the appropriate air traffic services unit.

3.1.8 Formation flights

Aircraft shall not be flown in formation except by pre-arrangement among the pilots-in-command of the aircraft taking part in the flight and, for formation flight in controlled airspace, in accordance with the conditions prescribed by the appropriate ATS authority(ies). These conditions shall include the following:

a) the formation operates as a single aircraft with regard to navigation and position reporting;

b) separation between aircraft in the flight shall be the responsibility of the flight leader and the pilots-in-command of the other aircraft in the flight and shall include periods of transition when aircraft are manoeuvring to attain their own separation within the formation and during join-up and break-away; and

c) a distance not exceeding 1 km (0.5 NM) laterally and longitudinally and 30 m (100 ft) vertically from the flight leader shall be maintained by each aircraft.

3.1.9 Unmanned free balloons

An unmanned free balloon shall be operated in such a manner as to minimize hazards to persons, property or other aircraft and in accordance with the conditions specified in Appendix 4.

3.1.10 Prohibited areas and restricted areas

Aircraft shall not be flown in a prohibited area, or in a restricted area, the particulars of which have been duly published, except in accordance with the conditions of the restrictions or by permission of the State over whose territory the areas are established.

3.2 Avoidance of collisions

Note.— It is important that vigilance for the purpose of detecting potential collisions be not relaxed on board an aircraft in flight, regardless of the type of flight or the class of airspace in which the aircraft is operating, and while operating on the movement area of an aerodrome.

3.2.1 Proximity

An aircraft shall not be operated in such proximity to other aircraft as to create a collision hazard.

3.2.2 Right-of-way

The aircraft that has the right-of-way shall maintain its heading and speed, but nothing in these rules shall relieve the pilot-in-command of an aircraft from the responsibility of taking such action, including collision avoidance manoeuvres based on resolution advisories provided by ACAS equipment, as will best avert collision.

Note 1.— Operating procedures for use of ACAS are contained in PANS-OPS (Doc 8168), Volume I, Part VIII, Chapter 3.

Note 2.— There are currently no ICAO provisions concerning mandatory carriage of ACAS equipment.

3.2.2.1 An aircraft that is obliged by the following rules to keep out of the way of another shall avoid passing over, under or in front of the other, unless it passes well clear and takes into account the effect of aircraft wake turbulence.

3.2.2.2 *Approaching head-on.* When two aircraft are approaching head-on or approximately so and there is danger of collision, each shall alter its heading to the right.

3.2.2.3 *Converging.* When two aircraft are converging at approximately the same level, the aircraft that has the other on its right shall give way, except as follows:

a) power-driven heavier-than-air aircraft shall give way to airships, gliders and balloons;

b) airships shall give way to gliders and balloons;

c) gliders shall give way to balloons;

d) power-driven aircraft shall give way to aircraft which are seen to be towing other aircraft or objects.

3.2.2.4 *Overtaking.* An overtaking aircraft is an aircraft that approaches another from the rear on a line forming an angle of less than 70 degrees with the plane of symmetry of the latter, i.e. is in such a position with reference to the other aircraft that at night it should be unable to see either of the aircraft's left (port) or right (starboard) navigation lights. An aircraft that is being overtaken has the right-of-way and the overtaking aircraft, whether climbing, descending or in horizontal flight, shall keep out of the way of the other aircraft by altering its heading to the right, and no subsequent change in the relative positions of the two aircraft shall absolve the overtaking aircraft from this obligation until it is entirely past and clear.

3.2.2.5 *Landing*

3.2.2.5.1 An aircraft in flight, or operating on the ground or water, shall give way to aircraft landing or in the final stages of an approach to land.

3.2.2.5.2 When two or more heavier-than-air aircraft are approaching an aerodrome for the purpose of landing, aircraft at the higher level shall give way to aircraft at the lower level, but the latter shall not take advantage of this rule to cut in in front of another which is in the final stages of an approach to land, or to overtake that aircraft. Nevertheless, power-driven heavier-than-air aircraft shall give way to gliders.

3.2.2.5.3 *Emergency landing.* An aircraft that is aware that another is compelled to land shall give way to that aircraft.

3.2.2.6 *Taking off.* An aircraft taxiing on the manoeuvring area of an aerodrome shall give way to aircraft taking off or about to take off.

3.2.2.7 *Surface movement of aircraft*

3.2.2.7.1 In case of danger of collision between two aircraft taxiing on the movement area of an aerodrome the following shall apply:

a) when two aircraft are approaching head on, or approximately so, each shall stop or where practicable alter its course to the right so as to keep well clear;

b) when two aircraft are on a converging course, the one which has the other on its right shall give way;

c) an aircraft which is being overtaken by another aircraft shall have the right-of-way and the overtaking aircraft shall keep well clear of the other aircraft.

Note.— For the description of an overtaking aircraft see 3.2.2.4.

3.2.2.7.2 An aircraft taxiing on the manoeuvring area shall stop and hold at all taxi-holding positions unless otherwise authorized by the aerodrome control tower.

Note.— For taxi-holding position markings and related signs, see Annex 14, Volume I, 5.2.9 and 5.4.2.

3.2.2.7.3 An aircraft taxiing on the manoeuvring area shall stop and hold at all lighted stop bars and may proceed further when the lights are switched off.

3.2.3 Lights to be displayed by aircraft

Note 1.— The characteristics of lights intended to meet the requirements of 3.2.3 for aeroplanes are specified in Annex 8. Specifications for navigation lights for aeroplanes are contained in the Appendices to Parts I and II of Annex 6. Detailed technical specifications for lights for aeroplanes are contained in Part III of the Airworthiness Technical Manual *(Doc 9051) and for helicopters in Part IV of that document.*

Note 2.— In the context of 3.2.3.2 c) and 3.2.3.4 a) an aircraft is understood to be operating when it is taxiing or being towed or is stopped temporarily during the course of taxiing or being towed.

Note 3.— For aircraft on the water see 3.2.6.2.

3.2.3.1 Except as provided by 3.2.3.5, from sunset to sunrise or during any other period which may be prescribed by the appropriate authority all aircraft in flight shall display:

a) anti-collision lights intended to attract attention to the aircraft; and

b) navigation lights intended to indicate the relative path of the aircraft to an observer and other lights shall not be displayed if they are likely to be mistaken for these lights.

Note.— Lights fitted for other purposes, such as landing lights and airframe floodlights, may be used in addition to the anti-collision lights specified in the Airworthiness Technical Manual *(Doc 9051) to enhance aircraft conspicuity.*

3.2.3.2 Except as provided by 3.2.3.5, from sunset to sunrise or during any other period prescribed by the appropriate authority:

a) all aircraft moving on the movement area of an aerodrome shall display navigation lights intended to indicate the relative path of the aircraft to an observer and other lights shall not be displayed if they are likely to be mistaken for these lights;

b) unless stationary and otherwise adequately illuminated, all aircraft on the movement area of an aerodrome shall display lights intended to indicate the extremities of their structure;

c) all aircraft operating on the movement area of an aerodrome shall display lights intended to attract attention to the aircraft; and

d) all aircraft on the movement area of an aerodrome whose engines are running shall display lights which indicate that fact.

Note.— If suitably located on the aircraft, the navigation lights referred to in 3.2.3.1 b) may also meet the requirements of 3.2.3.2 b). Red anti-collision lights fitted to meet the requirements of 3.2.3.1 a) may also meet the requirements of 3.2.3.2 c) and 3.2.3.2 d) provided they do not subject observers to harmful dazzle.

3.2.3.3 Except as provided by 3.2.3.5, all aircraft in flight and fitted with anti-collision lights to meet the requirement of 3.2.3.1 a) shall display such lights also outside the period specified in 3.2.3.1.

3.2.3.4 Except as provided by 3.2.3.5, all aircraft:

a) operating on the movement area of an aerodrome and fitted with anti-collision lights to meet the requirement of 3.2.3.2 c); or

b) on the movement area of an aerodrome and fitted with lights to meet the requirement of 3.2.3.2 d);

shall display such lights also outside the period specified in 3.2.3.2.

3.2.3.5 A pilot shall be permitted to switch off or reduce the intensity of any flashing lights fitted to meet the requirements of 3.2.3.1, 3.2.3.2, 3.2.3.3 and 3.2.3.4 if they do or are likely to:

a) adversely affect the satisfactory performance of duties; or

b) subject an outside observer to harmful dazzle.

3.2.4 Simulated instrument flights

An aircraft shall not be flown under simulated instrument flight conditions unless:

a) fully functioning dual controls are installed in the aircraft; and

b) a qualified pilot occupies a control seat to act as safety pilot for the person who is flying under simulated instrument conditions. The safety pilot shall have adequate vision forward and to each side of the aircraft, or a competent observer in communication with the safety pilot shall occupy a position in the aircraft from which the observer's field of vision adequately supplements that of the safety pilot.

3.2.5 Operation on and in the vicinity of an aerodrome

An aircraft operated on or in the vicinity of an aerodrome shall, whether or not within an aerodrome traffic zone:

a) observe other aerodrome traffic for the purpose of avoiding collision;

b) conform with or avoid the pattern of traffic formed by other aircraft in operation;

c) make all turns to the left, when approaching for a landing and after taking off, unless otherwise instructed;

d) land and take off into the wind unless safety, the runway configuration, or air traffic considerations determine that a different direction is preferable.

Note 1.— See 3.6.5.1.

Note 2.— Additional rules may apply in aerodrome traffic zones.

3.2.6 Water operations

Note.— In addition to the provisions of 3.2.6.1 of this Annex, rules set forth in the International Regulations for Preventing Collisions at Sea, developed by the International Conference on Revision of the International Regulations for Preventing Collisions at Sea (London, 1972) may be applicable in certain cases.

3.2.6.1 When two aircraft or an aircraft and a vessel are approaching one another and there is a risk of collision, the aircraft shall proceed with careful regard to existing circumstances and conditions including the limitations of the respective craft.

3.2.6.1.1 *Converging.* An aircraft which has another aircraft or a vessel on its right shall give way so as to keep well clear.

3.2.6.1.2 *Approaching head-on.* An aircraft approaching another aircraft or a vessel head-on, or approximately so, shall alter its heading to the right to keep well clear.

3.2.6.1.3 *Overtaking.* The aircraft or vessel which is being overtaken has the right of way, and the one overtaking shall alter its heading to keep well clear.

3.2.6.1.4 *Landing and taking off.* Aircraft landing on or taking off from the water shall, in so far as practicable, keep well clear of all vessels and avoid impeding their navigation.

3.2.6.2 *Lights to be displayed by aircraft on the water.* Between sunset and sunrise or such other period between sunset and sunrise as may be prescribed by the appropriate authority, all aircraft on the water shall display lights as required by the International Regulations for Preventing Collisions at Sea (revised 1972) unless it is impractical for them to do so, in which case they shall display lights as closely similar as possible in characteristics and position to those required by the International Regulations.

Note 1.— Specifications for lights to be shown by aeroplanes on the water are contained in the Appendices to Parts I and II of Annex 6.

Note 2.— The International Regulations for Preventing Collisions at Sea specify that the rules concerning lights shall be complied with from sunset to sunrise. Any lesser period between sunset and sunrise established in accordance with 3.2.6.2 cannot, therefore, be applied in areas where the International Regulations for Preventing Collisions at Sea apply, e.g. on the high seas.

3.3 Flight plans

3.3.1 Submission of a flight plan

3.3.1.1 Information relative to an intended flight or portion of a flight, to be provided to air traffic services units, shall be in the form of a flight plan.

3.3.1.2 A flight plan shall be submitted prior to operating:

a) any flight or portion thereof to be provided with air traffic control service;

b) any IFR flight within advisory airspace;

c) any flight within or into designated areas, or along designated routes, when so required by the appropriate ATS authority to facilitate the provision of flight information, alerting and search and rescue services;

d) any flight within or into designated areas, or along designated routes, when so required by the appropriate ATS authority to facilitate co-ordination with appropriate military units or with air traffic services units in adjacent States in order to avoid the possible need for interception for the purpose of identification;

e) any flight across international borders.

Note.— The term "flight plan" is used to mean variously, full information on all items comprised in the flight plan description, covering the whole route of a flight, or limited information required when the purpose is to obtain a clearance for a minor portion of a flight such as to cross an airway, to take off from, or to land at a controlled aerodrome.

3.3.1.3 A flight plan shall be submitted before departure to an air traffic services reporting office or, during flight, transmitted to the appropriate air traffic services unit or air-ground control radio station, unless arrangements have been made for submission of repetitive flight plans.

3.3.1.4 Unless otherwise prescribed by the appropriate ATS authority, a flight plan for a flight to be provided with air traffic control service or air traffic advisory service shall be submitted at least sixty minutes before departure, or, if submitted during flight, at a time which will ensure its receipt by the appropriate air traffic services unit at least ten minutes before the aircraft is estimated to reach:

a) the intended point of entry into a control area or advisory area; or

b) the point of crossing an airway or advisory route.

3.3.2 Contents of a flight plan

A flight plan shall comprise information regarding such of the following items as are considered relevant by the appropriate ATS authority:

— Aircraft identification

— Flight rules and type of flight

— Number and type(s) of aircraft and wake turbulence category

— Equipment

— Departure aerodrome (see Note 1)

— Estimated off-block time (see Note 2)

— Cruising speed(s)

— Cruising level(s)

— Route to be followed

— Destination aerodrome and total estimated elapsed time

— Alternate aerodrome(s)

— Fuel endurance

— Total number of persons on board

— Emergency and survival equipment

— Other information.

Note 1.— For flight plans submitted during flight, the information provided in respect of this item will be an indication of the location from which supplementary information concerning the flight may be obtained, if required.

Note 2.— For flight plans submitted during flight, the information to be provided in respect of this item will be the time over the first point of the route to which the flight plan relates.

Note 3.— The term "aerodrome" where used in the flight plan is intended to cover also sites other than aerodromes which may be used by certain types of aircraft, e.g. helicopters or balloons.

3.3.3 Completion of a flight plan

3.3.3.1 Whatever the purpose for which it is submitted, a flight plan shall contain information, as applicable, on relevant items up to and including "Alternate aerodrome(s)" regarding the whole route or the portion thereof for which the flight plan is submitted.

3.3.3.2 It shall, in addition, contain information, as applicable, on all other items when so prescribed by the appropriate ATS authority or when otherwise deemed necessary by the person submitting the flight plan.

3.3.4 Changes to a flight plan

Subject to the provisions of 3.6.2.2, all changes to a flight plan submitted for an IFR flight, or a VFR flight operated as a controlled flight, shall be reported as soon as practicable to the appropriate air traffic services unit. For other VFR flights, significant changes to a flight plan shall be reported as soon as practicable to the appropriate air traffic services unit.

Note 1.— Information submitted prior to departure regarding fuel endurance or total number of persons carried on board, if incorrect at time of departure, constitutes a significant change to the flight plan and as such must be reported.

Note 2.— Procedures for submission of changes to repetitive flight plans are contained in the PANS-RAC, Part II (Doc 4444).

3.3.5 Closing a flight plan

3.3.5.1 Unless otherwise prescribed by the appropriate ATS authority, a report of arrival shall be made either in person or by radio at the earliest possible moment after landing, to the appropriate air traffic services unit at the arrival aerodrome, by any flight for which a flight plan has been submitted covering the entire flight or the remaining portion of a flight to the destination aerodrome.

3.3.5.2 When a flight plan has been submitted only in respect of a portion of a flight, other than the remaining portion of a flight to destination, it shall, when required, be closed by an appropriate report to the relevant air traffic services unit.

3.3.5.3 When no air traffic services unit exists at the arrival aerodrome, the arrival report, when required, shall be made as soon as practicable after landing and by the quickest means available to the nearest air traffic services unit.

3.3.5.4 When communication facilities at the arrival aerodrome are known to be inadequate and alternate arrangements for the handling of arrival reports on the ground are not available, the following action shall be taken. Immediately prior to landing the aircraft shall, if practicable, transmit by radio to an appropriate air traffic services unit, a message comparable to an arrival report, where such a report is required. Normally, this transmission shall be made to the aeronautical station serving the air traffic services unit in charge of the flight information region in which the aircraft is operated.

3.3.5.5 Arrival reports made by aircraft shall contain the following elements of information:

a) aircraft identification;

b) departure aerodrome;

c) destination aerodrome (only in the case of a diversionary landing);

d) arrival aerodrome;

e) time of arrival.

Note.— Whenever an arrival report is required, failure to comply with these provisions may cause serious disruption in the air traffic services and incur great expense in carrying out unnecessary search and rescue operations.

3.4 Signals

3.4.1 Upon observing or receiving any of the signals given in Appendix 1, aircraft shall take such action as may be required by the interpretation of the signal given in that Appendix.

3.4.2 The signals of Appendix 1 shall, when used, have the meaning indicated therein. They shall be used only for the purpose indicated and no other signals likely to be confused with them shall be used.

3.5 Time

3.5.1 Co-ordinated Universal Time (UTC) shall be used and shall be expressed in hours and minutes of the 24-hour day beginning at midnight.

3.5.2 A time check shall be obtained prior to operating a controlled flight and at such other times during the flight as may be necessary.

Note.— Such time check is normally obtained from an air traffic services unit unless other arrangements have been made by the operator or by the appropriate ATS authority.

3.6 Air traffic control service

3.6.1 Air traffic control clearances

3.6.1.1 An air traffic control clearance shall be obtained prior to operating a controlled flight, or a portion of a flight as a controlled flight. Such clearance shall be requested through the submission of a flight plan to an air traffic control unit.

Note 1.— A flight plan may cover only part of a flight, as necessary, to describe that portion of the flight or those manoeuvres which are subject to air traffic control. A clearance may cover only part of a current flight plan, as indicated in a clearance limit or by reference to specific manoeuvres such as taxiing, landing or taking off.

Note 2.— If an air traffic control clearance is not satisfactory to a pilot-in-command of an aircraft, the pilot-in-command may request and, if practicable, will be issued an amended clearance.

3.6.1.2 Whenever an aircraft has requested a clearance involving priority, a report explaining the necessity for such priority shall be submitted, if requested by the appropriate air traffic control unit.

3.6.1.3 *Potential reclearance in flight.* If prior to departure it is anticipated that depending on fuel endurance and subject to reclearance in flight, a decision may be taken to proceed to a revised destination aerodrome, the appropriate air traffic control units shall be so notified by the insertion in the flight plan of information concerning the revised route (where known) and the revised destination.

Note.— The intent of this provision is to facilitate a reclearance to a revised destination, normally beyond the filed destination aerodrome.

3.6.1.4 An aircraft operated on a controlled aerodrome shall not taxi on the manoeuvring area without clearance from the aerodrome control tower and shall comply with any instructions given by that unit.

3.6.2 Adherence to flight plan

3.6.2.1 Except as provided for in 3.6.2.2 and 3.6.2.4, an aircraft shall adhere to the current flight plan or the applicable portion of a current flight plan submitted for a controlled flight unless a request for a change has been made and clearance obtained from the appropriate air traffic control unit, or unless an emergency situation arises which necessitates immediate action by the aircraft, in which event as soon as circumstances permit, after such emergency authority is exercised, the appropriate air traffic services unit shall be notified of the action taken and that this action has been taken under emergency authority.

3.6.2.1.1 Unless otherwise authorized or directed by the appropriate air traffic control unit, controlled flights shall, in so far as practicable:

a) when on an established ATS route, operate along the defined centre line of that route; or

b) when on any other route, operate directly between the navigation facilities and/or points defining that route.

3.6.2.1.2 Subject to the overriding requirement in 3.6.2.1.1, an aircraft operating along an ATS route segment defined by reference to very high frequency omnidirectional radio ranges shall change over for its primary navigation guidance from the facility behind the aircraft to that ahead of it at, or as close as operationally feasible to, the change-over point, where established.

3.6.2.1.3 Deviation from the requirements in 3.6.2.1.1 shall be notified to the appropriate air traffic services unit.

3.6.2.2 *Inadvertent changes.* In the event that a controlled flight inadvertently deviates from its current flight plan, the following action shall be taken:

a) *Deviation from track:* if the aircraft is off track, action shall be taken forthwith to adjust the heading of the aircraft to regain track as soon as practicable.

b) *Variation in true airspeed:* if the average true airspeed at cruising level between reporting points varies or is expected to vary by plus or minus 5 per cent of the true airspeed, from that given in the flight plan, the appropriate air traffic services unit shall be so informed.

c) *Change in time estimate:* if the time estimate for the next applicable reporting point, flight information region boundary or destination aerodrome, whichever comes first, is found to be in error in excess of three minutes from that notified to air traffic services, or such other period of time as is prescribed by the appropriate ATS authority or on the basis of air navigation regional agreements, a revised estimated time shall be notified as soon as possible to the appropriate air traffic services unit.

3.6.2.3 *Intended changes.* Requests for flight plan changes shall include information as indicated hereunder:

a) *Change of cruising level:* aircraft identification; requested new cruising level and cruising speed at this level, revised time estimates (when applicable) at subsequent flight information region boundaries.

b) *Change of route:*

1) *Destination unchanged:* aircraft identification; flight rules; description of new route of flight including related flight plan data beginning with the position from which requested change of route is to commence; revised time estimates; any other pertinent information.

2) *Destination changed:* aircraft identification; flight rules; description of revised route of flight to revised destination aerodrome including related flight plan data, beginning with the position from which requested change of route is to commence; revised time estimates; alternate aerodrome(s); any other pertinent information.

3.6.2.4 *Weather deterioration below the VMC.* When it becomes evident that flight in VMC in accordance with its current flight plan will not be practicable, a VFR flight operated as a controlled flight shall:

a) request an amended clearance enabling the aircraft to continue in VMC to destination or to an alternative aerodrome, or to leave the airspace within which an ATC clearance is required; or

b) if no clearance in accordance with a) can be obtained, continue to operate in VMC and notify the appropriate ATC unit of the action being taken either to leave the airspace concerned or to land at the nearest suitable aerodrome; or

c) if operated within a control zone, request authorization to operate as a special VFR flight; or

d) request clearance to operate in accordance with the instrument flight rules.

3.6.3 Position reports

Unless exempted by the appropriate ATS authority or by the appropriate air traffic services unit under conditions specified by that authority, a controlled flight shall report to the appropriate air traffic services unit, as soon as possible, the time and level of passing each designated compulsory reporting point, together with any other required information. Position reports shall similarly be made in relation to additional points when requested by the appropriate air traffic services unit. In the absence of designated reporting points, position reports shall be made at intervals prescribed by the appropriate ATS authority or specified by the appropriate air traffic services unit.

Note.— The conditions and circumstances in which SSR Mode C transmission of pressure-altitude satisfies the requirement for level information in position reports are indicated in the PANS-RAC, Part II (Doc 4444).

3.6.4 Termination of control

A controlled flight shall, except when landing at a controlled aerodrome, advise the appropriate ATC unit as soon as it ceases to be subject to air traffic control service.

3.6.5 Communications

3.6.5.1 An aircraft operated as a controlled flight shall maintain continuous listening watch on the appropriate radio frequency of, and establish two-way communication as necessary with, the appropriate air traffic control unit, except as may be prescribed by the appropriate ATS authority in respect of aircraft forming part of aerodrome traffic at a controlled aerodrome.

Note.— SELCAL or similar automatic signalling devices satisfy the requirement to maintain a listening watch.

3.6.5.2 *Communication failure.* If a radio failure precludes compliance with 3.6.5.1, the aircraft shall comply with the radiocommunication failure procedures of Annex 10, Volume II, and with such of the following procedures as are appropriate. In addition, the aircraft, when forming part of the aerodrome traffic at a controlled aerodrome, shall keep a watch for such instructions as may be issued by visual signals.

3.6.5.2.1 If in visual meteorological conditions, the aircraft shall:

a) continue to fly in visual meteorological conditions;

b) land at the nearest suitable aerodrome; and

c) report its arrival by the most expeditious means to the appropriate air traffic control unit.

3.6.5.2.2 If in instrument meteorological conditions or when weather conditions are such that it does not appear feasible to complete the flight in accordance with 3.6.5.2.1 (see Note 1), the aircraft shall:

a) proceed according to the current flight plan to the appropriate designated navigation aid serving the destination aerodrome (see Note 2) and, when required to ensure compliance with b) below, hold over this aid until commencement of descent;

b) commence descent from the navigation aid specified in a) at, or as close as possible to, the expected approach time last received and acknowledged; or, if no expected approach time has been received and acknowledged, at, or as close as possible to, the estimated time of arrival resulting from the current flight plan;

c) complete a normal instrument approach procedure as specified for the designated navigation aid; and

d) land, if possible, within thirty minutes after the estimated time of arrival specified in b) or the last acknowledged expected approach time, whichever is later.

Note 1.— As evidenced by the meteorological conditions prescribed therein, 3.6.5.2.1 relates to all controlled flights, whereas 3.6.5.2.2 relates only to IFR flights.

Note 2.— If the clearance for the levels covers only part of the route, the aircraft is expected to maintain the last assigned and acknowledged cruising level(s) to the point(s) specified in the clearance and thereafter the cruising level(s) in the current flight plan.

Note 3.— The provision of air traffic control service to other flights operating in the airspace concerned will be based on the assumption that an aircraft experiencing radio failure will comply with the rules in 3.6.5.2.2.

3.7 Unlawful interference

An aircraft which is being subjected to unlawful interference shall endeavour to notify the appropriate ATS unit of this fact, any significant circumstances associated therewith and any deviation from the current flight plan necessitated by the circumstances, in order to enable the ATS unit to give priority to the aircraft and to minimize conflict with other aircraft.

Note 1.— Responsibility of ATS units in situations of unlawful interference is contained in Annex 11.

Note 2.— Guidance material for use when unlawful interference occurs and the aircraft is unable to notify an ATS unit of this fact is contained in Attachment B to this Annex.

Note 3.— Action to be taken by SSR equipped aircraft which are being subjected to unlawful interference is contained in Annex 11, the PANS-RAC (Doc 4444) and the PANS-OPS (Doc 8168).

3.8 Interception

Note.— The word "interception" in this context does not include intercept and escort service provided, on request, to an aircraft in distress, in accordance with the Search and Rescue Manual *(Doc 7333).*

3.8.1 Interception of civil aircraft shall be governed by appropriate regulations and administrative directives issued by Contracting States in compliance with the Convention on International Civil Aviation, and in particular Article 3(d) under which Contracting States undertake, when issuing regulations for their State aircraft, to have due regard for the safety of navigation of civil aircraft. Accordingly, in drafting appropriate regulations and administrative directives due regard shall be had to the provisions of Appendix 1, Section 2 and Appendix 2, Section 1.

Note.— Recognizing that it is essential for the safety of flight that any visual signals employed in the event of an interception which should be undertaken only as a last resort be correctly employed and understood by civil and military aircraft throughout the world, the Council of the International Civil Aviation Organization, when adopting the visual signals in Appendix 1 to this Annex, urged Contracting States to ensure that they be strictly adhered to by their State aircraft. As interceptions of civil aircraft are, in all cases, potentially hazardous, the Council has also formulated special recommendations which Contracting States are urged to apply in a uniform manner. These special recommendations are contained in Attachment A.

3.8.2 The pilot-in-command of a civil aircraft, when intercepted, shall comply with the Standards in Appendix 2, Sections 2 and 3, interpreting and responding to visual signals as specified in Appendix 1, Section 2.

Note.— See also 2.1.1 and 3.4.

CHAPTER 4. VISUAL FLIGHT RULES

4.1 Except when operating as a special VFR flight, VFR flights shall be conducted so that the aircraft is flown in conditions of visibility and distance from clouds equal to or greater than those specified in Table 4-1.

4.2 Except when a clearance is obtained from an air traffic control unit, VFR flights shall not take off or land at an aerodrome within a control zone, or enter the aerodrome traffic zone or traffic pattern:

a) when the ceiling is less than 450 m (1 500 ft); or

b) when the ground visibility is less than 5 km.

4.3 VFR flights between sunset and sunrise, or such other period between sunset and sunrise as may be prescribed by the appropriate ATS authority, shall be operated in accordance with the conditions prescribed by such authority.

4.4 Unless authorized by the appropriate ATS authority, VFR flights shall not be operated:

a) above FL 200;

b) at transonic and supersonic speeds.

4.5 Authorization for VFR flights to operate above FL 290 shall not be granted in areas where a vertical separation minimum of 300 m (1 000 ft) is applied above FL 290.

Table 4-1*
(see 4.1)

Airspace class	B	C D E	F G	
			ABOVE 900 m (3 000 ft) AMSL or above 300 m (1 000 ft) above terrain, whichever is the higher	At and below 900 m (3 000 ft) AMSL or 300 m (1 000 ft) above terrain, whichever is the higher
Distance from cloud	Clear of cloud	1 500 m horizontally 300 m (1 000 ft) vertically		Clear of cloud and in sight of the surface
Flight visibility	8 km at and above 3 050 m (10 000 ft) AMSL 5 km below 3 050 m (10 000 ft) AMSL			5 km**

* When the height of the transition altitude is lower than 3 050 m (10 000 ft) AMSL, FL 100 should be used in lieu of 10 000 ft.

** When so prescribed by the appropriate ATS authority:

a) lower flight visibilities to 1 500 m may be permitted for flights operating:

1) at speeds that, in the prevailing visibility, will give adequate opportunity to observe other traffic or any obstacles in time to avoid collision; or

2) in circumstances in which the probability of encounters with other traffic would normally be low, e.g. in areas of low volume traffic and for aerial work at low levels.

b) HELICOPTERS may be permitted to operate *in less than 1 500 m* flight visibility, if manoeuvred at a speed that will give adequate opportunity to observe other traffic or any obstacles in time to avoid collision.

4.6 Except when necessary for take-off or landing, or except by permission from the appropriate authority, a VFR flight shall not be flown:

a) over the congested areas of cities, towns or settlements or over an open-air assembly of persons at a height less than 300 m (1 000 ft) above the highest obstacle within a radius of 600 m from the aircraft;

b) elsewhere than as specified in 4.6 a), at a height less than 150 m (500 ft) above the ground or water.

Note.— See also 3.1.2.

4.7 Except where otherwise indicated in air traffic control clearances or specified by the appropriate ATS authority, VFR flights in level cruising flight when operated above 900 m (3 000 ft) from the ground or water, or a higher datum as specified by the appropriate ATS authority, shall be conducted at a flight level appropriate to the track as specified in the Tables of cruising levels in Appendix 3.

4.8 VFR flights shall comply with the provisions of 3.6:

a) when operated within Classes B, C and D airspace;

b) when forming part of aerodrome traffic at controlled aerodromes; or

c) when operated as special VFR flights.

4.9 A VFR flight operating within or into areas, or along routes, designated by the appropriate ATS authority in accordance with 3.3.1.2 c) or d), shall maintain continuous listening watch on the appropriate radio frequency of, and report its position as necessary to, the air traffic services unit providing flight information service.

Note.— See Note following 3.6.5.1.

4.10 An aircraft operated in accordance with the visual flight rules which wishes to change to compliance with the instrument flight rules shall:

a) if a flight plan was submitted, communicate the necessary changes to be effected to its current flight plan, or

b) when so required by 3.3.1.2, submit a flight plan to the appropriate air traffic services unit and obtain a clearance prior to proceeding IFR when in controlled airspace.

CHAPTER 5. INSTRUMENT FLIGHT RULES

5.1 Rules applicable to all IFR flights

5.1.1 Aircraft equipment

Aircraft shall be equipped with suitable instruments and with navigation equipment appropriate to the route to be flown.

5.1.2 Minimum levels

Except when necessary for take-off or landing, or except when specifically authorized by the appropriate authority, an IFR flight shall be flown at a level which is not below the minimum flight altitude established by the State whose territory is overflown, or, where no such minimum flight altitude has been established:

a) over high terrain or in mountainous areas, at a level which is at least 600 m (2 000 ft) above the highest obstacle located within 8 km of the estimated position of the aircraft;

b) elsewhere than as specified in a), at a level which is at least 300 m (1 000 ft) above the highest obstacle located within 8 km of the estimated position of the aircraft.

Note 1.— The estimated position of the aircraft will take account of the navigational accuracy which can be achieved on the relevant route segment, having regard to the navigational facilities available on the ground and in the aircraft.

Note 2.— See also 3.1.2.

5.1.3 Change from IFR flight to VFR flight

5.1.3.1 An aircraft electing to change the conduct of its flight from compliance with the instrument flight rules to compliance with the visual flight rules shall, if a flight plan was submitted, notify the appropriate air traffic services unit specifically that the IFR flight is cancelled and communicate thereto the changes to be made to its current flight plan.

5.1.3.2 When an aircraft operating under the instrument flight rules is flown in or encounters visual meteorological conditions it shall not cancel its IFR flight unless it is anticipated, and intended, that the flight will be continued for a reasonable period of time in uninterrupted visual meteorological conditions.

5.2 Rules applicable to IFR flights within controlled airspace

5.2.1 IFR flights shall comply with the provisions of 3.6 when operated in controlled airspace.

5.2.2 An IFR flight operating in cruising flight in controlled airspace shall be flown at a cruising level, or, if authorized to employ cruise climb techniques, between two levels or above a level, selected from:

a) the Tables of cruising levels in Appendix 3, or

b) a modified table of cruising levels, when so prescribed in accordance with Appendix 3 for flight above FL 410,

except that the correlation of levels to track prescribed therein shall not apply whenever otherwise indicated in air traffic control clearances or specified by the appropriate ATS authority in Aeronautical Information Publications.

5.3 Rules applicable to IFR flights outside controlled airspace

5.3.1 Cruising levels

An IFR flight operating in level cruising flight outside of controlled airspace shall be flown at a cruising level appropriate to its track as specified in:

a) the Tables of cruising levels in Appendix 3, except when otherwise specified by the appropriate ATS authority for flight at or below 900 m (3 000 ft) above mean sea level; or

b) a modified table of cruising levels, when so prescribed in accordance with Appendix 3 for flight above FL 410.

Note.— This provision does not preclude the use of cruise climb techniques by aircraft in supersonic flight.

5.3.2 Communications

An IFR flight operating outside controlled airspace but within or into areas, or along routes, designated by the appropriate ATS authority in accordance with 3.3.1.2 c) or d), shall maintain a listening watch on the appropriate radio frequency and establish two-way communication, as necessary, with the air traffic services unit providing flight information service.

Note.— See Note following 3.6.5.1.

5.3.3 Position reports

An IFR flight operating outside controlled airspace and required by the appropriate ATS authority to:

— submit a flight plan,

— maintain a listening watch on the appropriate radio frequency and establish two-way communication, as necessary, with the air traffic services unit providing flight information service,

shall report position as specified in 3.6.3 for controlled flights.

Note.— Aircraft electing to use the air traffic advisory service whilst operating IFR within specified advisory airspace are expected to comply with the provisions of 3.6, except that the flight plan and changes thereto are not subjected to clearances and that two-way communication will be maintained with the unit providing the air traffic advisory service.

APPENDIX 1. SIGNALS

(Note.— See Chapter 3, 3.4 of the Annex)

1. DISTRESS AND URGENCY SIGNALS

Note 1.— None of the provisions in this section shall prevent the use, by an aircraft in distress, of any means at its disposal to attract attention, make known its position and obtain help.

Note 2.— For full details of telecommunication transmission procedures for the distress and urgency signals, see Annex 10, Volume II, Chapter 5.

Note 3.— For details of the search and rescue visual signals, see Annex 12.

1.1 Distress signals

The following signals, used either together or separately, mean that grave and imminent danger threatens, and immediate assistance is requested:

a) a signal made by radiotelegraphy or by any other signalling method consisting of the group SOS (· · · — — — · · · in the Morse Code);

b) a signal sent by radiotelephony consisting of the spoken word MAYDAY;

c) rockets or shells throwing red lights, fired one at a time at short intervals;

d) a parachute flare showing a red light.

Note.— Article 41 of the ITU Radio Regulations (Nos. 3268, 3270 and 3271 refer) provides information on the alarm signals for actuating radiotelegraph and radiotelephone auto-alarm systems:

3268 The radiotelegraph alarm signal consists of a series of twelve dashes sent in one minute, the duration of each dash being four seconds and the duration of the interval between consecutive dashes one second. It may be transmitted by hand but its transmission by means of an automatic instrument is recommended.

3270 The radiotelephone alarm signal consists of two substantially sinusoidal audio frequency tones transmitted alternately. One tone shall have a frequency of 2 200 Hz and the other a frequency of 1 300 Hz, the duration of each tone being 250 milliseconds.

3271 The radiotelephone alarm signal, when generated by automatic means, shall be sent continuously for a period of at least thirty seconds but not exceeding one minute; when generated by other means, the signal shall be sent as continuously as practicable over a period of approximately one minute.

1.2 Urgency signals

1.2.1 The following signals, used either together or separately, mean that an aircraft wishes to give notice of difficulties which compel it to land without requiring immediate assistance:

a) the repeated switching on and off of the landing lights; or

b) the repeated switching on and off of the navigation lights in such manner as to be distinct from flashing navigation lights.

1.2.2 The following signals, used either together or separately, mean that an aircraft has a very urgent message to transmit concerning the safety of a ship, aircraft or other vehicle, or of some person on board or within sight:

a) a signal made by radiotelegraphy or by any other signalling method consisting of the group XXX;

b) a signal sent by radiotelephony consisting of the spoken words PAN, PAN.

2. SIGNALS FOR USE IN THE EVENT OF INTERCEPTION

2.1 Signals initiated by intercepting aircraft and responses by intercepted aircraft

Series	*INTERCEPTING Aircraft Signals*	*Meaning*	*INTERCEPTED Aircraft Responds*	*Meaning*
1	DAY or NIGHT — Rocking aircraft and flashing navigational lights at irregular intervals (and landing lights in the case of a helicopter) from a position slightly above and ahead of, and normally to the left of, the intercepted aircraft (or to the right if the intercepted aircraft is a helicopter) and, after acknowledgement, a slow level turn, normally to the left, (or to the right in the case of a helicopter) on the desired heading. *Note 1.— Meteorological conditions or terrain may require the intercepting aircraft to reverse the positions and direction of turn given above in Series 1.* *Note 2.— If the intercepted aircraft is not able to keep pace with the intercepting aircraft, the latter is expected to fly a series of race-track patterns and to rock the aircraft each time it passes the intercepted aircraft.*	You have been intercepted. Follow me.	DAY or NIGHT — Rocking aircraft, flashing navigational lights at irregular intervals and following. *Note.— Additional action required to be taken by intercepted aircraft is prescribed in Chapter 3, 3.8.*	Understood, will comply.
2	DAY or NIGHT — An abrupt break-away manoeuvre from the intercepted aircraft consisting of a climbing turn of 90 degrees or more without crossing the line of flight of the intercepted aircraft.	You may proceed.	DAY or NIGHT — Rocking the aircraft.	Understood, will comply.
3	DAY or NIGHT — Lowering landing gear (if fitted), showing steady landing lights and overflying runway in use or, if the intercepted aircraft is a helicopter, overflying the helicopter landing area. In the case of helicopters, the intercepting helicopter makes a landing approach, coming to hover near to the landing area.	Land at this aerodrome.	DAY or NIGHT — Lowering landing gear, (if fitted), showing steady landing lights and following the intercepting aircraft and, if, after overflying the runway in use or helicopter landing area, landing is considered safe, proceeding to land.	Understood; will comply.

2.2 Signals initiated by intercepted aircraft and responses by intercepting aircraft

Series	*INTERCEPTED Aircraft Signals*	*Meaning*	*INTERCEPTING Aircraft Responds*	*Meaning*
4	DAY or NIGHT — Raising landing gear (if fitted) and flashing landing lights while passing over runway in use or helicopter landing area at a height exceeding 300 m (1 000 ft) but not exceeding 600 m (2 000 ft) (in the case of a helicopter, at a height exceeding 50 m (170 ft) but not exceeding 100 m (330 ft)) above the aerodrome level, and continuing to circle runway in use or helicopter landing area. If unable to flash landing lights, flash any other lights available.	Aerodrome you have designated is inadequate.	DAY or NIGHT — If it is desired that the intercepted aircraft follow the intercepting aircraft to an alternate aerodrome, the intercepting aircraft raises its landing gear (if fitted) and uses the Series 1 signals prescribed for intercepting aircraft. If it is decided to release the intercepted aircraft, the intercepting aircraft uses the Series 2 signals prescribed for intercepting aircraft.	Understood, follow me. Understood, you may proceed.
5	DAY or NIGHT — Regular switching on and off of all available lights but in such a manner as to be distinct from flashing lights.	Cannot comply.	DAY or NIGHT — Use Series 2 signals prescribed for intercepting aircraft.	Understood.
6	DAY or NIGHT — Irregular flashing of all available lights.	In distress.	DAY or NIGHT — Use Series 2 signals prescribed for intercepting aircraft.	Understood.

14/11/91

3. VISUAL SIGNALS USED TO WARN AN UNAUTHORIZED AIRCRAFT FLYING IN, OR ABOUT TO ENTER A RESTRICTED, PROHIBITED OR DANGER AREA

By day and by night, a series of projectiles discharged from the ground at intervals of 10 seconds, each showing, on bursting, red and green lights or stars will indicate to an unauthorized aircraft that it is flying in or about to enter a restricted, prohibited or danger area, and that the aircraft is to take such remedial action as may be necessary.

4. SIGNALS FOR AERODROME TRAFFIC

4.1 Light and pyrotechnic signals

4.1.1 Instructions

	Light	*From Aerodrome Control to:*	
		Aircraft in flight	*Aircraft on the ground*
Directed towards aircraft concerned (see Figure 1.1)	Steady green	Cleared to land	Cleared for take-off
	Steady red	Give way to other aircraft and continue circling	Stop
	Series of green flashes	Return for landing*	Cleared to taxi
	Series of red flashes	Aerodrome unsafe, do not land	Taxi clear of landing area in use
	Series of white flashes	Land at this aerodrome and proceed to apron*	Return to starting point on the aerodrome
	Red pyrotechnic	Notwithstanding any previous instructions, do not land for the time being	

* *Clearances to land and to taxi will be given in due course.*

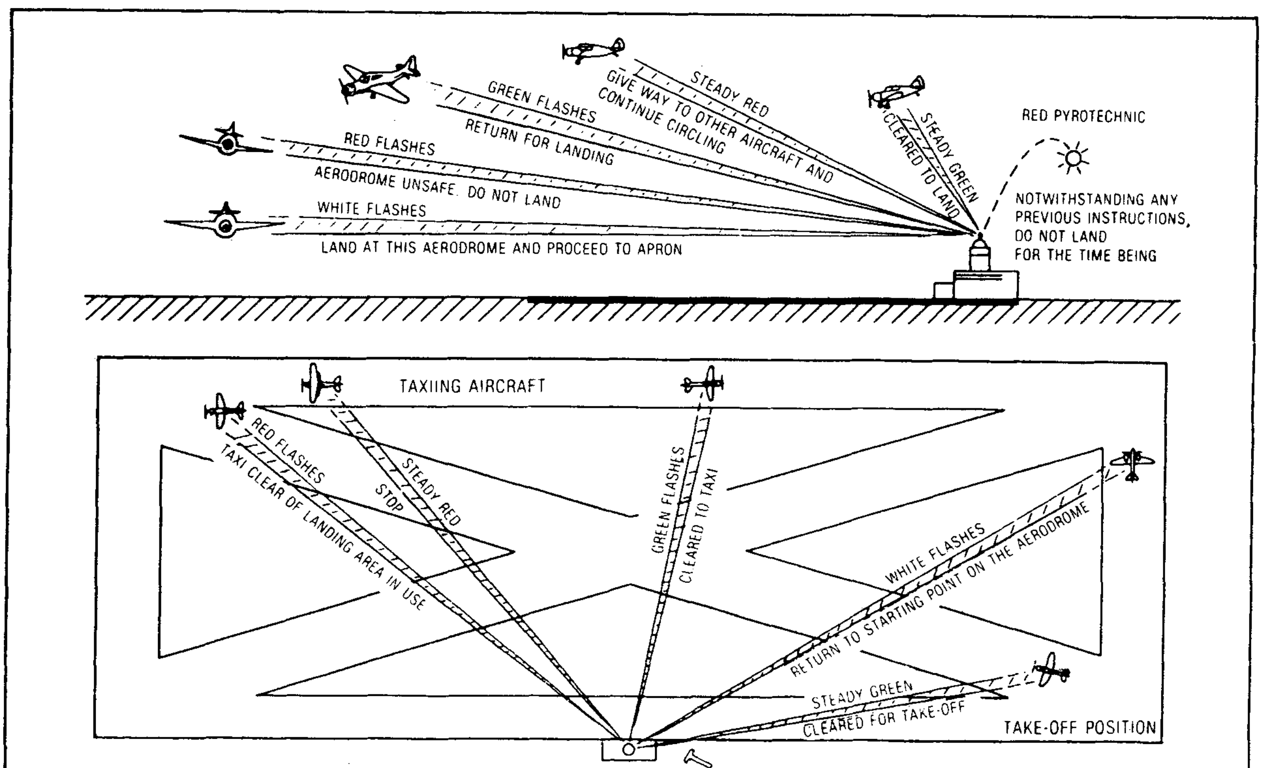

Figure 1.1 (see 4.1.1)

4.1.2 Acknowledgement by an aircraft

a) *When in flight:*

1) during the hours of daylight:

— by rocking the aircraft's wings;

Note.— This signal should not be expected on the base and final legs of the approach.

2) during the hours of darkness:

— by flashing on and off twice the aircraft's landing lights or, if not so equipped, by switching on and off twice its navigation lights.

b) *When on the ground:*

1) during the hours of daylight:

— by moving the aircraft's ailerons or rudder;

2) during the hours of darkness:

— by flashing on and off twice the aircraft's landing lights or, if not so equipped, by switching on and off twice its navigation lights.

4.2 Visual ground signals

Note.— For details of visual ground aids, see Annex 14.

4.2.1 Prohibition of landing

A horizontal red square panel with yellow diagonals (Figure 1.2) when displayed in a signal area indicates that landings are prohibited and that the prohibition is liable to be prolonged.

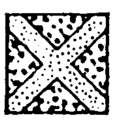

Figure 1.2

4.2.2 Need for special precautions while approaching or landing

A horizontal red square panel with one yellow diagonal (Figure 1.3) when displayed in a signal area indicates that owing to the bad state of the manoeuvring area, or for any other reason, special precautions must be observed in approaching to land or in landing.

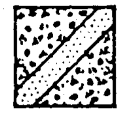

Figure 1.3

4.2.3 Use of runways and taxiways

4.2.3.1 A horizontal white dumb-bell (Figure 1.4) when displayed in a signal area indicates that aircraft are required to land, take off and taxi on runways and taxiways only.

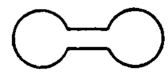

Figure 1.4

4.2.3.2 The same horizontal white dumb-bell as in 4.2.3.1 but with a black bar placed perpendicular to the shaft across each circular portion of the dumb-bell (Figure 1.5) when displayed in a signal area indicates that aircraft are required to land and take off on runways only, but other manoeuvres need not be confined to runways and taxiways.

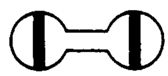

Figure 1.5

4.2.4 Closed runways or taxiways

Crosses of a single contrasting colour, yellow or white (Figure 1.6), displayed horizontally on runways and taxiways or parts thereof indicate an area unfit for movement of aircraft.

Figure 1.6

4.2.5 Directions for landing or take-off

4.2.5.1 A horizontal white or orange landing T (Figure 1.7) indicates the direction to be used by aircraft for landing and take-off, which shall be in a direction parallel to the shaft of the T towards the cross arm.

Note.— When used at night, the landing T is either illuminated or outlined in white coloured lights.

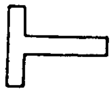

Figure 1.7

4.2.5.2 A set of two digits (Figure 1.8) displayed vertically at or near the aerodrome control tower indicates to aircraft on the manoeuvring area the direction for take-off, expressed in units of 10 degrees to the nearest 10 degrees of the magnetic compass.

09

Figure 1.8

4.2.6 Right-hand traffic

When displayed in a signal area, or horizontally at the end of the runway or strip in use, a right-hand arrow of conspicuous colour (Figure 1.9) indicates that turns are to be made to the right before landing and after take-off.

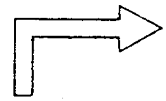

Figure 1.9

4.2.7 Air traffic services reporting office

The letter C displayed vertically in black against a yellow background (Figure 1.10) indicates the location of the air traffic services reporting office.

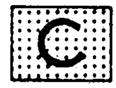

Figure 1.10

4.2.8 Glider flights in operation

A double white cross displayed horizontally (Figure 1.11) in the signal area indicates that the aerodrome is being used by gliders and that glider flights are being performed.

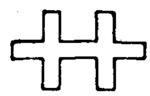

Figure 1.11

5. MARSHALLING SIGNALS

5.1 From a signalman to an aircraft

Note 1.— These signals are designed for use by the signalman, with hands illuminated as necessary to facilitate observation by the pilot, and facing the aircraft in a position:

a) for fixed-wing aircraft, *forward of the left-wing tip within view of the pilot; and*

b) for helicopters, *where the signalman can best be seen by the pilot.*

Note 2.— The meaning of the relevant signals remains the same if bats, illuminated wands or torchlights are held.

Note 3.— The aircraft engines are numbered, for the signalman facing the aircraft, from right to left (i.e. No. 1 engine being the port outer engine).

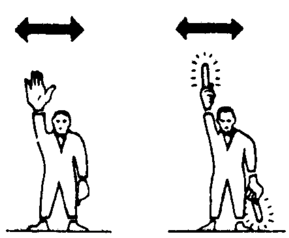
Note 4.— Signals marked with an asterisk are designed for use to hovering helicopters.

5.1.1 Prior to using the following signals, the signalman shall ascertain that the area within which an aircraft is to be guided is clear of objects which the aircraft, in complying with 3.4.1, might otherwise strike.

Note.— The design of many aircraft is such that the path of the wing tips, engines and other extremities cannot always be monitored visually from the flight deck while the aircraft is being manoeuvred on the ground.

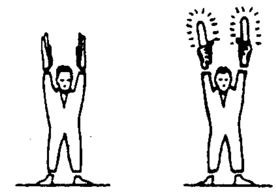
1. To proceed under further guidance by signalman

Signalman directs pilot if traffic conditions on aerodrome require this action.



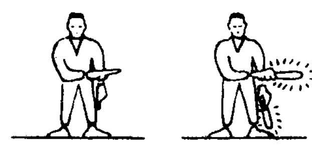
2. This bay

Arms above head in vertical position with palms facing inward.



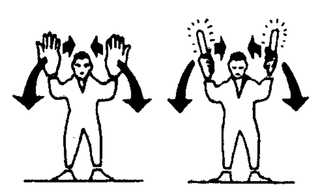
3. Proceed to next signalman

Right or left arm down, other arm moved across the body and extended to indicate direction of next signalman.



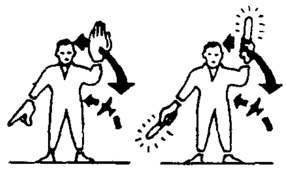
4. Move ahead

Arms a little aside, palms facing backward and repeatedly moved upward-backward from shoulder height.

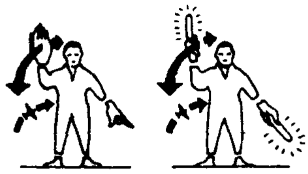


5. Turn

a) *Turn to your left:* right arm downward, left arm repeatedly moved upward-backward. Speed of arm movement indicating rate of turn.

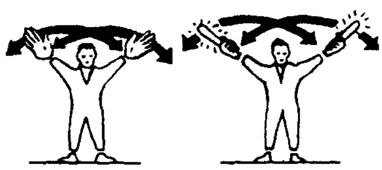


b) *Turn to your right:* left arm downward, right arm repeatedly moved upward-backward. Speed of arm movement indicating rate of turn.



6. Stop

Arms repeatedly crossed above head (the rapidity of the arm movement should be related to the urgency of the stop, i.e. the faster the movement the quicker the stop).



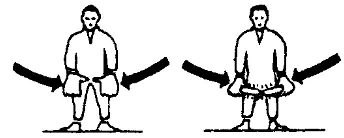
7. Brakes

a) *Engage brakes:* raise arm and hand, with fingers extended, horizontally in front of body, then clench fist.

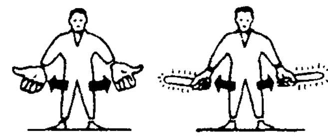
b) *Release brakes:* raise arm, with fist clenched, horizontally in front of body, then extend fingers.

8. Chocks

a) *Chocks inserted:* arms down, palms facing inwards, move arms from extended position inwards.



b) *Chocks removed:* arms down, palms facing outwards, move arms outwards.

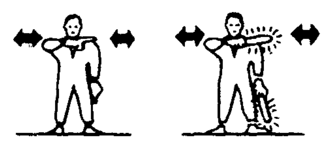


9. Start engine(s)

Left hand overhead with appropriate number of fingers extended, to indicate the number of the engine to be started, and circular motion of right hand at head level.

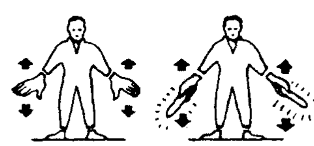
10. Cut engines

Either arm and hand level with shoulder, hand across throat, palm downward. The hand is moved sideways with the arm remaining bent.



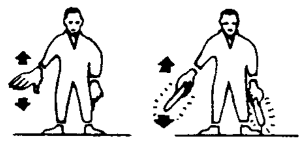
11. Slow down

Arms down with palms toward ground, then moved up and down several times.



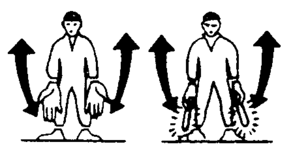
12. Slow down engine(s) on indicated side

Arms down with palms toward ground, then either *right* or *left* hand waved up and down indicating the *left* or *right* side engine(s) respectively should be slowed down.



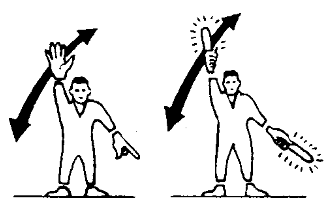
13. Move back

Arms by sides, palms facing forward, swept forward and upward repeatedly to shoulder height.

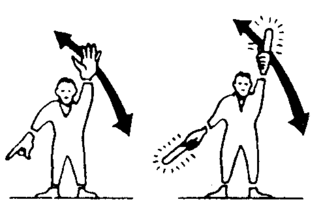


14. Turns while backing

a) *For tail to starboard:* point left arm down, and right arm brought from overhead, vertical position to horizontal forward position, repeating right arm movement.

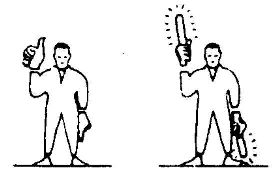


b) *For tail to port:* point right arm down, and left arm brought from overhead, vertical position to horizontal forward position, repeating left arm movement.



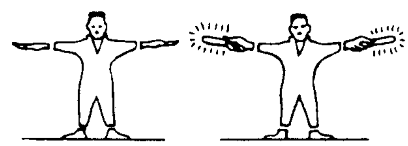
15. All clear

Right arm raised at elbow with thumb erect.



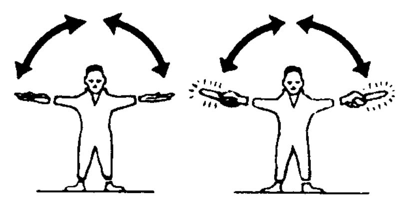
*16. Hover

Arms extended horizontally sideways.



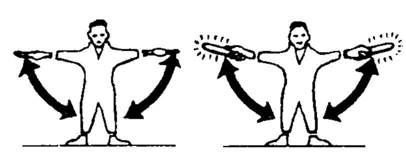
*17. Move upwards

Arms extended horizontally to the side beckoning upwards, with palms turned up. Speed of movement indicates rate of ascent.



*18. Move downwards

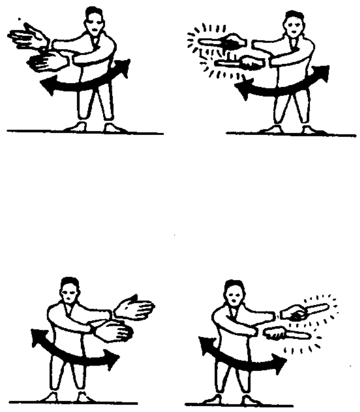
Arms extended horizontally to the side beckoning downwards, with palms turned down. Speed of movement indicates rate of descent.



14/11/91

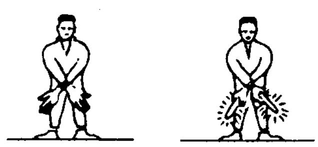
***19. Move horizontally**

Appropriate arm extended horizontally sideways in direction of movement and other arm moved in front of body in same direction, in a repeating movement.



***20. Land**

Arms crossed and extended downwards in front of the body.



5.2 From the pilot of an aircraft to a signalman

Note 1.— These signals are designed for use by a pilot in the cockpit with hands plainly visible to the signalman, and illuminated as necessary to facilitate observation by the signalman.

Note 2.— The aircraft engines are numbered in relation to the signalman facing the aircraft, from right to left (i.e. No. 1 engine being the port outer engine).

5.2.1 Brakes

Note.— The moment the fist is clenched or the fingers are extended indicates, respectively, the moment of brake engagement or release.

a) *Brakes engaged:* raise arm and hand, with fingers extended, horizontally in front of face, then clench fist.

b) *Brakes released:* raise arm, with fist clenched, horizontally in front of face, then extend fingers.

5.2.2 Chocks

a) *Insert chocks:* arms extended, palms outwards, move hands inwards to cross in front of face.

b) *Remove chocks:* hands crossed in front of face, palms outwards, move arms outwards.

5.2.3 Ready to start engine(s)

Raise the appropriate number of fingers on one hand indicating the number of the engine to be started.

APPENDIX 2. INTERCEPTION OF CIVIL AIRCRAFT

(Note.— See Chapter 3, 3.8 of the Annex)

1. Principles to be observed by States

1.1 To achieve the uniformity in regulations which is necessary for the safety of navigation of civil aircraft due regard shall be had by Contracting States to the following principles when developing regulations and administrative directives:

a) interception of civil aircraft will be undertaken only as a last resort;

b) if undertaken, an interception will be limited to determining the identity of the aircraft, unless it is necessary to return the aircraft to its planned track, direct it beyond the boundaries of national airspace, guide it away from a prohibited, restricted or danger area or instruct it to effect a landing at a designated aerodrome;

c) practice interception of civil aircraft will not be undertaken;

d) navigational guidance and related information will be given to an intercepted aircraft by radiotelephony, whenever radio contact can be established; and

e) in the case where an intercepted civil aircraft is required to land in the territory overflown, the aerodrome designated for the landing is to be suitable for the safe landing of the aircraft type concerned.

Note.— In the unanimous adoption by the 25th Session (Extraordinary) of the ICAO Assembly on 10 May 1984 of Article 3 bis to the Convention on International Civil Aviation, the Contracting States have recognized that "every State must refrain from resorting to the use of weapons against civil aircraft in flight."

1.2 Contracting States shall publish a standard method that has been established for the manoeuvring of aircraft intercepting a civil aircraft. Such method shall be designed to avoid any hazard for the intercepted aircraft.

Note.— Special recommendations regarding a method for the manoeuvring are contained in Attachment A, Section 3.

1.3 Contracting States shall ensure that provision is made for the use of secondary surveillance radar, where available, to identify civil aircraft in areas where they may be subject to interception.

2. Action by intercepted aircraft

2.1 An aircraft which is intercepted by another aircraft shall immediately:

a) follow the instructions given by the intercepting aircraft, interpreting and responding to visual signals in accordance with the specifications in Appendix 1;

b) notify, if possible, the appropriate air traffic services unit;

c) attempt to establish radiocommunication with the intercepting aircraft or with the appropriate intercept control unit, by making a general call on the emergency frequency 121.5 MHz, giving the identity of the intercepted aircraft and the nature of the flight; and if no contact has been established and if practicable, repeating this call on the emergency frequency 243 MHz;

d) if equipped with SSR transponder, select Mode A, Code 7700, unless otherwise instructed by the appropriate air traffic services unit.

2.2 If any instructions received by radio from any sources conflict with those given by the intercepting aircraft by visual signals, the intercepted aircraft shall request immediate clarification while continuing to comply with the visual instructions given by the intercepting aircraft.

2.3 If any instructions received by radio from any sources conflict with those given by the intercepting aircraft by radio, the intercepted aircraft shall request immediate clarification while continuing to comply with the radio instructions given by the intercepting aircraft.

3. Radiocommunication during interception

If radio contact is established during interception but communication in a common language is not possible, attempts shall be made to convey instructions, acknowledgement of instructions and essential information by using the phrases and pronunciations in Table 2.1 and transmitting each phrase twice:

Table 2.1

Phrases for use by INTERCEPTING aircraft			*Phrases for use by INTERCEPTED aircraft*		
Phrase	*Pronunciation*[1]	*Meaning*	*Phrase*	*Pronunciation*[1]	*Meaning*
CALL SIGN	KOL SA-IN	What is your call sign?	CALL SIGN (call sign)[2]	KOL SA-IN (call sign)	My call sign is (call sign)
FOLLOW	FOL-LO	Follow me	WILCO	VILL-KO	Understood Will comply
DESCEND	DEE-SEND	Descend for landing	CAN NOT	KANN NOTT	Unable to comply
YOU LAND	YOU LAAND	Land at this aerodrome	REPEAT	REE-PEET	Repeat your instruction
PROCEED	PRO-SEED	You may proceed	AM LOST	AM LOSST	Position unknown
			MAYDAY	MAYDAY	I am in distress
			HIJACK[3]	HI-JACK	I have been hijacked
			LAND (place name)	LAAND (place name)	I request to land at (place name)
			DESCEND	DEE-SEND	I require descent

1. In the second column, syllables to be emphasized are underlined.

2. The call sign required to be given is that used in radiotelephony communications with air traffic services units and corresponding to the aircraft identification in the flight plan.

3. Circumstances may not always permit, nor make desirable, the use of the phrase "HIJACK".

APPENDIX 3. TABLES OF CRUISING LEVELS

The cruising levels to be observed when so required by this Annex are as follows:

a) in areas where, on the basis of regional air navigation agreement and in accordance with conditions specified therein, a vertical separation minimum (VSM) of 300 m (1 000 ft) is applied between FL 290 and FL 410 inclusive:*

TRACK**											
From 000 degrees to 179 degrees***						From 180 degrees to 359 degrees***

490	14 950	49 000				510	15 550	51 000			
etc.	etc.	etc.				etc.	etc.	etc.			

* Except when, on the basis of regional air navigation agreements, a modified table of cruising levels based on a nominal vertical separation minimum of 300 m (1 000 ft) is prescribed for use, under specified conditions, by aircraft operating above FL 410 within designated portions of the airspace.

** Magnetic track, or in polar areas at latitudes higher than 70 degrees and within such extensions to those areas as may be prescribed by the appropriate ATS authorities, grid tracks as determined by a network of lines parallel to the Greenwich Meridian superimposed on a polar stereographic chart in which the direction towards the North Pole is employed as the Grid North.

*** Except where, on the basis of regional air navigation agreements, from 090 to 269 degrees and from 270 to 089 degrees is prescribed to accommodate predominant traffic directions and appropriate transition procedures to be associated therewith are specified.

Note.— Guidance material relating to vertical separation is contained in the *Manual on Implementation of a 300 m (1 000 ft) Vertical Separation Minimum Between FL 290 and FL 410 Inclusive* (Doc 9574).

b) in other areas:

TRACK*

450	13 700	45 000	460	14 000	46 000	470	14 350	47 000	480	14 650	48 000
490	14 950	49 000	500	15 250	50 000	510	15 550	51 000	520	15 850	52 000
etc.	etc.	etc.	etc.	etc.	etc.	etc.	etc.	etc.	etc.	etc.	etc.

* Magnetic track, or in polar areas at latitudes higher than 70 degrees and within such extensions to those areas as may be prescribed by the appropriate ATS authorities, grid tracks as determined by a network of lines parallel to the Greenwich Meridian superimposed on a polar stereographic chart in which the direction towards the North Pole is employed as the Grid North.

** Except where, on the basis of regional air navigation agreements, from 090 to 269 degrees and from 270 to 089 degrees is prescribed to accommodate predominant traffic directions and appropriate transition procedures to be associated therewith are specified.

Note.— Guidance material relating to vertical separation is contained in the *Manual on Implementation of a 300 m (1 000 ft) Vertical Separation Minimum Between FL 290 and FL 410 Inclusive* (Doc 9574).

APPENDIX 4. UNMANNED FREE BALLOONS

(Note.— See Chapter 3, 3.1.9 of the Annex)

1. Classification of unmanned free balloons

Unmanned free balloons shall be classified as:

a) *light:* an unmanned free balloon which carries a payload of one or more packages with a combined mass of less than 4 kg, unless qualifying as a heavy balloon in accordance with c) 2), 3) or 4) below; or

b) *medium:* an unmanned free balloon which carries a payload of two or more packages with a combined mass of 4 kg or more, but less than 6 kg, unless qualifying as a heavy balloon in accordance with c) 2), 3) or 4) below; or

c) *heavy:* an unmanned free balloon which carries a payload which:

1) has a combined mass of 6 kg or more; or

2) includes a package of 3 kg or more; or

3) includes a package of 2 kg or more with an area density of more than 13 g per square centimetre; or

4) uses a rope or other device for suspension of the payload that requires an impact force of 230 N or more to separate the suspended payload from the balloon.

Note 1.— The area density referred to in c) 3) is determined by dividing the total mass in grams of the payload package by the area in square centimetres of its smallest surface.

Note 2.— See Figure 4.1.

2. General operating rules

2.1 An unmanned free balloon shall not be operated without appropriate authorization from the State from which the launch is made.

2.2 An unmanned free balloon, other than a light balloon used exclusively for meteorological purposes and operated in the manner prescribed by the appropriate authority, shall not be operated across the territory of another State without appropriate authorization from the other State concerned.

2.3 The authorization referred to in 2.2 shall be obtained prior to the launching of the balloon if there is reasonable expectation, when planning the operation, that the balloon may drift into airspace over the territory of another State. Such authorization may be obtained for a series of balloon flights or for a particular type of recurring flight, e.g. atmospheric research balloon flights.

2.4 An unmanned free balloon shall be operated in accordance with conditions specified by the State of Registry and the State(s) expected to be overflown.

2.5 An unmanned free balloon shall not be operated in such a manner that impact of the balloon, or any part thereof, including its payload, with the surface of the earth, creates a hazard to persons or property not associated with the operation.

2.6 A heavy unmanned free balloon shall not be operated over the high seas without prior co-ordination with the appropriate ATS authority.

3. Operating limitations and equipment requirements

3.1 A heavy unmanned free balloon shall not be operated without authorization from the appropriate ATS authority at or through any level below 18 000 m (60 000 ft) pressure-altitude at which:

a) there are clouds or obscuring phenomena of more than four oktas coverage; or

b) the horizontal visibility is less than 8 km.

3.2 A heavy or medium unmanned free balloon shall not be released in a manner that will cause it to fly lower than 300 m (1 000 ft) over the congested areas of cities, towns or settlements or an open-air assembly of persons not associated with the operation.

3.3 A heavy unmanned free balloon shall not be operated unless:

a) it is equipped with at least two payload flight-termination devices or systems, whether automatic or operated by telecommand, that operate independently of each other;

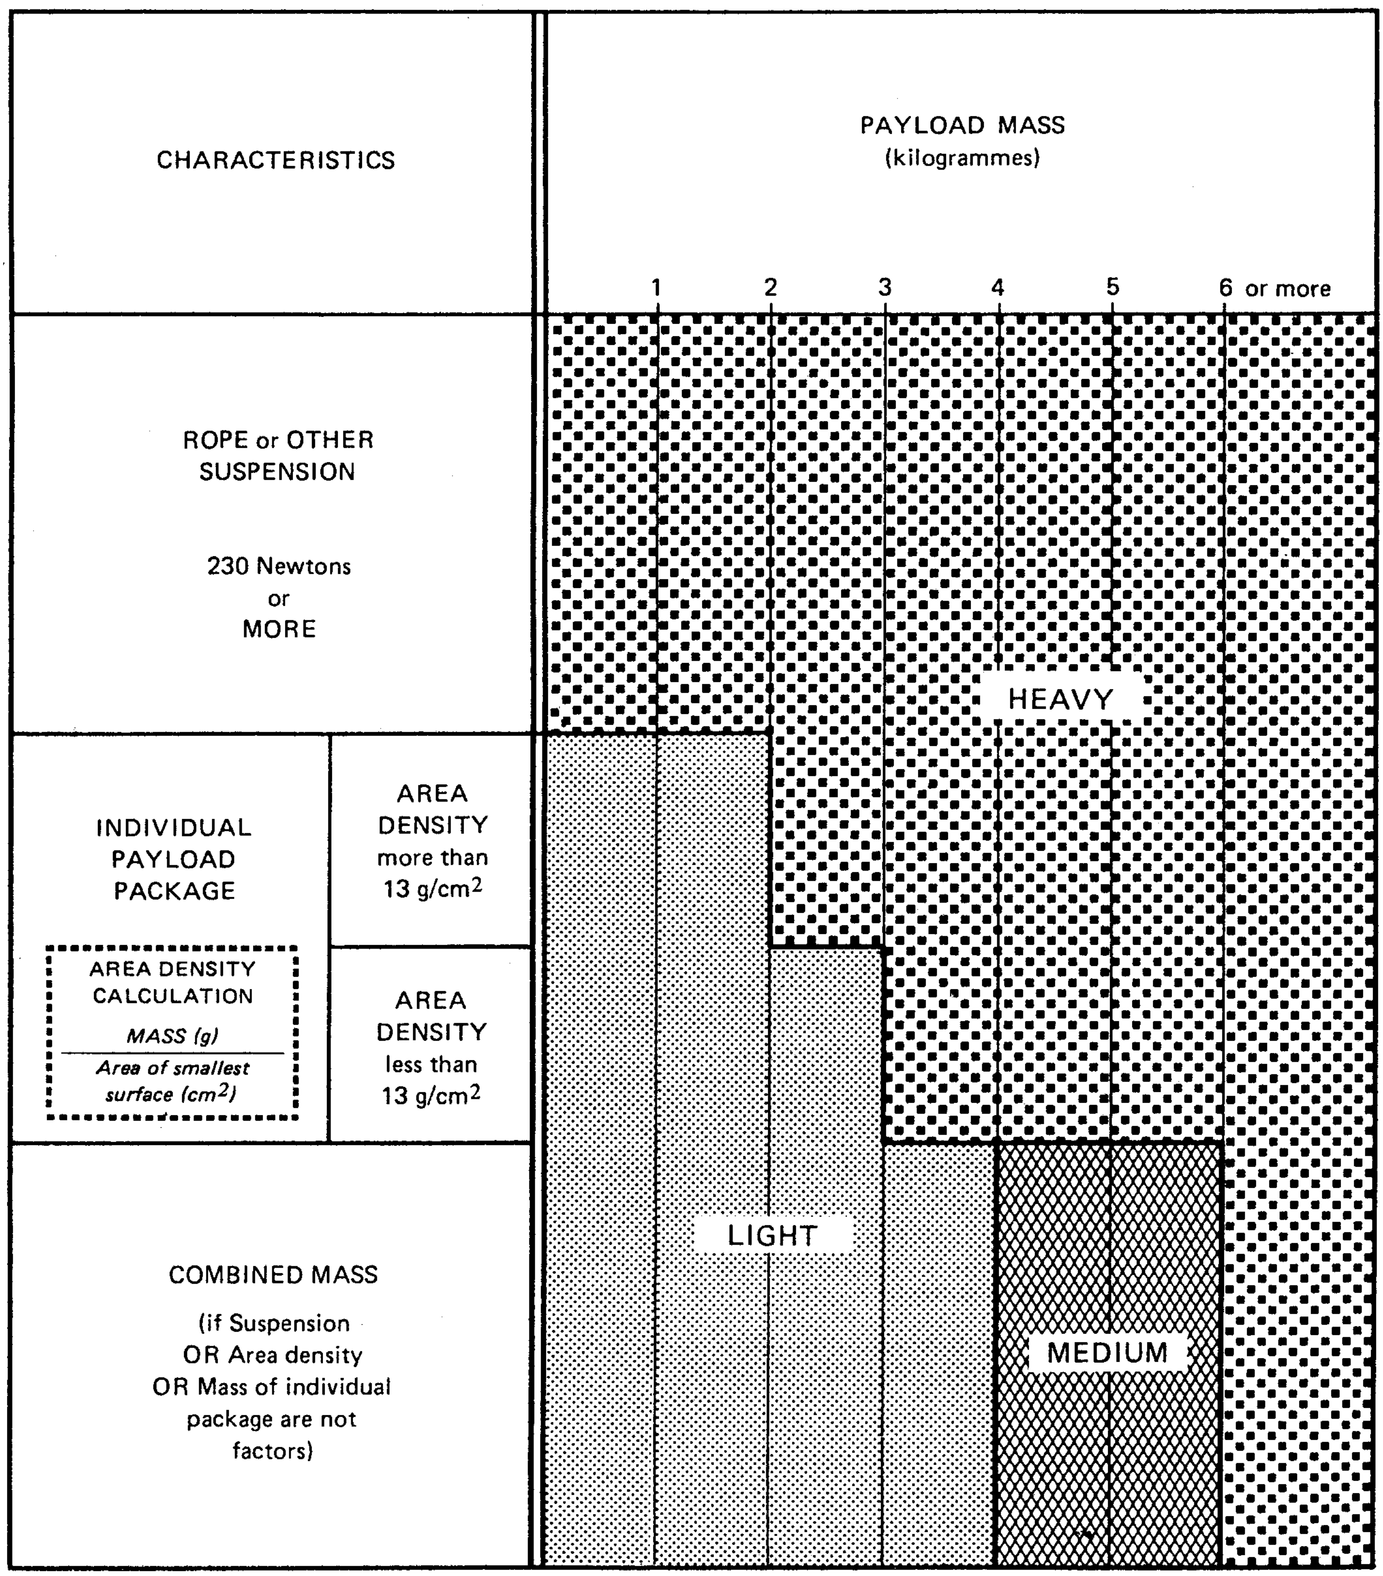

Figure 4.1 Classification of unmanned free balloons

b) for polyethylene zero-pressure balloons, at least two methods, systems, devices, or combinations thereof, that function independently of each other are employed for terminating the flight of the balloon envelope;

Note.— Superpressure balloons do not require these devices as they quickly rise after payload discharge and burst without the need for a device or system designed to puncture the balloon envelope. In this context a superpressure balloon is a simple non-extensible envelope capable of withstanding a differential of pressure, higher inside than out. It is inflated so that the smaller night-time pressure of the gas still fully extends the envelope. Such a superpressure balloon will keep essentially constant level until too much gas diffuses out of it.

c) the balloon envelope is equipped with either a radar reflective device(s) or radar reflective material that will present an echo to surface radar operating in the 200 MHz to 2 700 MHz frequency range, and/or the balloon is equipped with such other devices as will permit continuous tracking by the operator beyond the range of ground-based radar.

3.4 A heavy unmanned free balloon shall not be operated in an area where ground-based SSR equipment is in use, unless it is equipped with a secondary surveillance radar transponder, with altitude reporting capability, which is continuously operating on an assigned code, or which can be turned on when necessary by the tracking station.

3.5 An unmanned free balloon that is equipped with a trailing antenna that requires a force of more than 230 N to break it at any point, shall not be operated unless the antenna has coloured pennants or streamers that are attached at not more than 15 m intervals.

3.6 A heavy unmanned free balloon shall not be operated below 18 000 m (60 000 ft) pressure-altitude between sunset and sunrise or such other period between sunset and sunrise (corrected to the altitude of operation) as may be prescribed by the appropriate ATS authority, unless the balloon and its attachments and payload, whether or not they become separated during the operation, are lighted.

3.7 A heavy unmanned free balloon that is equipped with a suspension device (other than a highly conspicuously coloured open parachute) more than 15 m long, shall not be operated between sunrise and sunset below 18 000 m (60 000 ft) pressure-altitude unless the suspension device is coloured in alternate bands of high conspicuity colours or has coloured pennants attached.

4. Termination

The operator of a heavy unmanned free balloon shall activate the appropriate termination devices required by 3.3 a) and b) above:

a) when it becomes known that weather conditions are less than those prescribed for the operation;

b) if a malfunction or any other reason makes further operation hazardous to air traffic or to persons or property on the surface; or

c) prior to unauthorized entry into the airspace over another State's territory.

5. Flight notification

5.1 Pre-flight notification

5.1.1 Early notification of the intended flight of an unmanned free balloon in the medium or heavy category, shall be made to the appropriate air traffic services unit not less than seven days before the date of the intended flight.

5.1.2 Notification of the intended flight shall include such of the following information as may be required by the appropriate air traffic services unit:

a) balloon flight identification or project code name;

b) balloon classification and description;

c) SSR code or NDB frequency as applicable;

d) operator's name and telephone number;

e) launch site;

f) estimated time of launch (or time of commencement and completion of multiple launches);

g) number of balloons to be launched and the scheduled interval between launches (if multiple launches);

h) expected direction of ascent;

i) cruising level(s) (pressure-altitude);

j) the estimated elapsed time to pass 18 000 m (60 000 ft) pressure-altitude or to reach cruising level if at or below 18 000 m (60 000 ft), together with the estimated location;

Note.— If the operation consists of continuous launchings, the time to be included is the estimated time at which the first and the last in the series will reach the appropriate level (e.g. 122136Z-130330Z).

k) the estimated date and time of termination of the flight and the planned location of the impact/recovery area. In the case of balloons carrying out flights of long duration, as a result of which the date and time of termination of the flight and the location of impact cannot be forecast with accuracy, the term "long duration" shall be used.

Note.— If there is to be more than one location of impact/recovery, each location is to be listed together with the appropriate estimated time of impact. If there is to be a series of continuous impacts, the time to be included is the estimated time of the first and the last in the series (e.g. 070330Z-072300Z).

5.1.3 Any changes in the pre-launch information notified in accordance with 5.1.2 above shall be forwarded to the air traffic services unit concerned not less than 6 hours before the estimated time of launch, or in the case of solar or cosmic disturbance investigations involving a critical time element, not less than 30 minutes before the estimated time of the commencement of the operation.

5.2 Notification of launch

Immediately after a medium or heavy unmanned free balloon is launched the operator shall notify the appropriate air traffic services unit of the following:

a) balloon flight identification;

b) launch site;

c) actual time of launch;

d) estimated time at which 18 000 m (60 000 ft) pressure-altitude will be passed, or the estimated time at which the cruising level will be reached if at or below 18 000 m (60 000 ft), and the estimated location; and

e) any changes to the information previously notified in accordance with 5.1.2 g) and h).

5.3 Notification of cancellation

The operator shall notify the appropriate air traffic services unit immediately it is known that the intended flight of a medium or heavy unmanned free balloon, previously notified in accordance with 5.1, has been cancelled.

6. Position recording and reports

6.1 The operator of a heavy unmanned free balloon operating at or below 18 000 m (60 000 ft) pressure-altitude shall monitor the flight path of the balloon and forward reports of the balloon's position as requested by air traffic services. Unless air traffic services require reports of the balloon's position at more frequent intervals, the operator shall record the position every 2 hours.

6.2 The operator of a heavy unmanned free balloon operating above 18 000 m (60 000 ft) pressure-altitude shall monitor the flight progress of the balloon and forward reports of the balloon's position as requested by air traffic services. Unless air traffic services require reports of the balloon's position at more frequent intervals, the operator shall record the position every 24 hours.

6.3 If a position cannot be recorded in accordance with 6.1 and 6.2, the operator shall immediately notify the appropriate air traffic services unit. This notification shall include the last recorded position. The appropriate air traffic services unit shall be notified immediately when tracking of the balloon is re-established.

6.4 One hour before the beginning of planned descent of a heavy unmanned free balloon, the operator shall forward to the appropriate ATS unit the following information regarding the balloon:

a) the current geographical position;

b) the current level (pressure-altitude);

c) the forecast time of penetration of 18 000 m (60 000 ft) pressure-altitude, if applicable;

d) the forecast time and location of ground impact.

6.5 The operator of a heavy or medium unmanned free balloon shall notify the appropriate air traffic services unit when the operation is ended.

ATTACHMENT A. INTERCEPTION OF CIVIL AIRCRAFT

(Note.— See Chapter 3, 3.8 of the Annex and associated Note)

Note.— In the interest of completeness, the substance of the provisions in Appendix 2 to the Annex is incorporated in this Attachment.

1. In accordance with Article 3 d) of the Convention on International Civil Aviation the Contracting States of ICAO "undertake, when issuing regulations for their state aircraft, that they will have due regard for the safety of navigation of civil aircraft". As interceptions of civil aircraft are, in all cases, potentially hazardous, the Council of ICAO has formulated the following special recommendations which Contracting States are urged to implement through appropriate regulatory and administrative action. The uniform application by all concerned is considered essential in the interest of safety of civil aircraft and their occupants. For this reason the Council of ICAO invites Contracting States to notify ICAO of any differences which may exist between their national regulations or practices and the special recommendations hereunder.

2. General

2.1 Interception of civil aircraft should be avoided and should be undertaken only as a last resort. If undertaken, the interception should be limited to determining the identity of the aircraft, unless it is necessary to return the aircraft to its planned track, direct it beyond the boundaries of national airspace, guide it away from a prohibited, restricted or danger area or instruct it to effect a landing at a designated aerodrome. Practice interception of civil aircraft is not to be undertaken.

2.2 To eliminate or reduce the need for interception of civil aircraft, it is important that:

a) all possible efforts be made by intercept control units to secure identification of any aircraft which may be a civil aircraft, and to issue any necessary instructions or advice to such aircraft, through the appropriate air traffic services units. To this end, it is essential that means of rapid and reliable communications between intercept control units and air traffic services units be established and that agreements be formulated concerning exchanges of information between such units on the movements of civil aircraft, in accordance with the provisions of Annex 11;

b) areas prohibited to all civil flights and areas in which civil flight is not permitted without special authorization by the State be clearly promulgated in aeronautical information publications (AIP) in accordance with the provisions of Annex 15, together with the risk, if any, of interception in the event of penetration of such areas. When delineating such areas in close proximity to promulgated ATS routes, or other frequently used tracks, States should take into account the availability and over-all systems accuracy of the navigation systems to be used by civil aircraft and their ability to remain clear of the delineated areas;

c) the establishment of additional navigation aids be considered where necessary to ensure that civil aircraft are able safely to circumnavigate prohibited or, as required, restricted areas.

2.3 To eliminate or reduce the hazards inherent in interceptions undertaken as a last resort, all possible efforts should be made to ensure co-ordinated actions by the pilots and ground units concerned. To this end, it is essential that Contracting States take steps to ensure that:

a) all pilots of civil aircraft be made fully aware of the actions to be taken by them and the visual signals to be used, as specified in Chapter 3 and Appendix 1 of this Annex;

b) operators or pilots-in-command of civil aircraft implement the provisions in Annex 6, Parts I, II and III regarding the capability of aircraft to communicate on 121.5 MHz and the availability of interception procedures and visual signals on board aircraft;

c) all air traffic services personnel be made fully aware of the actions to be taken by them in accordance with the provisions of Annex 11, Chapter 2 and the PANS-RAC (Doc 4444);

d) all pilots-in-command of intercepting aircraft be made aware of the general performance limitations of civil aircraft and of the possibility that intercepted civil aircraft may be in a state of emergency due to technical difficulties or unlawful interference;

e) clear and unambiguous instructions be issued to intercept control units and to pilots-in-command of potential intercepting aircraft, covering interception manoeuvres, guidance of intercepted aircraft, action by intercepted aircraft, air-to-air visual signals, radiocommunication with intercepted aircraft, and the need to refrain from resorting to the use of weapons;

Note.— See paragraphs 3 to 8.

f) intercept control units and intercepting aircraft be provided with radiotelephony equipment compatible with the technical specifications of Annex 10, Volume I so as to enable them to communicate with intercepted aircraft on the emergency frequency 121.5 MHz;

g) secondary surveillance radar facilities be made available to the extent possible to permit intercept control units to identify civil aircraft in areas where they might otherwise be intercepted. Such facilities should permit recognition of discrete four-digit codes in Mode A, including immediate recognition of Mode A, Codes 7500, 7600 and 7700.

3. Interception manoeuvres

3.1 A standard method should be established for the manoeuvring of aircraft intercepting a civil aircraft in order to avoid any hazard for the intercepted aircraft. Such method should take due account of the performance limitations of civil aircraft, the need to avoid flying in such proximity to the intercepted aircraft that a collision hazard may be created and the need to avoid crossing the aircraft's flight path or to perform any other manoeuvre in such a manner that the wake turbulence may be hazardous, particularly if the intercepted aircraft is a light aircraft.

3.2 Manoeuvres for visual identification

The following method is recommended for the manoeuvring of intercepting aircraft for the purpose of visually identifying a civil aircraft:

Phase I

The intercepting aircraft should approach the intercepted aircraft from astern. The element leader, or the single intercepting aircraft, should normally take up a position on the left (port) side, slightly above and ahead of the intercepted aircraft, within the field of view of the pilot of the intercepted aircraft, and initially not closer to the aircraft than 300 m. Any other participating aircraft should stay well clear of the intercepted aircraft, preferably above and behind. After speed and position have been established, the aircraft should, if necessary, proceed with Phase II of the procedure.

Phase II

The element leader, or the single intercepting aircraft, should begin closing in gently on the intercepted aircraft, at the same level, until no closer than absolutely necessary to obtain the information needed. The element leader, or the single intercepting aircraft, should use caution to avoid startling the flight crew or the passengers of the intercepted aircraft, keeping constantly in mind the fact that manoeuvres considered normal to an intercepting aircraft may be considered hazardous to passengers and crews of civil aircraft. Any other participating aircraft should continue to stay well clear of the intercepted aircraft. Upon completion of identification, the intercepting aircraft should withdraw from the vicinity of the intercepted aircraft as outlined in Phase III.

Phase III

The element leader, or the single intercepting aircraft, should break gently away from the intercepted aircraft in a shallow dive. Any other participating aircraft should stay well clear of the intercepted aircraft and rejoin their leader.

3.3 Manoeuvres for navigational guidance

3.3.1 If, following the identification manoeuvres in Phase I and Phase II above, it is considered necessary to intervene in the navigation of the intercepted aircraft, the element leader, or the single intercepting aircraft, should normally take up a position on the left (port) side, slightly above and ahead of the intercepted aircraft, to enable the pilot-in-command of the latter aircraft to see the visual signals given.

3.3.2 It is indispensable that the pilot-in-command of the intercepting aircraft be satisfied that the pilot-in-command of the intercepted aircraft is aware of the interception and acknowledges the signals given. If repeated attempts to attract the attention of the pilot-in-command of the intercepted aircraft by use of the Series 1 signal in Appendix 1, Section 2 are unsuccessful, other methods of signalling may be used for this purpose, including as a last resort the visual effect of the reheat/afterburner, provided that no hazard is created for the intercepted aircraft.

3.4 It is recognized that meteorological conditions or terrain may occasionally make it necessary for the element leader, or the single intercepting aircraft, to take up a position on the right (starboard) side, slightly above and ahead of the intercepted aircraft. In such case, the pilot-in-command of the intercepting aircraft must take particular care that the intercepting aircraft is clearly visible at all times to the pilot-in-command of the intercepted aircraft.

4. Guidance of an intercepted aircraft

4.1 Navigational guidance and related information should be given to an intercepted aircraft by radiotelephony, whenever radio contact can be established.

4.2 When navigational guidance is given to an intercepted aircraft, care must be taken that the aircraft is not led into conditions where the visibility may be reduced below that required to maintain flight in visual meteorological conditions and that the manoeuvres demanded of the intercepted aircraft do not add to already existing hazards in the event that the operating efficiency of the aircraft is impaired.

4.3 In the exceptional case where an intercepted civil aircraft is required to land in the territory overflown, care must also be taken that:

a) the designated aerodrome is suitable for the safe landing of the aircraft type concerned, especially if the aerodrome is not normally used for civil air transport operations;

b) the surrounding terrain is suitable for circling, approach and missed approach manoeuvres;

c) the intercepted aircraft has sufficient fuel remaining to reach the aerodrome;

d) if the intercepted aircraft is a civil transport aircraft, the designated aerodrome has a runway with a length equivalent to at least 2 500 m at mean sea level and a bearing strength sufficient to support the aircraft; and

e) whenever possible, the designated aerodrome is one that is described in detail in the relevant aeronautical information publication.

4.4 When requiring a civil aircraft to land at an unfamiliar aerodrome, it is essential that sufficient time be allowed it to prepare for a landing, bearing in mind that only the pilot-in-command of the civil aircraft can judge the safety of the landing operation in relation to runway length and aircraft mass at the time.

4.5 It is particularly important that all information necessary to facilitate a safe approach and landing be given to the intercepted aircraft by radiotelephony.

5. Action by intercepted aircraft

The Standards in Appendix 2, Section 2 specify as follows:

"2.1 An aircraft which is intercepted by another aircraft shall immediately:

a) follow the instructions given by the intercepting aircraft, interpreting and responding to visual signals in accordance with the specifications in Appendix 1;

b) notify, if possible, the appropriate air traffic services unit;

c) attempt to establish radiocommunication with the intercepting aircraft or with the appropriate intercept control unit, by making a general call on the emergency frequency 121.5 MHz, giving the identity of the intercepted aircraft and the nature of the flight; and if no contact has been established and if practicable, repeating this call on the emergency frequency 243 MHz;

d) if equipped with SSR transponder, select Mode A, Code 7700, unless otherwise instructed by the appropriate air traffic services unit.

"2.2 If any instructions received by radio from any sources conflict with those given by the intercepting aircraft by visual signals, the intercepted aircraft shall request immediate clarification while continuing to comply with the visual instructions given by the intercepting aircraft.

"2.3 If any instructions received by radio from any sources conflict with those given by the intercepting aircraft by radio, the intercepted aircraft shall request immediate clarification while continuing to comply with the radio instructions given by the intercepting aircraft."

6. Air-to-air visual signals

The visual signals to be used by intercepting and intercepted aircraft are those set forth in Appendix 1 to this Annex. It is essential that intercepting and intercepted aircraft adhere strictly to those signals and interpret correctly the signals given by the other aircraft, and that the intercepting aircraft pay particular attention to any signals given by the intercepted aircraft to indicate that it is in a state of distress or urgency.

7. Radiocommunication between the intercept control unit or the intercepting aircraft and the intercepted aircraft

7.1 When an interception is being made, the intercept control unit and the intercepting aircraft should:

a) first attempt to establish two-way communication with the intercepted aircraft in a common language on the emergency frequency 121.5 MHz, using the call signs "INTERCEPT CONTROL", "INTERCEPTOR (call sign)" and "INTERCEPTED AIRCRAFT" respectively; and

b) failing this, attempt to establish two-way communication with the intercepted aircraft on such other frequency or frequencies as may have been prescribed by the appropriate ATS authority, or to establish contact through the appropriate ATS unit(s).

7.2 If radio contact is established during interception but communication in a common language is not possible, attempts must be made to convey instructions, acknowledgement of instructions and essential information by using the phrases and pronunciations in Table A-1 and transmitting each phrase twice.

8. Refraining from the use of weapons

Note.— In the unanimous adoption by the 25th Session (Extraordinary) of the ICAO Assembly on 10 May 1984 of

Article 3 bis *to the Convention on International Civil Aviation, the Contracting States have recognized that "every State must refrain from resorting to the use of weapons against civil aircraft in flight."*

The use of tracer bullets to attract attention is hazardous, and it is expected that measures will be taken to avoid their use so that the lives of persons on board and the safety of aircraft will not be endangered.

9. Co-ordination between intercept control units and air traffic services units

It is essential that close co-ordination be maintained between an intercept control unit and the appropriate air traffic services unit during all phases of an interception of an aircraft which is, or might be, a civil aircraft, in order that the air traffic services unit is kept fully informed of the developments and of the action required of the intercepted aircraft.

Table A-1

Phrases for use by INTERCEPTING aircraft			*Phrases for use by INTERCEPTED aircraft*		
Phrase	*Pronunciation*[1]	*Meaning*	*Phrase*	*Pronunciation*[1]	*Meaning*
CALL SIGN	KOL SA-IN	What is your call sign?	CALL SIGN (call sign)[2]	KOL SA-IN (call sign)	My call sign is (call sign)
FOLLOW	FOL-LO	Follow me	WILCO	VILL-KO	Understood Will comply
DESCEND	DEE-SEND	Descend for landing	CAN NOT	KANN NOTT	Unable to comply
YOU LAND	YOU LAAND	Land at this aerodrome	REPEAT	REE-PEET	Repeat your instruction
PROCEED	PRO-SEED	You may proceed	AM LOST	AM LOSST	Position unknown
			MAYDAY	MAYDAY	I am in distress
			HIJACK[3]	HI-JACK	I have been hijacked
			LAND (place name)	LAAND (place name)	I request to land at (place name)
			DESCEND	DEE-SEND	I require descent

1. In the second column, syllables to be emphasized are underlined.

2. The call sign required to be given is that used in radiotelephony communications with air traffic services units and corresponding to the aircraft identification in the flight plan.

3. Circumstances may not always permit, nor make desirable, the use of the phrase "HIJACK".

ATTACHMENT B. UNLAWFUL INTERFERENCE

1. General

The following procedures are intended as guidance for use by aircraft when unlawful interference occurs and the aircraft is unable to notify an ATS unit of this fact.

2. Procedures

2.1 Unless considerations aboard the aircraft dictate otherwise, the pilot-in-command should attempt to continue flying on the assigned track and at the assigned cruising level at least until able to notify an ATS unit or within radar coverage.

2.2 When an aircraft subjected to an act of unlawful interference must depart from its assigned track or its assigned cruising level without being able to make radiotelephony contact with ATS, the pilot-in-command should, whenever possible:

a) attempt to broadcast warnings on the VHF emergency frequency and other appropriate frequencies, unless considerations aboard the aircraft dictate otherwise. Other equipment such as on-board transponders, data links, etc., should also be used when it is advantageous to do so and circumstances permit; and

b) proceed in accordance with applicable special procedures for in-flight contingencies, where such procedures have been established and promulgated in Doc 7030 — *Regional Supplementary Procedures*; or

c) if no applicable regional procedures have been established, proceed at a level which differs from the cruising levels normally used for IFR flight in the area by 300 m (1 000 ft) if above FL 290 or by 150 m (500 ft) if below FL 290.

Note. — Action to be taken by an aircraft which is intercepted while being subject to an act of unlawful interference is prescribed in 3.8 of this Annex.

— END —

INTERNATIONAL STANDARDS AND RECOMMENDED PRACTICES

METEOROLOGICAL SERVICE FOR INTERNATIONAL AIR NAVIGATION

ANNEX 3

TO THE CONVENTION ON INTERNATIONAL CIVIL AVIATION

TWELFTH EDITION — JULY 1995

This edition incorporates all amendments adopted by the Council prior to 18 March 1995 and supersedes, on 1 January 1996, all previous editions of Annex 3.

For information regarding the applicability of the Standards and Recommended Practices, *see* Foreword.

INTERNATIONAL CIVIL AVIATION ORGANIZATION

Annex 3
Corrigendum
25/9/95

CORRIGENDUM

1. To incorporate this corrigendum, please make the following correction by hand:
   on page 4319, paragraph 4.13.2 c), *insert* the word «no» before the word «weather».
2. Record the entry of this corrigendum on page 4291.

AMENDMENTS

The issue of amendments is announced regularly in the *ICAO Journal* and in the monthly *Supplement to the Catalogue of ICAO Publications and Audio Visual Training Aids*, which holders of this publication should consult. The space below is provided to keep a record of such amendments.

TABLE OF CONTENTS

FOREWORD

Historical background

Standards and Recommended Practices relating to meteorology were first adopted by the Council on 16 April 1948, pursuant to the provisions of Article 37 of the Convention on International Civil Aviation (Chicago, 1944), and designated as Annex 3 to the Convention with the title *Standards and Recommended Practices — Meteorological Codes*. The Standards and Recommended Practices were based on recommendations of the Special Session of the Meteorology Division, held in September 1947.

Table A shows the origin of subsequent amendments, together with a list of the principal subjects involved and the dates on which the Annex and the amendments were adopted or approved by the Council, when they became effective and when they became applicable.

Action by Contracting States

Notification of differences. The attention of Contracting States is drawn to the obligation imposed by Article 38 of the Convention by which Contracting States are required to notify the Organization of any differences between their national regulations and practices and the International Standards contained in this Annex and any amendments thereto. Contracting States are invited to extend such notification to any differences from the Recommended Practices contained in this Annex, and any amendments thereto, when the notification of such differences is important for the safety of air navigation. Further, Contracting States are invited to keep the Organization currently informed of any differences which may subsequently occur, or of the withdrawal of any differences previously notified. A specific request for notification of differences will be sent to Contracting States immediately after the adoption of each Amendment to this Annex.

Attention of States is also drawn to the provisions of Annex 15 related to the publication of differences between their national regulations and practices and the related ICAO Standards and Recommended Practices through the Aeronautical Information Service, in addition to the obligation of States under Article 38 of the Convention.

Promulgation of information. The establishment and withdrawal of and changes to facilities, services and procedures affecting aircraft operations provided in accordance with the Standards and Recommended Practices specified in this Annex should be notified and take effect in accordance with the provisions of Annex 15.

Use of the text of the Annex in national regulations. The Council, on 13 April 1948, adopted a resolution inviting the attention of Contracting States to the desirability of using in their own national regulations, as far as is practicable, the precise language of those ICAO Standards that are of a regulatory character and also of indicating departures from the Standards, including any additional national regulations that are important for the safety or regularity of air navigation. Wherever possible, the provisions of this Annex have been written in such a way as would facilitate incorporation, without major textual changes, into national legislation.

Status of Annex components

An Annex is made up of the following component parts, not all of which, however, are necessarily found in every Annex; they have the status indicated:

1.— *Material comprising the Annex proper:*

a) *Standards* and *Recommended Practices* adopted by the Council under the provisions of the Convention. They are defined as follows:

Standard: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as necessary for the safety or regularity of international air navigation and to which Contracting States will conform in accordance with the Convention; in the event of impossibility of compliance, notification to the Council is compulsory under Article 38.

Recommended Practice: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as desirable in the interest of safety, regularity or efficiency of international air navigation, and to which Contracting States will endeavour to conform in accordance with the Convention.

b) *Appendices* comprising material grouped separately for convenience but forming part of the Standards and Recommended Practices adopted by the Council.

c) *Definitions* of terms used in the Standards and Recommended Practices* which are not self-explanatory in that they do not have accepted dictionary meanings. A definition does not have independent status but is an essential part of each Standard and Recommended Practice in which the term is used, since a change in the meaning of the term would affect the specification.

d) *Tables* and *Figures* which add to or illustrate a Standard or Recommended Practice and which are referred to therein, form part of the associated Standard or Recommended Practice and have the same status.

2.— *Material approved by the Council for publication in association with the Standards and Recommended Practices:*

a) *Forewords* comprising historical and explanatory material based on the action of the Council and including an explanation of the obligations of States with regard to the application of the Standards and Recommended Practices ensuing from the Convention and the Resolution of Adoption;

b) *Introductions* comprising explanatory material introduced at the beginning of parts, chapters or sections of the Annex to assist in the understanding of the application of the text;

c) *Notes* included in the text, where appropriate, to give factual information or references bearing on the Standards or Recommended Practices in question, but not constituting part of the Standards or Recommended Practices;

d) *Attachments* comprising material supplementary to the Standards and Recommended Practices, or included as a guide to their application.

Selection of language

This Annex has been adopted in four languages — English, French, Russian and Spanish. Each Contracting State is requested to select one of those texts for the purpose of national implementation and for other effects provided for in the Convention, either through direct use or through translation into its own national language, and to notify the Organization accordingly.

Editorial practices

The following practice has been adhered to in order to indicate at a glance the status of each statement: *Standards* have been printed in light face roman; *Recommended Practices* have been printed in light face italics, the status being indicated by the prefix **Recommendation**; *Notes* have been printed in light face italics, the status being indicated by the prefix *Note*.

The following editorial practice has been followed in the writing of specifications: for Standards the operative verb "shall" is used, and for Recommended Practices the operative verb "should" is used.

Any reference to a portion of this document, which is identified by a number, includes all subdivisions of the portion.

Applicability

The Standards and Recommended Practices in this document govern the application of the *Regional Supplementary Procedures* (Doc 7030, Part 3 — Meteorology), in which document will be found statements of regional choices, where such options are permitted by this Annex.

Responsibility

In accordance with a similar provision in the Foreword to Annex 6, Part II, the responsibility which devolves upon an operator, in accordance with the provisions of Annex 3, falls upon the pilot-in-command in the case of international general aviation.

Relation to corresponding WMO publications

The regulatory material contained in Annex 3 is, except for a few minor editorial differences, identical with that appearing in the Technical Regulations (Chapter C.3.1) of the World Meteorological Organization (WMO).

The aeronautical meteorological code forms referred to in Annex 3 are developed by the World Meteorological Organization on the basis of aeronautical requirements contained in this Annex, or stated from time to time by the Council. The aeronautical meteorological code forms are promulgated by WMO in its Publication No. 306 — *Manual on Codes*, Volume I.

Table A. Amendments to Annex 3

Amendment(s)	*Source(s)*	*Subject(s)*	*Adopted/approved* *Effective* *Applicable*
1st Edition	Second Session of the Meteorology Division	Meteorological codes for the transmission of meteorological information for aeronautical purposes.	16 April 1948 15 September 1948 1 January 1949
1 to 21	Special Session of the Meteorology Division	Updating and improvement of meteorological codes.	17 September 1948 23 December 1948 1 January 1949
22 to 37	Third Session of the Meteorology Division	Use of plain language and a simplified code for flight conditions in air-reports.	28 May 1951 1 October 1951 1 January 1952
38	First Air Navigation Conference	Introduction of the radiotelephony or radiotelegraphy AIREP form of air-report.	15 December 1953 1 August 1954 1 September 1954
39	First Air Navigation Conference	Revised radiotelegraphy form of POMAR Code for air-reports.	18 May 1954 20 August 1954 1 September 1954
40	World Meteorological Organization	New aeronautical meteorological figure codes in an Attachment, replacing those (except the POMAR code) hitherto appearing in the SARPs.	28 September 1954 1 January 1955 1 January 1955
41	Fourth Session of the Meteorology Division	Introduction of Standards and Recommended Practices governing the obligations of Contracting States relating to the establishment of meteorological organization in each State, adequate to satisfy Articles 28 and 37 of the Convention; consequential change of title of Annex 3 to read *International Standards and Recommended Practices — Meteorology.*	1 April 1955 1 August 1955 1 January 1956
42	Second Air Navigation Conference	Simplification of the detailed specifications for the method of determining the position in the AIREP and POMAR forms of air-report.	8 May 1956 1 September 1956 1 December 1956
43	Third Air Navigation Conference	Introduction of the term "SIGMET information" to replace the terms "advisory message" and "warning message"; amendment of the table for "State of Sea" in the POMAR code.	13 June 1957 1 October 1957 1 December 1957
44	Rules of the Air and Air Traffic Services/ Search and Rescue Divisions	Changes in the list of elements in Section 1 (Position report) of the AIREP form of air-report — deletion of the element "Flight conditions" and amendment of the last element in the Section to read "Next position and time over".	18 February 1960 1 May 1960 1 August 1960
45	Rules of the Air and Air Traffic Services/ Search and Rescue Divisions	Amendment of model AIREP and POMAR forms of air-report consequential to Amendment 44.	18 February 1960 — 1 August 1960
46	World Meteorological Organization	Updating of aeronautical meteorological figure codes, introduced by WMO, as of 1 January 1960.	8 June 1960 — 8 June 1960
47	Fifth Session of the Meteorology Division	Amendment to the procedures for aircraft meteorological observations and reports, modifying those for special observations and introducing requirements for additional observations; deletion of the POMAR form of air-report; elimination of flight meteorological watch and the introduction of en-route forecast service to supplement area meteorological watch; amendment to the provisions concerning meteorological conditions along the route to an alternate aerodrome.	2 December 1960 1 April 1961 1 July 1961

Amendment(s)	Source(s)	Subject(s)	Adopted/approved Effective Applicable
48	Fifth Session of the Meteorology Division	Amendment to model AIREP form of air-report to reflect changes in procedures for aircraft meteorological observations and reports, consequential to an amendment to the PANS-RAC.	2 December 1960 — 1 July 1961
49	Fifth Session of the Meteorology Division	Introduction of definition of "D-value".	8 April 1963 1 August 1963 1 November 1963
50	World Meteorological Organization	Updating of aeronautical meteorological figure codes, introduced by WMO, as of 1 January 1964.	18 March 1964 — 18 March 1964
51	Meteorology and Operations Divisional Meeting	Introduction of a requirement for observations to be made at locations where they will be representative of the area for which they are primarily required; extension of the criteria for special air-reports to cover phenomena likely to affect efficiency as well as safety, and deleting the requirement for "additional aircraft observations" according to regionally agreed criteria; deletion from the AIREP form of air-report of D-value, weather and cloud as standard items; introduction of a modified model AIREP form; changes to the provisions relating to forms of meteorological messages and providing for the exchange of information in pictorial form; introduction of definition of "plain language".	31 May 1965 1 October 1965 10 March 1966
52	World Meteorological Organization	Updating of aeronautical meteorological figure codes, introduced by WMO, as of 10 March 1966.	12 December 1966 — 12 December 1966
53	Meteorology and Operations Divisional Meeting	Permitting regional air navigation agreement on the use of a pictorial form of message for the dissemination of forecasts; replacement of the term "symbolic form of message" by a more specific description of the form of message to which this expression was intended to refer.	12 December 1966 12 April 1967 24 August 1967
54	World Meteorological Organization	Updating of aeronautical meteorological figure codes, introduced by WMO, as of 1 January 1968.	13 June 1967 — 1 January 1968
55	France	Permitting changes to be made to air-reports before their ground-to-ground dissemination.	16 December 1968 16 April 1969 18 September 1969
56	Sixth Air Navigation Conference	Introduction of: specifications for area forecast centres; simplified specifications for meteorological offices to reflect increasing centralization; extended coverage of aircraft reports to include adverse weather conditions encountered during initial climb and final approach; routine reporting by aircraft of "spot" rather than "mean" winds; improved criteria for in-flight reports of the intensity of turbulence; new definition of "air traffic services reporting office" and changes in the definition of "air traffic services unit"; changes to the aeronautical meteorological codes introduced by WMO, as of 18 September 1969.	15 May 1970 15 September 1970 4 February 1971
57	Second Meeting of the Technical Panel on Supersonic Transport Operations	Amendment to the definition of "SIGMET information" to take account of the requirements of SST aircraft operations; introduction of provisions for making and recording special observations whenever moderate turbulence, hail or cumulonimbus clouds are encountered during transonic or supersonic flight.	19 March 1971 6 September 1971 6 January 1972
58	World Meteorological Organization	Updating of aeronautical meteorological codes, introduced by WMO, as of 1 January 1972.	19 March 1971 — 6 January 1972
59	Sixth Air Navigation Conference	Permitting the omission of information on "next position and time over" from Section 1 of air-reports exchanged between meteorological offices; introduction of changes to the formats and data conventions in the model form of air-report to make it suitable for direct input into computers.	24 March 1972 24 July 1972 7 December 1972

Amendment(s)	*Source(s)*	*Subject(s)*	*Adopted/approved* *Effective* *Applicable*
60	Sixth Air Navigation Conference. Eighth Air Navigation Conference. Meteorology Divisional Meeting (1974)	Complete revision of Annex 3, incorporating the PANS-MET, the specifications of which were regarded as being suitable for inclusion in Annex 3 as Standards and Recommended Practices; the revision took into account recently approved operational requirements and up-to-date methods of meeting them; introduction of new Standards and Recommended Practices, relating to service for operators and flight crew members, meteorological information for air traffic services and for search and rescue services, together with requirements for communications and their use; the title of Annex 3 was, accordingly, amended to read *Meteorological Service for International Air Navigation.*	26 November 1975 26 March 1976 12 August 1976
61	Ninth Air Navigation Conference. Meteorology Divisional Meeting (1974)	New provisions and revision of existing provisions to improve the co-ordination between meteorological offices/stations and air traffic services units and the supply of meteorological information to the latter; new specifications for observations and reports for take-off and landing; introduction of a note referring to the specifications of Annex 14 for the siting and construction of equipment and installations on operational areas to reduce the hazard to aircraft to a minimum; replacement of the expression "supersonic transport aircraft" by the expression "supersonic aircraft"; updating of Part 2, Appendix 2; revision of definition of "nephanalysis" and deletion of "(29.92 in.)" from definition of "flight level"; deletion of Attachment D — Aeronautical Meteorological Codes.	14 December 1977 14 April 1978 10 August 1978
62	Eighth Air Navigation Conference and ICAO Council	Inclusion in Appendix 1 of model charts and forms developed by WMO on the basis of the operational requirements contained in Annex 3; transfer of the data designators and geographical designators from Appendix 2 to Annex 3 to the *Manual of Aeronautical Meteorological Practice* (Doc 8896).	26 June 1978 26 October 1978 29 November 1979
63	MET Divisional Meeting (1974). ICAO Secretariat. Operational Flight Information Service Panel. Ninth Air Navigation Conference. Doc 9328	Definition for "meteorological bulletin"; correction to shortcomings in ground-to-ground dissemination of air-reports; decrease in SIGMET messages dealing with "active thunderstorm area"; deletion of reference to "reporting lines"; reference to new *Manual of Runway Visual Range Observing and Reporting Practices.*	23 March 1981 23 July 1981 26 November 1981
64	ICAO Secretariat	New provisions and revision of existing provisions to meet operational requirements for observing and reporting of low-level wind shear, including the introduction of wind shear warnings for the climb-out and approach phases of flight.	6 December 1982 6 April 1983 24 November 1983
65	Communications/ Meteorology Divisional Meeting (1982). Third Meeting of the ADAPT Panel	New provisions and revision of existing provisions related to the introduction of the new world area forecast system; methods of exchange of operational meteorological data; improvement of accuracy of runway visual range assessment, and reporting.	10 June 1983 10 October 1983 22 November 1984
66	Communications/ Meteorology Divisional Meeting (1982). Second Asia/ Pacific Regional Air Navigation Meeting. Twenty-second and twenty-third meetings of the European Air Navigation Planning Group. World Meteorological Organization. Recommendations of the ANC relating to the method of reference date/ time and units of measurement. ICAO Secretariat	Amendment of the provisions related to the transmission of wind shear information beyond the aerodrome, criteria for the issuance of selected special reports, inclusion of cloud information in aerodrome forecasts, flight documentation to be provided for short-haul flights, format of the SIGMET message and meteorological bulletin headings; introduction of the definition for "SIGMET information"; alignment of Annex 3 with Annex 5 in respect of units of measurement and the referencing of time.	24 March 1986 27 July 1986 20 November 1986

Amendment(s)	Source(s)	Subject(s)	Adopted/approved Effective Applicable
67	Communications/ Meteorology Divisional Meeting (1982). Twenty-second and twenty-fifth meetings of the European Air Navigation Planning Group. ICAO Secretariat. World Meteorological Organization	Amendment of the provisions related to light intensity settings used for RVR assessment; the identification of selected aerodromes and the deletion of the requirement for temperature circles on WAFS charts; the transmission time of forecasts from regional area forecast centres to users; introduction of provisions for the origination and dissemination of volcanic ash warnings; inclusion of wind speed units in examples of the aviation meteorological figure codes; alignment of Annex 3 with the PANS-RAC in respect of the elements of the air-report; editorial amendment of the example of the SIGMET message.	27 March 1987 27 July 1987 19 November 1987
68	Communications/ Meteorology Divisional Meeting (1982). ICAO Secretariat. World Meteorological Organization	Amendment of the provisions relating to identification of RVR reporting positions; the criteria for the issuance of selected special reports for changes in RVR; RVR values for touchdown zone for all runways available for landing to be included in reports disseminated beyond the aerodrome; model charts and forms for flight documentation; issuance and updating of SIGMET messages relating to volcanic ash clouds; explicit provisions regarding the need to provide the aeronautical information services units with MET information; alignment with Annex 10 in respect of definitions for aeronautical fixed telecommunication network and aeronautical mobile service; alignment with PANS-OPS, Volume II, Part III, paragraph 6.3.1 in respect of terminology; editorial amendments to paragraph 3.3.7 to delete the equivalent pressure levels; the example of the SPECI report; the reference in Attachment B, Part 3, paragraph 1.4 b); and the footnote in Attachment C concerning visibility and RVR.	21 March 1989 23 July 1989 16 November 1989
69	Communications/ Meteorology/ Operations Divisional Meeting (1990). ICAO Secretariat	Amendment of the provisions related to the transition to the final phase of the WAFS; aeronautical meteorological codes, and guidance material on the selected criteria applicable to aerodrome reports; aeronautical climatological information; SIGMET information and related guidance material for the issuance of SIGMETs; automatic weather observing stations; meteorological information for helicopter operations; and alignment with Annex 6, Parts I and II in respect of the definition for alternate aerodrome.	23 March 1992 27 July 1992 12 November 1992; 1 July 1993
70	Communications/ Meteorology/ Operations Divisional Meeting (1990). Limited North Atlantic (COM/MET/RAC) Regional Air Navigation Meeting (1992). Third Asia/ Pacific Regional Air Navigation Meeting (1993). Thirty-second meeting of the European Air Navigation Planning Group. ICAO Secretariat	Definitions of AIRMET information, extended range operation, GAMET area forecast, operational control and tropical cyclone; amendment to the provisions concerning horizontal resolution of and the code form in which the upper wind and temperature grid-point forecasts are to be prepared by the world area forecast centres; issuance of special reports for changes in temperature at aerodromes; provisions related to the reporting and forecasting of meteorological information at aerodromes on which the new aeronautical meteorological codes are based and a consequential amendment to Models A1, A2, TA1, TA2 and SN to take account of the updated aeronautical meteorological codes; automated air reporting; provision of information on weather phenomenon hazardous to low-level flights; introduction of the minimum threshold value for the maximum surface wind speed for which SIGMETs for tropical cyclones should be issued; observation and reporting of wind shear to take account of new technology in ground-based wind shear observing equipment; interregional exchange of METARs and SPECIs to support extended range operations and long-haul flights conducted under centralized operational control; editorial amendments to replace the term "line squall" by "squall line"; editorial amendments to Models SWL and SN, to align the depiction of freezing level, and editorial corrections to Model A2; inclusion in Model SN of symbols for "volcanic eruptions", "state of the sea" and "sea surface temperature"; updating operationally desirable accuracy of measurement or observation and the currently attainable accuracy of measurement or observation; introduction of criteria for the inclusion of severe mountain waves in SIGMET information.	17 March 1995 24 July 1995 1 January 1996

INTERNATIONAL STANDARDS AND RECOMMENDED PRACTICES

CHAPTER 1. DEFINITIONS

1.1 Definitions

When the following terms are used in the Standards and Recommended Practices for Meteorological Service for International Air Navigation, they have the following meanings:

Aerodrome. A defined area on land or water (including any buildings, installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of aircraft.

Aerodrome climatological summary. Concise summary of specified meteorological elements at an aerodrome, based on statistical data.

Aerodrome climatological table. Table providing statistical data on the observed occurrence of one or more meteorological elements at an aerodrome.

Aerodrome control tower. A unit established to provide air traffic control service to aerodrome traffic.

Aerodrome elevation. The elevation of the highest point of the landing area.

Aerodrome meteorological office. An office, located at an aerodrome, designated to provide meteorological service for international air navigation.

Aeronautical fixed service (AFS). A telecommunication service between specified fixed points provided primarily for the safety of air navigation and for the regular, efficient and economical operation of air services.

Aeronautical fixed telecommunication network (AFTN). A world-wide system of aeronautical fixed circuits provided, as part of the aeronautical fixed service, for the exchange of messages and/or digital data between aeronautical fixed stations having the same or compatible communications characteristics.

Aeronautical meteorological station. A station designated to make observations and meteorological reports for use in international air navigation.

Aeronautical mobile service. A mobile service between aeronautical stations and aircraft stations, or between aircraft stations, in which survival craft stations may participate; emergency position-indicating radiobeacon stations may also participate in this service on designated distress and emergency frequencies.

Aeronautical telecommunication station. A station in the aeronautical telecommunication service.

Aircraft. Any machine that can derive support in the atmosphere from the reactions of the air other than the reactions of the air against the earth's surface.

Aircraft observation. The evaluation of one or more meteorological elements made from an aircraft in flight.

AIRMET information. Information issued by a meteorological watch office concerning the occurrence or expected occurrence of specified en-route weather phenomena which may affect the safety of low-level aircraft operations and which was not already included in the forecast issued for low-level flights in the flight information region concerned or sub-area thereof.

Air-report. A report from an aircraft in flight prepared in conformity with requirements for position, and operational and/or meteorological information.

Air traffic services unit. A generic term meaning variously, air traffic control unit, flight information centre or air traffic services reporting office.

Alternate aerodrome. An aerodrome to which an aircraft may proceed when it becomes either impossible or inadvisable to proceed to or to land at the aerodrome of intended landing. Alternate aerodromes include the following:

Take-off alternate. An alternate aerodrome at which an aircraft can land should this become necessary shortly after take-off and it is not possible to use the aerodrome of departure.

En-route alternate. An aerodrome at which an aircraft would be able to land after experiencing an abnormal or emergency condition while en route.

Destination alternate. An alternate aerodrome to which an aircraft may proceed should it become impossible or inadvisable to land at the aerodrome of intended landing.

Note.— The aerodrome from which a flight departs may also be an en-route or a destination alternate aerodrome for that flight.

Altitude. The vertical distance of a level, a point or an object considered as a point, measured from mean sea level (MSL).

Approach control office. A unit established to provide air traffic control service to controlled flights arriving at, or departing from, one or more aerodromes.

Appropriate ATS authority. The relevant authority designated by the State responsible for providing air traffic services in the airspace concerned.

Area control centre. A unit established to provide air traffic control service to controlled flights in control areas under its jurisdiction.

Area of coverage (world area forecast system). A geographical area for which a regional area forecast centre supplies forecasts for flights departing from aerodromes in its service area.

Area of responsibility (world area forecast system). A geographical area for which a regional area forecast centre prepares significant weather forecasts.

Briefing. Oral commentary on existing and/or expected meteorological conditions.

Consultation. Discussion with a meteorologist or another qualified person of existing and/or expected meteorological conditions relating to flight operations; a discussion includes answers to questions.

Control area. A controlled airspace extending upwards from a specified limit above the earth.

Cruising level. A level maintained during a significant portion of a flight.

Elevation. The vertical distance of a point or a level, on or affixed to the surface of the earth, measured from mean sea level.

Extended range operation. Any flight by an aeroplane with two turbine power-units where the flight time at the one power-unit inoperative cruise speed (in ISA and still air conditions), from a point on the route to an adequate alternate aerodrome, is greater than the threshold time approved by the State of the Operator.

Flight crew member. A licensed crew member charged with duties essential to the operation of an aircraft during flight time.

Flight documentation. Written or printed documents, including charts or forms, containing meteorological information for a flight.

Flight information centre. A unit established to provide flight information service and alerting service.

Flight information region. An airspace of defined dimensions within which flight information service and alerting service are provided.

Flight level. A surface of constant atmospheric pressure which is related to a specific pressure datum, 1 013.2 hectopascals (hPa), and is separated from other such surfaces by specific pressure intervals.

Note 1.— A pressure type altimeter calibrated in accordance with the Standard Atmosphere:

a) when set to a QNH altimeter setting, will indicated altitude;

b) when set to a QFE altimeter setting, will indicate height above the QFE reference datum;

c) when set to a pressure of 1 013.2 hectopascals (hPa) may be used to indicate flight levels.

Note 2.— The terms "height" and "altitude", used in Note 1 above, indicate altimetric rather than geometric heights and altitudes.

Forecast. A statement of expected meteorological conditions for a specified time or period, and for a specified area or portion of airspace.

GAMET area forecast. An area forecast in abbreviated plain language for low-level flights for a flight information region or sub-area thereof, prepared by the meteorological office designated by the meteorological authority concerned and exchanged with meteorological offices in adjacent flight information regions, as agreed between the meteorological authorities concerned.

Grid point data in digital form. Computer processed meteorological data for a set of regularly spaced points on a chart, for transmission from a meteorological computer to another computer in a code form suitable for automated use.

Note.— In most cases such data are transmitted on medium or high speed telecommunications channels.

Grid point data in numerical form. Processed meteorological data for a set of regularly spaced points on a chart, in a code form suitable for manual use.

Note.— In most cases such data are transmitted on low speed telecommunications channels.

Height. The vertical distance of a level, a point or an object considered as a point, measured from a specified datum.

Meteorological authority. The authority providing or arranging for the provision of meteorological service for international air navigation on behalf of a Contracting State.

Meteorological bulletin. A text comprising meteorological information preceded by an appropriate heading.

Meteorological information. Meteorological report, analysis, forecast, and any other statement relating to existing or expected meteorological conditions.

Meteorological office. An office designated to provide meteorological service for international air navigation.

Meteorological report. A statement of observed meteorological conditions related to a specified time and location.

Meteorological satellite. An artificial Earth satellite making meteorological observations and transmitting these observations to Earth.

Nephanalysis. The graphical depiction of analysed cloud data on a geographical map.

Observation (meteorological). The evaluation of one or more meteorological elements.

Operational control. The exercise of authority over the initiation, continuation, diversion or termination of a flight in the interest of the safety of the aircraft and the regularity and efficiency of the flight.

Operational flight plan. The operator's plan for the safe conduct of the flight based on considerations of aeroplane performance, other operating limitations and relevant expected conditions on the route to be followed and at the aerodromes concerned.

Operational planning. The planning of flight operations by an operator.

Operator. A person, organization or enterprise engaged in or offering to engage in an aircraft operation.

Pilot-in-command. The pilot responsible for the operation and safety of the aircraft during flight time.

Prognostic chart. A forecast of a specified meteorological element(s) for a specified time or period and a specified surface or portion of airspace, depicted graphically on a chart.

Regional air navigation agreement. Agreement approved by the Council of ICAO normally on the advice of a regional air navigation meeting.

Regional area forecast centre (RAFC). A meteorological centre designated to prepare and supply area forecasts for flights departing from aerodromes within its service area and to supply grid point data in digital form for up to world-wide coverage.

Reporting point. A specified geographical location in relation to which the position of an aircraft can be reported.

Rescue co-ordination centre. A unit responsible for promoting efficient organization of search and rescue service and for co-ordinating the conduct of search and rescue operations within a search and rescue region.

Runway. A defined rectangular area on a land aerodrome prepared for the landing and take-off of aircraft.

Runway visual range (RVR). The range over which the pilot of an aircraft on the centre line of a runway can see the runway surface markings or the lights delineating the runway or identifying its centre line.

Search and rescue services unit. A generic term meaning, as the case may be, rescue co-ordination centre, rescue subcentre or alerting post.

Service area (world area forecast system). A geographical area within which a regional area forecast centre is responsible for supplying area forecasts to meteorological authorities and other users.

SIGMET information. Information issued by a meteorological watch office concerning the occurrence or expected occurrence of specified en-route weather phenomena which may affect the safety of aircraft operations.

Standard isobaric surface. An isobaric surface used on a world-wide basis for representing and analysing the conditions in the atmosphere.

Threshold. The beginning of that portion of the runway usable for landing.

Touchdown zone. The portion of a runway, beyond the threshold, where it is intended landing aeroplanes first contact the runway.

Tropical cyclone. Generic term for a non-frontal synoptic-scale cyclone originating over tropical or sub-tropical waters with organized convection and definite cyclonic surface wind circulation.

Upper-air chart. A meteorological chart relating to a specified upper-air surface or layer of the atmosphere.

VOLMET broadcast. Routine broadcast of meteorological information for aircraft in flight.

World area forecast centre (WAFC). A meteorological centre designated to prepare and supply upper-air forecasts in digital form on a global basis to regional area forecast centres.

World area forecast system (WAFS). A world-wide system by which world and regional area forecast centres provide aeronautical meteorological en-route forecasts in uniform standardized formats.

1.2 Terms used with a limited meaning

For the purpose of this Annex, the following terms are used with a limited meaning as indicated below:

a) to avoid confusion in respect of the term ''service'' between the meteorological service considered as an administrative entity and the service which is provided, ''meteorological authority'' is used for the former and ''service'' for the latter;

b) ''provide'' is used solely in connexion with the provision of service;

c) ''issue'' is used solely in connexion with cases where the obligation specifically extends to sending out the information to a user;

d) ''make available'' is used solely in connexion with cases where the obligation ends with making the information accessible to a user;

e) ''supply'' is used solely in connexion with cases where either c) or d) applies.

CHAPTER 2. GENERAL PROVISIONS

Introductory Note 1.— It is recognized that the provisions of this Annex with respect to meteorological information are subject to the understanding that the obligation of a Contracting State is for the supply, under Article 28 of the Convention, of meteorological information and that the responsibility for the use made of such information is that of the user.

Introductory Note 2.— Although the Convention on International Civil Aviation allocates to the State of Registry certain functions which that State is entitled to discharge, or obligated to discharge, as the case may be, the Assembly recognized, in Resolution A23-13, that the State of Registry may be unable to fulfil its responsibilities adequately in instances where aircraft are leased, chartered or interchanged — in particular without crew — by an operator of another State and that the Convention may not adequately specify the rights and obligations of the State of an operator in such instances until such time as Article 83 bis *of the Convention enters into force. Accordingly, the Council urged that if, in the above-mentioned instances, the State of Registry finds itself unable to discharge adequately the functions allocated to it by the Convention, it delegate to the State of the Operator, subject to acceptance by the latter State, those functions of the State of Registry that can more adequately be discharged by the State of the Operator. It is understood that pending entry into force of Article 83* bis *of the Convention the foregoing action will only be a matter of practical convenience and will not affect either the provisions of the Chicago Convention prescribing the duties of the State of Registry or any third State.*

Introductory Note 3.— In the case of international operations effected jointly with aeroplanes not all of which are registered in the same Contracting State, nothing in this Annex prevents the States concerned entering into an agreement for the joint exercise of the functions placed upon the State of Registry by the provisions of this Annex.

2.1 Objective, determination and provision of meteorological service

2.1.1 The objective of meteorological service for international air navigation shall be to contribute towards the safety, regularity and efficiency of international air navigation.

2.1.2 This objective shall be achieved by supplying operators, flight crew members, air traffic services units, search and rescue services units, airport managements and others concerned with the conduct or development of international air navigation with the meteorological information necessary for the performance of their respective functions.

2.1.3 Each Contracting State shall determine the meteoro-logical service which it will provide to meet the needs of inter-national air navigation. This determination shall be made in accordance with the provisions of this Annex and with due regard to regional air navigation agreements; it shall include the determination of the meteorological service to be provided for international air navigation over international waters and other areas which lie outside the territory of the State concerned.

2.1.4 Each Contracting State shall designate the authority, hereinafter referred to as the meteorological authority, to provide or to arrange for the provision of meteorological service for international air navigation on its behalf.

2.2 Supply and use of meteorological information

2.2.1 Close liaison shall be maintained between those concerned with the supply and those concerned with the use of meteorological information on matters which affect the provision of meteorological service.

2.2.2 The meteorological information supplied to aero-nautical personnel shall be up to date and shall be in forms which require a minimum of interpretation by users, as speci-fied in the following chapters.

2.3 Notifications required from operators

2.3.1 An operator requiring meteorological service or changes in existing meteorological service shall notify, sufficiently in advance, the meteorological authority or the meteorological office(s) concerned. The minimum amount of advance notice required shall be as agreed between the meteorological authority or meteorological office(s) and the operator.

2.3.2 The meteorological authority shall be notified by the operator requiring service when:

a) new routes or new types of operations are planned;

b) changes of a lasting character are to be made in scheduled operations;

c) other changes, affecting the provision of meteorological service, are planned.

Such information shall contain all details necessary for the planning of appropriate arrangements by the meteorological authority.

2.3.3 The aerodrome meteorological office, or the meteorological office concerned, shall be notified by the operator or a flight crew member:

a) of flight schedules;

b) when non-scheduled flights are to be operated;

c) when flights are delayed, advanced or cancelled.

2.3.4 **Recommendation.—** *The notification to the aero-drome meteorological office, or the meteorological office concerned, of individual flights should contain the following information except that, in the case of scheduled flights, the requirement for some or all of this information may be waived by agreement between the meteorological office and the operator:*

a) aerodrome of departure and estimated time of departure;

b) destination and estimated time of arrival;

c) route to be flown and estimated times of arrival at, and departure from, any intermediate aerodrome(s);

d) alternate aerodromes needed to complete the oper-ational flight plan and taken from the relevant list contained in the regional air navigation plan;

e) cruising level;

f) for supersonic flights, the alternative subsonic cruising level and the locations of the transonic acceleration and deceleration areas and of the subsonic climb and descent paths;

g) type of flight, whether under the visual or the instrument flight rules;

h) type of meteorological information requested for a flight crew member, whether flight documentation and/or briefing or consultation;

i) time(s) at which briefing, consultation and/or flight documentation are required.

CHAPTER 3. WORLD AREA FORECAST SYSTEM AND METEOROLOGICAL OFFICES

3.1 Objectives of the world area forecast system

The objectives of the world area forecast system shall be:

a) to supply meteorological offices with forecasts of en-route meteorological conditions concerning upper winds, upper-air temperatures, direction, speed and height of maximum wind, tropopause height and significant weather in pictorial and/or alphanumeric form suitable, as far as practicable, for direct use by operators, flight crew members, air traffic services units and other aeronautical users;

b) to supply meteorological authorities and other users with upper wind, upper-air temperature, direction, speed and height of maximum wind and tropopause height forecasts and forecasts of significant weather phenomena for grid points in digital form.

These objectives shall be achieved through a comprehensive, integrated, world-wide and, as far as practicable, uniform system, and in a cost-effective manner.

3.2 World area forecast centres

3.2.1 A Contracting State, having accepted the responsibility for providing a world area forecast centre (WAFC) within the framework of the world area forecast system, shall arrange for that centre:

a) to prepare global forecasts for grid points in digital form for all required levels and in a standard format; the forecasts shall comprise upper winds, upper-air temperatures, tropopause heights and maximum wind speed, direction and height;

b) to prepare global forecasts of significant weather phenomena;

c) to issue the forecasts referred to in a) and b) above in digital and/or pictorial form; and

d) to prepare and issue amendments to the forecasts.

Note 1.— Criteria for the issuance of amendments to the forecasts are given in 3.2.11 and 3.2.12.

Note 2.— Specifications for the preparation of significant weather and upper-air prognostic charts are contained in the Appendix.

3.2.2 **Recommendation.—** *In case of interruption of the operation of a WAFC, its functions should be carried out by the other WAFC.*

3.2.3 **Recommendation.—** *The forecasts of upper winds and upper-air temperatures, direction, speed and height of maximum winds and tropopause heights prepared twice daily by a WAFC should be valid for 12, 18, 24 and 30 hours after the time (0000 and 1200 UTC) of the synoptic data on which the forecasts were based and should be available for start of transmission in the above order as soon as technically feasible but not later than 6 hours after standard time of observation.*

3.2.4 **Recommendation.—** *Forecasts of significant weather phenomena prepared by WAFCs should be issued four times a day for fixed valid times of 0000, 0600, 1200 and 1800 UTC. The transmission of each forecast should be completed as soon as technically feasible but at least twelve hours before its validity time.*

3.2.5 **Recommendation.—** *Forecasts of significant weather phenomena should include all the items listed in 9.6.1. When the forecasts are issued in chart form, they should be in agreement with the specifications in 3.3.7.*

3.2.6 **Recommendation.—** *The grid point forecasts prepared by a WAFC should comprise:*

a) wind and temperature data for flight levels 50 (850 hPa), 100 (700 hPa), 180 (500 hPa), 240 (400 hPa), 300 (300 hPa), 340 (250 hPa), 390 (200 hPa) and 450 (150 hPa);

b) tropopause height, and direction, speed and height of maximum wind; and

c) wind and temperature data for flight levels 530 (100 hPa) and 600 (70 hPa) when and where required.

3.2.7 **Recommendation.—** *The grid point forecasts of upper winds and upper-air temperatures, direction, speed and height of maximum winds and tropopause heights should be prepared by a WAFC in a fixed grid with a horizontal resolution of 140 km.*

Note.— 140 km represents a distance of about 1.25° of latitude.

3.2.8 WAFCs shall adopt uniform formats and codes for the supply of forecasts and amendments.

3.2.9 **Recommendation.—** *The grid point forecasts of upper winds, upper-air temperatures, direction, speed and height of maximum winds and tropopause heights should be issued by a WAFC in the GRIB code form.*

Note.— The GRIB code form is contained in WMO Publication No. 306, Manual on Codes, *Volume I, Part B — Binary Codes.*

3.2.10 **Recommendation.—** *The upper wind and upper-air temperature forecasts in pictorial form should be issued for flight levels as determined by regional air navigation agreement.*

3.2.11 **Recommendation.—** *Amendments to upper wind and upper-air temperature forecasts should be issued in accordance with the following criteria:*

Upper wind	*Change in direction of 30° or more, provided the wind speed is 60 km/h (30 kt) or more before or after the change; change in speed of 40 km/h (20 kt) or more.*
Upper-air temperatures	*Change of more than 5°C.*

3.2.12 **Recommendation.—** *WAFCs should apply the following criteria for the amendment of significant en-route weather forecasts:*

Aircraft icing and turbulence	*Newly expected occurrence; error in expected position of phenomena; intensity increasing; intensity decreasing from severe to light or nil, or from moderate to nil.*
Jet streams	*Newly expected occurrence or disappearance; error in expected position > 400 km; error in speed > 20 per cent; error in core height > 900 m (3 000 ft).*
Other significant en-route weather phenomena	*Newly expected occurrence; no longer expected.*

3.2.13 **Recommendation.—** *Amendments to the upper wind and upper-air temperature forecasts should be prepared in accordance with the criteria in 3.2.11 in the form of amended meteorological bulletins and abbreviated plain-language messages and should be issued with the minimum possible delay.*

Note.— Guidance on the use of abbreviated plain language is given in Attachment A.

3.2.14 **Recommendation.—** *Amendments to forecasts of significant weather phenomena should be issued with the minimum possible delay in accordance with the criteria in 3.2.12 and supplied in the form of abbreviated plain-language messages.*

Note.— Guidance on the preparation of abbreviated plain-language significant weather forecast messages is given in Attachment A.

3.3 Regional area forecast centres

3.3.1 A Contracting State, having accepted, by regional air navigation agreement, the responsibility for providing a regional area forecast centre (RAFC) within the framework of the area forecast system, shall arrange for that centre:

a) to receive global digital grid point data from a WAFC, so as to meet the needs of meteorological authorities and other users within its service area, including those needs related to centralized flight planning;

b) to store the digital grid point data received from a WAFC, and to process and supply selectively these data to meteorological authorities and other users in its service area, in an agreed format;

c) to prepare upper wind and temperature charts on the basis of the data received, and to supply the relevant charts and abbreviated plain-language amendments thereto to users as agreed between the RAFC and the users within its service area;

Note.— The upper wind and temperature charts will be produced from grid point data received from a WAFC, except on those occasions when the RAFC considers it essential to adjust the chart(s) on the basis of recent basic data received.

d) to notify the relevant WAFC immediately of the content of and reasons for any amendments it has issued to the forecast received from the WAFC;

e) to prepare significant weather charts and, as required, significant weather forecast messages in abbreviated plain language, for its area of responsibility;

Note.— In order to prepare these charts and amendments thereto the RAFC will also need to receive basic synoptic and asynoptic data, including satellite data (polar-orbiting and geostationary) and aircraft meteorological reports.

f) to supply the significant weather charts, significant weather forecast messages in abbreviated plain language, and plain-language amendments thereto in the same manner as in c) above;

g) to exchange the significant weather charts and abbreviated plain-language amendments thereto with other RAFCs as necessary, so as to enable each centre to provide significant weather charts for its area of coverage;

h) to prepare WINTEM messages and issue them to users as required.

Note 1.— Specifications for the preparation of significant weather and upper-air prognostic charts are contained in the Appendix.

Note 2.— Guidance on the preparation of abbreviated plain-language significant weather forecast messages is contained in Attachment A.

Note 3.— The WINTEM code is contained in WMO Publication No. 306, Manual on Codes, *Volume I.*

3.3.2 **Recommendation.—** *The lists of States/territories served by the RAFCs in each service area, as shown in the air navigation plans, should be adjusted as necessary in accordance with regional air navigation agreement.*

3.3.3 **Recommendation.—** *The areas of responsibility for the preparation of significant weather forecasts should be as agreed by the RAFCs responsible for providing significant weather charts and plain-language amendments thereto for flight operations conducted over the area of coverage, and subject to subsequent regional air navigation agreement.*

Note.— The areas of responsibility are contained in the relevant regional air navigation plan.

3.3.4 **Recommendation.—** *The areas of coverage of the forecasts in chart and/or alphanumeric form supplied to the users should be determined by agreement between the relevant RAFC and the users.*

Note.— Maximum areas of coverage suitable for use in flight documentation are contained in the relevant regional air navigation plan.

3.3.5 **Recommendation.—** *RAFC products should be issued four times a day for fixed valid times of 0000, 0600, 1200 and 1800 UTC. The transmission of each forecast should be completed at least 9 hours before its validity time, unless otherwise determined by regional air navigation agreement.*

Note.— Such regional agreement should take into account, as necessary, the flight documentation requirements for inter-regional flights and the exchange of SIGWX charts between RAFCs concerned.

3.3.6 **Recommendation.—** *The digital data should be transmitted to meteorological authorities and other users with minimum delay after receipt from the WAFC.*

3.3.7 **Recommendation.—** *The significant weather charts should include the phenomena listed in 9.6.1 between:*

a) flight levels 250 and 450;

b) flight levels 100 and 250 for limited geographical areas, as determined by regional air navigation agreement; and

c) flight levels 450 and 600 if so determined by regional air navigation agreement. When so determined, forecasts covering the layer between flight levels 450 and 600 should be combined with those at a) above.

3.3.8 **Recommendation.—** *The upper wind and upper-air temperature charts should be provided for flight levels as determined by regional air navigation agreement.*

3.3.9 **Recommendation.—** *Amendments to significant weather forecasts should be supplied in the form of abbreviated plain-language messages.*

Note.— Guidance on the preparation of abbreviated plain-language significant weather forecast messages is contained in Attachment A.

3.3.10 **Recommendation.—** *RAFCs should apply the following criteria for the amendment of significant en-route weather forecasts:*

Aircraft icing and turbulence	*Newly expected occurrence; error in expected position of phenomena; intensity increasing; intensity decreasing from severe to light or nil, or from moderate to nil.*
Jet streams	*Newly expected occurrence or disappearance; error in expected position > 400 km; error in speed > 20 per cent; error in core height > 900 m (3 000 ft).*
Other significant en-route weather phenomena	*Newly expected occurrence; no longer expected.*

3.3.11 **Recommendation.—** *RAFCs should supply to meteorological authorities and other users within their service areas amendments to upper wind and upper-air temperature forecasts with minimum delay after receipt from a WAFC.*

3.4 Meteorological offices

3.4.1 Each Contracting State shall establish one or more aerodrome and/or other meteorological offices which shall be adequate for the provision of the meteorological service required to satisfy operational needs.

3.4.2 An aerodrome meteorological office shall carry out all or some of the following functions as necessary to meet the needs of flight operations at the aerodrome:

a) prepare and/or obtain forecasts and other relevant information for flights with which it is concerned; the extent of its responsibilities to prepare forecasts shall be related to the local availability and use of en-route and aerodrome forecast material received from other offices;

b) prepare and/or obtain forecasts of local meteorological conditions;

c) maintain a continuous survey of meteorological conditions over the aerodromes for which it is designated to prepare forecasts;

d) provide briefing, consultation and flight documentation to flight crew members and/or other flight operations personnel;

e) supply other meteorological information to aeronautical users;

f) display the available meteorological information;

g) exchange meteorological information with other meteorological offices;

h) supply information received on pre-eruption volcanic activity, a volcanic eruption or volcanic ash cloud, to its associated air traffic services unit, aeronautical information service unit and meteorological watch office as agreed between the meteorological, aeronautical information service and ATS authorities concerned.

3.4.3 **Recommendation.—** *The aerodrome meteorological offices at which briefing, consultation and/or flight documentation are required, as well as the areas and/or air routes to be covered, should be determined by regional air navigation agreement and, as necessary, by supplementary agreement between the meteorological authority and the operator concerned.*

3.4.4 **Recommendation.—** *The aerodromes for which landing forecasts are required should be determined by regional air navigation agreement.*

3.4.5 The extent to which an aerodrome meteorological office prepares forecasts and/or makes use of products from WAFCs and/or RAFCs and other sources shall be determined by the meteorological authority concerned.

3.4.6 **Recommendation.—** *Aerodrome meteorological offices should use as far as practicable output products of the world area forecast system in the preparation of flight documentation.*

3.4.7 For aerodromes without meteorological offices:

a) the meteorological authority concerned shall designate one or more meteorological offices to supply meteorological information as required;

b) the competent authorities shall establish means by which such information can be supplied to the aerodromes concerned.

3.5 Meteorological watch offices

3.5.1 A Contracting State, having accepted the responsibility for providing air traffic services within a flight information region or a control area, shall establish one or more meteorological watch offices, or arrange for another Contracting State to do so.

3.5.2 A meteorological watch office shall:

a) maintain watch over meteorological conditions affecting flight operations within its area of responsibility;

b) prepare SIGMET and other information relating to its area of responsibility;

c) supply SIGMET information and, as required, other meteorological information to associated air traffic services units;

d) disseminate SIGMET information;

e) when required by regional air navigation agreement, in accordance with 7.3.1:

1) prepare AIRMET information related to its area of responsibility;

2) supply AIRMET information to associated air traffic services units; and

3) disseminate AIRMET information;

f) supply information received on pre-eruption volcanic activity, a volcanic eruption and volcanic ash cloud for which a SIGMET has not already been issued to its associated flight information centre or area control centre as agreed between the meteorological and ATS authorities concerned.

3.5.3 The extent to which a meteorological watch office makes use of products from WAFCs and/or RAFCs and other sources shall be determined by the meteorological authority concerned.

3.5.4 **Recommendation.—** *The boundaries of the area over which meteorological watch is to be maintained by a meteorological watch office should, in so far as is practicable, be coincident with the boundaries of a flight information region or a control area or a combination of flight information regions and/or control areas.*

3.5.5 **Recommendation.—** *Meteorological watch should be maintained continuously; however, in areas with a low density of traffic the watch may be restricted to the period relevant to expected flight operations.*

CHAPTER 4. METEOROLOGICAL OBSERVATIONS AND REPORTS

4.1 Aeronautical meteorological stations and observations

4.1.1 Each Contracting State shall establish at aerodromes and other points of significance to international air navigation, in its territory, such aeronautical meteorological stations as it determines to be necessary. An aeronautical meteorological station may be a separate station or may be combined with a synoptic station.

4.1.2 **Recommendation.—** *Each Contracting State should establish, or arrange for the establishment of, aeronautical meteorological stations on off-shore structures or at other points of significance in support of helicopter operations to off-shore structures, if required by regional air navigation agreement.*

4.1.3 Aeronautical meteorological stations shall make routine observations at fixed intervals. At aerodromes, the routine observations shall be supplemented by special observations whenever specified changes occur in respect of surface wind, visibility, runway visual range, present weather and/or cloud. Other non-routine observations, such as observations for take-off and landing, shall be made as agreed between the meteorological authority and the appropriate ATS authority.

4.1.4 **Recommendation.—** *The meteorological instruments used at an aerodrome should be situated in such a way as to supply data which are representative of the area for which the measurements are required.*

Note.— Specifications concerning the siting and construction of equipment and installations on operational areas, aimed at reducing the hazard to aircraft to a minimum, are contained in Annex 14, Volume I, Chapter 8.

4.1.5 **Recommendation.—** *Meteorological instruments at aeronautical meteorological stations should be exposed, operated and maintained in accordance with the practices, procedures and specifications promulgated by the World Meteorological Organization.*

4.1.6 **Recommendation.—** *The observers at an aerodrome should be located, in so far as is practicable, so as to supply data which are representative of the area for which the observations are required.*

4.1.7 **Recommendation.—** *Each Contracting State should arrange for its aeronautical meteorological stations to be inspected at sufficiently frequent intervals to ensure that a high standard of observations is maintained, that instruments and all their indicators are functioning correctly, and to check whether the exposure of the instruments has changed significantly.*

4.1.8 **Recommendation.—** *At aerodromes, suitable observation systems should be installed to complement the aids for final approach and landing. Where precision approaches and, in particular, where Operational Performance Category II, III A and III B operations are planned, those observation systems should include automated equipment for measuring or evaluating, as appropriate, and for monitoring and remote indicating of surface wind, runway visual range, cloud height, and where the state of technology permits, of other meteorological parameters affecting landing and take-off operations. At certain aerodromes, where high levels of traffic make this necessary, these devices should be integrated automatic systems for acquisition, processing, dissemination/display in real time of the meteorological parameters affecting landing and take-off operations.*

Note.— Operational performance categories are described in Annex 10, Volume I, Attachment C to Part I.

4.1.9 **Recommendation.—** *Where an integrated automatic system is used for the dissemination/display of meteorological information, it should be capable of accepting the manual insertion of data covering those meteorological elements which cannot be observed by automatic means.*

4.1.10 **Recommendation.—** *Where automatic observing equipment forms part of an integrated semi-automatic system, displays of data which are made available to the local ATS units should be a subset of and displayed parallel to those available in the local meteorological service unit. In those displays, each meteorological element should be annotated to identify, as appropriate, the locations for which the element is representative.*

4.1.11 The observations shall form the basis for the preparation of reports to be disseminated at the aerodrome of origin and for reports to be disseminated beyond the aerodrome of origin.

4.1.12 Owing to the variability of meteorological elements in space and time, to limitations of observing techniques and to limitations caused by the definitions of some of the elements, the specific value of any of the elements given in a report shall be understood by the recipient to be the best approximation to the actual conditions at the time of observation.

Note.— Guidance on the operationally desirable and currently attainable accuracy of measurement or observation is given in Attachment B.

4.2 Routine observations and reports

4.2.1 At aerodromes, routine observations shall be made throughout the 24 hours each day, except as otherwise agreed between the meteorological authority, the appropriate ATS authority and the operator concerned. Such observations shall be made at intervals of one hour or, if so determined by regional air navigation agreement, at intervals of one half-hour. At other aeronautical meteorological stations, such observations shall be made as determined by the meteorological authority taking into account the requirements of air traffic services units and aircraft operations.

4.2.2 Reports of routine observations shall be issued as routine reports to local air traffic services units as required and shall be made available to the operators and to other users at the aerodrome.

4.2.3 **Recommendation.—** *Routine reports should be disseminated beyond the aerodrome of origin in accordance with regional air navigation agreement.*

4.3 Special observations, special reports and selected special reports

4.3.1 A list of criteria for special observations shall be established by the meteorological authority, in consultation with the appropriate ATS authority, operators and others concerned. The list shall include the following:

a) those values which most closely correspond with the operating minima of the operators using the aerodrome;

b) those values which satisfy other local requirements of the air traffic services units and of the operators;

c) an increase in air temperature of 2°C or more from that given in the latest report, or an alternative threshold value as agreed between the meteorological authority, the appropriate ATS authority and operators concerned;

d) the available supplementary information concerning the occurrence of significant meteorological conditions in the approach and climb-out areas as given in 4.12.1;

e) those values which constitute criteria for selected special reports.

Note.— A selected special report is a report prepared in accordance with criteria listed in 4.3.3 and intended primarily for dissemination beyond the aerodrome of origin.

4.3.2 Reports of special observations shall be prepared for use at the aerodrome of origin; they shall be issued as special reports to local air traffic services units as soon as the specified conditions occur. However, by agreement between the meteorological authority and the appropriate ATS authority, they need not be issued in respect of:

a) any element for which there is in the local air traffic services unit an indicator corresponding to the one in the meteorological station, and where arrangements are in force for the use of this indicator to make observations to meet the needs for reports for landing and take-off;

b) runway visual range, when all changes of one or more steps on the reporting scale in use are being reported to the local air traffic services unit by an observer on the aerodrome.

Special reports shall also be made available to the operators and to other users at the aerodrome.

4.3.3 **Recommendation.—** *Reports of special observations indicating changes in accordance with the following criteria should be prepared as selected special reports:*

a) when the mean surface wind direction has changed by 60° or more from that given in the latest report, the mean speed before and/or after the change being 20 km/h (10 kt) or more;

b) when the mean surface wind speed has changed by 20 km/h (10 kt) or more from that given in the latest report;

c) when the variation from the mean surface wind speed (gusts) has increased by 20 km/h (10 kt) or more from that given in the latest report, the mean speed before and/or after the change being 30 km/h (15 kt) or more;

d) when the wind changes through values of operational significance. The threshold values should be established by the meteorological authority in consultation with the appropriate ATS authority and operators concerned, taking into account changes in the wind which would:

1) require a change in runway(s) in use; and

2) indicate that the runway tailwind and crosswind components have changed through values representing the main operating limits for typical aircraft operating at the aerodrome;

e) when the visibility changes to or passes:

1) 800, 1 500 or 3 000 m;

2) 5 000 m, in cases where significant numbers of flights are operated in accordance with the visual flight rules;

f) when the runway visual range changes to or passes 150, 350, 600 or 800 m;

g) when the onset, cessation or change in intensity of any of the following weather phenomena or combinations thereof occurs:

— freezing precipitation
— freezing fog
— moderate or heavy precipitation (including showers thereof)
— low drifting dust, sand or snow
— blowing dust, sand or snow (including snowstorm)
— duststorm
— sandstorm
— thunderstorm (with or without precipitation)
— squall
— funnel cloud (tornado or waterspout);

h) when the height of base of the lowest cloud layer of BKN or OVC extent changes to or passes:

1) 30, 60, 150 or 300 m (100, 200, 500 or 1 000 ft);

2) 450 m (1 500 ft), in cases where significant numbers of flights are operated in accordance with the visual flight rules;

i) when the amount of a cloud layer below 450 m (1 500 ft) changes:

1) from SKC, FEW or SCT to BKN or OVC; or

2) from BKN or OVC to SKC, FEW or SCT;

j) when the sky is obscured and the vertical visibility changes to or passes through 30, 60, 150 or 300 m (100, 200, 500 or 1 000 ft).

4.3.4 When a deterioration of one weather element is accompanied by an improvement in another element, a single selected special report shall be issued; it shall then be treated as a deterioration report.

4.3.5 **Recommendation.—** *A selected special report representing a deterioration in conditions should be disseminated immediately after the observation. A selected special report representing an improvement in conditions should be disseminated only after the improvement has been maintained for 10 minutes; it should be amended before dissemination, if necessary, to indicate the conditions prevailing at the end of that 10-minute period. A selected special report representing a deterioration of one weather element and an improvement in another element should be disseminated immediately after the observation.*

4.3.6 **Recommendation.—** *Selected special reports should be disseminated beyond the aerodrome of origin in accordance with regional air navigation agreement.*

4.4 Observations and reports for take-off and landing

Recommendation.— *The agreement between the meteorological authority and the appropriate ATS authority referred to in 4.1.3 should cover, amongst other things:*

a) the provision in air traffic services units of indicators or instruments of the kind referred to in 4.5.4 (surface wind), 4.7.6 (runway visual range) and 4.11.2 (pressure) or in 4.1.8 (integrated automatic systems);

b) the calibration and maintenance of these indicators/instruments;

c) the use to be made of these indicators/instruments by air traffic services personnel;

d) as and where necessary, supplementary visual observations (for example, of meteorological phenomena of operational significance in the climb-out and approach areas) if and when made by air traffic services personnel to update or supplement the information supplied by the meteorological station;

e) meteorological information obtained from aircraft taking off or landing (for example, on wind shear);

f) if available, meteorological information obtained from ground weather radar.

4.5 Observing and reporting of surface wind

Introductory Note.— Selected criteria applicable to meteorological information referred to in 4.5 to 4.12 for inclusion in aerodrome reports are given in tabular form in Attachment C.

4.5.1 **Recommendation.—** *The mean direction and the mean speed of the surface wind should be measured, as well as significant variations of the wind direction and speed. Since, in practice, the surface wind cannot be measured directly on the runway, surface wind observations for take-off and landing should be the best practicable indication of the winds which an aircraft will encounter during take-off and landing.*

4.5.2 **Recommendation.—** *For reports for take-off, the surface wind observations should be representative of conditions along the runway, and for reports for landing the observations should be representative of the touchdown zone. Surface wind information for take-off and landing should be representative of conditions at a height of 6 to 10 m (20 to 30 ft) above the runway. Surface wind observations made for reports disseminated beyond the aerodrome should be representative of conditions at a height of 6 to 10 m (20 to*

30 ft) above the whole runway where there is only one runway and the whole runway complex where there is more than one runway.

4.5.3 **Recommendation.—** *Representative surface wind observations should be obtained by the use of sensors appropriately sited as determined by local conditions. Sensors for surface wind observations for reports for take-off and landing should be sited to give the best practicable indication of conditions along the runway, e.g. lift-off and touchdown zones. At aerodromes where topography or prevalent weather conditions cause significant differences in surface wind at various sections of the runway, additional sensors should be provided.*

4.5.4 Surface wind indicators relating to each sensor shall be located in the meteorological station with corresponding indicators in the appropriate air traffic services units. The indicators in the meteorological station and in the air traffic services units shall relate to the same sensors, and where separate sensors are required as specified in 4.5.3, the indicators shall be clearly marked to identify the runway and section of runway monitored by each sensor.

4.5.5 **Recommendation.—** *The averaging period for wind observations should be:*

a) 10 minutes for reports disseminated beyond the aerodrome except that when the 10-minute period includes a marked discontinuity in the wind direction and/or speed, only data occurring since the discontinuity should be used for obtaining mean values, hence the time interval in these circumstances should be correspondingly reduced;

b) 2 minutes for reports used at the aerodrome for take-off and landing and for wind indicators in air traffic services units.

Note.— A marked discontinuity occurs when there is an abrupt and sustained change in wind direction of 30° or more, with a wind speed of 20 km/h (10 kt) before or after the change, or a change in wind speed of 20 km/h (10 kt) or more, lasting at least 2 minutes.

4.5.6 **Recommendation.—** *In reports for take-off and landing, variations in the wind direction should be given when the total variation is 60° or more with mean speeds above 6 km/h (3 kt); such directional variations should be expressed as the two extreme directions between which the wind has varied during the past 10 minutes. Variations from the mean wind speed (gusts) during the past 10 minutes should be reported only when the variation from the mean speed is 20 km/h (10 kt) or more; such speed variations (gusts) should be expressed as the maximum and minimum speeds attained. When the 10-minute period includes a marked discontinuity in the wind direction and/or speed, only variations in direction and speed occurring since the discontinuity should be reported. The variations in direction and speed should be derived:*

a) for non-automated systems from the wind direction and speed indicators or from the anemograph recorder trace if available; and/or

b) for automated systems from the actual measured values of wind direction and speed, and not from the 2-minute and 10-minute running averages required under 4.5.5.

In reports for take-off, surface winds of 6 km/h (3 kt) or less should include a range of wind directions, whenever possible, if the total variation is 60° or more.

Note.— See note under 4.5.5.

4.5.7 **Recommendation.—** *Where multiple sensors are installed, the 2-minute time averages of and significant variations in the surface wind direction and speed for each sensor used in reports for take-off and landing should be monitored by automatic equipment.*

4.5.8 **Recommendation.—** *In reports in abbreviated plain language, the wind direction and speed and significant variations thereof should be given; the wind direction should be given in three figures rounded to the nearest 10 degrees true, for example, 277° should be given as "280"; this should be followed by "/" and by the wind speed. The units used for speed should be kilometres per hour or knots and should be indicated in the written form of the message. When directional variations are to be reported, the two extreme directions between which the wind has varied should be reported in degrees, for example, "VRB BTN 350/AND 050/". When variations from the mean speed are to be reported they should be reported as the maximum and minimum values of the speed attained in kilometres per hour or knots in the form "MAX70 MNM20" or "MAX35 MNM10", respectively. When the wind speed is less than 2 km/h (1 kt), this should be indicated by the term "CALM". In reports for take-off, light variable winds of 6 km/h (3 kt) or less and variations in wind direction should be indicated in the form "VRB BTN 350/AND 050/6KMH" (or "VRB BTN 350/AND 050/3KT"); in other reports, where it is not possible to report a mean wind direction with variations in wind direction of 180° or more, such as in light wind conditions (6 km/h (3 kt) or less), or at higher wind speeds, for example, when a thunderstorm passes over the aerodrome, a variable wind direction should be indicated by the term "VRB" in the form "VRB6KMH" (or "VRB3KT").*

4.5.9 **Recommendation.—** *In reports disseminated beyond the aerodrome:*

a) variations from the mean wind direction should be given if the total variation is 60° or more with mean speeds above 6 km/h (3 kt);

b) maximum wind speed should be included only if it exceeds the mean speed by 20 km/h (10 kt) or more;

c) minimum wind speed should not be given.

4.6 Observing and reporting of visibility

4.6.1 **Recommendation.—** *The horizontal visibility should be measured or be observed by reference to objects whose distance from the point of observation is known.*

4.6.2 **Recommendation.—** *Where observations are made using automatic observing equipment, provision should be made for manual insertion of the horizontal visibility value(s) in the corresponding displays.*

4.6.3 **Recommendation.—** *For reports for take-off the visibility observations should be representative of the take-off and climb-out area, and for reports for landing the observations should be representative of the approach and landing area. Visibility observations made for reports disseminated beyond the aerodrome should be representative of the aerodrome and its immediate vicinity; in such observations special attention should be given to significant directional variations.*

4.6.4 **Recommendation.—** *In reports in abbreviated plain language, the name of the element should be given and the units used for visibility should be specified clearly. When the visibility is less than 500 m it should be expressed in steps of 50 m in the form "VIS 350M", when it is 500 m or more but less than 5 km in steps of 100 m; 5 km or more but less than 10 km in kilometre steps, in the form "VIS 7KM"; and when it is 10 km or more, it should be given as 10 km, except when the conditions for the use of CAVOK apply.*

Note 1.— Specifications concerning the use of CAVOK are given in 4.13.2.

Note 2.— Guidance on currently attainable accuracy for observing visibility is given in Attachment B.

4.6.5 **Recommendation.—** *In reports disseminated beyond the aerodrome, when the visibility is not the same in different directions the lowest visibility should be reported. When the visibility is not the same in different directions and the visibility in one or more directions is more than 50 per cent above the lowest visibility, the lowest visibility observed should be reported and its general direction in relation to the site of the meteorological station indicated by reference to one of the eight points of the compass, for example, "VIS 1200M TO S". If the lowest visibility is observed in more than one direction, then the most operationally significant direction should be reported. Directional variations in visibility should be reported when the lowest visibility is less than 1 500 m and the visibility in another direction is more than 5 000 m, for example "VIS 1200M TO S 6KM TO W". Where such variations in visibility are observed in more than one direction, then the most operationally significant direction should be reported. When the visibility is fluctuating rapidly, and significant directional variations cannot be given, the lowest visibility should be reported, with no indication of direction.*

4.7 Observing and reporting of runway visual range

4.7.1 **Recommendation.—** *Since, in practice, the runway visual range cannot be measured directly on the runway and in view of other limitations imposed by observation methods, a runway visual range observation should be the best possible assessment of the range over which the pilot of an aircraft on the centre line of a runway can see the runway surface markings or the lights delineating the runway or identifying its centre line. For this assessment a height of approximately 5 m (15 ft) should be regarded as corresponding to the average eye level of a pilot in an aircraft.*

Note.— Guidance on the subject of runway visual range is contained in the ICAO Manual of Runway Visual Range Observing and Reporting Practices *(Doc 9328).*

4.7.2 **Recommendation.—** *Runway visual range observations should be representative of the touchdown zone and, as may be selected by the authority concerned, of the middle and far sections of the runway.*

4.7.3 **Recommendation.—** *Runway visual range observations should be made on all runways intended for use during periods of reduced visibility and in particular on:*

a) precision approach runways;

b) runways used for take-off and having high-intensity edge lights and/or centre line lights.

Note.— Precision approach runways are defined in Annex 14, Volume I, Chapter 1, under "Instrument runway".

4.7.4 **Recommendation.—** *Runway visual range observations should be carried out at a lateral distance from the runway centre line of not more than 120 m. The site for observations to be representative of the touchdown zone should be located about 300 m along the runway from the threshold. The sites for observations to be representative of the middle and far sections of the runway should be located at a distance of 1000 to 1500 m along the runway from the threshold and at a distance of about 300 m from the other end of the runway. The exact position of these sites and, if necessary, additional sites should be decided after considering aeronautical, meteorological and climatological factors such as long runways, swamps and other fog-prone areas.*

4.7.5 **Recommendation.—** *Runway visual range observations should be made, and the runway visual range reported, throughout periods when either the horizontal visibility or the runway visual range is observed to be less than 1 500 m.*

4.7.6 **Recommendation.—** *Where runway visual range is determined by instrumental means, one indicator — for example, recorder and dials — or more if required, should be located in the meteorological station with corresponding* *indicators, for example, dials or digital indicators, in the appropriate air traffic services units. The indicators in the meteorological station and in the air traffic services units should be connected to the same measuring device(s).*

4.7.7 **Recommendation.—** *Where a transmissometer is used for determination of runway visual range:*

a) the conversion of its readings should be based on the appropriate intensity of the runway lights;

b) the averaging period of its readings should be 1 minute; and

c) its readings should be updated as necessary to permit the provision of current, representative values.

Note.— Guidance on the conversion of transmissometer readings into runway visual range is given in Attachment D.

4.7.8 **Recommendation.—** *When instruments are used for determination of runway visual range, computations should be made separately for each available runway. The light intensity to be used for the computation should be:*

a) for a runway with the lights switched on, the light intensity actually in use on that runway;

b) for a runway with lights switched off (or at the lowest setting pending the resumption of operations), the optimum light intensity that would be appropriate for operational use in the prevailing conditions.

4.7.9 **Recommendation.—** *The units providing air traffic service and aeronautical information service for an aerodrome should be kept informed without delay of changes in the serviceability status of the runway visual range observing system.*

4.7.10 **Recommendation.—** *The reporting scale should consist of increments between 25 m and 60 m for runway visual range up to 800 m and increments of 100 m for runway visual range above 800 m. Where the observations are made by counting runway edge lights, the reporting increments should be determined largely by the spacing of those lights. Any observed value which does not fit the reporting scale in use should be rounded down to the nearest lower step in the scale.*

4.7.11 **Recommendation.—** *Fifty metres should be considered the lower limit and 1 500 metres the upper limit for assessments of runway visual range. Outside of these limits reports should merely indicate that the runway visual range is less than 50 m or more than 1 500 m, in the form "RVR BLW 50M" or "RVR ABV 1500M", respectively.*

4.7.12 **Recommendation.—** *Runway visual range should be reported to the appropriate local air traffic services units, whenever there is a change in the value to be reported in accordance with the reporting scale (except where the provisions of 4.3.2 a) or b) apply). The transmission of such reports should normally be completed within 15 seconds after the termination of the observation.*

4.7.13 **Recommendation.—** *In reports in abbreviated plain language the name of the element should be given in abbreviated form and the units used should be included, for example, "RVR 400M". When runway visual range is above the maximum value which can be determined by the system in use, it should be reported, for example, in the form "RVR ABV 1200M", where the figure 1 200 is the maximum value that can be determined by the system. When the runway visual range is below the minimum value which can be determined by the system in use, it should be reported, for example, in the form "RVR BLW 150M" where the figure 150 is the minimum value that can be determined by that system. If runway visual range is observed from one location along the runway, about 300 m from the threshold, it should be included without any indication of location. If the runway visual range is observed from more than one location along the runway, the value representative of the touchdown zone should be given first, followed by the values representative of the mid-point and stop-end. The locations for which these values are representative should be indicated as "TDZ", "MID" and "END" respectively, for example, "RVR RWY 16 TDZ 600M MID 500M END 400M". When there is more than one runway in use, the available runway visual range values for each runway should be given and the runways to which the values refer should be indicated, for example, "RWY 26 RVR 500M RWY 20 RVR 800M"; if more than one runway is in use, but runway visual range is available only for one runway, that information should be indicated in the form "RWY 20 RVR 500M".*

4.7.14 **Recommendation.—** *In reports disseminated beyond the aerodrome only the value representative of the touchdown zone should be given and no indication of location on the runway should be included. Where there is more than one runway available for landing, touchdown zone runway visual range values should be included for all such runways up to a maximum of four and the runways to which the values refer should be indicated in the form "RWY 26 RVR 500M RWY 20 RVR 800M". Runway visual range should be based on the same light intensity settings as those appropriate for use during take-off and landing at the time the report is made, but excluding any temporary changes in the light intensity settings. When the runway visual range information is determined using instruments, the runway visual range reported should be the mean value during the 10-minute period immediately preceding the observation. If the runway visual range values during the 10-minute period have shown a distinct tendency, such that the mean during the first 5 minutes varies by 100 m or more from the mean during the second 5 minutes of the period, this should be indicated. When the variation of the runway visual range values shows an upward or downward tendency this should be indicated by the abbreviation "U" or "D" respectively in the form "RWY 12 RVR 200M/U". In circumstances when actual fluctuations* *during the 10-minute period indicate no distinct tendency this should be reported using the abbreviation "N". When indications of tendency are not available, none of the foregoing abbreviations should be included. If the one-minute runway visual range values during the 10-minute period immediately preceding the observation vary from the mean value by more than 50 m or more than 20 per cent of the mean value, whichever is greater, the one-minute mean minimum and the one-minute mean maximum values should be reported instead of the 10-minute mean value, in the form "RWY 26 RVR MNM700M MAX1200M". If the 10-minute period immediately preceding the observation includes a marked discontinuity in runway visual range values, only those values occurring after the discontinuity should be used to obtain mean values, and variations.*

Note.— A marked discontinuity occurs when there is an abrupt and sustained change in runway visual range, lasting at least 2 minutes, which reaches or passes through criteria for the issuance of selected special reports given in 4.3.3 f).

4.8 Observing and reporting of present weather

4.8.1 **Recommendation.—** *The present weather occurring at and/or near the aerodrome should be observed. For reports for take-off and landing, the present weather information should be representative, as far as is practicable, of the take-off and climb-out area or of the approach and landing area respectively. Observations of present weather made for reports disseminated beyond the aerodrome should be representative of the aerodrome and its immediate vicinity.*

4.8.2 **Recommendation.—** *Where observations are made using automatic observing equipment, provision should be made for manual insertion in the corresponding displays of those weather elements which cannot be determined adequately by that equipment.*

4.8.3 **Recommendation.—** *Present weather phenomena should be reported in terms of type and characteristics and qualified with respect to intensity or proximity to the aerodrome, as appropriate.*

4.8.4 **Recommendation.—** *The types of present weather phenomena which should be reported, their respective abbreviations and relevant criteria for their reporting of significance to aviation are as follows:*

a) Precipitation

Drizzle	*DZ*
Rain	*RA*
Snow	*SN*
Snow grains	*SG*
Ice pellets	*PE*
Ice crystals (very small ice crystals in suspension also known as diamond dust) — *Reported only when associated visibility is 5 000 m or less.*	*IC*
Hail — *Reported when diameter of largest hailstones is 5 mm or more.*	*GR*
Small hail and/or snow pellets — *Reported when diameter of largest hailstones is less than 5 mm.*	*GS*

b) Obscurations (hydrometeors)

Fog — *Reported when visibility is less than 1 000 m, except when qualified by "MI", "BC", "PR" or "VC" (see 4.8.5 and 4.8.6).*	*FG*
Mist — *Reported when visibility is at least 1 000 m but not more than 5 000 m.*	*BR*

c) Obscurations (lithometeors)

The following should be used only when the obscuration consists predominantly of lithometeors and the visibility is 5 000 m or less except "SA" when qualified by "DR" (see 4.8.5) and volcanic ash.

Sand	*SA*
Dust (widespread)	*DU*
Haze	*HZ*
Smoke	*FU*
Volcanic ash	*VA*

d) Other phenomena

Dust/sand whirls (dust devils)	*PO*
Squall	*SQ*
Funnel cloud (tornado or waterspout)	*FC*
Duststorm	*DS*
Sandstorm	*SS*

4.8.5 **Recommendation.—** *The characteristics of the present weather phenomena which should be reported, as necessary, and their respective abbreviations are as follows:*

Thunderstorm — *Used to report a thunderstorm with rain "TSRA", snow "TSSN", ice pellets "TSPE", hail "TSGR" or small hail and/or snow pellets "TSGS" or combinations thereof, for example, "TSRASN". When thunder is heard during the 10-minute period preceding the time of observation but no precipitation is observed at the aerodrome, the abbreviation "TS" should be used without qualification.*	*TS*

Shower — SH
— *Used to report showers of rain "SHRA", snow "SHSN", ice pellets "SHPE", hail "SHGR", small hail and/or snow pellets "SHGS", or combinations thereof, for example "SHRASN". Showers observed in the vicinity of the aerodrome (see 4.8.6) should be reported as "VCSH" without qualification regarding type or intensity of precipitation.*

Freezing (supercooled water droplets or precipitation, used only with FG, DZ and RA) — FZ

Blowing — BL
— *Used to report DU, SA or SN (including snowstorm) raised by the wind to a height of 2 m (6 ft) or more above the ground; in the case of snow, also used to report snow falling from a cloud and mixed with snow raised by the wind from the ground.*

Low drifting (used with DU, SA or SN raised by the wind to less than 2 m (6 ft) above ground level) — DR

Shallow (less than 2 m (6 ft) above ground level) — MI

Patches (fog patches randomly covering the aerodrome) — BC

Partial (a substantial part of the aerodrome covered by fog while the remainder is clear) — PR

4.8.6 **Recommendation.—** *The relevant intensity or, as appropriate, the proximity to the aerodrome of the reported present weather phenomena should be indicated as follows:*

	(abbreviated plain language)	*(METAR)*
Light	*FBL*	–
Moderate	*MOD*	*(no indication)*
Heavy	*HVY*	+

— *Used only with: precipitation; SH and TS (in these cases intensity refers to precipitation in accordance with 4.8.7); BLDU; BLSA; BLSN; DS; SS; and PO, FC (in these cases HVY means well developed).*

Vicinity — VC
— *Not at the aerodrome but not further away than approximately 8 km from the aerodrome perimeter and used only with DS, SS, FG, FC, SH, PO, BLDU, BLSA, BLSN and TS when not reported under 4.8.5.*

4.8.7 **Recommendation.—** *In reports in abbreviated plain language, one or more up to a maximum of three of the present weather abbreviations given in 4.8.4 and 4.8.5 should be used, as necessary, together with an indication, where appropriate, of the characteristics and intensity or proximity to the aerodrome, so as to convey a complete description of the present weather at or near the aerodrome of significance to flight operations. In reporting this information, the indication of intensity or proximity as appropriate, should be reported first followed respectively by the characteristics and the type of weather phenomena in the form "HVY TSRA" or "VC FG". Where two different types of weather are observed, they should be reported in two separate groups, in the form "HVY DZ FG" or "FBL DZ VC FG" where the intensity or proximity indicator refers to the weather phenomenon which follows the indicator. However, different types of precipitation occurring at the time of observation should be reported as one single group with the dominant type of precipitation reported first and preceded by only one intensity qualifier which refers to the intensity of the total precipitation in the form "HVY TSRASN" or "FBL SNRA FG".*

4.9 Observing and reporting of cloud

4.9.1 **Recommendation.—** *Cloud amount, type and height of base should be observed as necessary to describe the general cloud distribution.*

4.9.2 **Recommendation.—** *Where ceilometers are used as a part of automated observing equipment to measure height of cloud base, provision should be made for manual insertion of cloud amounts and, where appropriate, cloud type(s), together with the heights of those layers or masses not directly measurable by the ceilometer(s).*

4.9.3 **Recommendation.—** *Cloud observations for reports for landing should be representative of the approach area or, in the case of aerodromes with precision approach runways, of the middle marker site of the instrument landing system. Cloud observations made for reports disseminated beyond the aerodrome should be representative of the aerodrome and its immediate vicinity.*

Note.— Specifications concerning the middle marker site of an instrument landing system are given in Annex 10, Volume I, Part I.

4.9.4 **Recommendation.—** *The height of the base of cloud should normally be reported above aerodrome elevation. When a precision approach runway is in use which has a threshold elevation 15 m (50 ft) or more below the aerodrome elevation, local arrangements should be made in order that the height of clouds reported to arriving aircraft should refer to the threshold elevation. In the case of reports from off-shore structures the height of the base of cloud should be given above mean sea level.*

4.9.5 **Recommendation.—** *In reports in abbreviated plain language, cloud amount should be given using the abbreviations "FEW" (1 to 2 oktas), "SCT" (3 to 4 oktas), "BKN" (5 to 7 oktas) or "OVC" (8 oktas). If there are no clouds and no restriction on vertical visibility and the abbreviation "CAVOK" is not appropriate, the abbreviation "SKC" should be used. When the sky is obscured and information on vertical visibility is available, it should be reported in the form "VER VIS", followed by the value of the vertical visibility and the units used. When several layers or masses of cloud are observed, their amount and height should be reported in the following order:*

a) the lowest layer or mass, regardless of amount to be reported as FEW, SCT, BKN or OVC as appropriate;

b) the next layer or mass, covering more than 2/8 to be reported as SCT, BKN or OVC as appropriate;

c) the next higher layer or mass, covering more than 4/8 to be reported as BKN or OVC as appropriate;

d) cumulonimbus and/or towering cumulus clouds, whenever observed and not reported in a) to c) above.

The type of cloud should be identified only for cumulonimbus and towering cumulus when observed at or near the aerodrome. These should be given as "CB" and "TCU" respectively. The height of the base of cloud should be reported in steps of 30 m (100 ft) up to 3 000 m (10 000 ft) together with the units used, in the form "300M" or "1000FT" and in steps of 300 m (1 000 ft) above 3 000 m (10 000 ft). When the cloud base is diffuse or ragged or fluctuating rapidly, the minimum height of the cloud, or cloud fragments, should be given, followed by the relevant abbreviation "DIF" or "RAG" or "FLUC". When an individual layer (mass) of cloud is composed of cumulonimbus and towering cumulus clouds with a common cloud base, the type of cloud should be reported as cumulonimbus only.

Note.— Towering cumulus (TCU) is used to indicate cumulus congestus clouds of great vertical extent.

4.10 Observing and reporting of air temperature and dew-point temperature

4.10.1 **Recommendation.—** *The air temperature and the dew-point temperature should be reported to the nearest whole degree Celsius, with observed values involving 0.5°C rounded up to the next higher whole degree Celsius, for example, +2.5°C should be rounded off to +3°C, –2.5°C should be rounded off to –2°C.*

4.10.2 **Recommendation.—** *Observations of air temperature and dew-point temperature should be representative of the runways.*

4.10.3 **Recommendation.—** *In reports in abbreviated plain language, the air temperature should be identified by "T" and the dew-point temperature by "DP" in the form "T21 DP8". For a temperature below 0°C the value should be preceded by "MS".*

4.11 Observing and reporting of pressure values

4.11.1 **Recommendation.—** *The atmospheric pressure should be measured and QNH and/or QFE values should be computed in tenths of a hectopascal.*

4.11.2 **Recommendation.—** *For local air traffic services units QNH and, if required, QFE should be kept current by routine issues, supplemented by the issue of new data whenever changes occur which exceed an agreed magnitude. Such supplementary data need not be issued when the air traffic services unit is equipped with a remote indicator from the barometer in the meteorological station or with a separate barometer, and where arrangements are in force for the use of the remote indicator, or separate barometer, to make observations to meet the need for reports for landing and take-off.*

4.11.3 **Recommendation.—** *The reference level for the computation of QFE should be the aerodrome elevation. For non-precision approach runways, the thresholds of which are 2 m (7 ft) or more below the aerodrome elevation, and for precision approach runways, the QFE, if required, should refer to the relevant threshold elevation.*

4.11.4 **Recommendation.—** *In routine reports disseminated at the aerodrome QNH should be included regularly and QFE should be included either on request or, if so agreed locally, on a regular basis. Those values should be rounded down to the nearest lower whole hectopascal. For example, QNH 995.6 hPa should be given as "QNH 995".*

4.11.5 **Recommendation.—** *In reports disseminated beyond the aerodrome of origin QNH values should be included and the values should be rounded down to the nearest lower whole hectopascal.*

4.12 Observing and reporting of supplementary information

4.12.1 **Recommendation.—** *Observations made at aerodromes should include the available supplementary information concerning significant meteorological conditions, particularly those in the approach and climb-out areas, and specifically the location of cumulonimbus or thunderstorm, moderate or severe turbulence, wind shear, hail, severe squall line, moderate or severe icing, freezing precipitation, severe mountain waves, sandstorm, duststorm, blowing snow or funnel cloud (tornado or waterspout). Where practicable, the* *information should identify the vertical extent and direction and rate of movement of the phenomenon. As icing, turbulence and to a large extent, wind shear, for the time being cannot be satisfactorily observed from the ground, evidence of their existence should be derived from aircraft observations during the climb-out or approach phases of flight to be made in accordance with Chapter 5, 5.5.*

Note.— The preparation and dissemination of warnings of wind shear in the climb-out and approach paths is dealt with in Chapter 7, 7.6.1 to 7.6.6.

4.12.2 **Recommendation.—** *Where observations are made using automatic observing equipment, provision should be made for manual insertion of information concerning significant meteorological conditions which cannot be determined adequately by that equipment.*

4.12.3 **Recommendation.—** *When any of the following weather phenomena or combinations thereof were observed at the aerodrome during the period since the last issued routine report or last hour, whichever is the shorter, but not at the time of observation, this should be reported, up to a maximum of three groups, in the supplementary information:*

- *— freezing precipitation*
- *— moderate or heavy precipitation (including showers thereof)*
- *— moderate or heavy blowing snow (including snowstorm)*
- *— duststorm or sandstorm*
- *— thunderstorm*
- *— funnel cloud (tornado or water spout)*
- *— volcanic ash.*

4.12.4 **Recommendation.—** *Information on the state of the runway should be included in accordance with regional air navigation agreement.*

4.12.5 **Recommendation.—** *The available supplementary information should be included in abbreviated plain language. Wind shear in the approach area should be reported, for example, as "SURFACE WIND 320/20KMH WIND AT 60M 360/50KMH IN APCH" (or "SURFACE WIND 320/10KT WIND AT 60 M 360/25KT IN APCH"). Moderate turbulence and icing in cloud in the climb-out area should be reported as "MOD TURB AND ICE INC IN CLIMB-OUT". Information on recent significant weather should be reported, for example, as "REDZ".*

4.12.6 **Recommendation.—** *Information on recent weather of operational significance as given in 4.12.3 observed at the aerodrome within the period since the last issued routine report or last hour, whichever is the shorter, but not at the time of observation and, where local circumstances so warrant, information on wind shear should be added in reports disseminated beyond the aerodrome, while other supplementary information should be added in such reports only in accordance with regional air navigation agreement. Information on recent significant weather should be added in the form, for example, "REFZRA". Information on wind shear should be added, if necessary, in the form "WS RWY 12" or "WS ALL RWY".*

Note.— The local circumstances referred to in 4.12.6 include, but are not necessarily limited to, wind shear of a non-transitory nature such as might be associated with low level temperature inversions or local topography.

4.12.7 **Recommendation.—** *Information on sea-surface temperature and the state of the sea should be included in reports from aeronautical meteorological stations established on off-shore structures in support of helicopter operations, as determined by regional air navigation agreement.*

Note.— The state of the sea is specified in WMO Publication No. 306, Manual on Codes, *Volume I, Code Table 3700.*

4.13 Contents of reports

4.13.1 **Recommendation.—** *Routine, special and selected special reports should contain the following information in the order indicated, except that special reports need not contain information as provided for under 4.3.2:*

a) identification of the type of report;

b) location indicator;

c) time of the observation;

d) surface wind direction and speed;

e) visibility;

f) runway visual range, when applicable;

g) present weather;

h) cloud amount, type (only for cumulonimbus and towering cumulus clouds at or near the aerodrome) and height of base;

i) air temperature and dew-point temperature (included in routine and selected special reports and, in accordance with regional air navigation agreement, in special reports);

j) QNH and, when applicable, QFE (QFE included only in reports disseminated locally at the aerodrome by agreement between the meteorological and air traffic services authorities and operators concerned);

k) supplementary information.

Note 1.— The location indicators referred to under b) and their significations are published in ICAO Doc 7910 — Location Indicators.

Note 2.— For explanation of towering cumulus see note following 4.9.5.

4.13.2 When the following conditions obtain simultaneously at the time of observation:

a) visibility, 10 km or more;

b) no cloud below 1 500 m (5 000 ft) or below the highest minimum sector altitude, whichever is greater, and no cumulonimbus;

c) weather of significance to aviation as given in 4.8.4 and 4.8.5;

information on visibility, runway visual range, present weather and cloud amount, type and height shall be replaced in all meteorological reports by the term "CAVOK".

4.13.3 **Recommendation.—** *Where reports for take-off and landing are required by the local aerodrome control tower and/or approach control office, the contents of such reports should be determined by local agreement. All elements included in reports for take-off and landing should be based on observations which are representative of conditions existing immediately prior to the transmission of the report.*

4.14 Format of reports

4.14.1 Routine and special reports and, where required, reports for take-off and landing, which are not disseminated beyond the aerodrome of origin shall be in a form agreed with the air traffic services units, operators and other aeronautical users concerned.

4.14.2 Routine and selected special reports which are exchanged between meteorological offices shall be:

a) in the METAR or SPECI code forms prescribed by the World Meteorological Organization; or

b) when agreed between the meteorological authorities concerned, in abbreviated plain language or in teletypewriter characters and symbols, the significance of which has been agreed upon by the meteorological authorities concerned.

Note.— The METAR and SPECI code forms are contained in WMO Publication No. 306, Manual on Codes, *Volume I.*

4.14.3 **Recommendation.—** *Routine reports in the METAR code form and selected special reports in the SPECI code form should normally contain all information which the codes provide for, except the meteorological elements given in optional groups which should be included in accordance with regional air navigation agreement.*

4.14.4 **Recommendation.—** *Routine reports from aeronautical meteorological stations not at international aerodromes should, when disseminated in a code form prescribed by the World Meteorological Organization, be in the METAR code form except that, if so desired by the meteorological authority responsible for their preparation, they may be in the SYNOP code form.*

4.14.5 Reports in abbreviated plain language shall convey to aeronautical personnel a directly intelligible meaning through the use of:

a) abbreviations approved by ICAO for use in the international aeronautical telecommunication service; and

b) numerical values of self-explanatory nature;

supplemented, if suitable approved abbreviations are not available, by the vocabulary of a national language, taken with its usual meaning in aviation. With the exception of QNH and QFE, no signals of the Q Code shall be used in such reports.

Note.— The abbreviations referred to under a) are contained in the Procedures for Air Navigation Services — ICAO Abbreviations and Codes *(Doc 8400).*

4.14.6 **Recommendation.—** *Routine reports in abbreviated plain language should be identified as "MET REPORT" and special and selected special reports as "SPECIAL". When a group of routine reports is dissemi-nated, the identifier need only be used with the first report; in the case of special and selected special reports the identifier should always be included with each report. The date of the observation should be indicated by two figures followed by the actual time the observation is made in hours and minutes UTC, in the form "042230Z". When a group of reports is included in a message, the actual time of the first report contained in the message should be given; the time of any other report included in the message should be given only if it differs from the time of the first report by more than 10 minutes.*

4.14.7 **Recommendation.—** *The terminology, units and scales employed in reports for take-off and landing should be the same as those used in routine, special and selected special reports for the same aerodrome.*

4.15 Observations and reports of volcanic activity

Recommendation.— *The occurrence of pre-eruption volcanic activity, volcanic eruptions and volcanic ash cloud* *should be reported without delay to the associated air traffic services unit, aeronautical information services unit and meteorological watch office. The report should be made in the form of a volcanic activity report comprising the following information in the order indicated:*

a) message type, VOLCANIC ACTIVITY REPORT;

b) station identifier, location indicator or name of station;

c) date/time of message;

d) location of volcano and name if known;

e) concise description of event including, as appropriate, level of intensity of volcanic activity, occurrence of an eruption and its date and time and the existence of a volcanic ash cloud in the area together with direction of ash cloud movement and height.

Note.— Pre-eruption volcanic activity in this context means unusual and/or increasing volcanic activity which could presage a volcanic eruption.

EXAMPLES OF REPORTS

Example 1.— Routine report

a) METAR for YUDO (Donlon/International):*

METAR YUDO 221630Z 24015KMH 0600 R12/1000U FG DZ SCT010 OVC020 17/16 Q1018 BECMG TL1700 0800 FG BECMG AT1800 9999 NSW

b) Abbreviated plain-language report (same location and weather conditions as METAR):

MET REPORT YUDO 221630Z 240/15KMH VIS 600M RWY12 RVR 1000M/U FG DZ SCT 300M OVC 600M T17 DP16 QNH 1018 BECMG TL1700 VIS 800M FG BECMG AT1800 VIS 10KM NSW

c) Meaning of both reports:

Routine report for Donlon/International* issued on the 22nd of the month at 1630 UTC; surface wind direction 240 degrees; wind speed 15 kilometres per hour; visibility 600 metres; runway visual range representative of the touchdown zone for runway 12 is 1 000 metres and the runway visual range values have shown an upward tendency during previous 10 minutes; fog and drizzle; scattered cloud at 300 metres; overcast at 600 metres; air temperature 17 degrees Celsius; dew-point temperature 16 degrees Celsius; QNH 1018 hectopascals; trend during next two hours visibility becoming 800 metres in fog by 1700 UTC; at 1800 UTC visibility becoming 10 kilometres or more and nil significant weather.

* Fictitious location

Note.— In this example, the primary units "kilometre per hour" and "metre" were used for wind speed and height of cloud base respectively. However, in accordance with Annex 5, the corresponding non-SI alternative units "knot" and "foot" may be used instead.

Example 2.— Selected special report

a) SPECI for YUDO (Donlon/International):*

SPECI YUDO 151115Z 05025G37KT 1200NE 6000S +TSRA BKN005CB 25/22 Q1008 TEMPO TL1200 0600 BECMG AT1200 9999 NSW NSC

b) Abbreviated plain-language report (same location and weather conditions as SPECI):

SPECIAL YUDO 151115Z 050/25KT MAX37 MNM10 VIS 1200M TO NE 6000M TO S HVY TSRA BKN CB 500FT T25 DP22 QNH 1008 TEMPO TL1200 VIS 600M BECMG AT1200 10KM NSW NSC

c) Meaning of both reports:

Selected special report for Donlon/International* issued on the 15th of the month at 1115 UTC; surface wind direction 050 degrees; wind speed 25 knots gusting between 10 and 37 knots (minimum wind speed not to be included in SPECI); visibility lowest to north east at 1 200 metres, visibility 6 000 metres to South; heavy thunderstorm with rain; broken cumulonimbus cloud at 500 feet; air temperature 25 degrees Celsius; dew-point temperature 22 degrees Celsius; QNH 1008 hectopascals; trend during next two hours, visibility temporarily 600 metres from 1115 to 1200, becoming at 1200 UTC visibility 10 km or more, thunderstorm ceases and nil significant weather and nil significant cloud.

* Fictitious location

Note.— In this example, the non-SI alternative units "knot" and "foot" were used for wind speed and height of cloud base respectively. However, in accordance with Annex 5, the corresponding primary units "kilometre per hour" and "metre" may be used instead.

Example 3.— Volcanic activity report

VOLCANIC ACTIVITY REPORT YUSB* 231500 MT TROJEEN* VOLCANO 5605N 12652W ERUPTED 231445 LARGE ASH CLOUD EXTENDING TO APPROX 30000 FEET MOVING SW

Meaning: Volcanic activity report issued by Siby/Bistock meteorological station at 1500 UTC on the 23rd of the month. Mt Trojeen volcano 56 degrees 5 minutes north 126 degrees 52 minutes west erupted at 1445 UTC on the 23rd; a large ash cloud was observed extending to approximately 30 000 feet and moving in a south-westerly direction.

* Fictitious locations

CHAPTER 5. AIRCRAFT OBSERVATIONS AND REPORTS

5.1 Obligations of States

Each Contracting State shall arrange, according to the provisions of this chapter, for observations to be made by aircraft of its registry operating on international air routes and for the recording and reporting of these observations.

5.2 Aircraft observations

The following aircraft observations shall be made:

a) routine aircraft observations during en-route and climb-out phases of the flight; and

b) special and other non-routine aircraft observations during any phase of the flight.

5.3 Reporting of aircraft observations during flight

5.3.1 Aircraft observations shall be reported by air-ground data link. Where air-ground data link is not available or appropriate, aircraft observations shall be reported by voice communications.

5.3.2 Aircraft observations shall be reported during flight at the time the observation is made or as soon thereafter as is practicable.

5.4 Routine aircraft observations

5.4.1 **Recommendation.—** *When air-ground data link is used and automatic dependent surveillance (ADS) is being applied, automated routine observations should be made every 15 minutes during the en-route phase and every 30 seconds during the climb-out phase for the first 10 minutes of the flight.*

5.4.2 When voice communications are used, routine observations shall be made during the en-route phase in relation to those air traffic services reporting points or intervals:

a) at which the applicable air traffic services procedures require routine position reports; and

b) which are those separated by distances corresponding most closely to intervals of one hour of flying time.

5.4.3 **Recommendation.—** *For helicopter operations to and from aerodromes on off-shore structures, routine observations should be made from helicopters at points and times as agreed between the meteorological authorities and the helicopter operators concerned.*

5.4.4 In the case of air routes with high-density air traffic (e.g. organized tracks), an aircraft from among the aircraft operating at each flight level shall be designated, at approximately hourly intervals, to make routine observations in accordance with 5.4.1 or 5.4.2, as appropriate. The designation procedures shall be subject to regional air navigation agreement.

5.4.5 In the case of the requirement to report during the climb-out phase, an aircraft shall be designated, at approximately hourly intervals, at each aerodrome to make routine observations in accordance with 5.4.1.

5.4.6 When voice communications are used, an aircraft shall be exempted from making the routine observations specified in 5.4.2 when:

a) the aircraft is not equipped with RNAV equipment; or

b) the flight duration is 2 hours or less; or

c) the aircraft is at a distance equivalent to less than one hour of flying time from the next intended point of landing; or

d) the altitude of the flight path is below 1 500 m (5 000 ft).

5.4.7 **Recommendation.—** *When voice communications are used, additional exemptions may be prescribed by regional air navigation agreement for flights over routes and areas with high density air traffic and/or with adequate synoptic networks. Such procedures should take the form of exemption or designation procedures and should:*

a) make it possible for the minimum requirements for aircraft observations of all meteorological offices concerned to be met; and

b) be as simple as possible to implement and preferably not involving consideration of individual cases.

5.5 Special and other non-routine aircraft observations

5.5.1 Special observations shall be made by all aircraft whenever the following conditions are encountered or observed:

a) severe turbulence; or

b) severe icing; or

c) severe mountain wave; or

d) thunderstorms, without hail, that are obscured, embedded, widespread or in squall lines; or

e) thunderstorms, with hail, that are obscured, embedded, widespread or in squall lines; or

f) heavy duststorm or heavy sandstorm; or

g) volcanic ash cloud; or

h) pre-eruption volcanic activity or a volcanic eruption.

Note.— Pre-eruption volcanic activity in this context means unusual and/or increasing volcanic activity which could presage a volcanic eruption.

In addition, in the case of transonic and supersonic flights:

i) moderate turbulence; or

j) hail; or

k) cumulonimbus clouds.

5.5.2 When other meteorological conditions not listed under 5.5.1, e.g. wind shear, are encountered and which, in the opinion of the pilot-in-command, may affect the safety or markedly affect the efficiency of other aircraft operations, the pilot-in-command shall advise the appropriate air traffic services unit as soon as practicable.

Note.— According to Chapter 4, 4.12.1 and Chapter 7, 7.6.2, icing, turbulence and, to a large extent, wind shear, are elements which, for the time being, cannot be satisfactorily observed from the ground and for which in most cases aircraft observations represent the only available evidence.

5.5.3 **Recommendation.—** *When reporting aircraft observations of wind shear encountered during the climb-out and approach phases of flight, the aircraft type should be included.*

5.5.4 **Recommendation.—** *Where wind shear conditions in the climb-out or approach phases of flight were reported or forecast but not encountered, the pilot-in-command should advise the appropriate air traffic services unit as soon as practicable unless the pilot-in-command is aware that the appropriate air traffic services unit has already been so advised by a preceding aircraft.*

5.6 Content of air-reports

5.6.1 When voice communications are used, the elements contained in routine and special air-reports shall be:

Routine air-reports

Message type designator
Section 1
(Position information)
Aircraft identification
Position or latitude and longitude
Time
Flight level or altitude
Next position and time over
Ensuing significant point
Section 2
(Operational information)
Estimated time of arrival
Endurance
Section 3
(Meteorological information)
Air temperature
Wind direction
Wind speed
Turbulence
Aircraft icing
Humidity (if available)

Special air-reports

Message type designator
Section 1
(Position information)
Aircraft identification
Position or latitude and longitude
Time
Flight level or altitude
Section 3
(Meteorological information)
Condition prompting the issuance of a special air-report, to be selected from the list presented under 5.5.1

Note 1.— Air-reports are considered routine by default. The message type designator for special air-reports is specified in the Procedures for Air Navigation Services — Rules of the Air and Air Traffic Services *(PANS-RAC, Doc 4444), Appendix 1.*

Note 2.— In the case of the transmission of a special air-report of pre-eruption volcanic activity, volcanic eruption or volcanic ash cloud, additional requirements are indicated in 5.8.

5.6.2 When air-ground data link is used, the elements contained in routine and special air-reports shall be:

Message type designator
Aircraft identification
Data block 1
 Latitude
 Longitude
 Pressure-altitude
 Time
Data block 2
 Wind direction
 Wind speed
 Temperature
 Turbulence (if available)
 Humidity (if available)
Data block 3
 Condition prompting the issuance of a special air-report (in special air-reports only), to be selected from the list presented under 5.5.1.

Note 1.— In the case of the transmission of a special air-report of pre-eruption volcanic activity, volcanic eruption or volcanic ash cloud, additional requirements are indicated in 5.8.

Note 2.— Data block 1 is available from the basic ADS message, data block 2 from the meteorological block of the ADS message and data block 3 from the pilot/controller two-way data-link message set. The ADS message format is specified in the Procedures for Air Navigation Services — Rules of the Air and Air Traffic Services *(PANS-RAC, Doc 4444).*

5.7 Exchange of air-reports

5.7.1 The meteorological authority concerned shall make arrangements with the appropriate ATS authority to ensure that the meteorological observations reported by aircraft in flight to air traffic services units are delivered without delay to:

a) the WAFCs and, as appropriate, RAFCs; and

b) the associated meteorological watch office in case of all special air-reports and those routine reports which are received by voice communications.

5.7.2 The meteorological watch offices shall assemble the routine air-reports received by voice communications and shall disseminate them to other meteorological offices in accordance with regional air navigation agreement. The exchange of collectives on an hourly basis may be found desirable when reports are numerous.

5.7.3 The meteorological watch office shall transmit without delay special air-reports of pre-eruption volcanic activity, a volcanic eruption or volcanic ash cloud received to the associated regional meteorological centre(s) providing advisory information concerning volcanic ash cloud, in accordance with 7.2.7.

5.7.4 When a special air-report is received at the meteorological watch office but the forecaster considers that the phenomenon causing the report is not expected to persist and, therefore, does not warrant issuance of a SIGMET, the special air-report shall be disseminated in the same way that SIGMET messages are disseminated in accordance with 7.2.9, i.e. to meteorological watch offices and other meteorological offices in accordance with regional air navigation agreement.

5.7.5 Air-reports at WAFCs and RAFCs shall be further disseminated as basic meteorological data.

5.7.6 **Recommendation.—** *Where supplementary dissemination of air-reports is required to satisfy special aeronautical or meteorological requirements, such dissemination should be arranged between the meteorological authorities concerned.*

5.7.7 Air-reports shall be exchanged in the format in which they are received, except that when voice communications are used, if the position is given by reference to an ATS reporting point, it shall be converted, by the meteorological watch office, into the corresponding latitude and longitude.

5.8 Recording and post-flight reporting of aircraft observations of volcanic activity

5.8.1 Special aircraft observations of pre-eruption volcanic activity, a volcanic eruption or volcanic ash cloud shall be recorded on the special air-report of volcanic activity form. A copy of the form shall be included with the flight documentation provided to flights operating on routes which, in the opinion of the meteorological authority concerned, could be affected by volcanic ash clouds.

Note.— The detailed instructions for recording and reporting volcanic activity observations are given in the Procedures for Air Navigation Services — Rules of the Air and Air Traffic Services *(PANS-RAC, Doc 4444), Appendix 1.*

5.8.2 On arrival of a flight at an aerodrome, the completed report of volcanic activity shall be delivered by the operator or a flight crew member, without delay, to the aerodrome meteorological office, or if such office is not easily accessible to arriving flight crew members, the completed form shall be dealt with in accordance with local arrangements made by the meteorological authority and the operator.

5.8.3 The completed report of volcanic activity received by a meteorological office shall be transmitted without delay to the meteorological watch office responsible for the provision of meteorological watch for the flight information region in which the volcanic activity was observed.

CHAPTER 6. FORECASTS

6.1 Interpretation and use of forecasts

6.1.1 Owing to the variability of meteorological elements in space and time, to limitations of forecasting techniques and to limitations caused by the definitions of some of the elements, the specific value of any of the elements given in a forecast shall be understood by the recipient to be the most probable value which the element is likely to assume during the period of the forecast. Similarly, when the time of occurrence or change of an element is given in a forecast, this time shall be understood to be the most probable time.

Note.— Guidance on the operationally desirable accuracy of forecasts is given in Attachment E.

6.1.2 The issue of a new forecast by a meteorological office, such as a routine aerodrome forecast, shall be understood to cancel automatically any forecast of the same type previously issued for the same place and for the same period of validity or part thereof.

6.2 Aerodrome forecasts

6.2.1 An aerodrome forecast shall be prepared by the meteorological office designated by the meteorological authority concerned.

6.2.2 An aerodrome forecast shall consist of a concise statement of the expected meteorological conditions at an aerodrome during a specified period; it shall include surface wind, visibility, weather and cloud and expected significant changes to one or more of these elements during the period.

6.2.3 **Recommendation.—** *Additional elements should be included in aerodrome forecasts for local dissemination as agreed between the meteorological authority and the operators concerned.*

6.2.4 Meteorological offices preparing aerodrome forecasts shall keep the forecasts under continuous review and, when necessary, shall issue amendments promptly. The length of the forecast messages and the number of changes indicated in the forecast shall be kept to a minimum.

6.2.5 **Recommendation.—** *The criteria used for the inclusion of change groups in aerodrome forecasts or for the amendment of aerodrome forecasts should be based on the following:*

a) when the surface wind is forecast to change through values of operational significance the threshold values should be established by the meteorological authority in consultation with the appropriate ATS authority and operators concerned, taking into account changes in the wind which would:

1) require a change in runway(s) in use; and

2) indicate that the runway tailwind and crosswind components will change through values representing the main operating limits for typical aircraft operating at the aerodrome;

b) when the visibility is forecast to change to or pass through:

1) 150, 350, 600, 800, 1 500 or 3 000 m;

2) 5 000 m in cases where significant numbers of flights are operated in accordance with the visual flight rules;

c) when any of the following weather phenomena or combinations thereof are forecast to begin or end or change in intensity:

- *freezing precipitation*
- *freezing fog*
- *moderate or heavy precipitation (including showers thereof)*
- *low drifting dust, sand or snow*
- *blowing dust, sand or snow (including snowstorm)*
- *duststorm*
- *sandstorm*
- *thunderstorm (with or without precipitation)*
- *squall*
- *funnel cloud (tornado or waterspout)*
- *other weather phenomena given in 4.8.4 only if they are expected to cause a significant change in visibility;*

d) when the height of base of the lowest layer or mass of cloud of BKN or OVC extent is forecast to change to or pass through:

1) 30, 60, 150 or 300 m (100, 200, 500 or 1 000 ft); or

2) 450 m (1 500 ft), in cases where significant numbers of flights are operated in accordance with the visual flight rules;

EXAMPLES OF AERODROME FORECASTS

a) TAF for YUDO (Donlon/International):*

TAF YUDO 160000Z 160624 13018KMH 9000 BKN020 BECMG 0608 SCT015CB BKN020 TEMPO 0812 17025G40KMH 1000 TSRA SCT010CB BKN020 FM1230 15015KMH 9999 BKN020 BKN100

b) Abbreviated plain-language aerodrome forecast (for same location and weather conditions):

FCST YUDO 160000Z 16 06/24 130/18KMH VIS 9KM BKN 600M BECMG 06/08 SCT CB 450M BKN 600M TEMPO 08/12 170/25 KMH MAX40 VIS 1000M MOD TSRA SCT CB 300M BKN 600M FM1230 150/15KMH 10KM BKN 600M BKN 3000M

c) Meanings of both forecasts:

Aerodrome forecast for Donlon/International* issued on the 16th of the month at 0000UTC valid from 0600 UTC to 2400 UTC on the 16th of the month; surface wind direction 130 degrees; wind speed 18 kilometres per hour; visibility 9 kilometres, broken cloud at 600 metres; becoming between 0600 UTC and 0800 UTC, scattered cumulonimbus cloud at 450 metres and broken cloud at 600 metres; temporarily between 0800 UTC and 1200 UTC surface wind direction 170 degrees; wind speed 25 kilometres per hour gusting to 40 kilometres per hour; visibility 1 000 metres in a moderate thunderstorm with rain, scattered cumulonimbus cloud at 300 metres and broken cloud at 600 metres; from 1230 UTC surface wind direction 150 degrees; wind speed 15 kilometres per hour; visibility 10 km or more; broken cloud at 600 metres and broken cloud at 3 000 metres.

* Fictitious location

Note.— In this example, the primary units "kilometre per hour" and "metre" were used for wind speed and height of cloud base respectively. However, in accordance with Annex 5, the corresponding non-SI alternative units "knot" and "foot" may be used instead.

e) when the amount of a layer or mass of cloud below 450 m (1 500 ft) is forecast to change:

1) from SKC, FEW or SCT to BKN or OVC; or

2) from BKN or OVC to SKC, FEW or SCT;

f) when cumulonimbus clouds are forecast to develop or dissipate;

g) when the vertical visibility is forecast to change to or pass through 30, 60, 150 or 300 m (100, 200, 500 or 1 000 ft);

h) any other criteria based on local aerodrome operating minima, as agreed between the meteorological authority and the operators, including those concerned under 6.2.3.

6.2.6 **Recommendation.—** *The period of validity of routine aerodrome forecasts should be not less than 9 hours nor more than 24 hours; this period should be determined by regional air navigation agreement. The period of validity should be subdivided, as necessary, in accordance with 6.2.15. Routine aerodrome forecasts valid for less than 12 hours should be issued every 3 hours and those valid for 12 to 24 hours should be issued every 6 hours.*

6.2.7 **Recommendation.—** *Aerodrome forecasts and amendments to aerodrome forecasts which are disseminated locally should be in the form prescribed for the exchange of such information between meteorological offices, or in another form as agreed locally.*

6.2.8 Aerodrome forecasts and amendments thereto which are exchanged between meteorological offices shall be:

a) in the TAF code form prescribed by the World Meteorological Organization;

b) in abbreviated plain language; or

c) in teletypewriter characters and symbols, the significance of which has been agreed upon by the meteorological authorities concerned.

Note.— The TAF code form is contained in WMO Publication No. 306, Manual on Codes, *Volume I.*

6.2.9 **Recommendation.—** *Aerodrome forecasts should be exchanged in the TAF code form except as otherwise determined by regional air navigation agreement, or by agreement between the meteorological authorities concerned.*

6.2.10 **Recommendation.—** *Aerodrome forecasts in the TAF code form should contain all information for which the* *code provides except that the optional groups should be used in accordance with regional air navigation agreement or agreement between the meteorological authorities concerned.*

6.2.11 **Recommendation.—** *When a change in any of the elements given in 6.2.2 is required to be indicated in accordance with the criteria given in 6.2.5, the change indicators "BECMG" or "TEMPO" should be used followed by the time period during which the change is expected to occur. The time period should be indicated as the beginning and end of the period in whole hours UTC, for example, "BECMG 0608" (TAF code form) or "BECMG 06/08" (abbreviated plain language). Only those elements for which a significant change is expected should be included following a change indicator. However, in the case of significant changes in respect of cloud, all cloud groups, including layers or masses not expected to change, should be indicated.*

6.2.12 **Recommendation.—** *The change indicator "BECMG" and the associated time group should be used to describe changes where the meteorological conditions are expected to reach or pass through specified threshold values at a regular or irregular rate and at an unspecified time during the time period. The time period should normally not exceed 2 hours but in any case should not exceed 4 hours.*

6.2.13 **Recommendation.—** *The change indicator "TEMPO" and the associated time group should be used to describe expected frequent or infrequent temporary fluctuations in the meteorological conditions which reach or pass specified threshold values and last for a period of less than one hour in each instance and, in the aggregate, cover less than one-half of the forecast period during which the fluctuations are expected to occur, for example, "TEMPO 1214" (TAF code form) or "TEMPO 12/14" (abbreviated plain language). If the temporary fluctuation is expected to last one hour or longer, the change group "BECMG" should be used in accordance with 6.2.12 or the validity period should be subdivided in accordance with 6.2.15.*

6.2.14 **Recommendation.—** *The probability of occurrence of an alternative value of a forecast element or elements should be indicated, as necessary, by use of the abbreviation "PROB" followed by the probability in tens of per cent and the time period during which the alternative value(s) is (are) expected to apply. The probability information should be placed after the element or elements forecast and be followed by the alternative value of the element or elements in the form, "1500 PROB30 1214 0800 FG" (TAF code form) or "VIS 1500M PROB30 12/14 800M FG" (abbreviated plain language). The probability of a forecast of temporary fluctuations in meteorological conditions should be indicated, as necessary, by use of the abbreviation "PROB" followed by the probability in tens of per cent, placed before the change indicator "TEMPO" and associated time group, in the form "PROB40 TEMPO 1517" (TAF code form) or "PROB40 TEMPO 15/17" (abbreviated plain language). A probability of an alternative value or change of less than 30 per cent should not be considered sufficiently significant to be indicated. A probability of an alternative value or change of 50 per cent or more, for aviation purposes, should not be considered a probability but instead should be indicated, as necessary, by use of the change indicators "BECMG" or "TEMPO" or by sub-division of the validity period using the abbreviation "FM". The probability group should not be used to qualify the change indicator "BECMG" nor the time indicator "FM".*

6.2.15 **Recommendation.—** *Where one set of prevailing weather conditions is expected to change significantly and more or less completely to a different set of conditions, the period of validity should be subdivided into self-contained periods using the abbreviation "FM" followed immediately by a four-figure time group in whole hours and minutes UTC indicating the time the change is expected to occur, for example, "FM1800" (in both TAF code form and abbreviated plain language). The subdivided period following the abbreviation "FM" should be self-contained and all forecast conditions given before the abbreviation should be superseded by those following the abbreviation.*

6.2.16 **Recommendation.—** *In forecasting surface wind, the expected prevailing direction should be given. When it is not possible to forecast a prevailing surface wind direction due to its expected variability, for example, during light wind conditions (6 km/h (3 kt) or less) or thunderstorms, the forecast wind direction should be indicated by use of the abbreviation "VRB". When the wind is forecast to be calm this should be indicated by the term "CALM".*

6.2.17 **Recommendation.—** *When the visibility is forecast to be less than 500 m it should be expressed in steps of 50 m in the form "0350" (TAF code form) or "VIS 350M" (abbreviated plain language); when it is forecast to be 500 m or more but less than 5 km in steps of 100 m; 5 km or more but less than 10 km in kilometre steps in the form "7000" (TAF code form) or "VIS 7KM" (abbreviated plain language) and when it is forecast to be 10 km or more it should be expressed as 10 km except when conditions of CAVOK are forecast to apply. When visibility is forecast to vary in different directions the lowest forecast visibility should be given.*

Note.— Guidance on operationally desirable accuracy of forecasts of visibility is given in Attachment E.

6.2.18 **Recommendation.—** *The following weather phenomena or combinations thereof, their characteristics and, where appropriate, intensity should be forecast if they are expected to occur at the aerodrome:*

- *— freezing precipitation*
- *— freezing fog*
- *— moderate or heavy precipitation (including showers thereof)*
- *— low drifting dust, sand or snow*
- *— blowing dust, sand or snow (including snowstorm)*
- *— duststorm*

— sandstorm
— thunderstorm (with or without precipitation)
— squall
— funnel cloud (tornado or waterspout)
— other weather phenomena given in 4.8.4 only if they are expected to cause a significant change in visibility.

For example, moderate rain should be indicated in the form "BECMG 1214 RA" (in the TAF code form) or "BECMG 12/14 MOD RA" (in abbreviated plain language). The expected end of occurrence of those phenomena should be indicated by the abbreviation "NSW", in the form, for example, "BECMG 1618 NSW" (TAF code form) or "BECMG 16/18 NSW" (abbreviated plain language).

6.2.19 **Recommendation.—** *Cloud amount should be forecast using the abbreviations "FEW", "SCT", "BKN" or "OVC" as necessary. If no clouds are forecast, and the abbreviation "CAVOK" is not appropriate, the abbreviation "SKC" should be used. When it is expected that the sky will remain or become obscured and clouds cannot be forecast and information on vertical visibility is available at the aerodrome, the vertical visibility should be forecast in the form "VER VIS" followed by the forecast value of the vertical visibility and the units used. When several layers or masses of cloud are forecast, their amount and height of base should be included in the following order:*

a) the lowest layer or mass regardless of amount, to be forecast as FEW, SCT, BKN or OVC as appropriate;

b) the next layer or mass covering more than 2/8, to be forecast as SCT, BKN or OVC as appropriate;

c) the next higher layer or mass covering more than 4/8 to be forecast as BKN or OVC as appropriate; and

d) cumulonimbus clouds whenever forecast and not already included under a) to c) above.

When so determined by regional air navigation agreement, cloud information should be limited to cloud of operational significance, i.e. cloud below 1 500 m (5 000 ft) or the highest minimum sector altitude whichever is greater, and cumulonimbus whenever forecast. In applying this limitation, when no cumulonimbus and no cloud below 1 500 m (5 000 ft) or below the highest minimum sector altitude whichever is greater are forecast, and "CAVOK" or "SKC" are not appropriate, the abbreviation "NSC" should be used.

6.2.20 **Recommendation.—** *An aerodrome forecast in abbreviated plain language should be identified as "FCST" and an amendment thereto as "AMD FCST". The date the period of validity of the forecast begins should be indicated by two figures. The period of validity of the forecast should be given in a time group indicating the beginning and the end of that period by two figures each, separated by "/"; for example, a period of validity from 1200 UTC on the 3rd of the month to 2100 UTC should be given as "03 12/21".*

6.2.21 **Recommendation.—** *The order of the elements and the terminology, units and scales used in aerodrome forecasts in abbreviated plain language should be the same as those used in routine and special reports for the same aerodrome. Changes and probabilities should be indicated in such forecasts by means of the same abbreviations as are used in forecasts for the same aerodrome prepared in the TAF code form.*

6.3 Landing forecasts

6.3.1 A landing forecast shall be prepared by the meteorological office designated by the meteorological authority concerned; such forecasts are intended to meet requirements of local users and of aircraft within about one hour's flying time from the aerodrome.

6.3.2 **Recommendation.—** *Landing forecasts should be prepared either in the form of a self-contained forecast or in the form of a trend-type forecast, as determined by regional air navigation agreement.*

6.3.3 A self-contained landing forecast shall consist of a concise statement of the expected meteorological conditions at the aerodrome concerned and it shall contain any or all of the elements surface wind, visibility, significant weather and cloud. Other significant information shall be included as agreed between the meteorological authority and the operator concerned. The period of validity of a self-contained landing forecast shall not exceed 2 hours from the time of issue.

6.3.4 A trend-type landing forecast shall consist of a routine, special or selected special report for an aerodrome to which is appended a concise statement of the expected trend of the meteorological conditions at that aerodrome. The period of validity of a trend-type landing forecast shall be 2 hours from the time of the report which forms part of the landing forecast. The trend-type landing forecast shall indicate significant changes in respect of one or more of the elements surface wind, visibility, weather and cloud. Only those elements shall be included for which a significant change is expected. However, in the case of significant changes in respect of cloud, all cloud groups, including layers or masses not expected to change, shall be indicated. In the case of a significant change in visibility, the phenomenon causing the reduction of visibility shall also be indicated. When no change is expected to occur, this shall be indicated by the term "NOSIG", in both the METAR code form and the abbreviated plain-language version.

6.3.5 **Recommendation.—** *Elements other than surface wind, visibility, weather and cloud should, if so agreed between the meteorological authority and the operator concerned, be included in a trend-type landing forecast.*

6.3.6 When a change is expected to occur, the trend part of the trend-type forecast message shall begin with one of the change indicators "BECMG" or "TEMPO".

6.3.7 The change indicator "BECMG" shall be used to describe forecast changes where the meteorological conditions are expected to reach or pass through specified values at a regular or irregular rate. The period during which, or the time at which, the change is forecast to occur shall be indicated, using the abbreviations "FM", "TL", or "AT", as appropriate, each followed by a time group in hours and minutes. When the change is forecast to begin and end wholly within the trend forecast period, the beginning and end of the change shall be indicated by using the abbreviations "FM" and "TL" respectively with their associated time groups, for example, for a trend forecast period from 1000 to 1200 UTC in the form, "BECMG FM1030 TL1130" (in both METAR code form and abbreviated plain language). When the change is forecast to commence at the beginning of the trend forecast period but be completed before the end of that period, the abbreviation "FM" and its associated time group shall be omitted and only "TL" and its associated time group shall be used, for example "BECMG TL1100" (in both METAR code form and abbreviated plain language). When the change is forecast to begin during the trend forecast period and be completed at the end of that period, the abbreviation "TL" and its associated time group shall be omitted and only "FM" and its associated time group shall be used, for example "BECMG FM1100" (in both METAR code form and abbreviated plain language). When the change is forecast to occur at a specified time during the trend forecast period, the abbreviation "AT" followed by its associated time group shall be used, for example "BECMG AT1100" (in both METAR code form and abbreviated plain language). When the change is forecast to commence at the beginning of the trend forecast period and be completed by the end of that period or when the change is forecast to occur within the trend forecast period but the time is uncertain, the abbreviations "FM", "TL" or "AT" and their associated time groups shall be omitted and the change indicator "BECMG" shall be used alone.

6.3.8 The change indicator "TEMPO" shall be used to describe forecast temporary fluctuations in the meteorological conditions which reach or pass specified values and last for a period of less than one hour in each instance and, in the aggregate, cover less than one-half of the period during which the fluctuations are forecast to occur. The period during which the temporary fluctuations are forecast to occur shall be indicated, using the abbreviations "FM" and/or "TL", as appropriate, each followed by a time group in hours and minutes. When the period of temporary fluctuations in the meteorological conditions is forecast to begin and end wholly within the trend forecast period, the beginning and end of the period of temporary fluctuations shall be indicated by using the abbreviations "FM" and "TL" respectively with their associated time groups, for example, for a trend forecast period from 1000 to 1200 UTC in the form "TEMPO FM1030 TL1130" (in both METAR code form and abbreviated plain language). When the period of temporary fluctuations is forecast to commence at the beginning of the trend forecast period but cease before the end of that period, the abbreviation "FM" and its associated time group shall be omitted and only "TL" and its associated time group shall be used, for example, "TEMPO TL1130" (in both METAR code form and abbreviated plain language). When the period of temporary fluctuations is forecast to begin during the trend forecast period and cease by the end of that period, the abbreviation "TL" and its associated time group shall be omitted and only "FM" and its associated time group shall be used, for example "TEMPO FM1030" (in both METAR code form and abbreviated plain language). When the period of temporary fluctuations is forecast to commence at the beginning of the trend forecast period and cease by the end of that period, both abbreviations "FM" and "TL" and their associated time groups shall be omitted and the change indicator "TEMPO" shall be used alone.

6.3.9 The indicator "PROB" shall not be used in trend-type landing forecasts.

6.3.10 The trend part of the trend-type landing forecast shall indicate changes in the surface wind which involve:

a) a change in the mean wind direction of 60° or more, the mean speed before and/or after the change being 20 km/h (10 kt) or more;

b) a change in mean wind speed of 20 km/h (10 kt) or more;

c) changes in the wind through values of operational significance. The threshold values should be established by the meteorological authority in consultation with the appropriate ATS authority and operators concerned, taking into account changes in the wind which would:

1) require a change in runway(s) in use; and

2) indicate that the runway tailwind and crosswind components will change through values representing the main operating limits for typical aircraft operating at the aerodrome.

For example, an expected temporary surface wind from 250° at 70 km/h (35 kt) with maximum speeds (gusts) to 100 km/h (50 kt) throughout the period of the trend forecast shall be indicated in the form "TEMPO 25035G50KT" or "TEMPO 25070G100KMH" (METAR code form) and "TEMPO 250/35KT MAX50" or "TEMPO 250/70KMH MAX100" (abbreviated plain language).

6.3.11 When the visibility is expected to change to or pass any one of the values 150, 350, 600, 800, 1 500 or 3 000 m, the trend part of the trend-type landing forecast shall indicate the change. When significant numbers of flights are conducted in accordance with the visual flight rules, the forecast shall additionally indicate changes to or passing 5 000 m. For example, a temporary reduction throughout the period of the trend forecast of the visibility to 750 m in fog shall be rounded down to 700 m and indicated in the form "TEMPO 0700" (METAR code form) or "TEMPO VIS 700M" (abbreviated plain language).

6.3.12 The trend part of the trend-type landing forecast shall indicate the expected onset, cessation or change in intensity of the following weather phenomena or combinations thereof:

- — freezing precipitation
- — freezing fog
- — moderate or heavy precipitation (including showers thereof)
- — low drifting dust, sand or snow
- — blowing dust, sand or snow (including snowstorm)
- — duststorm
- — sandstorm
- — thunderstorm (with or without precipitation)
- — squall
- — funnel cloud (tornado or waterspout)
- — other weather phenomena given in 4.8.4 only if they are expected to cause a significant change in visibility.

For example, forecast temporary moderate freezing rain between 0300 and 0430 UTC shall be indicated in the form "TEMPO FM0300 TL0430 FZRA" (METAR code form) and "TEMPO FM0300 TL0430 MOD FZRA" (abbreviated plain language). The expected end of occurrence of those phenomena shall be indicated by the abbreviation "NSW". For example, an expected cessation at 1630 UTC , of significant weather, such as a thunderstorm, shall be indicated in the form "BECMG AT1630 NSW" (in both METAR code form and abbreviated plain language).

6.3.13 When the height of the base of a cloud layer of BKN or OVC extent is below, is expected to fall below or rise above 450 m (1 500 ft), the trend part of the trend-type landing forecast shall indicate changes to or passing any one of the following values: 30, 60, 150, 300 and 450 m (100, 200, 500, 1 000 and 1 500 ft). When the height of the base of a cloud layer is below, is expected to fall below or rise above 450 m (1 500 ft), the trend part of the trend-type landing forecast shall also indicate changes in cloud amount from SKC, FEW, or SCT increasing to BKN or OVC, or changes from BKN or OVC decreasing to SKC, FEW or SCT, for example a forecast rapid increase in stratus cloud at 1130 UTC from SCT to OVC shall be indicated in the form "BECMG AT1130 OVC010" (METAR code form) or "BECMG AT 1130 OVC 300M" (abbreviated plain language). When no cumulonimbus and no cloud below 1 500 m (5 000 ft) or below the highest minimum sector altitude whichever is greater are forecast, and "CAVOK" and "SKC" are not appropriate, the abbreviation "NSC" shall be used.

6.3.14 When the sky is expected to remain or become obscured and vertical visibility observations are available at the aerodrome, the trend part of the trend-type landing forecast shall indicate changes in vertical visibility to or passing any one of the following values: 30, 60, 150 or 300 m (100, 200, 500 or 1 000 ft).

6.3.15 Criteria for the indication of changes based on local aerodrome operating minima, additional to those specified in 6.3.10 to 6.3.14, shall be used as agreed between the meteorological authority and the operator(s) concerned.

6.3.16 The order of the elements and the terminology, units and scales used in the trend part of the trend-type landing forecast shall be the same as those used in the report to which it is appended.

6.4 Forecasts for take-off

6.4.1 A forecast for take-off shall be prepared by the meteorological office designated by the meteorological authority concerned.

6.4.2 **Recommendation.—** *A forecast for take-off should refer to a specified period of time and should contain information on expected conditions over the runway complex in regard to surface wind direction and speed and any variations thereof, temperature, pressure (QNH), and any other elements as agreed locally.*

6.4.3 **Recommendation.—** *A forecast for take-off should be supplied to operators and flight crew members on request within the 3 hours before the expected time of departure.*

6.4.4 **Recommendation.—** *The format of the forecast should be as agreed between the meteorological authority and the operator concerned. The order of the elements and the terminology, units and scales used in forecasts for take-off should be the same as those used in reports for the same aerodrome.*

6.4.5 **Recommendation.—** *Meteorological offices preparing forecasts for take-off should keep the forecasts under continuous review and, when necessary, should issue amendments promptly. The criteria for the issuance of amendments for forecasts for take-off for surface wind direction and speed, temperature and pressure and any other elements agreed locally should be agreed between the meteorological authority and the operators concerned. The criteria should be consistent with the corresponding criteria for special reports established for the aerodrome in accordance with 4.3.1.*

6.5 Area and route forecasts, other than forecasts issued by regional area forecast centres

Note.— Provisions concerning forecasts issued within the framework of the world area forecast system are contained in Chapter 3.

6.5.1 Area and route forecasts shall contain upper winds, upper-air temperatures, significant en-route weather phenomena and associated clouds. Other elements may be added as required. This information shall cover the flight operations for which they are intended in respect of time, altitude and geographical extent.

6.5.2 **Recommendation.—** *When the density of traffic operating below flight level 100 warrants the routine issue and dissemination of area forecasts for such operations, the frequency of issue and the fixed time or period of validity of those forecasts should be determined by the meteorological authority in consultation with the users.*

6.5.3 Meteorological offices preparing area and route forecasts shall keep the forecasts under continuous review and issue amendments as necessary.

6.5.4 A list of criteria to be used for amendments to area and route forecasts shall be established by the meteorological authority, in consultation with operators and other users concerned.

6.5.5 **Recommendation.—** *The list of criteria should call for the issue of amendments to area and route forecasts when the following changes are expected:*

Upper wind	*Change in direction of 30° or more, provided the wind speed is 60 km/h (30 kt) or more before or after the change; change in speed of 40 km/h (20 kt) or more.*
Upper-air temperatures	*Change of more than 5°C.*
Aircraft icing and turbulence	*New expectation; intensity increasing; intensity decreasing from severe to light or from moderate to nil.*
Other significant en-route weather phenomena	*New expectation; no longer expected.*

6.5.6 Area and route forecasts, and amendments thereto, disseminated locally, shall be in one of the forms prescribed for the exchange of such information between meteorological offices or in another form as agreed locally.

6.5.7 Area and route forecasts and amendments thereto which are exchanged between meteorological offices in a code form prescribed by the World Meteorological Organization shall be in the ARFOR, WINTEM or ROFOR code form.

Note.— The ARFOR, WINTEM and ROFOR code forms are contained in WMO Publication No. 306, Manual on Codes, *Volume I.*

6.5.8 **Recommendation.—** *The order of the elements in area and route forecasts (or amendments thereto) in abbreviated plain language should normally follow that of the corresponding coded form of message. The terminology and units employed should be consistent with those used in the related aerodrome reports and forecasts. The identifier employed should be "AREA FCST" or "ROUTE FCST" respectively, preceded in the case of amendments by "AMD". The CAVOK procedure applied in aerodrome forecasts should not be used in area and route forecasts.*

6.6 Area forecasts for low-level flights to support issuance of AIRMET information

6.6.1 When the density of traffic operating below flight level 100 warrants the issuance of AIRMET information in accordance with 7.3.1, area forecasts for such operations shall be exchanged between meteorological offices responsible for the issuance of flight documentation for low-level flights in the flight information regions concerned.

6.6.2 Area forecasts for low-level flights exchanged between meteorological offices in support of the issuance of AIRMET information shall be prepared in a format agreed upon between the meteorological authorities concerned. When abbreviated plain language is used, the forecast shall be prepared as a GAMET area forecast, employing approved ICAO abbreviations and numerical values. The area forecasts shall be issued to cover the layer between the ground and flight level 100 (or up to flight level 150 in mountainous areas) and shall contain information on en-route weather phenomena hazardous to low-level flights. The area forecasts shall contain the following information as necessary and, when prepared in GAMET format, in the order indicated:

a) location indicator of the air traffic services unit serving the flight information region(s) to which the area forecast for low-level flights refers; for example, "YUCC";

b) message identification using the abbreviation "GAMET";

c) date-time groups indicating the period of validity in UTC; for example, "VALID 220600/221200";

d) location indicator of the meteorological office originating the message, followed by a hyphen to separate the preamble from the text; for example, "YUDO-";

e) on the next line, name of the flight information region, or a sub-area thereof, for which the area forecast for low-level flights is issued; for example "AMSWELL FIR/2";

f) widespread mean surface wind speed exceeding 60 km/h (30 kt); for example, "SFC WSPD: 10/12 65 KMH";

g) widespread areas of surface visibility below 5 000 m; for example, "SFC VIS: 06/08 N OF 51 DEG N 3000 M";

h) significant weather, i.e. thunderstorms and heavy sand- and duststorm (except for phenomena for which a SIGMET message has already been issued); for example, "SIGWX: 11/12 ISOL TS";

i) mountain obscuration; for example, "MT OBSC: MT PASSES S OF 48 DEG N OBSC";

j) widespread areas of broken or overcast cloud with height of base less than 300 m (1 000 ft) above ground level and/or any occurrence of cumulonimbus (CB) clouds without thunderstorm; for example, "CLD: 06/09 OVC 800 FT N OF 51 DEG N";

k) icing (except for that occurring in convective clouds and for severe icing for which a SIGMET message has already been issued); for example, "ICE: MOD FL050/080";

l) turbulence (except for that occurring in convective clouds and for severe turbulence for which a SIGMET message has already been issued); for example, "TURB: MOD ABV FL090";

m) mountain wave (except for severe mountain wave for which a SIGMET message has already been issued); for example, "MTW: MOD ABV FL080 E OF 63 DEG N";

n) SIGMET messages applicable to the FIR concerned or the sub-area thereof, for which the area forecast is valid; for example, "SIGMET APPLICABLE: 3,5".

Each of the items f) to n) shall, when applicable, be included in the GAMET area forecast beginning on a new line. Items for which no hazardous phenomenon is expected to occur, or which are already covered by a SIGMET message, shall be omitted from the area forecast. When no weather phenomena hazardous to low-level flights occur and no SIGMET information is applicable, the term "HAZARDOUS WX NIL" shall replace all items listed under f) to n). When a weather phenomenon hazardous to low-level flights has been included in the GAMET area forecast and the phenomenon forecast does not occur, or is no longer forecast, a GAMET AMD shall be issued, amending only the weather element concerned.

Note.— Specifications regarding the issuance of AIRMET information amending the area forecast in respect of weather phenomena hazardous for low-level flights are given in 7.3.1.

6.6.3 Area forecasts for low-level flights exchanged between meteorological offices in support of the issuance of AIRMET information shall be issued every 6 hours for a period of validity of 6 hours and transmitted to meteorological offices concerned not later than one hour prior to the beginning of their validity period.

Note.— The requirements for flight documentation for low-level flights are stated in 9.6.3 and 9.8.3.

EXAMPLE OF GAMET AREA FORECAST

YUCC GAMET VALID 220600/221200 YUDO-
AMSWELL FIR/2
SFC WSPD: 10/12 65 KMH
SFC VIS: 06/08 N OF 51 DEG N 3000 M
SIGWX: 11/12 ISOL TS
CLD: 06/09 OVC 800 FT N OF 51 DEG N
ICE: MOD FL050/080
TURB: MOD ABV FL090
SIGMETS APPLICABLE: 3,5

Meaning: An area forecast for low-level flights (GAMET) issued for sub-area two of the Amswell* flight information region (identified by YUCC Amswell area control centre) by the Donlon/International* meteorological office (YUDO); the message is valid from 0600 UTC to 1200 UTC on the 22nd of the month; surface wind speeds: between 1000 UTC and 1200 UTC 65 kilometres per hour; surface visibility: between 0600 UTC and 0800 UTC 3 000 metres north of 51 degrees north; significant weather phenomena: between 1100 UTC and 1200 UTC isolated thunderstorms without hail; clouds: between 0600 UTC and 0900 UTC overcast at 800 feet above ground level north of 51 degrees north; icing: moderate between flight level 050 and 080; turbulence: moderate above flight level 090 (at least up to flight level 100); SIGMET messages 3 and 5 applicable to the validity period and sub-area concerned.

* Fictitious locations

CHAPTER 7. SIGMET AND AIRMET INFORMATION, AERODROME WARNINGS AND WIND SHEAR WARNINGS

7.1 SIGMET information — general provisions

7.1.1 SIGMET information shall be issued by a meteorological watch office and shall give a concise description in abbreviated plain language concerning the occurrence and/or expected occurrence of specified en-route weather phenomena, which may affect the safety of aircraft operations, and of the development of those phenomena in time and space. The information shall be indicated using one of the following as appropriate:

a) at subsonic cruising levels:

thunderstorm	
— obscured	OBSC TS
— embedded	EMBD TS
— frequent	FRQ TS
— squall line	SQL TS
— obscured with heavy hail	OBSC TS HVYGR
— embedded with heavy hail	EMBD TS HVYGR
— frequent, with heavy hail	FRQ TS HVYGR
— squall line with heavy hail	SQL TS HVYGR
tropical cyclone	
— tropical cyclone with 10-minute mean surface wind speed of 63 km/h (34 kt) or more	TC (+ cyclone name)
turbulence	
— severe turbulence	SEV TURB
icing	
— severe icing	SEV ICE
— severe icing due to freezing rain	SEV ICE (FZRA)
mountain wave	
— severe mountain wave	SEV MTW
duststorm	
— heavy duststorm	HVY DS
sandstorm	
— heavy sandstorm	HVY SS
volcanic ash	
— volcanic ash	VA (+ volcano name, if known)

b) at transonic levels and supersonic cruising levels:

turbulence	
— moderate turbulence	MOD TURB
— severe turbulence	SEV TURB
cumulonimbus	
— isolated cumulonimbus	ISOL CB
— occasional cumulonimbus	OCNL CB
— frequent cumulonimbus	FRQ CB
hail	
— hail	GR
volcanic ash	
— volcanic ash	VA (+ volcano name, if known)

Note.— Guidance on the preparation of SIGMET messages is given in Attachment F.

7.1.2 SIGMET information shall not contain unnecessary descriptive material. In describing the weather phenomena for which the SIGMET is issued, no descriptive material additional to that given in 7.1.1 shall be included. SIGMET information concerning thunderstorms or a tropical cyclone shall not include references to associated turbulence and icing. However, the occurrence of heavy hail with thunderstorm shall be indicated.

7.1.3 SIGMET information shall be cancelled when the phenomena are no longer occurring or are no longer expected to occur in the area.

7.2 Format and exchange of SIGMET messages

7.2.1 A SIGMET message shall contain the following information as necessary and in the order indicated:

a) location indicator of the air traffic services unit serving the flight information region or control area to which the SIGMET message refers; for example, "YUCC";

Note.— In cases where the airspace is divided into a flight information region (FIR) and an upper flight information region (UIR), the SIGMET is identified by the location indicator of the air traffic services unit serving the FIR; nevertheless, the SIGMET message applies to the whole airspace within the lateral limits of

EXAMPLE OF SIGMET MESSAGE

YUCC SIGMET 5 VALID 221215/221600 YUDO-
AMSWELL FIR SEV TURB OBS AT 1210 YUSB FL250 MOV E 40 KMH WKN

Meaning: The fifth SIGMET message issued for the AMSWELL* flight information region (identified in abbreviated plain language and by YUCC Amswell area control centre) by the Donlon/International* meteorological watch office (YUDO) since 0001 UTC; the message is valid from 1215 UTC to 1600 UTC on the 22nd of the month; severe turbulence was observed at 1210 UTC over Siby/Bistock* aerodrome (YUSB) at flight level 250; the turbulence is expected to move eastwards at 40 kilometres per hour and to weaken in intensity.

* Fictitious locations

the FIR, i.e. to the FIR and to the UIR. The particular areas and/or flight levels affected by the meteorological phenomena causing the issuance of the SIGMET are given in the text of the message.

b) message identification and sequence number; for example, "SIGMET 5";

Note.— The sequence of SIGMET messages may be indicated by figures or a combination of figures and letters.

c) date-time groups indicating the period of validity in UTC; for example, "VALID 221215/221600";

d) location indicator of the meteorological watch office originating the message followed by a hyphen to separate the preamble from the text; for example, "YUDO-";

e) on the next line, name of the flight information region or control area for which the SIGMET is issued; for example, "AMSWELL FIR";

f) phenomenon and description of the phenomenon causing the issuance of the SIGMET taken, as appropriate, from the list given in 7.1.1; for example, "FRQ TS";

g) indication whether the information is observed and expected to continue, using the abbreviation "OBS" and where relevant the time of observation in UTC, or forecast using the abbreviation "FCST";

h) location (referring, where possible, to latitude and longitude and/or locations or geographic features well known internationally) and level; for example, "FCST TOPS FL390 S OF 54 DEGN" or "SIBY/BISTOK AT FL250";

i) movement or expected movement with reference to one of the eight points of compass given in kilometres per hour or knots, or stationary; for example, "MOV E 40 KMH";

j) changes in intensity; using, as appropriate, the abbreviations "INTSF", "WKN" or "NC";

k) on the next line, an outlook providing information beyond the period of validity specified under c) above, of the trajectory of the volcanic ash cloud and positions of the tropical cyclone centre; for example,

YUCC SIGMET 3 VALID 251600/252200 YUDO-
AMSWELL FIR TC GLORIA OBS 27.1N 73.1W AT 1600 UTC FRQ TS TOPS FL500 WI 150 NM OF CENTRE MOV NW 10KT NC
OTLK TC CENTRE 260400 28.5N 74.5W 261000 31.0N 76.0W

7.2.2 SIGMET messages shall be prepared in abbreviated plain language, using approved ICAO abbreviations and numerical values of self-explanatory nature supplemented, if suitable approved abbreviations are not available, by the vocabulary of a national language, taken with its usual meaning in aviation.

7.2.3 Messages containing SIGMET information for subsonic aircraft shall be identified as "SIGMET", those containing SIGMET information for supersonic aircraft during transonic or supersonic flight shall be identified as "SIGMET SST".

7.2.4 The sequence number referred to in 7.2.1 b) shall correspond with the number of SIGMET messages issued for the flight information region since 0001 UTC on the day concerned. Separate series of sequence numbers shall be used for "SIGMET" and "SIGMET SST" messages.

7.2.5 **Recommendation.—** *The period of validity of a SIGMET message should be not more than 6 hours, and preferably not more than 4 hours. It should be indicated by the term "VALID" followed by date-time groups indicating the beginning and the end of that period in six figures each, separated by "/"; for example, a period of validity from 1215 UTC to 1600 UTC on the 22nd day of the month should be given as "VALID 221215/221600".*

7.2.6 **Recommendation.—** *In the special case of SIGMET messages for volcanic ash cloud and tropical cyclones, an outlook should be included giving information for* *up to 12 hours beyond the period of validity specified in 7.2.5, concerning the trajectory of the volcanic ash cloud and positions of the tropical cyclone centre.*

7.2.7 **Recommendation.—** *The outlook included in SIGMET messages in accordance with 7.2.6 concerning volcanic ash cloud and tropical cyclones should be based, where possible, on advisory information provided by meteorological centres designated by regional air navigation agreement.*

7.2.8 **Recommendation.—** *A SIGMET message relating to the expected occurrence of weather phenomena listed in 7.1.1, with the exception of volcanic ash cloud and tropical cyclones, should be issued not more than 6 hours, and preferably not more than 4 hours, before the expected time of occurrence of that phenomenon. SIGMET messages concerning volcanic ash cloud or tropical cyclones expected to affect a flight information region should be issued up to 12 hours before the commencement of the period of validity or as soon as practicable if such advance warning of the existence of these phenomena is not available. SIGMET messages for volcanic ash and tropical cyclones should be updated at least every 6 hours.*

7.2.9 **Recommendation.—** *SIGMET messages should be disseminated to meteorological watch offices, WAFCs and, as appropriate, RAFCs and to other meteorological offices, in accordance with regional air navigation agreement.*

7.3 AIRMET information

7.3.1 AIRMET information shall be issued by a meteorological watch office in accordance with regional air navigation agreement, taking into account the density of air traffic operating below flight level 100. AIRMET information shall give a concise description in abbreviated plain language concerning the occurrence and/or expected occurrence of specified en-route weather phenomena, which have not been included in the area forecast for low-level flights issued in accordance with Section 6.6 and which may affect the safety of low-level flights, and of the development of those phenomena in time and space. The information shall be indicated using one of the following as appropriate:

At cruising levels below flight level 100 (or below flight level 150 in mountainous areas):

surface wind speed	
— widespread mean surface wind speed above 60 km/h (30 kt)	SFC WSPD (+ wind speed and units)
surface visibility	
— widespread areas affected by reduction of visibility to less than 5 000 m	SFC VIS (+ visibility)
thunderstorms	
— isolated thunderstorms without hail	ISOL TS
— occasional thunderstorms without hail	OCNL TS
— isolated thunderstorms with hail	ISOL TSGR
— occasional thunderstorms with hail	OCNL TSGR
mountain obscuration	
— mountains obscured	MT OBSC
cloud	
— widespread areas of broken or overcast cloud with height of base less than 300 m (1 000 ft) above ground level:	
— broken	BKN CLD (+ height of the base and units)
— overcast	OVC CLD (+ height of the base and units)
— cumulonimbus clouds without thunderstorm which are:	
— isolated	ISOL CB
— occasional	OCNL CB
— frequent	FRQ CB
icing	
— moderate icing (except for icing in convective clouds)	MOD ICE
turbulence	
— moderate turbulence (except for turbulence in convective clouds)	MOD TURB
mountain wave	
— moderate mountain wave	MOD MTW

Note.— Guidance on the preparation of AIRMET messages is given in Attachment F.

7.3.2 AIRMET information shall not contain unnecessary descriptive material. In describing the weather phenomena for which the AIRMET is issued, no descriptive material additional to that given in 7.3.1 shall be included. AIRMET information concerning thunderstorms or cumulonimbus clouds shall not include references to associated turbulence and icing. However, the occurrence of hail with thunderstorms shall be indicated.

Note.— The specifications for SIGMET information which is also applicable to low-level flights are given in 7.1.1.

7.3.3 AIRMET information shall be cancelled when the phenomena are no longer occurring or are no longer expected to occur in the area.

7.4 Format and exchange of AIRMET messages

7.4.1 An AIRMET message shall contain the following information, as necessary, and in the order indicated:

a) location indicator of the air traffic services unit serving the flight information region or control area to which the AIRMET message refers; for example, "YUCC";

b) message identification and sequence number; for example, "AIRMET 2";

c) date-time groups indicating the period of validity in UTC; for example, "VALID 221215/221600";

d) location indicator of the meteorological watch office originating the message followed by a hyphen to separate the preamble from the text; for example, "YUDO-";

e) on the next line, name of the flight information region or a sub-area thereof for which the AIRMET is issued; for example, "AMSWELL FIR";

f) phenomenon and description of the phenomenon causing the issuance of the AIRMET taken, as appropriate, from the list given in 7.3.1; for example, "MOD MTW";

g) indication whether the information is observed and expected to continue, using the abbreviation "OBS" and where relevant the time of observation in UTC, or forecast using the abbreviation "FCST";

h) location (referring, where possible, to latitude and longitude and/or locations or geographic features well known internationally) and level; for example, "OBS 48 DEG N 10 DEG E AT FL080";

i) movement or expected movement with reference to one of the eight points of compass given in kilometres per hour or knots, or stationary; for example, "STNR";

j) changes in intensity; using, as appropriate, the abbreviations "INTSF", "WKN" or "NC".

7.4.2 AIRMET messages shall be prepared in abbreviated plain language, using approved ICAO abbreviations and numerical values.

7.4.3 The sequence number referred to in 7.4.1 b) shall correspond with the number of AIRMET messages issued for the flight information region since 0001 UTC on the day concerned.

7.4.4 **Recommendation.**— *The period of validity of an AIRMET message should be not more than 6 hours, and preferably not more than 4 hours. It should be indicated by the term "VALID" followed by date-time groups indicating the beginning and the end of that period in six figures each, separated by "/"; for example, a period of validity from 1215 UTC to 1600 UTC on the 22nd day of the month should be given as "VALID 221215/221600".*

7.4.5 **Recommendation.**— *AIRMET messages should be disseminated to meteorological watch offices in adjacent flight information regions and to other meteorological offices, as agreed by the meteorological authorities concerned.*

7.5 Aerodrome warnings

7.5.1 Aerodrome warnings shall give concise information, in plain language, of meteorological conditions which could adversely affect aircraft on the ground, including parked aircraft, and the aerodrome facilities and services. The warnings shall be issued in accordance with local arrangements to operators, aerodrome services and to others concerned, by the meteorological office designated to provide service for that aerodrome.

EXAMPLE OF AIRMET MESSAGE

YUCC AIRMET 2 VALID 221215/221600 YUDO-
AMSWELL FIR MOD MTW OBS AT 1205 48 DEG N 10 DEG E AT FL080 STNR NC

Meaning: The second AIRMET message issued for the AMSWELL* flight information region (identified in abbreviated plain language and by YUCC Amswell area control centre) by the Donlon/International* meteorological watch office (YUDO) since 0001 UTC; the message is valid from 1215 UTC to 1600 UTC on the 22nd of the month; moderate mountain wave was observed at 1205 UTC at 48 degrees north and 10 degrees east at flight level 080; the mountain wave is expected to remain stationary and not to undergo any changes in intensity.

* Fictitious locations

7.5.2 **Recommendation.**— *Aerodrome warnings should relate to the occurrence or expected occurrence of one or more of the following phenomena:*

- *tropical cyclone*
- *thunderstorm*
- *hail*
- *snow*
- *freezing precipitation*
- *hoar frost or rime*
- *sandstorm*
- *duststorm*

— *rising sand or dust*
— *strong surface wind and gusts*
— *squall*
— *frost.*

7.5.3 **Recommendation.—** *When quantitative criteria are necessary for the issue of aerodrome warnings covering, for example, the expected maximum wind speed or the expected total snowfall, the criteria should be established by agreement between the meteorological office and the users of the warnings.*

7.6 Wind shear warnings

7.6.1 Wind shear warnings shall give concise information of the observed or expected existence of wind shear which could adversely affect aircraft on the approach path or take-off path or during circling approach between runway level and 500 m (1 600 ft) above that level and aircraft on the runway during the landing roll or take-off run. The warnings shall be prepared and disseminated for aerodromes where wind shear is considered a factor in accordance with local arrangements with the appropriate ATS authority and operators concerned and by the meteorological office designated to provide service for the aerodrome or disseminated directly from automated ground-based wind shear remote sensing or detection equipment referred to in 7.6.2 a) and b). Where local topography has been shown to produce significant wind shears at heights in excess of 500 m (1 600 ft) above runway level, then 500 m (1 600 ft) shall not be considered restrictive..

Note 1.— Wind shear conditions are normally associated with the following phenomena:

— *thunderstorms, microbursts, funnel cloud (tornado or waterspout), and gust fronts*
— *frontal surfaces*
— *strong surface winds coupled with local topography*
— *sea breeze fronts*
— *mountain waves (including low-level rotors in the terminal area)*
— *low-level temperature inversions.*

Note 2.— Guidance on the subject of wind shear is contained in the ICAO Circular Wind Shear *(Circ 186).*

Note 3.— Information on wind shear is also to be included as supplementary information in routine, special and selected special reports in accordance with 4.12.5 and 4.12.7.

7.6.2 **Recommendation.—** *Evidence of the existence of wind shear should be derived from:*

a) ground-based wind shear remote-sensing equipment, for example, Doppler radar;

b) ground-based wind shear detection equipment, for example, a system of surface wind and/or pressure sensors located in an array monitoring a specific runway or runways and associated approach and departure paths;

c) aircraft observations during the climb-out or approach phases of flight to be made in accordance with Chapter 5, 5.5.2; or

d) other meteorological information, for example, from appropriate sensors located on existing masts or towers in the vicinity of the aerodrome or nearby areas of high ground.

7.6.3 **Recommendation.—** *Wind shear warnings should be prepared in abbreviated plain language. Wind shear in the approach area should be reported, for example, as "WS WRNG SURFACE WIND 320/20KMH WIND AT 60M 360/50KMH IN APCH" or "WS WRNG SURFACE WIND 320/10KT WIND AT 60M 360/25KT IN APCH". Where microbursts are observed, reported by pilots or detected by ground-based wind shear detection or remote-sensing equipment, the wind shear warning should include a specific reference to microburst, for example, "WS WRNG MBST APCH RWY 26".*

7.6.4 **Recommendation.—** *Where information from ground-based wind shear detection or remote-sensing equipment is used to prepare a wind shear warning, the warning should, if practicable, relate to specific sections of the runway and distances along the approach path or take-off path as agreed between the meteorological authority, the appropriate ATS authority and the operators concerned, for example, "WS WRNG 30KT AIRSPEED LOSS 2NM FINAL RWY 13" or "WS WRNG 60KMH AIRSPEED LOSS 4KM FINAL RWY 13".*

7.6.5 **Recommendation.—** *When an aircraft report is used to prepare a wind shear warning, or to confirm a warning previously issued, the corresponding aircraft report, including the aircraft type, should be given unchanged in the warning, for example, "WS WRNG B747 REPORTED MOD WS IN APCH RWY 34 AT 1510".*

Note 1.— Following reported encounters by both arriving and departing aircraft two different wind shear warnings may exist, one for arriving aircraft and one for departing aircraft.

Note 2.— Specifications for reporting the intensity of wind shear are still undergoing development. It is recognized, however, that pilots, when reporting wind shear, may use the qualifying terms "moderate", "strong" or "severe", based to a large extent on their subjective assessment of the intensity of the wind shear encountered. In accordance with 7.6.5, such reports are to be incorporated unchanged in wind shear warnings.

7.6.6 **Recommendation.—** *Wind shear warnings for arriving aircraft and/or departing aircraft should be cancelled when aircraft reports indicate that wind shear no longer exists, or alternatively, after an agreed elapsed time. The criteria for the cancellation of a wind shear warning should be defined locally for each aerodrome, as agreed between the meteorological authority, the appropriate ATS authority and the operators concerned.*

CHAPTER 8. AERONAUTICAL CLIMATOLOGICAL INFORMATION

8.1 General provisions

Note.— In cases where it is impracticable to meet the requirements for aeronautical climatological information on a national basis, the collection, processing and storage of observational data may be effected through computer facilities available for international use, and the responsibility for the preparation of the required aeronautical climatological information may be delegated by agreement between the meteorological authorities concerned.

8.1.1 Aeronautical climatological information required for the planning of flight operations shall be prepared in the form of aerodrome climatological tables and aerodrome climatological summaries. Such information shall be supplied to aeronautical users as agreed between the meteorological authority and those users.

Note.— Climatological data required for aerodrome planning purposes are set out in Annex 14, Volume I, 3.1.3 and Attachment A.

8.1.2 **Recommendation.—** *Aeronautical climatological information should normally be based on observations made over a period of at least five years and the period should be indicated in the information supplied.*

8.1.3 **Recommendation.—** *Aeronautical climatological information should be exchanged on request between meteorological authorities. Operators and other aeronautical users desiring such information should normally apply to the meteorological authority responsible for its preparation.*

8.1.4 **Recommendation.—** *Meteorological observations for regular and alternate aerodromes should be collected, processed and stored in a form suitable for the preparation of aerodrome climatological information.*

8.1.5 **Recommendation.—** *Climatological data related to sites for new aerodromes and to additional runways at existing aerodromes should be collected starting as early as possible before the commissioning of those aerodromes or runways.*

8.2 Aerodrome climatological tables

8.2.1 **Recommendation.—** *Each Contracting State should make arrangements for collecting and retaining the necessary observational data and have the capability:*

a) to prepare aerodrome climatological tables for each regular and alternate international aerodrome within its territory; and

b) to make available such climatological tables to an aeronautical user within a time period as agreed between the meteorological authority and that user.

8.2.2 **Recommendation.—** *An aerodrome climatological table should give as applicable:*

a) mean values and variations therefrom, including maximum and minimum values, of meteorological elements (for example, of air temperature); and/or

b) the frequency of occurrence of present weather phenomena affecting flight operations at the aerodrome (for example, of sandstorms); and/or

c) the frequency of occurrence of specified values of one, or of a combination of two or more, elements (for example, of a combination of low visibility and low cloud).

8.2.3 **Recommendation.—** *Aerodrome climatological tables should include information required for the preparation of aerodrome climatological summaries in accordance with 8.3.2.*

8.3 Aerodrome climatological summaries

8.3.1 **Recommendation.—** *Aerodrome climatological summaries should follow the procedures prescribed by the World Meteorological Organization. Where computer facilities are available to store, process and retrieve the information, the summaries should be published, or otherwise made available to aeronautical users on request. Where such computer facilities are not available, the summaries should be prepared using the models specified by the World Meteorological Organization, and should be published and kept up to date as necessary.*

8.3.2 **Recommendation.—** *Aerodrome climatological summaries should cover:*

a) frequencies of the occurrence of runway visual range/visibility and/or height of the base of the lowest cloud layer of BKN or OVC extent below specified values at specified times;

b) frequencies of visibility below specified values at specified times;

c) frequencies of the height of the base of the lowest cloud layer of BKN or OVC extent below specified values at specified times;

d) frequencies of occurrence of concurrent wind direction and speed within specified ranges;

e) frequencies of surface temperature in specified ranges of 5°C at specified times; and *f) mean values and variations therefrom, including maximum and minimum values of meteorological elements required for operational planning purposes, including take-off performance calculations.*

Note.— Models of climatological summaries related to a) to e) above are given in WMO Publication No. 49, Technical Regulations, *Vol. II, C.3.2.*

8.4 Copies of meteorological observational data

Each meteorological authority, on request and to the extent practicable, shall make available to any other meteorological authority, to operators and to others concerned with the application of meteorology to international air navigation, meteorological observational data required for research, investigation or operational analysis.

CHAPTER 9. SERVICE FOR OPERATORS AND FLIGHT CREW MEMBERS

9.1 General provisions

9.1.1 Meteorological information shall be supplied to operators and flight crew members for:

a) pre-flight planning by operators;

b) use by flight crew members before departure;

c) aircraft in flight.

9.1.2 Meteorological information supplied to operators and flight crew members shall cover the flight in respect of time, altitude and geographical extent. Accordingly, the information shall relate to appropriate fixed times, or periods of time, and shall extend to that aerodrome of intended landing at which new information is to be supplied. On request, or whenever conditions impose doubt as to the practicability of landing at that aerodrome, additional information shall be included, covering the meteorological conditions expected between the aerodrome of intended landing and one alternate aerodrome designated by the operator. In addition, if agreed between the meteorological authority and the operator, information up to a further aerodrome may be supplied.

9.1.3 Meteorological information supplied to operators and flight crew members shall include upper winds and upper-air temperatures, significant en-route weather phenomena, meteorological reports, aerodrome forecasts, forecasts for take-off, landing forecasts, SIGMET information and those special air-reports not covered by a SIGMET and AIRMET information, which are available at the meteorological office and which are relevant to the planned flight operations.

9.1.4 Meteorological information supplied to operators and flight crew members shall include forecasts for the aerodrome of departure and for the aerodrome of intended landing. On request, forecasts shall also be supplied for one or more suitable en-route and destination alternate aerodromes as required by the operator to complete the operational flight plan.

9.1.5 **Recommendation.—** *Aerodrome forecasts additional to those referred to in 9.1.4 which may be required by an operator should be supplied, if available, by agreement between the meteorological authority and the operator.*

9.1.6 **Recommendation.—** *Meteorological information supplied to operators and flight crew members should include reports for the aerodrome of departure, take-off and en-route alternate aerodromes, the aerodrome of intended landing and destination alternate aerodromes located within 2 hours' flying time of the aerodrome of departure, but with possible exceptions for certain routes and operations, such as extended range operations and flights conducted under centralized operational control, as determined by regional air navigation agreement. Additional relevant reports should be supplied if available. Where such information is provided in the form of bulletins of reports, the time of observation indicated in the bulletin heading should be retained. In cases where a new bulletin to meet particular operational needs is compiled from reports taken from other bulletins, the time of observation of each report should be clearly identified, either in the new bulletin heading or as part of the individual reports.*

9.1.7 **Recommendation.—** *On request by the operator, the meteorological information supplied for flight planning should include data for the determination of the lowest usable flight level.*

9.1.8 Where necessary, the meteorological authority of the State providing service for operators and flight crew members shall initiate co-ordinating action with the meteorological authorities of other States with a view to obtaining from them the reports and/or forecasts required.

9.1.9 Meteorological information shall be supplied to operators and flight crew members by one or more of the following, as agreed between the meteorological authority and operator concerned, and with the order shown below not implying priorities:

a) written or printed material, including specified charts and forms;

b) grid point data in digital form;

c) briefing;

d) consultation;

e) display.

9.1.10 The meteorological authority, in consultation with the operator, shall determine:

a) the type and format of meteorological information to be supplied;

b) methods and means of supplying that information.

9.1.11 Meteorological information shall be supplied to operators and flight crew members at the location to be determined by the meteorological authority, after consultation with the operators and at the time to be agreed upon between the meteorological office and the operator concerned. The service shall normally be confined to flights originating within the territory of the State concerned, unless otherwise agreed between the meteorological authority and the operator concerned. At an aerodrome without a meteorological office, arrangements for the supply of meteorological information shall be as agreed upon between the meteorological authority and the operator concerned.

9.2 Information for pre-flight planning by operators

9.2.1 Meteorological information for pre-flight planning by operators shall include any or all of the following information, as required:

a) current and forecast upper winds, upper-air temperatures, tropopause heights and maximum wind information;

b) existing and expected significant en-route weather phenomena and jetstream information;

c) a forecast for take-off;

d) aerodrome reports and aerodrome forecasts.

9.2.2 **Recommendation.—** *Meteorological information for pre-flight planning by operators for supersonic aircraft should include data covering the levels used for transonic and supersonic flight, together with the levels that may be used for subsonic flight. Particular mention should be made of occurrence and expected occurrence, location and vertical extent of cumulonimbus clouds, turbulence and precipitation.*

9.2.3 **Recommendation.—** *Meteorological information for pre-flight planning by operators of helicopters flying to off-shore structures should include data covering the layers from sea-level to flight level 100. Particular mention should be made of the expected surface visibility, the amount, type (where available), base and tops of cloud below flight level 100, sea state and sea surface temperature, mean sea-level pressure, and the occurrence and expected occurrence of turbulence and icing, as determined by regional air navigation agreement.*

9.2.4 When upper-air information is supplied in chart form, it shall consist of charts for standard isobaric surfaces and/or other types of upper-air charts as applicable.

9.2.5 **Recommendation.—** *The upper wind and upper-air temperature information and the significant en-route weather information requested for pre-flight planning by the operator should normally be supplied as soon as it becomes available, but not later than 3 hours before departure. Other meteorological information requested for pre-flight planning by the operator should normally be supplied as soon as is practicable.*

9.2.6 **Recommendation.—** *Whenever it becomes apparent that the meteorological information to be included in the flight documentation will differ materially from that made available for pre-flight planning, the operator should be advised immediately and, if practicable, be supplied with the revised information.*

9.3 Briefing, consultation and display

9.3.1 Briefing and/or consultation shall be provided, on request, to flight crew members and/or other flight operations personnel. Its purpose shall be to supply the latest available information on existing and expected meteorological conditions along the route to be flown, at the aerodrome of intended landing, alternate aerodromes and other aerodromes as relevant, either to explain and amplify the information contained in the flight documentation or, if so agreed between the meteorological authority and the operator, in lieu of flight documentation.

9.3.2 Meteorological information used for briefing and consultation shall include any or all of the following, as required:

a) current and forecast upper winds, upper-air temperatures, tropopause heights and maximum wind information;

b) existing and expected significant en-route weather phenomena and jetstream information;

c) a forecast for take-off;

d) aerodrome reports and aerodrome forecasts.

9.3.3 **Recommendation.—** *Briefing and/or consultation for flight crew members of supersonic aircraft should include meteorological information covering the flight levels of transonic and supersonic flight. Particular mention should be made of occurrence and expected occurrence, location and vertical extent of cumulonimbus clouds, turbulence and precipitation.*

9.3.4 **Recommendation.—** *Briefing and/or consultation for low-level flights, including those in accordance with the visual flight rules, should include meteorological information covering altitudes up to flight level 100. Particular mention should be made of the occurrence or expected occurrence of precipitation, fog and other phenomena causing widespread reduction of visibility to less than 5 000 m, as well as the occurrence or expected occurrence of clouds which may affect the flight.*

9.3.5 If the meteorological office expresses an opinion on the development of the meteorological conditions at an aerodrome which differs appreciably from the aerodrome forecast included in the flight documentation, the attention of flight crew members shall be drawn to the divergence. The portion of the briefing dealing with the divergence shall be recorded at the time of briefing and this record shall be made available to the operator.

9.3.6 The required briefing, consultation, display and/or flight documentation shall normally be provided by the meteorological office associated with the aerodrome of departure. At an aerodrome where these services are not available, arrangements to meet the requirements of flight crew members shall be as agreed upon between the meteorological authority and the operator concerned. In exceptional circumstances, such as an undue delay, the meteorological office associated with the aerodrome shall provide or, if that is not practicable, arrange for the provision of a new briefing, consultation and/or flight documentation as necessary.

9.3.7 **Recommendation.—** *The flight crew member or other flight operations personnel for whom briefing, consultation and/or flight documentation has been requested should visit the meteorological office at the time agreed upon between the meteorological office and the operator concerned. Where local circumstances at an aerodrome make personal briefing or consultation impracticable, the meteorological office should provide those services by telephone or other suitable telecommunications facilities.*

9.3.8 To assist the flight crew members and others concerned with the preparation of the flight and for use in briefing and consultation, the meteorological office shall display the latest available:

a) routine and selected special reports;

b) aerodrome and landing forecasts;

c) aerodrome warnings relating to the local aerodrome;

d) forecasts for take-off;

e) SIGMET and AIRMET information and special air-reports not covered by a SIGMET;

f) current and prognostic charts;

g) meteorological satellite photographs or mosaics and/or nephanalyses;

h) ground-based weather radar information.

9.3.9 **Recommendation.—** *The material displayed should be readily accessible to the flight crew members or other flight operations personnel concerned. By agreement between the meteorological authority and the user, the display may be used in lieu of briefing and/or consultation.*

9.4 Flight documentation — general

9.4.1 **Recommendation.—** *Flight documentation for flights of more than two hours' duration should comprise information on:*

a) upper winds and upper-air temperatures;

b) expected significant en-route weather phenomena and, if relevant, tropopause heights and jetstreams;

c) aerodrome forecasts;

d) aerodrome reports and selected special reports for destination aerodromes and en-route and destination alternate aerodromes for extended range operations and flights conducted under centralized operational control, as determined by regional air navigation agreement;

e) SIGMET information and appropriate special air-reports for a distance corresponding to the first two hours' flying time and SIGMET information for volcanic ash cloud and tropical cyclone related to the whole route;

Note.— Appropriate special air-reports will be those not already used in preparation of SIGMET messages.

f) AIRMET information for low-level flights.

9.4.2 **Recommendation.—** *Flight documentation for flights of two hours' duration or less should comprise information on:*

a) upper winds and upper-air temperatures;

b) expected significant en-route weather phenomena and, if relevant, tropopause heights and jetstreams;

c) aerodrome forecasts;

d) aerodrome reports, selected special reports, SIGMET information and appropriate special air-reports;

Note.— Appropriate special air-reports will be those not already used in the preparation of SIGMET messages.

e) AIRMET information for low-level flights.

However, in accordance with regional air navigation agreement, or in the absence thereof when agreed between the meteorological authority and operator concerned, flight documentation for flights after a short intermediate stop or turnaround may be limited to the information operationally needed but in all cases the flight documentation should at least comprise information on c), d) and, if appropriate, e).

9.4.3 **Recommendation.—** *Meteorological offices should, as far as practicable, provide information received within the framework of the world area forecast system for flight documentation. The flight documentation should be presented in the form of charts, tabular forms, or abbreviated plain-language texts. Aerodrome forecasts should be presented in the TAF code, or in abbreviated plain-language text using a tabular presentation.*

Note.— Models of charts and forms for use in the preparation of flight documentation are given in the Appendix. These models and methods for their completion are developed by the World Meteorological Organization on the basis of relevant operational requirements stated by the International Civil Aviation Organization.

9.4.4 **Recommendation.—** *Charts included in flight documentation should have a high standard of clarity and legibility and should have the following physical characteristics:*

a) for convenience, the largest size of charts should be about 42 x 30 cm (standard size A3) and the smallest size should be about 21 x 30 cm (standard size A4). The choice between these sizes should depend on the route lengths and the amount of detail that needs to be given in the charts as agreed between meteorological authorities and users;

b) major geographical features, such as coastlines, major rivers and lakes should be depicted in a way that makes them easily recognizable;

c) for charts prepared by computer, meteorological data should take preference over basic chart information, the former cancelling the latter wherever they overlap;

d) major aerodromes should be shown as a dot and identified by the first letter of the name of the city the aerodrome serves as given in Table AOP of the relevant regional air navigation plan;

e) a geographical grid should be shown with meridians and parallels represented by dotted lines at each 10° latitude and longitude; dots should be spaced one degree apart;

f) latitude and longitude values should be indicated at various points throughout the charts (i.e. not only at the edges);

g) labels on the charts should be clear and simple and should present the name of the regional area forecast centre, the type of chart, date and valid time and if necessary the types of units used in an unambiguous way.

9.4.5 **Recommendation.—** *Meteorological information included in flight documentation should be represented as follows:*

a) winds on charts should be depicted by arrows with feathers and shaded pennants on a sufficiently dense grid;

b) temperatures should be depicted by figures on a sufficiently dense grid;

c) wind and temperature data selected from the data sets received from a world area forecast centre should be depicted in a sufficiently dense latitude/longitude grid; and

d) wind arrows should take precedence over temperatures and either should take precedence over chart background.

9.4.6 **Recommendation.—** *For short-haul flights charts should be prepared covering limited areas at a scale of 1:15 x 10^6 as required and subject to regional air navigation agreement.*

9.4.7 **Recommendation.—** *The minimum number of charts for flights between flight level 250 and flight level 450 should include a high-level significant weather chart (flight level 250 to flight level 450) and a forecast 250 hPa wind and temperature chart. The actual charts provided for pre-flight and in-flight planning and for flight documentation should be as agreed between meteorological authorities and other users and the appropriate regional area forecast centre(s) concerned within a service area.*

9.4.8 **Recommendation.—** *The set of charts to be provided under the area forecast system for flights below flight level 250 and for flights above flight level 450 including supersonic flights should be as agreed between user States and other users and the regional area forecast centre concerned within a service area.*

9.4.9 **Recommendation.—** *Flight documentation should normally be supplied as shortly before departure as is practicable.*

9.4.10 **Recommendation.—** *Whenever necessary and possible, the flight documentation should be brought up to date, in writing or orally, before it is supplied to flight crew members. In cases where a need for amendment arises after the flight documentation has been supplied, and before take-off of the aircraft, the meteorological office should, as agreed locally, issue the necessary amendment or updated information to the operator or to the local air traffic services unit, for transmission to the aircraft.*

9.4.11 **Recommendation.—** *In flight documentation height indications should be given as follows:*

a) all references to en-route meteorological conditions, such as height indications of upper winds, turbulence or bases and tops of clouds, should preferably be expressed *in flight levels; they may also be expressed in pressure-altitude, pressure, altitude or, for low-level flights, height above ground level;*

b) all references to aerodrome meteorological conditions, such as height indications of the bases of clouds, should be expressed in height above the aerodrome elevation.

9.4.12 **Recommendation.—** *The forms and charts included in flight documentation should be printed in English, French, Russian or Spanish; they should, wherever practicable, be completed in the language requested by the operator, preferably using one of those languages. Where appropriate, approved abbreviations should be used. The units employed for each element should be indicated; they should normally be those employed by the meteorological authority concerned.*

9.4.13 The meteorological authority shall retain a copy of the written or printed flight documentation, including charts and specified forms, supplied to flight crew members, for a period of at least 30 days from the date of issue. This information shall be made available, on request, for inquiries or investigations and, for these purposes, shall be retained until the inquiry or investigation is completed.

9.5 Flight documentation — upper wind and upper-air temperature information

9.5.1 Where upper wind and upper-air temperature information is supplied in chart form to flight crew members before departure, the charts shall be fixed time prognostic charts for standard isobaric surfaces. In tropical areas, or for short flights, current charts may be provided in lieu of prognostic charts; in such cases, the levels depicted shall correspond to the standard isobaric levels.

9.5.2 **Recommendation.—** *Where upper wind and upper-air temperature information is supplied in tabular form, it should include data for the same flight levels as for upper-air charts. This information should be given for spot locations on a regular grid.*

Note.— Examples of the form of presentation of tabular forecasts of upper winds and upper-air temperatures are given in the Appendix.

9.6 Flight documentation — significant weather charts

9.6.1 Where information on significant en-route weather phenomena is supplied in chart form to flight crew members before departure, the charts shall be significant weather charts valid for a specified fixed time. Such charts shall show, as appropriate to the flight:

a) thunderstorms;

b) tropical cyclone;

c) severe squall lines;

d) moderate or severe turbulence (in cloud or clear air);

e) moderate or severe icing;

f) widespread sandstorm/duststorm;

g) for flight level 100 to flight level 250, clouds associated with a) to f) above;

h) above flight level 250, cumulonimbus cloud associated with a) to f) above;

i) surface position of well-defined convergence zones;

j) surface positions, speed and direction of movement of frontal systems;

k) tropopause heights;

l) jetstreams; and

m) information on the location of volcanic eruptions which are producing ash clouds of significance to aircraft operations, name of volcano and time of first eruption, if known, and a reminder to users that reference should be made to SIGMETs issued for the area concerned.

Note 1.— For aircraft operating above flight level 250, items a) to f) are only required if expected to be above that level.

Note 2.— Thunderstorms shown on significant weather charts should include those which warrant the issuance of a SIGMET as given in 7.1.1 a).

Note 3.— The abbreviation "CB" should only be included where it refers to the occurrence or expected occurrence of an area of widespread cumulonimbus clouds or cumulonimbus along a line with little or no space between individual clouds, or to cumulonimbus embedded in cloud layers or concealed by haze. It does not refer to isolated or scattered cumulonimbus not embedded in cloud layers or concealed by haze.

Note 4.— Frontal systems should be included only when associated with significant en-route weather phenomena.

9.6.2 **Recommendation.—** *On significant weather charts, the inclusion of "CB" or the thunderstorm symbol should be understood to include all weather phenomena normally associated with cumulonimbus or thunderstorm, namely, moderate or severe icing, moderate or severe turbulence and hail.*

9.6.3 **Recommendation.—** *Significant weather charts for low-level flights, including those in accordance with the visual flight rules, operating up to flight level 100 should show, as appropriate to the flight:*

a) fronts and convergence zones and their expected movement;

b) areas and levels affected by thunderstorm, tropical cyclone, squall line, hail, moderate or severe turbulence in cloud or in clear air, mountain waves and associated downdrafts, aircraft icing, freezing precipitation, widespread sandstorm or duststorm, fog, precipitation and other phenomena causing widespread reduction of visibility to less than 5 000 m;

c) cloud amount, type and height indications of bases and tops;

d) surface visibility, if less than 5 000 m;

e) pressure centres and their expected movement;

f) height indication of 0°C level(s) if lower than the top of the airspace for which the forecast is provided;

g) sea-surface temperature and state of the sea if so determined by regional air navigation agreement.

h) information on the location of volcanic eruptions which are producing ash clouds of significance to aircraft operations, name of volcano and time of first eruption, if known, and a reminder to users that reference should be made to SIGMETs issued for the area concerned.

Note.— Examples of the form of presentation of significant weather charts are given in the Appendix.

9.7 Flight documentation — aerodrome forecasts

9.7.1 The flight documentation shall in all cases include the aerodrome forecasts for the aerodrome of departure, and for the aerodrome of intended landing. In addition, the flight documentation shall include aerodrome forecasts for one or more suitable alternate aerodromes, as needed to complete the operational flight plan and as selected by agreement between the meteorological authority and the operators, and taken from the list of aerodromes contained in the relevant regional air navigation plan.

9.7.2 **Recommendation.—** *By agreement between the meteorological authority and the operator the flight documentation should include forecasts for a limited number of alternate aerodromes en route and of aerodromes where intermediate stops are planned. In such cases use should be made of available forecasts for regular aerodromes.*

9.7.3 Aerodrome forecasts received from other meteorological offices shall be included in flight documentation without change in substance.

9.7.4 **Recommendation.—** *When an aerodrome forecast is not received in time, the meteorological office associated with the aerodrome of departure should make all practicable efforts to obtain the forecast but, if unobtainable, the office should, if possible, prepare a provisional forecast. The meteorological office should inform the flight crew member that the forecast is provisional and record its origin in the flight documentation.*

9.7.5 **Recommendation.—** *Aerodrome forecasts should be presented in the TAF code form; they may also be presented in tabular form or in the form of an abbreviated plain-language text. Where presentation in the TAF code form is used, the location indicators and the abbreviations used should be explained in the flight documentation. If several aerodrome forecasts are included in the TAF code form, they should be presented in a manner which permits the ready identification of the beginning and end of each forecast.*

Note.— Examples of the form of presentation of aerodrome forecasts are given in the Appendix.

9.8 Flight documentation — supplementary charts and other forms of presentation

9.8.1 **Recommendation.—** *Where flight documentation covering the significant en-route weather conditions is not supplied in chart form, it should be presented in tabular form and/or as an abbreviated plain-language text.*

Note.— Examples of the form of presentation of tabular forecasts are given in the Appendix.

9.8.2 **Recommendation.—** *Where flight documentation is supplied in the form of an abbreviated plain-language text, it should cover the whole route to be flown. If such documentation covers more than one route, it should permit ready identification by the user of the information relevant to the route to be flown.*

9.8.3 **Recommendation.—** *Flight documentation for low-level flights, including those in accordance with the visual flight rules, should contain the following information as appropriate to the flight and, where the forecasts are issued in the form of an abbreviated plain-language text, in the order indicated:*

a) pressure centres, fronts and convergence zones and their expected movements and developments;

b) significant weather phenomena as specified in 9.6.3 b);

c) cloud amount, type and height indications of bases and tops;

d) surface visibility, if less than 5 000 m;

e) pressure values for altimeter setting, if required;

f) height indication of 0°C level(s), if lower than the top of the airspace for which the forecast is supplied;

g) upper winds and upper-air temperatures for points separated by no more than 500 km (300 NM) and for altitude intervals not exceeding 1 500 m (5 000 ft) up to flight level 100. If available, upper winds and upper-air temperatures should be supplied for altitude intervals not exceeding 900 m (3 000 ft);

h) sea-surface temperature and state of the sea if so determined by regional air navigation agreement;

i) location of volcanic eruptions which are producing ash clouds of significance to aircraft operations, name of volcano and time of first eruption, if known, and a reminder to users that reference should be made to SIGMETs issued for the area concerned;

j) if necessary, a brief general indication (outlook) concerning changes which are expected to occur after the end of the forecast period.

9.9 Information for aircraft in flight

9.9.1 Meteorological information for use by aircraft in flight shall be supplied by a meteorological office to its associated air traffic services unit and through VOLMET broadcasts. Meteorological information for planning by the operator for aircraft in flight shall be supplied on request, as agreed between the meteorological authority or authorities and the operator concerned.

9.9.2 Meteorological information for use by aircraft in flight shall be supplied to air traffic services units in accordance with the specifications of Chapter 10.

9.9.3 **Recommendation.—** *Meteorological information should be supplied through VOLMET broadcasts as determined by regional air navigation agreement, and in accordance with the specifications of Chapter 11.*

9.9.4 **Recommendation.—** *If, in exceptional circumstances, an aircraft in flight requests meteorological information, the meteorological office which receives the request should arrange to supply the information with the assistance, if necessary, of another meteorological office.*

9.9.5 **Recommendation.—** *For supersonic aircraft in flight the meteorological office serving the aerodrome of intended landing should, on request by the operator, supply a forecast covering the transonic deceleration and subsonic descent phases. This forecast should be transmitted to the area control centre or flight information centre concerned within the two hours before arrival. The operator should advise the meteorological office, in good time, of the location of the descent path and of the time at which the aircraft is expected to commence the descent.*

9.9.6 **Recommendation.—** *Meteorological information for planning by the operator for aircraft in flight should be supplied during the period of the flight and should normally consist of any or all of the following:*

a) routine and special reports, aerodrome forecasts and landing forecasts;

b) SIGMET and AIRMET information and special air-reports relevant to the flight, unless the latter have been the subject of a SIGMET message;

c) upper wind and upper-air temperature information.

CHAPTER 10. INFORMATION FOR AIR TRAFFIC SERVICES, SEARCH AND RESCUE SERVICES AND AERONAUTICAL INFORMATION SERVICES

10.1 Information for air traffic services units

10.1.1 The meteorological authority shall designate a meteorological office to be associated with each air traffic services unit. The associated meteorological office shall, after co-ordination with the air traffic services unit, supply, or arrange for the supply of up-to-date meteorological information to the unit as necessary for the conduct of its functions.

10.1.2 **Recommendation.—** *The associated meteorological office for an aerodrome control tower or approach control office should be an aerodrome meteorological office.*

10.1.3 The associated meteorological office for a flight information centre or an area control centre shall be a meteorological watch office.

10.1.4 **Recommendation.—** *Where, owing to local circumstances, it is convenient for the duties of an associated meteorological office to be shared between two or more meteorological offices, the division of responsibility should be determined by the meteorological authority in consultation with the appropriate ATS authority.*

10.1.5 The following meteorological information shall be supplied, as necessary, to an aerodrome control tower by its associated aerodrome meteorological office:

a) routine, special and selected special reports, including current pressure data, aerodrome and landing forecasts and amendments thereto, for the aerodrome concerned;

b) SIGMET and AIRMET information, wind shear warnings and aerodrome warnings;

c) any additional meteorological information agreed upon locally, such as reports for take-off or forecasts of surface wind for the determination of possible runway changes;

d) information received on volcanic ash cloud, for which a SIGMET has not already been issued, as agreed between the meteorological and ATS authorities concerned.

10.1.6 The following meteorological information shall be supplied, as necessary, to an approach control office by its associated aerodrome meteorological office:

a) routine, special and selected special reports, including current pressure data, aerodrome and landing forecasts and amendments thereto for the aerodrome(s) with which the approach control office is concerned;

b) SIGMET and AIRMET information; wind shear warnings and appropriate special air-reports for the airspace with which the approach control office is concerned and aerodrome warnings;

c) any additional meteorological information agreed upon locally, such as reports for landing;

d) information received on volcanic ash cloud, for which a SIGMET has not already been issued, as agreed between the meteorological and ATS authorities concerned.

10.1.7 The following meteorological information shall be supplied, as necessary, to a flight information centre or an area control centre by its associated meteorological watch office:

a) routine reports and selected special reports, including current pressure data for aerodromes and other locations, aerodrome forecasts and landing forecasts and amendments thereto, covering the flight information region or the control area and, if required by the flight information centre or area control centre, covering aerodromes in neighbouring flight information regions, as determined by regional air navigation agreement;

b) forecasts of upper winds, upper-air temperatures and significant en-route weather phenomena and amendments thereto, particularly those which are likely to make operation under visual flight rules impracticable, SIGMET and AIRMET information and appropriate special air-reports for the flight information region or control area and, if determined by regional air navigation agreement and required by the flight information centre or area control centre, for neighbouring flight information regions;

c) any other meteorological information required by the flight information centre or area control centre to meet requests from aircraft in flight; if the information requested is not available in the associated meteorological watch office, that office shall request the assistance of another meteorological office in supplying it;

d) information received on volcanic ash cloud, for which a SIGMET has not already been issued, as agreed between the meteorological and ATS authorities concerned.

10.1.8 Information received on pre-eruption volcanic activity and/or a volcanic eruption shall be supplied, as necessary, to an ATS unit by its corresponding associated meteorological office as agreed between the meteorological and ATS authorities concerned.

10.1.9 Any meteorological information requested by an air traffic services unit in connexion with an aircraft emergency shall be supplied as rapidly as possible.

10.1.10 **Recommendation.—** *The information supplied to flight information centres and area control centres for supersonic aircraft should cover the levels used for transonic and supersonic flight and should include forecasts for subsonic descent paths to aerodromes in the flight information region.*

10.1.11 Where necessary for flight information purposes, current meteorological reports and forecasts shall be supplied to designated aeronautical telecommunication stations. A copy of such information shall be forwarded, if required, to the flight information centre or the area control centre.

10.1.12 **Recommendation.—** *Routine, special and selected special reports, aerodrome and landing forecasts, SIGMET and AIRMET information, upper wind and upper-air temperature forecasts and amendments thereto should be supplied tc air traffic services units in the form in which they are prepared, disseminated to other meteorological offices or received from other meteorological offices, unless otherwise agreed locally.*

10.1.13 **Recommendation.—** *When computer-processed upper-air data for grid points are made available to air traffic services units in digital form for use by air traffic services computers, the contents, format and transmission arrangements should be as agreed between the meteorological authority and the appropriate ATS authority. The data should normally be supplied as soon as is practicable after the processing of the forecasts has been completed.*

10.2 Information for search and rescue services units

10.2.1 Meteorological offices designated by the meteorological authority in accordance with regional air navigation agreement shall supply search and rescue services units with the meteorological information they require in a form established by mutual agreement. For that purpose, the designated meteorological office shall maintain liaison with the search and rescue services unit throughout a search and rescue operation.

10.2.2 Information to be supplied to rescue co-ordination centres shall include the meteorological conditions that existed in the last known position of a missing aircraft and along the intended route of that aircraft with particular reference to:

a) significant en-route weather phenomena;

b) cloud amount and type, particularly cumulonimbus; height indications of bases and tops;

c) visibility and phenomena reducing visibility;

d) surface wind and upper wind;

e) state of ground, in particular, any snow cover or flooding;

f) sea-surface temperature, state of the sea, ice cover if any and ocean currents, if relevant to the search area;

g) sea level pressure data.

10.2.3 **Recommendation.—** *On request from the rescue co-ordination centre, the designated meteorological office should arrange to obtain details of the flight documentation which was supplied to the missing aircraft, together with any amendments to the forecast which were transmitted to the aircraft in flight.*

10.2.4 **Recommendation.—** *To facilitate search and rescue operations the designated meteorological office should, on request, supply:*

a) complete and detailed information on the current and forecast meteorological conditions in the search area;

b) current and forecast conditions en route, covering flights by search aircraft from and returning to the aerodrome from which the search is being conducted.

10.2.5 **Recommendation.—** *On request from the rescue co-ordination centre the designated meteorological office should supply, or arrange for the supply of meteorological information required by ships undertaking search and rescue operations.*

10.3 Information for aeronautical information services units

10.3.1 **Recommendation.—** *The meteorological authority, in co-ordination with the appropriate civil aviation authority, should arrange for the supply of up-to-date meteorological information to relevant aeronautical information services units, as necessary, for the conduct of their functions.*

10.3.2 The following information shall be supplied, as necessary, to an aeronautical information services unit:

a) information on meteorological service for international air navigation, intended for inclusion in the aeronautical information publication(s) concerned;

Note.— Details of this information are given in Annex 15, Aeronautical Information Services, *Appendix 1, Part 1, 3.5 and Part 3, 2.2, 2.11, 3.2 and 3.11.*

b) information necessary for the preparation of NOTAM including, in particular, information on:

1) the establishment, withdrawal and significant changes in operation of aeronautical meteorological services. This information is required to be provided to the aeronautical information services unit sufficiently in advance of the effective date to permit issuance of NOTAM in compliance with Annex 15, 5.1.1 and 5.1.1.1;

2) the occurrence of volcanic activity.

Note.— The specific information required is given in 3.4.2 and 4.15 of this Annex.

c) information necessary for the preparation of aeronautical information circulars including, in particular, information on:

1) expected important changes in aeronautical meteorological procedures, services and facilities provided; and

2) effect of certain weather phenomena on aircraft operations.

CHAPTER 11. REQUIREMENTS FOR AND USE OF COMMUNICATIONS

Note.— It is recognized that it is for each Contracting State to decide upon its own internal organization and responsibility for implementing the communications facilities referred to in this Chapter.

11.1 Requirements for communications

11.1.1 Suitable telecommunications facilities shall be made available to permit aerodrome meteorological offices and, as necessary, aeronautical meteorological stations to supply the required meteorological information to air traffic services units on the aerodromes for which those offices and stations are responsible, and in particular to aerodrome control towers, approach control offices and the aeronautical telecommunications stations serving these aerodromes.

11.1.2 Suitable telecommunications facilities shall be made available to permit meteorological watch offices to supply the required meteorological information to air traffic services and search and rescue services units in respect of the flight information regions, control areas and search and rescue regions for which those offices are responsible, and in particular to flight information centres, area control centres and rescue co-ordination centres and the associated aeronautical telecommunications stations.

11.1.3 Suitable telecommunications facilities shall be made available to permit world and regional area forecast centres to supply the required world area forecast system products to meteorological offices, meteorological authorities and other users.

11.1.4 **Recommendation.—** *The telecommunications facilities used for the supply of world area forecast system products should be:*

a) for world area forecast centres, the aeronautical fixed service; and

b) for regional area forecast centres, the aeronautical fixed service, except as otherwise determined by regional air navigation agreement.

11.1.5 Telecommunications facilities between meteorological offices and, as necessary, aeronautical meteorological stations and aerodrome control towers or approach control offices shall permit communications by direct speech, the speed with which the communications can be established being such that the required points may normally be contacted within approximately 15 seconds.

11.1.6 **Recommendation.—** *Telecommunications facilities between meteorological offices and flight information centres, area control centres, rescue co-ordination centres and aeronautical telecommunications stations should permit:*

a) communications by direct speech, the speed with which the communications can be established being such that the required points may normally be contacted within approximately 15 seconds; and

b) printed communications, when a record is required by the recipients; the message transit time should not exceed 5 minutes.

Note.— In 11.1.5 and 11.1.6 "approximately 15 seconds" refers to telephony communications involving switchboard operation and "5 minutes" refers to printed communications involving retransmission.

11.1.7 **Recommendation.—** *The telecommunications facilities required in accordance with 11.1.5 and 11.1.6 should be supplemented, as and where necessary, by other forms of visual or audio communications, for example, closed-circuit television or separate information processing systems.*

11.1.8 **Recommendation.—** *As agreed between the meteorological authority and operators, provision should be made to enable operators to establish suitable telecommunications facilities for obtaining meteorological information from aerodrome meteorological offices or other appropriate sources.*

11.1.9 Suitable telecommunications facilities shall be made available to permit meteorological offices to exchange operational meteorological information with other meteorological offices.

11.1.10 **Recommendation.—** *The telecommunication facilities used for the exchange of operational meteorological information should be the aeronautical fixed service.*

11.1.11 **Recommendation.—** *Unless otherwise determined by regional air navigation agreement, AFTN messages and bulletins containing operational meteorological information should achieve transit times of less than the following:*

SIGMET messages and special air-reports . . . . 5 minutes

Abbreviated plain-language amendments to significant weather and upper air forecasts . . . . . 5 minutes

Amended aerodrome forecasts and corrections to aerodrome forecasts		*5 minutes*
Aerodrome reports *Trend-type landing forecasts*	*0-900 km (500 NM)*	*5 minutes*
Aerodrome forecasts *Selected special reports*	*more than 900 km (500 NM)*	*10 minutes*
WINTEM messages		*15 minutes*
Abbreviated plain-language significant weather forecast messages		*15 minutes*

11.1.12 **Recommendation.—** *When upper-air data for grid points in digital form are made available for use by air traffic services computers, the transmission arrangements should be as agreed between the meteorological authority and the appropriate ATS authority.*

11.1.13 **Recommendation.—** *When upper-air data for grid points in digital form are made available to operators for flight planning by computer, the transmission arrangements should be as agreed among the world or regional area forecast centre concerned, the meteorological authority and the operators.*

11.2 Use of aeronautical fixed service communications — meteorological bulletins in alphanumeric format

11.2.1 Meteorological bulletins containing operational meteorological information to be transmitted via the aeronautical fixed service shall be originated by the appropriate meteorological office or aeronautical meteorological station.

Note.— Meteorological bulletins containing operational meteorological information authorized for transmission via the aeronautical fixed service are listed in Annex 10, Volume II, Chapter 4, together with the relevant priorities and priority indicators.

11.2.2 **Recommendation.—** *Whenever possible, exchanges of operational meteorological information should be made in consolidated bulletins of the same types of meteorological information.*

11.2.3 **Recommendation.—** *Meteorological bulletins required for scheduled transmissions should be filed regularly and at the prescribed scheduled times. Aerodrome reports should be filed for transmission not later than 5 minutes after the actual time of observation. Aerodrome forecasts should be filed for transmission at least one hour before the commencement of their period of validity, unless otherwise determined by regional air navigation agreement.*

11.2.4 Meteorological bulletins containing operational meteorological information to be transmitted via the aeronautical fixed service facilities shall contain a heading consisting of:

a) an identifier of four letters and two figures;

b) the ICAO four-letter location indicator corresponding to the geographical location of the meteorological office originating or compiling the meteorological bulletin;

c) a date-time group;

d) if required, a three-letter indicator.

Note 1.— Detailed specifications on format and contents of the heading are given in the WMO Manual on the Global Telecommunications System, *Volume I and are reproduced in the ICAO* Manual of Aeronautical Meteorological Practice *(Doc 8896).*

Note 2.— ICAO location indicators are listed in ICAO Doc 7910 — Location Indicators.

11.2.5 Meteorological bulletins containing operational meteorological information to be transmitted via the aeronautical fixed telecommunication network (AFTN) shall be encapsulated in the text part of the AFTN message format.

11.3 Use of aeronautical fixed service communications — world area forecast system products

11.3.1 **Recommendation.—** *World area forecast system products in grid point or chart forms should be transmitted using binary data communications or digital facsimile techniques. The method and channels used for the dissemination of the products should be as determined by regional air navigation agreement.*

11.3.2 **Recommendation.—** *Where world area forecast system products are disseminated in chart form, the quality of the charts received should be such as to permit reproduction in a sufficiently legible form for flight planning and documentation. Charts received should be legible over 95 per cent of their area.*

11.3.3 **Recommendation.—** *Transmissions should be such as to ensure that their interruption should not exceed 10 minutes during any period of 6 hours.*

11.3.4 Meteorological bulletins containing WAFS products in digital form to be transmitted via aeronautical fixed service facilities shall contain a heading as given in 11.2.4.

11.4 Use of aeronautical mobile service communications

11.4.1 The contents and format of reports, forecasts and SIGMET information transmitted to aircraft shall be consistent with the provisions of Chapters 4, 6 and 7 of this Annex.

11.4.2 **Recommendation.—** *The contents and format of air-reports transmitted by aircraft should be consistent with the provisions of Chapter 5 of this Annex and of the* Procedures for Air Navigation Services — Rules of the Air and Air Traffic Services *(PANS-RAC, Doc 4444), Appendix 1.*

11.4.3 The substance of a meteorological bulletin transmitted via the aeronautical mobile service shall remain unchanged from that contained in the bulletin as originated.

11.5 Use of aeronautical broadcasting service — contents of VOLMET broadcasts

11.5.1 Continuous VOLMET broadcasts, normally on very high frequencies (VHF), shall contain current aerodrome weather reports, with trend parts where available.

11.5.2 Scheduled VOLMET broadcasts, normally on high frequencies (HF), shall contain current aerodrome reports, with trend parts where available and, where so determined by regional air navigation agreement, aerodrome forecasts.

11.5.3 **Recommendation.—** *The aerodromes for which reports and forecasts are to be included in VOLMET broadcasts, the sequence in which they are to be transmitted and the broadcast time should be determined by regional air navigation agreement.*

11.5.4 **Recommendation.—** *When a report has not arrived from an aerodrome in time for a broadcast, the latest available report should be included in the broadcast, together with the time of observation.*

11.5.5 **Recommendation.—** *Aerodrome forecasts included in scheduled VOLMET broadcasts should have a period of validity of 9 hours; they should be issued every 3 hours and should, between these routine issues, be amended as necessary to ensure that a forecast, when transmitted, reflects the latest opinion of the meteorological office concerned.*

11.5.6 **Recommendation.—** *SIGMET messages should be included in scheduled VOLMET broadcasts if determined by regional air navigation agreement. Where this is done, the SIGMET message or an indication of "NIL SIGMET" should be transmitted at the beginning of the broadcast or of a five-minute time block.*

11.5.7 **Recommendation.—** *The contents and format of reports, forecasts and SIGMET information included in VOLMET broadcasts should be consistent with the provisions of Chapters 4, 6 and 7 of this Annex, as applicable to bulletins disseminated beyond the aerodrome of origin.*

APPENDIX. FLIGHT DOCUMENTATION — MODEL CHARTS AND FORMS

(See 9.4 to 9.8 of this Annex)

MODEL A1 — Aerodrome forecasts (tabular form)

MODEL A2 — Aerodrome forecasts (TAF code form)

MODEL TA1 — Tabular forecast of en-route conditions

MODEL TA2 — Tabular forecast of en-route conditions

MODEL TB — Tabular forecast of upper winds and upper-air temperatures
Example 1 — Spot locations
Example 2 — Grid mesh (from WINTEM)

MODEL IS — Upper wind and temperature chart for standard isobaric surface
Example 1 — Arrows and feathers (Mercator projection)
Example 2 — Arrows and feathers (Polar stereographic projection)

MODEL SWH — Significant weather chart (high level)
Example 1 — Mercator projection
Example 2 — Polar stereographic projection

MODEL SWM — Significant weather chart (medium level)

MODEL SWL — Significant weather chart (low level)
Example 1
Example 2

MODEL SN — Sheet of notations used in flight documentation

ISSUED BY.......................... METEOROLOGICAL OFFICE (DATE, TIME UTC)............

INTENSITY

" – " (light); no indicator (moderate); " + " [heavy or well-developed in the case of dust/sand whirls (dust devils) and funnel clouds] are used to indicate the forecast intensity of certain phenomena

DESCRIPTORS

MI – shallow
BC – patches
PR – partial
DR – low drifting
BL – blowing
SH – shower(s)
TS – thunderstorm
FZ – freezing (supercooled)

FORECAST WEATHER ABBREVIATIONS

DZ – drizzle
RA – rain
SN – snow
SG – snow grains
IC – ice crystals (diamond dust)
PE – ice pellets
GR – hail
GS – small hail and/or snow pellets
BR – mist
FG – fog
FU – smoke
VA – volcanic ash
DU – widespread dust
SA – sand
HZ – haze
PO – dust/sand whirls (dust devils)
SQ – squall
FC – funnel cloud(s) (tornado or waterspout)
SS – sandstorm
DS – duststorm

EXAMPLES

+SHRA – heavy shower of rain
FZDZ – moderate freezing drizzle
+TSSNGR – heavy thunderstorm with snow and hail
TSSN – moderate thunderstorm with snow
SNRA – moderate snow and rain

Model SN. Sheet of notations used in flight documentation

1. Symbols for significant weather

Thunderstorms	Drizzle
Tropical cyclone	Rain
Severe squall line*	Snow
Moderate turbulence	Shower
Severe turbulence	Widespread blowing snow
Mountain waves	Severe sand or dust haze
Slight aircraft icing	Widespread sandstorm or duststorm
Moderate aircraft icing	Widespread haze
Severe aircraft icing	Widespread mist
Widespread fog	Widespread smoke
Hail	Freezing precipitation **
Volcanic eruption***	

* In flight documentation for flights operating up to FL 100, this symbol refers to "squall line".

** This symbol does not refer to icing due to precipitation coming into contact with an aircraft which is at a very low temperature.

*** The following information referring to the symbol should be included in the side of the chart.
Volcanic eruption
Name of volcano (if known)
Latitude/longitude
Date and time of the first eruption (if known)
Check SIGMETs for volcanic ash

Note — Height indications between which phenomena are expected, top above base as per chart legend.

2. Fronts and convergence zones and other symbols used

Cold front at the surface	Position, speed and level of max. wind (FL 270)
Warm front at the surface	Convergence line
Occluded front at the surface	0°:100 Freezing level
Quasi-stationary front at the surface	Intertropical convergence zone
H 460 Tropopause High	10 State of the sea
270 L Tropopause Low	18 Sea surface temperature
380 Tropopause Level	

FL 300 — FL 340

The double bar denotes changes of level by 3000 ft or less and/or wind speeds by 37 km/h-20 kt. in the example, at the double bar the wind speed is 225 km/h-120kt.

The heavy line delineating the jet axis begins/ends at the points where a wind speed of 150 km/h-80 kt is forecast.

3. Abbreviations used to describe clouds

3.1 Type

CI = Cirrus
CC = Cirrocumulus
CS = Cirrostratus
AC = Altocumulus
AS = Altostratus
NS = Nimbostratus
SC = Stratocumulus
ST = Stratus
CU = Cumulus
CB = Cumulonimbus

3.2 Amount

Clouds except CB
SKC = sky clear (0/8)
FEW = few (1/8 to 2/8)
SCT = scattered (3/8 to 4/8)
BKN = broken (5/8 to 7/8)
OVC = overcast (8/8)

CB only
ISOL = individual CBs (isolated)
OCNL = well-separated CBs (occasional)
FRQ = CBs with little or no separation (frequent)
EMBD = CBs embedded in layers of other clouds or concealed by haze (embedded)

3.3 Heights

Heights are indicated on SWH and SWM charts in flight levels (FL), top over base. When XXX is used, tops or bases are outside the layer of the atmosphere to which the chart applies.
In SWL charts:
i) heights are indicated as altitudes above mean sea level
ii) the abbreviation SFC is used to indicate ground level

4. Depicting of lines and systems on specific charts

4.1 Models SWH and SWM — Significant weather charts (high and medium)

Scalloped line = demarcation of areas of significant weather
Heavy broken line = delineation of area of CAT
Heavy solid line interrupted by wind arrow and flight level = position of jet stream axis with indication of wind direction, speed in kt or km/h and height in flight levels
Figures on arrows = speed in kt or km/h of movements of frontal system
Flight levels inside small rectangles = height in flight levels of tropopause at spot locations, e.g. 340. Low and High points of the tropopause topography are indicated by the letters L or H respectively inside a pentagon with the height in flight levels.

4.2 Model SWL — Significant weather chart (low level)

X = position of pressure centres given in hectopascals
L = centre of low pressure
H = centre of high pressure
Scalloped lines = demarcation of area of significant weather
Dashed lines = altitude of 0°C isotherm in feet (hectofeet) or metres. Note: 0°C level may also be indicated by 0° : 060, i.e. 0°C level is at an altitude of 6000 ft
Figures on arrows = speed in kt or km/h of movement of frontal systems, depressions or anticyclones

Figure inside the state of the sea symbol = total wave height in feet or metres

Figure inside the sea surface temperature symbol = sea surface temperature in °C.

4.3 Arrows and feathers

Arrows indicate direction. Number of pennants and/or feathers correspond to speed.
Example:

270°/115 kt (equivalent to 213 km/h)
Pennants correspond to 50 kt or 93 km/h
Feathers correspond to 10 kt or 18 km/h
Half-feathers correspond to 5 kt or 9 km/h

Conversion of knots into kilometres per hour

Kilometres per hour

knots	0	1	2	3	4	5	6	7	8	9

ATTACHMENT A. GUIDANCE ON AREA FORECASTS IN ABBREVIATED PLAIN LANGUAGE

(See 3.2.13, 3.2.14, 3.3.1 and 3.3.9 of this Annex)

PART 1 — FORMAT FOR ABBREVIATED PLAIN-LANGUAGE SIGNIFICANT WEATHER FORECAST MESSAGES AND AMENDMENTS THERETO TO SERVE INTERNATIONAL CIVIL AVIATION IN OPERATIONS ABOVE FLIGHT LEVEL 250

1. Specifications

1.1 For the purpose of these instructions, "abbreviated plain language" refers to a language conveying to aeronautical personnel a directly intelligible meaning through the use of abbreviations (except signals of the Q code) approved by ICAO and numerical values of self-explanatory nature supplemented, if suitable ICAO-approved abbreviations are not available, by other words taken with their usual meaning in aviation.

Note.— ICAO-approved abbreviations are published in ICAO Doc 8400, Procedures for Air Navigation Services — ICAO Abbreviations and Codes. *Signals of the Q code should not be used in abbreviated plain-language significant weather area forecast messages.*

1.2 In abbreviated plain-language significant weather forecast messages, the term "CB" should be understood to include pertinent weather phenomena normally associated with cumulonimbus, namely thunderstorms, moderate or severe turbulence, moderate or severe icing, and hail.

1.3 An abbreviated plain-language significant weather forecast message should be consistent with the significant weather forecast chart from which it was derived.

1.4 The format should be as follows:

a) World Meteorological Organization abbreviated heading.

b) Type of message; applicable vertical range; valid time; area to which the forecast message relates. Describe the forecast area by reference to latitude, to longitude, to latitude/longitude coordinates, to major geographical features, or to any combination thereof. Describe, in the same manner, any part of the area for which a significant weather forecast cannot be given because of lack of data.

c) Synopsis. Include descriptions of significant weather features, such as tropical cyclones, surface positions of frontal systems and well-defined convergence zones; their forecast positions; their speed and direction of movement; and intensification or weakening, if considered significant. Give forecast positions as in b). Describe direction of movement in terms of eight points of the compass related to true north; give speed of movement in kilometres per hour or knots.

d) Significant weather phenomena. Describe areas as in b). Describe the amount of cumulonimbus as ISOL EMBD CB (individual embedded cumulonimbus) or ISOL CB IN HAZE (individual cumulonimbus concealed in haze); OCNL EMBD CB (well separated embedded cumulonimbus) or OCNL CB IN HAZE (well separated cumulonimbus concealed in haze); or FRQ CB (cumulonimbus clouds with little or no separation). Describe cumulonimbus clouds contained in layers of other clouds as EMBD. Give bases and tops of significant weather phenomena as flight level (FL). If no significant weather is forecast, enter the term "SIGWX NIL".

Note.— Give bases of significant weather phenomena only if expected to be at or above the lowest level of the atmosphere for which the forecast is prepared. Similarly, give the tops of significant weather phenomena only if expected to be at or below the highest level of the atmosphere for which the forecast is prepared.

e) Turbulence. This should include turbulence, other than that associated with cumulonimbus, if expected to be moderate or severe, and the intensity thereof. Describe areas as in b). Give bases and tops of phenomenon as FL. If no turbulence in this category is forecast, no entry for turbulence should be given.

Note.— See Note under 1.4 d) for similar application.

f) Volcanic eruptions. Include information on the location of volcanic eruptions which are producing ash clouds of significance to aircraft operations, name of volcano and time of first eruption, if known, together with a reminder to users that reference should be made to SIGMETs issued for the area concerned.

2. Examples

Examples of abbreviated plain-language significant weather messages are given below.

Example 1

FAPN13 KWBC 101200
AREA FCST FL250 TO FL450 VALID 110000 FOR AREA 37N135E 48N108W 28N130W 28N158E 37N135E.

SYNOPSIS. COLD FRONT 45N179W 33N179W MOV E 20 KT. COLD FRONT 43N152W 44N140W 35N131W 29N134W MOV NE 15 KT INTSF.

PART 2 — FORMAT FOR ABBREVIATED PLAIN-LANGUAGE SIGNIFICANT WEATHER FORECAST MESSAGES AND AMENDMENTS THERETO TO SERVE INTERNATIONAL CIVIL AVIATION IN OPERATIONS BETWEEN FLIGHT LEVELS 100 AND 250

1. Specifications

1.1 For the purpose of these instructions, "abbreviated plain language" refers to a language conveying to aeronautical personnel a directly intelligible meaning through the use of abbreviations (except signals of the Q code) approved by ICAO and numerical values of self-explanatory nature supplemented, if suitable ICAO-approved abbreviations are not available, by other words taken with their usual meaning in aviation.

Note.— ICAO-approved abbreviations are published in ICAO Doc 8400, Procedures for Air Navigation Services — ICAO Abbreviations and Codes. *Signals of the Q code should not be used in abbreviated plain-language significant weather area forecast messages.*

1.2 In abbreviated plain-language significant weather forecast messages, the term "CB" should be understood to include pertinent weather phenomena normally associated with cumulonimbus, namely thunderstorms, moderate or severe turbulence, moderate or severe icing, and hail.

1.3 An abbreviated plain-language significant weather forecast message should be consistent with the significant weather forecast chart from which it was derived.

1.4 The format should be as follows:

a) World Meteorological Organization abbreviated heading.

b) Type of message; applicable vertical range; valid time; area to which the forecast message relates. Describe the forecast area by reference to latitude, to longitude, to latitude/longitude coordinates, to major geographical features, or to any combination thereof. Describe, in the same manner, any part of the area for which a significant weather forecast cannot be given because of lack of data.

c) Synopsis. Include descriptions of significant weather features, such as tropical cyclones, surface positions of frontal systems and well-defined convergence zones; their forecast positions; their speed and direction of movement; and intensification or weakening, if considered significant. Give forecast positions as in b). Describe direction of movement in terms of eight points of the compass related to true north; give speed of movement in kilometres per hour or knots.

d) Significant weather phenomena and associated clouds. Describe areas as in b). Give cloud amounts, except for cumulonimbus clouds, in terms of FEW (1 to 2 oktas), SCT (3 to 4 oktas), BKN (5 to 7 oktas), or OVC (8 oktas). Describe the amount of cumulonimbus as ISOL EMBD CB (individual embedded cumulonimbus) or ISOL CB IN HAZE (individual cumulonimbus concealed in haze); OCNL EMBD CB (well separated embedded cumulonimbus) or OCNL CB IN HAZE (well separated cumulonimbus concealed in haze); or FRQ CB (cumulonimbus clouds with little or no separation). Describe cumulonimbus clouds contained in layers of other clouds as EMBD. Give bases and tops of significant weather phenomena and associated clouds as flight level (FL). If no significant weather is forecast, enter the term "SIGWX NIL".

e) Turbulence. This should include turbulence, other than that associated with cumulonimbus, if expected to be moderate or severe, and the intensity thereof. Describe areas as in b). Give bases and tops of phenomenon as FL. If no turbulence in this category is forecast, no entry for turbulence should be given.

f) Icing. This should include icing, other than that associated with cumulonimbus, if expected to be moderate or severe, and the intensity thereof. Should also include icing in area(s) of forecast, freezing precipitation. Describe areas as in b). Give bases and tops of phenomenon as FL. If aircraft icing, other than that associated with cumulonimbus, is not forecast, no entry for icing should be given.

g) Volcanic eruptions. Include information on the location of volcanic eruptions which are producing ash clouds of significance to aircraft operations, name of volcano and time of first eruption, if known, together with a reminder to users that reference should be made to SIGMETs issued for the area concerned.

Note.— Give bases of significant weather phenomena (and associated clouds, if any) only if expected to be at or above the lowest level of the atmosphere for which the forecast is prepared. Similarly, give the tops of significant weather phenomena (and associated clouds, if any) only if expected to be at or below the highest level of the atmosphere for which the forecast is prepared.

2. Examples

Examples of abbreviated plain-language significant weather messages are given on the following page.

Example 1

FAPN16 KWBC 101200
AREA FCST FL100 TO FL250 VALID 110000 FOR AREA 37N135E 48N108W 28N130W 28N158E 37N135E.

OTHER AMD NIL.

PART 3 — FORMAT FOR MESSAGES CONTAINING ABBREVIATED PLAIN-LANGUAGE AMENDMENTS TO UPPER-AIR FORECASTS

1. Specifications

1.1 For the purpose of these instructions, "abbreviated plain language" refers to a language conveying to aeronautical personnel a directly intelligible meaning through the use of abbreviations (except signals of the Q code) approved by the International Civil Aviation Organization (ICAO) and numerical values of self-explanatory nature supplemented, if suitable ICAO-approved abbreviations are not available, by other words taken with their usual meaning in aviation.

Note.— ICAO-approved abbreviations are published in ICAO Doc 8400, Procedures for Air Navigation Services — ICAO Abbreviations and Codes. *Signals of the Q code should not be used in abbreviated plain-language messages issued as amendments to relevant upper-air wind and temperature forecasts.*

1.2 Abbreviated plain-language amendments to upper-air forecasts should be understood to apply to all relevant forecasts prepared by world and regional area forecast centres for any specified area, level and valid time(s). Such forecasts could include meteorological charts, grid point data in numerical form and grid point data in digital form.

1.3 The area and levels for which amendments to upper-air forecasts are to be issued should be described with regard to horizontal dimensions by applicable latitude/longitude coordinates and with regard to vertical dimensions by applicable ICAO flight levels related to standard constant pressure surfaces.

1.4 To minimize the possibility of misinterpretation of the amendments, the procedures given below should be followed:

a) amendments should be issued in abbreviated plain language as an amended area forecast under a World Meteorological Organization abbreviated heading, using as date time group the standard time of observation in UTC on which the original forecast was based;

b) the amendment criteria given by Annex 3, 3.2.11 should be followed;

c) the valid time(s) to which an amendment is intended to apply should be given in terms of 12, 18, 24 and/or 30 hours following the standard time in UTC on which the original forecast was based;

d) the area to which an amendment to be issued is intended to apply should be described as a four-sided polygon in terms of latitude/longitude intersections giving corner coordinates of the polygon. To minimize the risk of misinterpretation, the corner coordinates should be given in a clockwise or counter-clockwise sequence. Latitude should be given in whole degrees (two digits) followed by N (north) or S (south). Longitude should be given in whole degrees (three digits) followed by E (east) or W (west);

e) the ICAO flight levels to which an amendment is intended to apply should be given in the text of the amendment messages;

f) amendments to forecasts of wind speed should be given in terms of percentage increase, using three digits (010, 020, 030, 120 and so forth) preceded by PS (plus) or of percentage decrease (010, 020, 030 and so forth up to a maximum decrease of 099) preceded by MS (minus);

g) amendments to forecasts of wind direction should be given in terms of clockwise or counter-clockwise rotation from the forecast being amended, using three digits (010, 020 and so forth up to 180) preceded by CW (for clockwise) or CC (for counter-clockwise); and

h) amendments to upper-air temperature forecasts should be given in three digits as absolute increases or decreases, in degrees Celsius, preceded by PS (plus) or MS (minus).

Note.— No entry should be made for any feature for which an amendment is not being issued.

2. Examples

Examples of messages containing amendments to upper-air forecasts are given on the following page.

Example 1

FXPA1 KWBC 241200 AMD
AMD AREA FCST

SPEED CHANGE PER CENT INCR (PS) OR DECR (MS).
DIRECTION CHANGE CLOCKWISE (CW) OR COUNTER-CLOCKWISE (CC).
TEMPERATURE CHANGE ABSOLUTE INCR (PS) OR DECR (MS).

AMEND WIND AND TEMPERATURE FORECAST IN AREA 38N160E 46N160E 47N178W 35N178W.
AMENDMENT VALID 18 HR 24 HR AND 30 HR AFTER 241200.

AMENDMENT FOR	FL250	FL300	FL340	FL390
WIND SPEED/PER CENT	PS035	PS035	PS035	PS035
WIND DIRECTION/DEG	CC020	CC020	CC020	CC020
TEMPERATURE/DEG C	PS005	PS005	PS005	PS005

AMEND WIND AND TEMPERATURE FORECAST IN AREA 47N177W 40N161W 30N161W 35N177W.
AMENDMENT VALID 18 HR 24 HR AND 30 HR AFTER 241200.

AMENDMENT FOR	FL250	FL300	FL340	FL390
WIND SPEED/PER CENT	MS025	MS040	MS050	MS040

Example 2

AMD AREA FCST

SPEED CHANGE PER CENT INCR (PS) OR DECR (MS).
DIRECTION CHANGE CLOCKWISE (CW) OR COUNTER-CLOCKWISE (CC).
TEMPERATURE CHANGE ABSOLUTE INCR (PS) OR DECR (MS).

AMEND WIND AND TEMPERATURE FORECAST IN AREA 33N143E 43N147E 45N159E 33N159E.
AMENDMENT VALID 18 HR AND 24 HR AFTER 241200.

AMENDMENT FOR	FL250	FL300	FL340	FL390
WIND SPEED/PER CENT	PS040	PS050	PS070	PS050
WIND DIRECTION/DEG	CW020	CW020	CW020	CW020
TEMPERATURE/DEG C	MS005	MS008	MS010	MS008

ATTACHMENT B. OPERATIONALLY DESIRABLE AND CURRENTLY ATTAINABLE ACCURACY OF MEASUREMENT OR OBSERVATION

Note.— The guidance contained in this table relates to Chapter 4 — Meteorological observations and reports, in particular to 4.1.12

Element to be observed	*Operationally desirable accuracy of measurement or observation*	*Attainable* accuracy of measurement or observation (1994)*
Mean surface wind	Direction: ± 10° Speed: ± 2 km/h (1 kt) up to 19 km/h (10 kt) ± 10% above 19 km/h (10 kt)	Direction: ± 5° Speed: ± 2 km/h (1 kt) up to 37 km/h (20 kt) ± 5% above 37 km/h (20 kt)
Variations from the mean surface wind	± 4 km/h (2 kt), in terms of longitudinal and lateral components	as above
Visibility	± 50 m up to 600 m ± 10% between 600 m and 1 500 m ± 20% above 1 500 m	± 50 m up to 500 m ± 10% between 500 m and 2 000 m ± 20% above 2 000 m up to 10 km
Runway visual range	± 10 m up to 400 m ± 25 m between 400 m and 800 m ± 10% above 800 m	± 25 m up to150 m ± 50 m between 150 m and 500 m ± 10% above 500 m up to 2 000 m
Cloud amount	± 1 okta	In daylight an observer can attain an accuracy of ± 1 okta at the point of observation. In darkness, and when atmospheric phenomena limit the viewing of low cloud, there will be difficulty in attaining that accuracy.
Cloud height	± 10 m (33 ft) up to 100 m (330 ft) ± 10% above 100 m (330 ft)	± 10 m (33 ft) up to 1 000 m (3 300 ft) ± 30 m (100 ft) above 1 000 m (3 300 ft) up to 3 000 m (10 000 ft)
Air temperature and dew point temperature	± 1°C	± 0.2 °C
Pressure value (QNH, QFE)	± 0.5 hPa	± 0.3 hPa

* The accuracy stated refers to assessment by instruments (except for cloud amount): it is not normally attainable in observations made without the aid of instruments.

ATTACHMENT C. SELECTED CRITERIA APPLICABLE TO AERODROME REPORTS

(The guidance in this table relates to Chapter 4 — Meteorological observations and reports, 4.5 to 4.12 inclusive)

	Surface wind			Visibility (VIS)			RVR[1] (A: −10, B: −5, C: OBS TIME) (Time, MIN)			Present weather	Cloud: Amount				Cloud: Type[2]	Temperature	Pressure (QNH, QFE)		Supplementary information
Specifications	Directional variations[3] ≥ 6 0° Mean speed		Speed variations[3]	Directional variations[4]	Special cases		Past tendency[5] $\mid \bar{R}_{5(AB)} - \bar{R}_{5(BC)} \mid$		Variations[5]		Layers reported if coverage								
	≤ 6 km/h (3 kt)	> 6 km/h (3 kt)	Exceeding the mean speed by ≥ 20 km/h (10 kt)	General rule	VIS ≥ 1.5× Minimum VIS in one or more directions	Minimum VIS < 1 500 m and VIS > 5 km in another direction	< 100 m	≥ 100 m	$\mid \bar{R}_1 - \bar{R}_{10} \mid > MAX[50\ m\ or\ 20\% \times \bar{R}_{10}]$	No general criteria applicable to all the WX phenomena (for specific criteria see 4.8.4-4.8.7)	Lowest layer	Next layer >	Next higher layer >	CB[6] or TCU	Identification		Parameters reported	Updated if changes > agreed magnitude	Parameter to be included
Take-off	2 min [7] 2 extreme directions	2 min 2 extreme directions	2 min Minimum and maximum speed	N/A	N/A	N/A	1 min N/A[8]	N/A	1 min N/A		Always	2/8	4/8	Always	CB TCU	No criteria	QNH QFE[9]	Yes	All[10]
Landing	2 min VRB[11] (no extremes)	2 min 2 extreme directions	2 min Minimum and maximum speed	N/A	N/A	N/A	1 min N/A	N/A	1 min N/A		Always	2/8	4/8	Always	CB TCU		QNH QFE[9]	Yes	All[10]
METAR	10 min VRB[11] (no extremes)	10 min 2 extreme directions	10 min Maximum speed[12]	Minimum VIS	Minimum VIS + direction	Minimum VIS + direction, and higher VIS + direction	10 min No tendency observed ("N")	Upward ("U") or downward ("D")	1 min Minimum and maximum (instead of 10-minute mean)		Always	2/8	4/8	Always	CB TCU		QNH	No	Recent WX of operational significance and wind shear[13]
Relevant reporting scales for all messages	Direction in three figures *rounded* off to the nearest 10 degrees (degrees 1-4 down, degrees 5-9 up)		Speed in 1 km/h or 1 kt Speed < 2 km/h (1 kt) indicated as CALM	*If* VIS < 500 m; 500 ≤ VIS < 5 000 m; 5 000 m ≤ VIS < 10 km; VIS ≥ 10 km	*Step applicable*: 50 m; 100 m; 1 km; None, given as 10 km or covered under CAVOK		*If* RVR ≤ 800 m; RVR > 800 m. The following subset of the above reporting scale is applied in EUR Region: RVR < 400 m; 400 ≤ RVR ≤ 800 m; RVR > 800 m	*Step applicable*: 25 – 60 m; 100 m[14]. 25 m; 50 m; 100 m		N/A	*If* Base ≤ 3 000 m (10 000 ft); Base > 3 000 m (10 000 ft) (Reference level: Aerodrome elevation[15] or mean sea level for off-shore structures)			*Step applicable*: 30 m (100 ft); 300 m (1 000 ft)		Rounded off to whole degrees: up (down) for decimals 5-9 (1-4)	In whole hPa[16] *rounding* down for decimals 1-9[17]		N/A

Notes.—

1. Considered for the past 10 minutes (exception: if the 10-minute period includes *a marked discontinuity* (i.e. RVR changes or passes 150; 350, 600 or 800 m, lasting ≥ 2 minutes), only data after the discontinuity to be used). A simple diagrammatic convention is used to illustrate those parts of the 10-minute period prior to the observation relevant to RVR criteria, i.e. AB, BC and AC.
2. Layer composed of CB and TCU *with a common base* should be reported as "CB".
3. Considered for the past 10 minutes (exception: if the 10-minute period includes *a marked discontinuity* (i.e. the direction changes ≥ 30° with a speed ≥ 20 km/h *or* the speed changes ≥ 20 km/h lasting ≥ 2 minutes), only data after the discontinuity to be used).
4. If several directions, the most operationally significant direction used.
5. Let $\bar{R}_1$ = any 1-minute mean RVR-value during period AC, $\bar{R}_{10}$ = 10-minute mean RVR-value during period AC, $\bar{R}_{5(AB)}$ = 5-minute mean RVR-value during period AB and $\bar{R}_{5(BC)}$ = 5-minute mean RVR-value during period BC.
6. CB (cumulonimbus) and TCU (towering cumulus = cumulus congestus of great vertical extent) if not already indicated as one of the other layers.
7. Time averaging, if applicable, indicated in the upper left-hand corner.
8. N/A = not applicable.
9. QFE is to be included if required.
10. As listed in 4.12.1 to 4.12.5.
11. Also used at higher wind speeds where it is not possible to report a mean wind direction (e.g. a thunderstorm passing over the aerodrome).
12. According to the WMO *Manual on Codes* (WMO — No. 306) paragraph 15.4.5 "It is recommended that the wind measuring systems should be such the peak gusts should represent a three-second average."
13. Also sea-surface temperature and state of the sea from off-shore structures. Other information may only be inserted in accordance with regional air navigation agreement.
14. Report if RVR and/or VIS < 1 500 m, limits for assessments 50 and 1 500 m.
15. For landing at aerodromes with precision approach runways and with the threshold elevation ≥ 15 m below the aerodrome elevation, the *threshold elevation* to be used as a reference.
16. Measured in 0.1 hPa.
17. Reference elevation for QFE should be aerodrome elevation except for precision approach runways, and non-precision approach runways with threshold ≥ 2 m (7 ft) below aerodrome elevation, where the reference level should be the relevant threshold elevation.

ATTACHMENT D. CONVERSION OF TRANSMISSOMETER READINGS INTO RUNWAY VISUAL RANGE

(See 4.7.7 of this Annex)

1. The conversion of transmissometer readings into runway visual range is based on Koschmieder's Law or Allard's Law, depending on whether the pilot can be expected to obtain his main visual guidance from the runway and its markings or from the runway lights. In the interest of standardization in runwây visual range assessments, this Attachment provides guidance on the use and application of the main conversion factors to be used in these computations.

2. In Koschmieder's Law one of the factors to be taken into account is the pilot contrast threshold. The agreed constant to be used for this is 0.05 (dimensionless)

3. In Allard's Law the corresponding factor is the illumination threshold. This is not a constant, but a continuous function dependent on the background luminance. The agreed relationship to be used in transmissometer systems with continuous adjustment of the illumination threshold by a background luminance sensor is shown by the curve in Figure D-1.

4. In transmissometer systems without continuous adjustment of the illumination threshold, the use of four equally spaced illumination threshold values with agreed corresponding background luminance ranges is convenient. The four values are shown in Figure D-1 in the form of a step function; they are tabulated in Table D-1 for greater clarity.

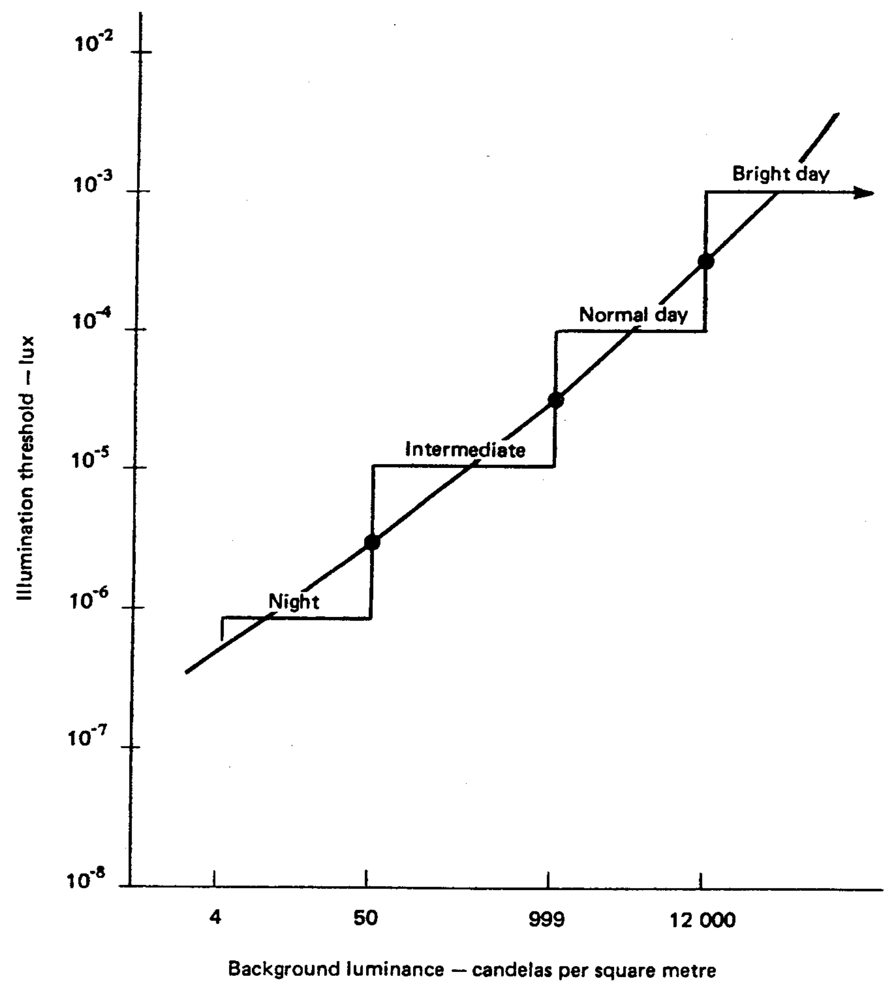

Figure D-1.

5. In transmissometer systems of the kind referred to in 4 above, values for illumination threshold other than those indicated by the step function and by Table D-1 may be used, provided they give corresponding or slightly lower values of runway visual range. The number of illumination threshold values to be used at any location will depend on the frequency of occurrence and on the duration of various levels of background luminance. For example, in some areas two values may be found adequate.

Note.— Information and guidance material on the runway lights to be used for assessment of runway visual range are contained in the ICAO Manual of Runway Visual Range Observing and Reporting Practices *(Doc 9328).*

Table D-1

	Illumination threshold	*Background luminance*
Night	8×10^{-7} lux	4 to 50 cd/m^2
Intermediate value	10^{-5} lux	51 to 999 cd/m^2
Normal day	10^{-4} lux	1 000 to 12 000 cd/m^2
Bright day (e.g. sunlit fog)	10^{-3} lux	more than 12 000 cd/m^2

ATTACHMENT E. OPERATIONALLY DESIRABLE ACCURACY OF FORECASTS

Note 1.— The guidance contained in this table relates to Chapter 6 — Forecasts, in particular to 6.1.1.

Note 2.— If the accuracy of the forecasts remains within the operationally desirable range shown in the second column, for the percentage of cases indicated in the third column, the effect of forecast errors is not considered serious in comparison with the effects of navigational errors and of other operational uncertainties.

Element to be forecast	*Operationally desirable accuracy of forecasts*	*Minimum percentage of cases within range*
	AERODROME FORECAST	
Wind direction	± 30°	80% of cases
Wind speed	± 9 km/h (5 kt) up to 46 km/h (25 kt) ± 20% above 46 km/h (25 kt)	80% of cases
Visibility	± 200 m up to 700 m 30% between 700 m and 10 km	80% of cases
Precipitation	Occurrence or non-occurrence	80% of cases
Cloud amount	± 2 oktas	70% of cases
Cloud height	± 30 m (100 ft) up to 120 m (400 ft) ± 30% between 120 m (400 ft) and 3 000 m (10 000 ft)	70% of cases
Air temperature	± 1°C	70% of cases
	LANDING FORECAST	
Wind direction	± 30°	90% of cases
Wind speed	± 9 km/h (5 kt) up to 46 km/h (25 kt) ± 20% above 46 km/h (25 kt)	90% of cases
Visibility	± 200 m up to 700 m ± 30% between 700 m and 10 km	90% of cases
Precipitation	Occurrence or non-occurrence	90% of cases

Element to be forecast	*Operationally desirable accuracy of forecasts*	*Minimum percentage of cases within range*
Cloud amount	± 2 oktas ± 30% between 700 m and 10 km	90% of cases
Cloud height	± 30 m (100 ft) up to 120 m (400 ft) ± 30% between 120 m (400 ft) and 3 000 m (10 000 ft)	90% of cases
	FORECAST FOR TAKE-OFF	
Wind direction	± 30°	90% of cases
Wind speed	± 9 km/h (5 kt) up to 46 km/h (25 kt) ± 20% above 46 km/h (25 kt)	90% of cases
Air temperature	± 1°C	90% of cases
Pressure value (QNH)	± 1 hPa	90% of cases
	AREA, FLIGHT AND ROUTE FORECASTS	
Upper-air temperature	± 3°C (Mean for 900 km/500 NM)	90% of cases
Upper wind	± 28 km/h (15 kt) up to flight level 250 ± 37 km/h (20 kt) above flight level 250 (Modulus of vector difference for 900 km/500 NM)	90% of cases
Significant en-route weather phenomena and cloud	Occurrence or non-occurrence	80% of cases
	Location: ± 100 km/60 NM	70% of cases
	Vertical extent: ± 600 m/2 000 ft	70% of cases

ATTACHMENT F. SIGMET AND AIRMET

(The guidance in this table relates to Chapter 7 — SIGMET and AIRMET information, aerodrome warnings and wind shear warnings and, in particular, to 7.1.1, 7.2.1, 7.3.1 and 7.4.1)

FIRST LINE				SUBSEQUENT LINES						
					Weather phenomenon plus description to be used in *(1) SIGMET MESSAGES[1]* *(f)*					
Location indicator of the ATS unit serving the FIR or CTA to which the SIGMET or AIRMET refers *(a)*	*Message number* *(b)*	*Validity period (UTC)* *(c)*	*Issuing MWO* *(d)*	*Name of FIR or CTA for which the SIGMET or AIRMET is issued* *(e)*	*a) At subsonic cruising levels*	*b) At transonic levels and supersonic cruising levels*	*Observed or forecast* *(g)*	*Location/ level* *(h)*	*Movement and direction* *(i)*	*Change in intensity* *(j)*
e.g. YUDD*	The number must correspond with the number of SIGMET or AIRMET messages issued for the FIR/UIR since 0000/UTC on the day concerned	Date time/ date time, e.g. "170600/ 171000"	e.g. "YUSO-*" First line always ends in hyphen	Always begins second line, e.g. "SHANLON* FIR/UIR"	OBSC[2] TS EMBD[3] TS FRQ[4] TS SQL[5] TS OBSC TS HVYGR[6] EMBD TS HVYGR FRQ TS HVYGR SQL TS HVYGR TC (+ name) SEV TURB[7] SEV ICE[8] FZRA[9] SEV MTW[10] HVY DS HVY SS VA (+ volcano name)	MOD TURB SEV TURB ISOL CB[11] OCNL CB FRQ CB GR VA (+ volcano name)	1. OBS to be used when the phenomenon is observed and forecast. Where relevant the time of observation should be added. 2. FCST to be used when the phenomenon is forecast but not yet observed.	Area (refer to latitude/longitude and/or well-known locations or geographical features) and flight levels affected, e.g. information on TS tops: "FCST TOPS FL390 S OF 54DEG N" or on severe turbulence: "SEV TURB BTN FL350/390"	Movement in KTS or KMH. 					(2) AIRMET MESSAGES					
					SFC WSPD (+ wind speed and units) SFC VIS (+ visibility) ISOL TS OCNL TS ISOL TSGR OCNL TSGR MT OBSC BKN CLD (+ height of the base and units) OVC CLD (+ height of the base and units) ISOL CB OCNL CB FRQ CB MOD ICE MOD TURB MOD MTW					

* Fictitious location

Notes.—

1. Only one of the weather phenomena listed in column (f) above should be selected and included in each SIGMET.

2. Obscured (OBSC) indicates that the thunderstorm (including, if necessary, cumulonimbus cloud which is not accompanied by a thunderstorm) is obscured by haze or smoke or cannot be readily seen due to darkness.

3. Embedded (EMBD) indicates that the thunderstorm (including cumulonimbus cloud which is not accompanied by a thunderstorm) is embedded within cloud layers and cannot be readily recognized.

4. Frequent (FRQ) indicates an area of thunderstorms within which there is little or no separation between adjacent thunderstorms.

5. Squall line (SQL) indicates thunderstorm along a line with little or no space between individual clouds.

6. Heavy hail (HVYGR) may be used as a further description of the thunderstorm as necessary.

7. Severe and moderate turbulence (TURB) refers only to low level turbulence associated with strong surface winds, rotor streaming, or turbulence whether in cloud or not (CAT) near to jet streams and is not required to be used for turbulence in convective clouds.

8. Severe and moderate icing (ICE) refers to severe icing in other than convective clouds.

9. Freezing rain (FZRA) refers to severe icing conditions caused by freezing rain.

10. A mountain wave (MTW) is considered:
    a) severe whenever an accompanying downdraft of 3.0 m/s (600 ft/min) or more and/or severe turbulence is observed or forecast;
    b) moderate whenever an accompanying downdraft of 1.75-3.0 m/s (350-600 ft/min) and/or moderate turbulence is observed or forecast.

11. The use of cumulonimbus, CB, is restricted to AIRMETs and SIGMETs related to SST flight during transonic and supersonic cruise.

General note.— Severe or moderate icing and severe or moderate turbulence (SEV ICE, MOD ICE, SEV TURB, MOD TURB) associated with thunderstorms, cumulonimbus clouds or tropical cyclones should not be included.

INTERNATIONAL STANDARDS
AND RECOMMENDED PRACTICES

AERONAUTICAL CHARTS

ANNEX 4

TO THE CONVENTION ON INTERNATIONAL CIVIL AVIATION

NINTH EDITION — JULY 1995

This edition incorporates all amendments adopted by the Council prior to 2 March 1995 and supersedes, on 9 November 1995, all previous editions of Annex 4.

For information regarding the applicability of the Standards and Recommended Practices, *see* Chapter 1 and Foreword.

INTERNATIONAL CIVIL AVIATION ORGANIZATION

AMENDMENTS

The issue of amendments is announced regularly in the *ICAO Journal* and in the monthly *Supplement to the Catalogue of ICAO Publications and Audio Visual Training Aids*, which holders of this publication should consult. The space below is provided to keep a record of such amendments.

TABLE OF CONTENTS

FOREWORD

Historical background

Standards and Recommended Practices for Aeronautical Charts were first adopted by the Council on 16 April 1948, pursuant to the provisions of Article 37 of the Convention on International Civil Aviation (Chicago, 1944), and were designated as Annex 4 to the Convention. They became applicable on 1 March 1949.

Table A shows the origin of subsequent amendments together with a list of the principal subjects involved and the dates on which the Annex and the amendments were adopted by the Council, when they became effective and when they became applicable.

Action by Contracting States

Notification of differences. The attention of Contracting States is drawn to the obligation imposed by Article 38 of the Convention by which Contracting States are required to notify the Organization of any differences between their national regulations and practices and the International Standards contained in this Annex and any amendments thereto. Contracting States are invited to extend such notification to any differences from the Recommended Practices contained in this Annex, and any amendments thereto when the notification of such differences is important for the safety of air navigation. Further, Contracting States are invited to keep the Organization currently informed of any differences which may subsequently occur, or of the withdrawal of any differences previously notified. A specific request for notification of differences will be sent to Contracting States immediately after the adoption of each Amendment to this Annex.

The attention of States is also drawn to the provisions of Annex 15 related to the publication of differences between their national regulations and practices and the related ICAO Standards and Recommended Practices through the Aeronautical Information Service, in addition to the obligation of States under Article 38 of the Convention.

Promulgation of information. Information relating to the availability and amendment of aeronautical charts affecting aircraft operations, provided according to the Standards, Recommended Practices and Procedures specified in this Annex, should be notified and take effect in accordance with Annex 15.

Status of Annex components

An Annex is made up of the following component parts, not all of which, however, are necessarily found in every Annex; they have the status indicated:

1.— *Material comprising the Annex proper:*

a) *Standards* and *Recommended Practices* adopted by the Council under the provisions of the Convention. They are defined as follows:

Standard. Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as necessary for the safety or regularity of international air navigation and to which Contracting States will conform in accordance with the Convention; in the event of impossibility of compliance, notification to the Council is compulsory under Article 38.

Recommended Practice. Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as desirable in the interests of safety, regularity or efficiency of international air navigation, and to which Contracting States will endeavour to conform in accordance with the Convention.

b) *Appendices* comprising material grouped separately for convenience but forming part of the Standards and Recommended Practices adopted by the Council.

c) *Definitions* of terms used in the Standards and Recommended Practices which are not self-explanatory in that they do not have accepted dictionary meanings. A definition does not have an independent status but is an essential part of each Standard and Recommended Practice in which the term is used, since a change in the meaning of the term would affect the specification.

d) *Tables* and *Figures* which add to or illustrate a Standard or Recommended Practice and which are referred to therein, form part of the associated Standard or Recommended Practice and have the same status.

2.— *Material approved by the Council for publication in association with the Standards and Recommended Practices:*

a) *Forewords* comprising historical and explanatory material based on the action of the Council and including an explanation of the obligations of States with regard to the application of the Standards and Recommended Practices ensuing from the Convention and the Resolution of Adoption.

b) *Introductions* comprising explanatory material introduced at the beginning of parts, chapters or sections of the Annex to assist in the understanding of the application of the text.

c) *Notes* included in the text, where appropriate, to give factual information or references bearing on the Standards or Recommended Practices in question, but not constituting part of the Standards or Recommended Practices.

d) *Attachments* comprising material supplementary to the Standards and Recommended Practices, or included as a guide to their application.

Selection of language

This Annex has been adopted in four languages — English, French, Russian and Spanish. Each Contracting State is requested to select one of those texts for the purpose of national implementation and for other effects provided for in the Convention, either through direct use or through translation into its own national language, and to notify the Organization accordingly.

Editorial practices

The following practice has been adhered to in order to indicate at a glance the status of each statement: *Standards* have been printed in light face roman; *Recommended Practices* have been printed in light face italics, the status being indicated by the prefix **Recommendation**; *Notes* have been printed in light face italics, the status being indicated by the prefix *Note.*

It is to be noted that in the English text the following practice has been adhered to when writing the specifications: Standards employ the operative verb "shall" while Recommended Practices employ the operative verb "should".

Throughout this document measurements are given in the metric system followed in parentheses by corresponding measurements in the foot-pound system.

Any reference to a portion of this document, which is identified by a number and/or title, includes all subdivisions of that portion.

49	Amendment 33 to Annex 11; Amendment 39 to Annex 14; Adoption of Annex 14, Vol. II; Amendments 5 and 6 to Doc 8168, PANS-OPS, Vols. I and II, respectively	Definitions; General specifications; Enroute Chart — ICAO; Area Chart — ICAO; Instrument Approach Chart — ICAO; Visual Approach Chart — ICAO; Aerodrome Chart — ICAO; World Aeronautical Chart — ICAO 1:1 000 000; Aeronautical Chart — ICAO 1:500 000; ICAO Chart Symbols.	28 February 1992 27 July 1992 12 November 1992
50	Adoption by Council of WGS-84 as the standard geodetic reference system for international aviation; WAFS planning and implementation; PANS-OPS implementation problems; revision of the Manual of All-Weather Operations; integration of helicopter traffic with conventional aeroplane traffic; proposal by RGCSP/8; and the Secretariat	Definitions; introduction of new provisions concerning the promulgation, as of 1 January 1998, of WGS-84 related geographical coordinates; deletion of the requirement for presentation of level acceleration altitude/height; introduction of RNP type; inclusion of the note on close-in obstacles on SID charts; and introduction of new chart symbol for active volcano.	1 March 1995 24 July 1995 9 November 1995; 1 January 1998

INTERNATIONAL STANDARDS AND RECOMMENDED PRACTICES

CHAPTER 1. DEFINITIONS, APPLICABILITY AND AVAILABILITY

1.1 Definitions

When the following terms are used in the Standards and Recommended Practices for Aeronautical Charts they have the following meanings:

Aerodrome. A defined area on land or water (including any buildings, installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of aircraft.

Aerodrome elevation. The elevation of the highest point of the landing area.

Aerodrome operating minima. The limits of usability of an aerodrome for:

a) take-off, expressed in terms of runway visual range and/or visibility and, if necessary, cloud conditions;

b) landing in precision approach and landing operations, expressed in terms of visibility and/or runway visual range and decision altitude/height (DA/H) as appropriate to the category of the operation; and

c) landing in non-precision approach and landing operations, expressed in terms of visibility and/or runway visual range, minimum descent altitude/height (MDA/H) and, if necessary, cloud conditions.

Aerodrome reference point. The designated geographical location of an aerodrome.

Aeronautical chart. A representation of a portion of the earth, its culture and relief, specifically designated to meet the requirements of air navigation.

Aircraft stand. A designated area on an apron intended to be used for parking an aircraft.

Air taxiway. A defined path on the surface established for the air taxiing of helicopters.

Air traffic service. A generic term meaning variously, flight information service, alerting service, air traffic advisory service, air traffic control service (area control service, approach control service or aerodrome control service).

Air transit route. A defined path on the surface established for the air transitting of helicopters.

Airway. A control area or portion thereof established in the form of a corridor equipped with radio navigation aids.

Altitude. The vertical distance of a level, a point or an object considered as a point, measured from mean sea level (MSL).

Apron. A defined area, on a land aerodrome, intended to accommodate aircraft for purposes of loading or unloading passengers, mail or cargo, fuelling, parking or maintenance.

Area minimum altitude. The lowest altitude to be used under instrument meteorological conditions (IMC) which will provide a minimum vertical clearance of 300 m (1 000 ft) or in designated mountainous terrain 600 m (2 000 ft) above all obstacles located in the area specified, rounded up to the nearest (next higher) 30 m (100 ft).

Arrival routes. Routes identified in an instrument approach procedure by which aircraft may proceed from the en-route phase of flight to an initial approach fix.

ATS route. A specified route designed for channelling the flow of traffic as necessary for the provision of air traffic services.

Note.— The term ATS route is used to mean variously, airway, advisory route, controlled or uncontrolled route, arrival or departure route, etc.

Change-over point. The point at which an aircraft navigating on an ATS route segment defined by reference to very high frequency omnidirectional radio ranges is expected to transfer its primary navigational reference from the facility behind the aircraft to the next facility ahead of the aircraft.

Note.— Change-over points are established to provide the optimum balance in respect of signal strength and quality between facilities at all levels to be used and to ensure a common source of azimuth guidance for all aircraft operating along the same portion of a route segment.

Clearway. A defined rectangular area on the ground or water under the control of the appropriate authority, selected or prepared as a suitable area over which an aeroplane may make a portion of its initial climb to a specified height.

Culture. All features constructed on the surface of the earth by man, such as cities, railways, canals, etc.

Danger area. An airspace of defined dimensions within which activities dangerous to the flight of aircraft may exist at specified times.

Displaced threshold. A threshold not located at the extremity of a runway.

Elevation. The vertical distance of a point or a level, on or affixed to the surface of the earth, measured from mean sea level.

Final approach. That part of an instrument approach procedure which commences at the specified final approach fix or point, or where such a fix or point is not specified,

a) at the end of the last procedure turn, base turn or inbound turn of a racetrack procedure, if specified; or

b) at the point of interception of the last track specified in the approach procedure; and

ends at a point in the vicinity of an aerodrome from which:

1) a landing can be made; or

2) a missed approach procedure is initiated.

Final approach and take-off area (FATO). A defined area over which the final phase of the approach manoeuvre to hover or landing is completed and from which the take-off manoeuvre is commenced. Where the FATO is to be used by performance class 1 helicopters, the defined area includes the rejected take-off area available.

Final approach fix or point. That fix or point of an instrument approach procedure where the final approach segment commences.

Final approach segment. That segment of an instrument approach procedure in which alignment and descent for landing are accomplished.

Flight information region. An airspace of defined dimensions within which flight information service and alerting service are provided.

Flight level. A surface of constant atmospheric pressure which is related to a specific pressure datum, 1 013.2 hectopascals (hPa) and is separated from other such surfaces by specific pressure intervals.

Note 1.— A pressure-type altimeter calibrated in accordance with the standard atmosphere:

a) when set to a QNH altimeter setting, will indicate altitude;

b) when set to a QFE altimeter setting, will indicate height above the QFE reference datum; and

c) when set to a pressure of 1 013.2 hPa may be used to indicate flight levels.

Note 2.— The terms height and altitude, used in Note 1 above, indicate altimetric rather than geometric heights and altitudes.

Glide path. A descent profile determined for vertical guidance during a final approach.

Height. The vertical distance of a level, a point or an object considered as a point, measured from a specified datum.

Helicopter stand. An aircraft stand which provides for parking a helicopter and, where air taxiing operations are contemplated, the helicopter touchdown and lift-off.

Heliport. An aerodrome or a defined area on a structure intended to be used wholly or in part for the arrival, departure and surface movement of helicopters.

Holding procedure. A predetermined manoeuvre which keeps an aircraft within a specified airspace while awaiting further clearance.

Hypsometric tints. A succession of shades or colour gradations used to depict ranges of elevation.

Initial approach segment. That segment of an instrument approach procedure between the initial approach fix and the intermediate approach fix or, where applicable, the final approach fix or point.

Instrument approach procedure. A series of predetermined manoeuvres by reference to flight instruments with specified protection from obstacles from the initial approach fix, or where applicable, from the beginning of a defined arrival route to a point from which a landing can be completed and thereafter, if a landing is not completed, to a position at which holding or en-route obstacle clearance criteria apply.

Intermediate approach segment. That segment of an instrument approach procedure between either the intermediate approach fix and the final approach fix or point, or between the end of a reversal, racetrack or dead reckoning track procedure and the final approach fix or point, as appropriate.

Isogonal. A line on a map or chart on which all points have the same magnetic variation for a specified epoch.

Isogriv. A line on a map or chart which joins points of equal angular difference between the North of the navigation grid and Magnetic North.

Landing area. That part of a movement area intended for the landing or take-off of aircraft.

Landing direction indicator. A device to indicate visually the direction currently designated for landing and for take-off.

Level. A generic term relating to the vertical position of an aircraft in flight and meaning variously, height, altitude or flight level.

Magnetic variation. The angular difference between True North and Magnetic North.

Note.— The value given indicates whether the angular difference is East or West of True North.

Manoeuvring area. That part of an aerodrome to be used for the take-off, landing and taxiing of aircraft, excluding aprons.

Marking. A symbol or group of symbols displayed on the surface of the movement area in order to convey aeronautical information.

Minimum sector altitude. The lowest altitude which may be used under emergency conditions which will provide a minimum clearance of 300 m (1 000 ft) above all objects located in an area contained within a sector of a circle of 46 km (25 NM) radius centred on a radio aid to navigation.

Missed approach point (MAPt). That point in an instrument approach procedure at or before which the prescribed missed approach procedure must be initiated in order to ensure that the minimum obstacle clearance is not infringed.

Missed approach procedure. The procedure to be followed if the approach cannot be continued.

Movement area. That part of an aerodrome to be used for the take-off, landing and taxiing of aircraft, consisting of the manoeuvring area and the apron(s).

Obstacle clearance altitude (OCA) or obstacle clearance height (OCH). The lowest altitude or the lowest height above the elevation of the relevant runway threshold or the aerodrome elevation as applicable, used in establishing compliance with appropriate obstacle clearance criteria.

Note 1.— Obstacle clearance altitude is referenced to mean sea level and obstacle clearance height is referenced to the threshold elevation or in the case of non-precision approaches to the aerodrome elevation or the threshold elevation if that is more than 2 m (7 ft) below the aerodrome elevation. An obstacle clearance height for a circling approach is referenced to the aerodrome elevation.

Note 2.— For convenience when both expressions are used they may be written in the form "obstacle clearance altitude/height" and abbreviated "OCA/H".

Note 3.— See Procedures for Air Navigation Services — Aircraft Operations *(Doc 8168), Vol. I, Part III, 1.5 and Vol. II, Part III, 6.3 for specific applications of this definition.*

Obstacle free zone (OFZ). The airspace above the inner approach surface, inner transitional surfaces, and balked landing surface and that portion of the strip bounded by these surfaces, which is not penetrated by any fixed obstacles other than a low-mass and frangibly mounted one required for air navigation purposes.

Point light. A luminous signal appearing without perceptible length.

Precision approach procedure. An instrument approach procedure utilizing azimuth and glide path information provided by ILS or PAR.

Procedure turn. A manoeuvre in which a turn is made away from a designated track followed by a turn in the opposite direction to permit the aircraft to intercept and proceed along the reciprocal of the designated track.

Note 1.— Procedure turns are designated "left" or "right" according to the direction of the initial turn.

Note 2.— Procedure turns may be designated as being made either in level flight or while descending, according to the circumstances of each individual procedure.

Prohibited area. An airspace of defined dimensions, above the land areas or territorial waters of a State, within which the flight of aircraft is prohibited.

Radar vectoring. Provision of navigational guidance to aircraft in the form of specific headings, based on the use of radar.

Relief. The inequalities in elevation of the surface of the earth represented on the aeronautical charts by contours, hypsometric tints, shading or spot elevations.

Reporting point. A specified geographical location in relation to which the position of an aircraft can be reported.

Required Navigation Performance (RNP). A statement of the navigation performance accuracy necessary for operation within a defined airspace.

Restricted area. An airspace of defined dimensions, above the land areas or territorial waters of a State, within which the flight of aircraft is restricted in accordance with certain specified conditions.

Reversal procedure. A procedure designed to enable aircraft to reverse direction during the initial approach segment of an instrument approach procedure. The sequence may include procedure turns or base turns.

RNP type. A containment value expressed as a distance in nautical miles from the intended position within which flights would be for at least 95 per cent of the total flying time.

Example.— RNP 4 represents a navigation accuracy of plus or minus 7.4 km (4 NM) on a 95 per cent containment basis.

Runway. A defined rectangular area on a land aerodrome prepared for the landing and take-off of aircraft.

Runway strip. A defined area including the runway and stopway, if provided, intended:

a) to reduce the risk of damage to aircraft running off a runway; and

b) to protect aircraft flying over it during take-off or landing operations.

Runway visual range (RVR). The range over which the pilot of an aircraft on the centre line of a runway can see the runway surface markings or the lights delineating the runway or identifying its centre line.

Shoulder. An area adjacent to the edge of a pavement so prepared as to provide a transition between the pavement and the adjacent surface.

Significant obstacle. Any natural terrain feature or man-made fixed object, permanent or temporary, which has vertical significance in relation to adjacent and surrounding features and which is considered a potential hazard to the safe passage of aircraft in the type of operation for which the individual chart series is designed.

Note.— The term "significant obstacle" is used in this Annex solely for the purpose of specifying the objects to be included on charts. Obstacles are specified in other terms in Annex 14, Volumes I and II, for the purpose of clearing and marking.

Significant point. A specified geographical location used in defining an ATS route or the flight path of an aircraft and for other navigation and ATS purposes.

Stopway. A defined rectangular area on the ground at the end of take-off run available prepared as a suitable area in which an aircraft can be stopped in the case of an abandoned take-off.

Taxi-holding position. A designated position at which taxiing aircraft and other vehicles may be required to hold in order to provide adequate clearance from a runway.

Taxiing. Movement of an aircraft on the surface of an aerodrome under its own power, excluding take-off and landing.

Taxiway. A defined path on a land aerodrome established for the taxiing of aircraft and intended to provide a link between one part of the aerodrome and another, including:

a) *Aircraft stand taxilane.* A portion of an apron designated as a taxiway and intended to provide access to aircraft stands only.

b) *Apron taxiway.* A portion of a taxiway system located on an apron and intended to provide a through taxi route across the apron.

c) *Rapid exit taxiway.* A taxiway connected to a runway at an acute angle and designed to allow landing aeroplanes to turn off at higher speeds than are achieved on other exit taxiways thereby minimizing runway occupancy times.

Threshold. The beginning of that portion of the runway usable for landing.

Touchdown and lift-off area (TLOF). A load bearing area on which a helicopter may touch down or lift off.

Touchdown zone. The portion of a runway, beyond the threshold, where it is intended landing aeroplanes first contact the runway.

Track. The projection on the earth's surface of the path of an aircraft, the direction of which path at any point is usually expressed in degrees from North (true, magnetic or grid).

Transition altitude. The altitude at or below which the vertical position of an aircraft is controlled by reference to altitudes.

Way-point. A specified geographical location used to define an area navigation route or the flight path of an aircraft employing area navigation.

1.2 Applicability

1.2.1 The specifications in this Annex are applicable on and after 9 November 1995.

1.2.2 All charts coming within the scope of this Annex and bearing the aeronautical information date of 9 November 1995 or later shall conform to the Standards relevant to the particular chart.

1.2.2.1 **Recommendation.—** *All such charts should in addition conform to the Recommended Practices relevant to the particular chart.*

1.3 Availability

1.3.1 *Information.* A Contracting State shall on request by another Contracting State provide all information relating to its own territory that is necessary to enable the Standards of this Annex to be met.

1.3.2 *Charts.* Contracting States shall, when so specified, ensure the availability of charts in whichever of the following ways is appropriate for a particular chart or single sheet of a chart series.

1.3.2.1 For any chart or single sheet of a chart series entirely contained within the territory of a Contracting State, the State having jurisdiction over the territory shall either:

1) produce the chart or sheet itself; or

2) arrange for its production by another Contracting State or by an agency; or

3) provide another Contracting State prepared to accept an obligation to produce the chart or sheet with the data necessary for its production.

1.3.2.2 For any chart or single sheet of a chart series which includes the territory of two or more Contracting States, the States having jurisdiction over the territory so included shall determine the manner in which the chart or sheet will be made available. This determination shall be made with due regard being given to regional air navigation agreements and to any programme of allocation established by the Council of ICAO.

Note.— The phrase "regional air navigation agreements" refers to the agreements approved by the Council of ICAO normally on the advice of regional air navigation meetings.

1.3.3 Contracting States shall take all reasonable measures to ensure that the information it provides and the aeronautical charts made available are adequate and accurate and that they are maintained up to date by an adequate revision service.

1.3.4 **Recommendation.—** *To improve world-wide dissemination of information on new charting techniques and production methods, appropriate charts produced by Contracting States should be made available without charge to other Contracting States on request on a reciprocal basis.*

Note.— Guidance material on the preparation of aeronautical charts, including sample formats, is contained in the Aeronautical Chart Manual *(Doc 8697).*

CHAPTER 2. GENERAL SPECIFICATIONS

Note.— The Standards and Recommended Practices contained in this chapter are applicable to all ICAO aeronautical charts unless otherwise stated in the specifications of the chart concerned.

2.1 Operational requirements for charts

Note.— For the purposes of this Annex, the total flight is divided into the following phases:

Phase 1 — Taxi from aircraft stand to take-off point

Phase 2 — Take-off and climb to en-route ATS route structure

Phase 3 — En-route ATS route structure

Phase 4 — Descent to approach

Phase 5 — Approach to land and missed approach

Phase 6 — Landing and taxi to aircraft stand.

2.1.1 Each type of chart shall provide information relevant to the function of the chart.

2.1.2 Each type of chart shall provide information appropriate to the phase of flight, to ensure the safe and expeditious operation of the aircraft.

2.1.3 The presentation of information shall be accurate, free from distortion and clutter, unambiguous, and be readable under all normal operating conditions.

2.1.4 Colours or tints and type size used shall be such that the chart can be easily read and interpreted by the pilot in varying conditions of natural and artificial light.

2.1.5 The information shall be in a form which enables the pilot to acquire it in a reasonable time consistent with workload and operating conditions.

2.1.6 The presentation of information provided on each type of chart shall permit smooth transition from chart to chart as appropriate to the phase of flight.

2.1.7 **Recommendation.—** *The charts should be True North orientated.*

2.1.8 **Recommendation.—** *The basic sheet size of the charts should be 210 × 148 mm (8.27 × 5.82 in) (A5).*

2.2 Titles

The title of a chart or chart series prepared in accordance with the specifications contained in this Annex and intended to satisfy the function of the chart, shall be that of the relevant chapter heading as modified by application of any Standard contained therein, except that such title shall not include "ICAO" unless the chart conforms with all Standards specified in this Chapter 2 and any specified for the particular chart.

2.3 Miscellaneous information

2.3.1 The marginal note layout shall be as given in Appendix 1, except as otherwise specified for a particular chart.

2.3.2 The following information shall be shown on the face of each chart unless otherwise stated in the specification of the chart concerned:

1) designation or title of the chart series;

Note.— The title may be abbreviated.

2) name and reference of the sheet;

3) on each margin an indication of the adjoining sheet (when applicable).

2.3.3 A legend to the symbols and abbreviations used shall be provided. The legend shall be on the face or reverse of each chart except that, where it is impracticable for reasons of space, a legend may be published separately.

2.3.4 The name and adequate address of the producing agency shall be shown in the margin of the chart except that, where the chart is published as part of an aeronautical document, this information may be placed in the front of that document.

2.4 Symbols

Symbols used shall conform to those shown in Appendix 2 — ICAO Chart Symbols, except that where it is desired to show on an aeronautical chart special features or items of importance to civil aviation for which no ICAO symbol is at present provided, any appropriate symbol may be chosen for this purpose, provided that it does not cause confusion with any existing ICAO chart symbol or impair the legibility of the chart.

Note.— The size and prominence of symbols and the thickness and spacing of lines may be varied according to the scale and functions of the chart, with due regard to the importance of the information they convey.

2.5 Units of measurement

2.5.1 Distances shall be expressed in either kilometres and tenths thereof or nautical miles and tenths thereof or both, provided the units are clearly differentiated.

2.5.2 Altitudes, elevations and heights shall be expressed in either metres or feet or both provided the units are clearly differentiated.

2.5.3 Linear dimensions on aerodromes and short distances shall be expressed in metres.

2.5.4 The units of measurement used to express distances, altitudes, elevations and heights shall be conspicuously stated on the face of each chart.

2.5.5 Conversion scales (kilometres/nautical miles, metres/feet) shall be provided on each chart on which distances, elevations or altitudes are shown. The conversion scales shall be placed on the face of each chart.

2.6 Scale and projection

2.6.1 For charts of large areas, the name and basic parameters and scale of the projection shall be indicated.

2.6.2 For charts of small areas, a linear scale only shall be indicated.

2.7 Date of validity of aeronautical information

The date of validity of aeronautical information shall be clearly indicated on the face of each chart.

2.8 Spelling of geographical names

2.8.1 The symbols of the Roman alphabet shall be used for all writing.

2.8.2 The names of places and of geographical features in countries which officially use varieties of the Roman alphabet shall be accepted in their official spelling, including the accents and diacritical marks used in the respective alphabets.

2.8.3 Where a geographical term such as "cape", "point", "gulf", "river", is abbreviated on any particular chart, that word shall be spelt out in full in the language used by the publishing agency, in respect of the most important example of each type. Punctuation marks shall not be used in abbreviations within the body of a chart.

2.8.4 **Recommendation.—** *In areas where romanized names have not been officially produced or adopted, and outside the territory of Contracting States, names should be transliterated from the non-Roman alphabet form by the system generally used by the producing agency.*

2.9 Abbreviations

2.9.1 Abbreviations shall be used on aeronautical charts whenever they are appropriate.

2.9.2 **Recommendation.—** *Where applicable, abbreviations should be selected from the* Procedures for Air Navigation Services — ICAO Abbreviations and Codes *(Doc 8400).*

2.10 Political boundaries

2.10.1 International boundaries shall be shown, but may be interrupted if data more important to the use of the chart would be obscured.

2.10.2 Where the territory of more than one State appears on a chart, the names identifying the countries shall be indicated.

Note.— In the case of a dependent territory, the name of the sovereign State may be added in brackets.

2.11 Colours

Recommendation.— *Colours used on charts should conform to Appendix 3 — Colour Guide.*

2.12 Relief

2.12.1 Relief, where shown, shall be portrayed in a manner that will satisfy the chart users' need for:

a) orientation and identification;

b) safe terrain clearance;

c) clarity of aeronautical information when shown;

d) planning.

Note.— Relief is usually portrayed by combinations of contours, hypsometric tints, spot elevations and hill shading, the choice of method being affected by the nature and scale of the chart and its intended use.

2.12.2 **Recommendation.—** *Where relief is shown by hypsometric tints, the tints used should be based on those shown in the Hypsometric Tint Guide in Appendix 4.*

2.12.3 Where spot elevations are used they shall be shown for selected critical points.

2.12.3.1 The value of spot elevations of doubtful accuracy shall be followed by the sign ±.

2.13 Prohibited, restricted and danger areas

When prohibited, restricted or danger areas are shown, the reference or other identification shall be included, except that the nationality letters may be omitted.

Note.— Nationality letters are those contained in Doc 7910 — Location Indicators.

2.14 Air traffic services airspaces

2.14.1 When ATS airspace is shown on a chart, the class of airspace shall be indicated.

2.14.2 **Recommendation.—** *On charts used for visual flight, those parts of the ATS Airspace Classifications table in Annex 11 applicable to the airspace depicted on the chart should be on the face or reverse of each chart.*

2.15 Magnetic variation

2.15.1 True North and magnetic variation shall be indicated.

2.15.2 **Recommendation.—** *When magnetic variation is shown on a chart, the values shown should be those for the year nearest to the date of publication that is divisible by 5, i.e. 1980, 1985, etc. In exceptional cases where the current value would be more than one degree different, after applying the calculation for annual change, an interim date and value should be quoted.*

Note.— The date and the annual change may be shown.

2.16 Typography

Note.— Samples of type suitable for use on aeronautical charts are included in the Aeronautical Chart Manual *(Doc 8697).*

2.17 Geographical coordinates

2.17.1 Applicable as of 1 January 1998, geographical coordinates indicating latitude and longitude shown on a chart shall be expressed in terms of the World Geodetic System — 1984 (WGS-84) geodetic reference datum. Geographical coordinates which have been transformed into WGS-84 coordinates but whose accuracy of original field work does not meet the requirements in Annex 11, Chapter 2 and Annex 14, Volumes I and II, Chapter 2, shall be identified by an asterisk.

2.17.2 The order of resolution of geographical coordinates shall be that as specified for a particular chart.

Note.— Specifications governing the determination and reporting of WGS-84 coordinates are given in Annex 11, Chapter 2 and Annex 14, Volumes I and II, Chapter 2.

CHAPTER 3. AERODROME OBSTACLE CHART — ICAO TYPE A (OPERATING LIMITATIONS)

3.1 Function

This chart, in combination with the Aerodrome Obstacle Chart — ICAO Type C or with the relevant information published in the AIP, shall provide the data necessary to enable an operator to comply with the operating limitations of Annex 6, Parts I and II, Chapter 5, and Part III, Chapter 3.

3.2 Applicability

3.2.1 Aerodrome Obstacle Charts — ICAO Type A (Operating Limitations) shall be made available in the manner prescribed in 1.3.2 for all aerodromes regularly used by international civil aviation, except for those aerodromes where there are no significant obstacles in the take-off flight path areas.

3.2.2 Where a chart is not required because no significant obstacles exist in the take-off flight path area, a notification to this effect shall be published.

3.3 Units of measurement

3.3.1 Elevations shall be shown to the nearest half-metre or to the nearest foot.

3.3.2 Linear dimensions shall be shown to the nearest half-metre.

3.4 Coverage and scale

3.4.1 The extent of each plan shall be sufficient to cover all significant obstacles.

Note.— Isolated distant significant obstacles that would unnecessarily increase the sheet size may be indicated by the appropriate symbol and an arrow, provided that the distance and bearing from the end of the runway farthest removed and the elevation are given.

3.4.2 The horizontal scale shall be within the range of 1:10 000 to 1:15 000.

3.4.3 **Recommendation.—** *The horizontal scale should be 1:10 000.*

Note.— When the production of the charts would be expedited thereby, a scale of 1:20 000 may be used.

3.4.4 The vertical scale shall be ten times the horizontal scale.

3.4.5 *Linear scales.* Horizontal and vertical linear scales showing both metres and feet shall be included in the charts.

3.5 Format

3.5.1 The charts shall depict a plan and profile of each runway, any associated stopway or clearway, the take-off flight path area, and significant obstacles.

3.5.2 The profile for each runway, stopway, clearway and the obstacles in the take-off flight path area shall be shown above its corresponding plan. The profile of an alternative take-off flight path area shall comprise a linear projection of the full take-off flight path and shall be disposed above its corresponding plan in the manner most suited to the ready interpretation of the information.

3.5.3 A profile grid shall be ruled over the entire profile area exclusive of the runway. The zero for vertical coordinates shall be mean sea level. The zero for horizontal coordinates shall be the end of the runway furthest from the take-off flight path area concerned. Graduation marks indicating the sub-divisions of intervals shall be shown along the base of the grid and along the vertical margins.

3.5.3.1 **Recommendation.—** *The vertical grid should have intervals of 30 m (100 ft) and the horizontal grid should have intervals of 300 m (1 000 ft).*

3.5.4 The chart shall include:

a) a box for recording the operational data specified in 3.8.3;

b) a box for recording amendments and dates thereof.

3.6 Identification

The chart shall be identified by the name of the country in which the aerodrome is located, the name of the city or town, or area, which the aerodrome serves, the name of the aerodrome and the designator(s) of the runway(s).

3.7 Magnetic variation

The magnetic variation to the nearest degree and date of information shall be indicated.

3.8 Aeronautical data

3.8.1 Obstacles

3.8.1.1 Obstacles in the take-off flight path area which project above a plane surface having a 1.2 per cent slope and having a common origin with the take-off flight path area, shall be regarded as significant obstacles, except that significant obstacles lying wholly below the shadow of other significant obstacles as defined in 3.8.1.2 need not be shown. Mobile obstacles such as boats, trains, trucks, etc., which may project above the 1.2 per cent plane shall be considered significant obstacles but shall not be considered as being capable of creating a shadow.

3.8.1.2 The shadow of an obstacle is considered to be a plane surface originating at a horizontal line passing through the top of the obstacle at right angles to the centre line of the take-off flight path area. The plane covers the complete width of the take-off flight path area and extends to the plane defined at 3.8.1.1 or to the next higher significant obstacle if it occurs first. For the first 300 m (1 000 ft) of the take-off flight path area, the shadow planes are horizontal and beyond this point such planes have an upward slope of 1.2 per cent.

3.8.1.3 If the significant obstacle creating a shadow is likely to be removed, objects that would become significant obstacles by its removal shall be shown.

3.8.2 Take-off flight path area

3.8.2.1 The take-off flight path area consists of a quadrilateral area on the surface of the earth lying directly below, and symmetrically disposed about, the take-off flight path. This area has the following characteristics:

a) it commences at the end of the area declared suitable for take-off (i.e. at the end of the runway or clearway as appropriate);

b) its width at the point of origin is 180 m (600 ft) and this width increases at the rate of 0.25D to a maximum of 1 800 m (6 000 ft), where D is the distance from the point of origin;

c) it extends to the point beyond which no significant obstacles exist or to a distance of 10.0 km (5.4 NM), whichever is the lesser.

3.8.2.2 For runways serving aircraft having operating limitations which do not preclude the use of a take-off flight path gradient of less than 1.2 per cent, the extent of the take-off flight path area specified in 3.8.2.1 c) shall be increased to not less than 12.0 km (6.5 NM) and the slope of the plane surface specified in 3.8.1.1 and 3.8.1.2 shall be reduced to 1.0 per cent or less.

Note.— When a 1.0 per cent survey plane touches no obstacles, this plane may be lowered until it touches the first obstacle.

3.8.3 Declared distances

3.8.3.1 The following information for each direction of each runway shall be entered in the space provided:

a) take-off run available;

b) accelerate-stop distance available;

c) take-off distance available;

d) landing distance available.

Note.— In Annex 14, Volume I, Attachment A, Section 3, guidance is given on declared distances.

3.8.3.2 **Recommendation.—** *Where a declared distance is not provided because a runway is usable in one direction only, that runway should be identified as "not usable for take-off, landing, or both".*

3.8.4 Plan and profile views

3.8.4.1 The plan view shall show:

a) the outline of the runways by a solid line, including the length and width, the magnetic bearing to the nearest degree, and the runway number;

b) the outline of the clearways by a broken line, including the length and identification as such;

c) take-off flight path areas by a dashed line and the centre line by a fine line consisting of short and long dashes;

d) alternative take-off flight path areas. When alternative take-off flight path areas not centred on the extension of the runway centre line are shown, notes shall be provided explaining the significance of such areas;

e) obstacles, including:

1) the exact location of each significant obstacle together with a symbol indicative of its type;

2) the elevation and identification of each significant obstacle;

3) the limits of penetration of significant obstacles of large extent in a distinctive manner identified in the legend.

Note.— This does not exclude the necessity for indicating critical spot elevations within the take-off flight path area.

3.8.4.1.1 **Recommendation.—** *The nature of the runway and stopway surfaces should be indicated.*

3.8.4.1.2 **Recommendation.—** *Stopways should be identified as such and should be shown by a broken line.*

3.8.4.1.3 When stopways are shown, the length of each stopway shall be indicated.

3.8.4.2 The profile view shall show:

a) the profile of the centre line of the runway by a solid line and the profile of the centre line of any associated stopways and clearways by a broken line;

b) the elevation of the runway centre line at each end of the runway, at the stopway and at the origin of each take-off flight path area, and at each significant change in slope of runway and stopway;

c) obstacles, including:

1) each significant obstacle by a solid vertical line extending from a convenient grid line over at least one other grid line to the elevation of the top of the obstacle;

2) identification of each significant obstacle;

3) the limits of penetration of significant obstacles of large extent in a distinctive manner identified in the legend.

Note.— An obstacle profile consisting of a line joining the tops of each significant obstacle and representing the shadow created by successive significant obstacles may be shown.

3.9 Accuracy

3.9.1 The order of accuracy attained shall be shown on the chart.

3.9.2 **Recommendation.—** *The horizontal dimensions and the elevations of the runway, stopway and clearway to be printed on the chart should be determined to the nearest 0.5 m (1 ft).*

3.9.3 **Recommendation.—** *The order of accuracy of the field work and the precision of chart production should be such that measurements in the take-off flight path areas can be taken from the chart within the following maximum deviations:*

1) horizontal distances: 5 m (15 ft) at a point of origin increasing at a rate of 1 per 500;

2) vertical distances: 0.5 m (1.5 ft) in the first 300 m (1 000 ft) and increasing at a rate of 1 per 1 000.

3.9.4 *Datum.* Where no accurate datum for vertical reference is available, the elevation of the datum used shall be stated and shall be identified as assumed.

CHAPTER 4. AERODROME OBSTACLE CHART — ICAO TYPE B

4.1 Function

This chart shall provide information to satisfy the following functions:

a) the determination of minimum safe altitudes/heights including those for circling procedures;

b) the determination of procedures for use in the event of an emergency during take-off or landing;

c) the application of obstacle clearing and marking criteria; and

d) the provision of source material for aeronautical charts.

4.2 Applicability

4.2.1 **Recommendation.**— *Aerodrome Obstacle Charts — ICAO Type B should be made available, in the manner prescribed in 1.3.2, for all aerodromes regularly used by international civil aviation.*

4.2.2 When a chart combining the specifications of Chapters 3 and 4 is made available, it shall be called the Aerodrome Obstacle Chart — ICAO (Comprehensive).

4.3 Units of measurement

4.3.1 Elevations shall be shown to the nearest half-metre or to the nearest foot.

4.3.2 Linear dimensions shall be shown to the nearest half-metre.

4.4 Coverage and scale

4.4.1 The extent of each plan shall be sufficient to cover all significant obstacles.

Note.— Isolated distant obstacles that would unnecessarily increase the sheet size may be indicated by the appropriate symbol and an arrow, provided that the distance and bearing from the aerodrome reference point and elevation are given.

4.4.2 The horizontal scale shall be within the range of 1:10 000 to 1:20 000.

4.4.3 A horizontal linear scale showing both metres and feet shall be included in the chart. When necessary, a linear scale for kilometres and a linear scale for nautical miles shall also be shown.

4.5 Format

The charts shall include:

a) any necessary explanation of the projection used;

b) any necessary identification of the grid used;

c) a notation indicating that obstacles are those which penetrate the surfaces specified in Annex 14, Volume I, Chapter 4;

d) a box for recording amendments and dates thereof;

e) outside the neat line, every minute of latitude and longitude marked in degrees and minutes.

Note.— Lines of latitude and longitude may be shown across the face of the chart.

4.6 Identification

The chart shall be identified by the name of the country in which the aerodrome is located, the name of the city or town, or area, which the aerodrome serves and the name of the aerodrome.

4.7 Culture and topography

4.7.1 Drainage and hydrographic details shall be kept to a minimum.

4.7.2 Buildings and other salient features associated with the aerodrome shall be shown. Wherever possible, they shall be shown to scale.

4.7.3 All objects, either cultural or natural, that project above the take-off and approach surfaces specified in 4.7 or the clearing and marking surfaces specified in Annex 14, Volume I, Chapter 4 shall be shown.

4.7.4 Roads and railroads within the take-off and approach area, and less than 600 m (2 000 ft) from the end of the runway or runway extensions, shall be shown.

Note.— Geographical names of features may be shown if of significance.

4.8 Magnetic variation

The chart shall show a compass rose orientated to the True North, or a North point, showing the magnetic variation to the nearest degree with the date of magnetic information and annual change.

4.9 Aeronautical data

4.9.1 The charts shall show:

a) the aerodrome reference point and its geographical coordinates in degrees, minutes and seconds;

b) the outline of the runways by a solid line;

c) the length and width of the runway;

d) the magnetic bearing to the nearest degree of the runway and the runway number;

e) the elevation of the runway centre line at each end of the runway, at the stopway, at the origin of each take-off and approach area, and at each significant change of slope of runway and stopway;

f) taxiways, aprons and parking areas identified as such, and the outlines by a solid line;

g) stopways identified as such and depicted by a broken line;

h) the length of each stopway;

i) clearways identified as such and depicted by a broken line;

j) the length of each clearway;

k) take-off and approach surfaces identified as such and depicted by a broken line;

l) take-off and approach areas;

Note.— The take-off area is described in 3.8.2.1. The approach area consists of an area on the surface of the earth lying directly below the approach surface as specified in Annex 14, Volume I, Chapter 4.

m) significant obstacles at their exact location, including:

1) a symbol indicative of their type;

2) elevation;

3) identification;

4) limits of penetration of large extent in a distinctive manner identified in the legend;

Note.— This does not exclude the necessity for indicating critical spot elevations within the take-off and approach areas.

n) any additional obstacles, as determined by 3.8.1.1 including the obstacles in the shadow of a significant obstacle, which would otherwise be exempted.

Note.— The specifications in Annex 14, Volume I, Chapter 4, are minimum requirements. Where the competent authority has established lower surfaces, they may be used in the determination of significant obstacles.

4.9.1.1 **Recommendation.—** *The nature of the runway and stopway surfaces should be given.*

4.9.1.2 **Recommendation.—** *Wherever practicable the highest object or obstacle between adjacent approach areas within a radius of 5 000 m (15 000 ft) from the aerodrome reference point should be indicated in a prominent manner.*

4.9.1.3 **Recommendation.—** *The extent of tree areas and relief features, part of which constitute significant obstacles, should be shown.*

4.10 Accuracy

4.10.1 The order of accuracy attained shall be shown on the chart.

4.10.2 **Recommendation.—** *The horizontal dimensions and the elevations of the movement area, stopways and clearways to be printed on the chart should be determined to the nearest 0.5 m (1 ft).*

4.10.3 **Recommendation.—** *The order or accuracy of the field work and the precision of chart production should be such that the resulting data will be within the maximum deviations indicated herein:*

a) Take-off and approach areas:

1) horizontal distances: 5 m (15 ft) at point of origin increasing at a rate of 1 per 500;

2) vertical distances: 0.5 m (1.5 ft) in the first 300 m (1 000 ft) and increasing at a rate of 1 per 1 000.

b) Other areas:

1) horizontal distances: 5 m (15 ft) within 5 000 m (15 000 ft) of the aerodrome reference point and 12 m (40 ft) beyond that area;

2) vertical distances: 1 m (3 ft) within 1 500 m (5 000 ft) of the aerodrome reference point increasing at a rate of 1 per 1 000.

4.10.4 *Datum.* Where no accurate datum for vertical reference is available, the elevation of the datum used shall be stated and identified as assumed.

CHAPTER 5. AERODROME OBSTACLE CHART — ICAO TYPE C

5.1 Function

When produced, this chart shall provide the obstacle data necessary to enable an operator to develop procedures to comply with the operating limitations of Annex 6, Parts I and II, Chapter 5, and Part III, Chapter 3, with particular reference to information on obstacles that limit the maximum permissible take-off mass, and also to:

a) determine minimum safe heights including those for circling procedures;

b) determine procedures for use in the event of an emergency during take-off or landing;

c) provide source material for aeronautical charts.

Note.— An explanation of the intended purpose and use of this chart is given in the Aeronautical Chart Manual *(Doc 8697).*

5.2 Applicability

This chart is not required where:

a) the obstacle data specified in 5.1 are published in the AIP; or

b) no significant obstacles exist and notification of this is published in the AIP.

5.3 Coverage and scale

5.3.1 The extent of each chart shall be sufficient:

a) to cover all significant obstacles, including obstacles in the shadow of a significant obstacle, in the take-off flight path area which project above a plane surface having a 1.2 per cent slope and having a common origin with the take-off flight path area. Account shall be taken of mobile obstacles such as boats, trains, trucks, etc., which may project above the 1.2 per cent plane;

b) to cover all obstacles exceeding 120 m (400 ft) above the lowest elevation on the runway(s) which may influence the maximum permissible take-off mass or the choice of the aircraft's flight profile both straight ahead and in all areas where turning departures may occur;

c) to provide topographical information covering a distance of approximately 45 km (24 NM) from the aerodrome reference point.

5.3.2 The horizontal scale shall be within the range of 1:20 000 to 1:100 000.

Note.— A scale of 1:50 000 is preferred.

5.4 Format

The chart shall include:

a) any necessary explanation of the projection used;

b) any necessary identification of the grid used;

c) a box for recording amendments and dates thereof;

d) a box for recording the declared distances specified in 5.8.2;

e) graduation marks at consistent intervals outside the neat line, at least every 10 minutes of latitude and longitude and marked in degrees and minutes.

Note 1.— Lines of latitude and longitude may be shown across the face of the chart.

Note 2.— Aerodrome Obstacle Chart — ICAO Type C may consist of any suitable topographical chart or series of charts available, overprinted with the necessary aeronautical data in a distinctive colour.

5.5 Identification

The chart shall be identified by the name of the country in which the aerodrome is located, the name of the city or town which the aerodrome serves, and the name of the aerodrome.

5.6 Magnetic variation

Recommendation.— *The chart should show the magnetic variation to the nearest degree with the date and annual change.*

5.7 Units of measurement

5.7.1 Elevations shall be shown to the nearest metre or to the nearest foot.

5.7.2 Linear dimensions shall be shown to the nearest metre.

5.8 Aeronautical data

5.8.1 The chart shall show:

a) the aerodrome reference point and its geographical coordinates in degrees, minutes and seconds;

b) the runways and the extended runway centre lines;

c) significant obstacles as specified in 5.3.1 a) and b); the extent of each plan shall be sufficient to cover all significant obstacles except that isolated distant obstacles that would unnecessarily increase the sheet size may be indicated by an arrow, provided that the distance and bearing from a reference point and elevation are given;

d) the exact location of each significant obstacle by a symbol;

e) the elevation of each significant obstacle;

f) an indication of the type of each significant obstacle;

Note.— The obstacle type may be given in textual form or in areas where excessive clutter would ensue, the obstacle may be identified by a number on the chart and the number and type tabulated in the margin or on a separate sheet.

g) the limits of penetration of significant obstacles of large extent in a distinctive manner identified in the legend;

Note.— This does not exclude the necessity for indicating critical spot elevations within such an area.

h) the positions of all radio navigation aids.

5.8.2 Declared distances

5.8.2.1 The following information for each direction of each runway shall be entered in the space provided:

a) take-off run available;

b) accelerate-stop distance available;

c) take-off distance available;

d) landing distance available.

Note.— In Annex 14, Volume I, Attachment A, guidance is given on declared distances.

5.8.2.2 **Recommendation.—** *Where a declared distance is not provided because a runway direction cannot be used for take-off or landing or both, then this should be indicated and the words "not usable" or the abbreviation "NU" entered.*

5.9 Accuracy

5.9.1 The order of accuracy attained shall be shown on the chart.

5.9.2 **Recommendation.—** *The order of accuracy of the field work and the precision of chart production should be such that the resulting data will be within the maximum deviations indicated herein:*

1) horizontal distances: 50 m (150 ft);

2) vertical distances: 10 m (30 ft).

Note.— These accuracies are satisfactory for normal use. In cases where more precise information on horizontal and/or vertical distances is needed it is assumed that this will be obtained by other means.

CHAPTER 6. PRECISION APPROACH TERRAIN CHART — ICAO

6.1 Function

The chart shall provide detailed terrain profile information within a defined portion of the final approach so as to enable aircraft operating agencies to assess the effect of the terrain on decision height determination by the use of radio altimeters.

6.2 Applicability

6.2.1 The Precision Approach Terrain Chart — ICAO shall be made available for all precision approach runways Categories II and III at aerodromes used by international civil aviation.

6.2.2 The Precision Approach Terrain Chart — ICAO shall be revised whenever any significant change occurs.

6.3 Scale

6.3.1 **Recommendation.—** *The horizontal scale should be 1:2 500, and the vertical scale 1:500.*

6.3.2 **Recommendation.—** *When the chart includes a profile of the terrain to a distance greater than 900 m (3 000 ft) from the runway threshold, the horizontal scale should be 1:5 000.*

6.4 Identification

The chart shall be identified by the name of the country in which the aerodrome is located, the name of the city or town, or area, which the aerodrome serves, the name of the aerodrome and the designator of the runway.

6.5 Plan and profile information

6.5.1 The chart shall include:

1) a plan showing contours at 1 m (3 ft) intervals in the area 60 m (200 ft) on either side of the extended centre line of the runway, to the same distance as the profile, the contours to be related to the runway threshold;

2) an indication where the terrain or any object thereon, within the plan defined in 1) above, differs by ± 3 m (10 ft) in height from the centre line profile and is likely to affect a radio altimeter;

3) a profile of the terrain to a distance of 900 m (3 000 ft) from the threshold along the extended centre line of the runway.

6.5.2 **Recommendation.—** *Where the terrain at a distance greater than 900 m (3 000 ft) from the runway threshold is mountainous or otherwise significant to users of the chart, the profile of the terrain should be shown to a distance not exceeding 2 000 m (6 500 ft) from the runway threshold.*

6.5.3 **Recommendation.—** *The chart should include an indication of the height of the ILS reference datum.*

CHAPTER 7. ENROUTE CHART — ICAO

7.1 Function

This chart shall provide flight crews with information to facilitate navigation along ATS routes in compliance with air traffic services procedures.

Note.— Simplified versions of these charts are appropriate for inclusion in Aeronautical Information Publications to complement the tabulation of radio communication and navigation facilities.

7.2 Applicability

7.2.1 The Enroute Chart — ICAO shall be made available in the manner prescribed in 1.3.2 for all areas where flight information regions have been established.

Note.— Under certain conditions, an Area Chart — ICAO may have to be provided. (See Chapter 8.)

7.2.2 Where different air traffic services routes, position reporting requirements or lateral limits of flight information regions or control areas exist in different layers of airspace and cannot be shown with sufficient clarity on one chart, separate charts shall be provided.

7.3 Coverage and scale

Note 1.— A uniform scale for charts of this type cannot be specified due to the varying degree of congestion of information in certain areas.

Note 2.— A linear scale based on the mean scale of the chart may be shown.

7.3.1 **Recommendation.—** *Layout of sheet lines should be determined by the density and pattern of the ATS route structure.*

7.3.2 Large variations of scale between adjacent charts showing a continuous route structure shall be avoided.

7.3.3 An adequate overlap of charts shall be provided to ensure continuity of navigation.

7.4 Projection

7.4.1 **Recommendation.—** *A conformal projection on which a straight line approximates a great circle should be used.*

7.4.2 Parallels and meridians shall be shown at suitable intervals.

7.4.3 Graduation marks shall be placed at consistent intervals along selected parallels and meridians.

7.5 Identification

Each sheet shall be identified by chart series and number.

7.6 Culture and topography

7.6.1 Generalized shore lines of all open water areas, large lakes and rivers shall be shown except where they conflict with data more applicable to the function of the chart.

7.6.2 Within each quadrilateral formed by the parallels and meridians the Area Minimum Altitude shall be shown, except as provided for in 7.6.3.

7.6.3 **Recommendation.—** *In areas of high latitude where it is determined by the appropriate authority that True North orientation of the chart is impractical, the Area Minimum Altitude should be shown within each quadrilateral formed by reference lines of the graticule (grid) used.*

7.6.4 Where charts are not True North orientated this fact and the selected orientation used shall be clearly indicated.

7.7 Magnetic variation

Recommendation.— *Isogonals should be indicated and the date of the isogonic information given.*

7.8 Bearings, tracks and radials

7.8.1 Bearings, tracks and radials shall be magnetic, except as provided for in 7.8.2.

7.8.2 **Recommendation.—** *In areas of high latitude where it is determined by the appropriate authority that reference to Magnetic North is impractical, another suitable reference, i.e. True North or Grid North, should be used.*

7.8.3 Where bearings, tracks or radials are given with reference to True North or Grid North, this shall be clearly indicated. When Grid North is used its reference grid meridian shall be identified.

7.9 Aeronautical data

7.9.1 Aerodromes

All aerodromes used by international civil aviation to which an instrument approach can be made shall be shown.

Note.— Other aerodromes may be shown.

7.9.2 Prohibited, restricted and danger areas

Prohibited, restricted and danger areas relevant to the layer of airspace, shall be depicted with their identification and vertical limits.

7.9.3 Air traffic services system

7.9.3.1 Where appropriate, the components of the established air traffic services system shall be shown.

7.9.3.1.1 The components shall include the following:

1) the radio navigation aids associated with the air traffic services system together with their names, identifications, frequencies and geographical coordinates in degrees, minutes and seconds;

2) in respect of DME, additionally the elevation of the DME site to the nearest 30 m (100 ft);

3) an indication of all designated airspace, including lateral and vertical limits and the appropriate class of airspace;

4) all ATS routes for en-route flight including route designators, required navigation performance (RNP) types, the track in both directions along each segment of the routes and, where applicable, the direction of traffic flow;

5) all significant points which define the ATS routes and are not marked by the site of a radio navigation aid, together with their name-codes and geographical coordinates in degrees, minutes and seconds;

6) in respect of way-points defining VOR/DME area navigation routes, additionally,

   a) the station identification and radio frequency of the reference VOR/DME;

   b) the bearing to the nearest tenth of a degree and the distance to the nearest two-tenths of a kilometre (tenth of a nautical mile) from the reference VOR/DME, if the way-point is not collocated with it;

7) an indication of all compulsory and "on-request" reporting points and ATS/MET reporting points;

8) the distances between significant points constituting turning points or reporting points;

   Note.— Over-all distances between radio navigation aids may also be shown.

9) change-over points on route segments defined by reference to very high frequency omnidirectional radio ranges, indicating the distances to the navigation aids;

   Note.— Change-over points established at the mid-point between two aids, or at the intersection of two radials in the case of a route which changes direction between the aids, need not be shown for each route segment if a general statement regarding their existence is made.

10) minimum flight altitudes on ATS routes (see Annex 11, 2.21);

11) radio communication facilities listed with their frequencies.

7.9.4 Supplementary information

7.9.4.1 Details of departure and arrival routes and associated holding patterns in terminal areas shall be shown unless they are shown on an Area Chart, a Standard Departure Chart — Instrument (SID) — ICAO or a Standard Arrival Chart — Instrument (STAR) — ICAO.

Note 1.— For specifications of these charts see Chapters 8, 9 and 10.

Note 2.— Departure routes normally originate at the end of a runway; arrival routes normally terminate at the point where an instrument approach is initiated.

7.9.4.2 Where established, altimeter setting regions shall be shown and identified.

9/11/95

CHAPTER 8. AREA CHART — ICAO

8.1 Function

This chart shall provide the flight crew with information to facilitate the following phases of instrument flight:

a) the transition between the en-route phase and approach to an aerodrome;

b) the transition between take-off/missed approach and en-route phase of flight; and

c) flights through areas of complex ATS routes or airspace structure.

Note.— The function described in 8.1 c) may be satisfied by a separate chart or an inset on an Enroute Chart — ICAO.

8.2 Applicability

8.2.1 The Area Chart — ICAO shall be made available in the manner prescribed in 1.3.2 where the air traffic services routes or position reporting requirements are complex and cannot be adequately shown on an Enroute Chart — ICAO.

8.2.2 Where air traffic services routes or position reporting requirements are different for arrivals and for departures, and these cannot be shown with sufficient clarity on one chart, separate charts shall be provided.

Note.— Under certain conditions a Standard Departure Chart — Instrument (SID) — ICAO and a Standard Arrival Chart — Instrument (STAR) — ICAO may have to be provided (see Chapters 9 and 10).

8.3 Coverage and scale

8.3.1 The coverage of each chart shall extend to points that effectively show departure and arrival routes.

8.3.2 The chart shall be drawn to scale and a scale-bar shown.

8.4 Projection

8.4.1 **Recommendation.—** *A conformal projection on which a straight line approximates a great circle should be used.*

8.4.2 **Recommendation.—** *Parallels and meridians should be shown at suitable intervals.*

8.4.3 Graduation marks shall be placed at consistent intervals along the neat lines.

8.5 Identification

Each sheet shall be identified by a name associated with the airspace portrayed.

Note.— The name may be that of the air traffic services centre, the name of the largest city or town situated in the area covered by the chart or the name of the city which the aerodrome serves. Where more than one aerodrome serves the city or town, the name of the aerodrome on which the procedures are based should be added.

8.6 Culture and topography

8.6.1 Generalized shore lines of all open water areas, large lakes and rivers shall be shown except where they conflict with data more applicable to the function of the chart.

8.6.2 Area Minimum Altitudes shall be shown in a manner best suited to the particular function of the chart and the elevation characteristics of the area portrayed.

8.7 Magnetic variation

The average magnetic variation of the area covered by the chart shall be shown.

8.8 Bearings, tracks and radials

8.8.1 Bearings, tracks and radials shall be magnetic, except as provided for in 8.8.2.

8.8.2 **Recommendation.—** *In areas of high latitude, where it is determined by the appropriate authority that reference to Magnetic North is impractical, another suitable reference, i.e. True North or Grid North, should be used.*

8.8.3 Where bearings, tracks and radials are given with reference to True North or Grid North, this shall be clearly indicated. When Grid North is used its reference grid meridian shall be identified.

8.9 Aeronautical data

8.9.1 Aerodromes

All aerodromes which affect the terminal routings shall be shown. Where appropriate a runway pattern symbol shall be used.

8.9.2 Prohibited, restricted and danger areas

Prohibited, restricted and danger areas shall be depicted with their identification and vertical limits.

8.9.3 Air traffic services system

8.9.3.1 The components of the established relevant air traffic services system shall be shown.

8.9.3.1.1 The components shall include the following:

1) the radio navigation aids associated with the air traffic services system together with their names, identifications, frequencies and geographical coordinates in degrees, minutes and seconds;

2) in respect of DME, additionally the elevation of the DME site to the nearest 30 m (100 ft);

3) terminal radio aids which are required for outbound and inbound traffic and for holding patterns;

4) the lateral and vertical limits of all designated airspace and the appropriate class of airspace;

5) holding patterns and terminal routings, together with the route designators, and the track along each segment of the prescribed airways and terminal routings;

6) all significant points which define the terminal routings and are not marked by the site of a radio navigation aid, together with their name-codes and geographical coordinates in degrees, minutes and seconds;

7) in respect of way-points defining VOR/DME area navigation routes, additionally,

   a) the station identification and radio frequency of the reference VOR/DME;

   b) the bearing to the nearest tenth of a degree and the distance to the nearest two-tenths of a kilometre (tenth of a nautical mile) from the reference VOR/DME, if the way-point is not collocated with it;

8) an indication of all compulsory and "on-request" reporting points;

9) the distances between significant points constituting turning points or reporting points;

   Note.— Over-all distances between radio navigation aids may also be shown.

10) change-over points on route segments defined by reference to very high frequency omnidirectional radio ranges, indicating the distances to the radio navigation aids;

   Note.— Change-over points established at mid-point between two aids, or at the intersection of two radials in the case of a route which changes direction between the aids, need not be shown for each route segment if a general statement regarding their existence is made.

11) minimum flight altitudes on ATS routes (see Annex 11, 2.21);

12) established minimum altitudes where radar vectoring on departure or arrival is provided, clearly identified;

   Note.— Where radar procedures are used to vector aircraft to or from a significant point on a published standard departure or arrival route, these may be depicted on the Area Chart — ICAO unless excessive chart clutter will result.

13) area speed and level/altitude restrictions where established;

14) radio communication facilities listed with their frequencies.

CHAPTER 9. STANDARD DEPARTURE CHART — INSTRUMENT (SID) — ICAO

9.1 Function

This chart shall provide the flight crew with information to enable it to comply with the designated standard departure route — instrument from take-off phase to the en-route phase.

Note 1.— Provisions governing the identification of standard departure routes are in Annex 11, Appendix 3; guidance material relating to the establishment of such routes is contained in the Air Traffic Services Planning Manual *(Doc 9426).*

Note 2.— Provisions governing obstacle clearance criteria and details of the minimum information to be published are contained in PANS-OPS, Volume II, Part II (Doc 8168).

9.2 Applicability

The Standard Departure Chart — Instrument (SID) — ICAO shall be made available wherever a standard departure route — instrument has been established and cannot be shown with sufficient clarity on the Area Chart — ICAO.

9.3 Coverage and scale

9.3.1 The coverage of the chart shall be sufficient to indicate the point where the departure route begins and the specified significant point at which the en-route phase of flight along a designated air traffic services route can be commenced.

Note.— The departure route normally originates at the end of a runway.

9.3.2 **Recommendation.—** *The chart should be drawn to scale.*

9.3.3 If the chart is drawn to scale, a scale-bar shall be shown.

9.3.4 When the chart is not drawn to scale the annotation "NOT TO SCALE" shall be shown and the symbol for scale-break shall be used on tracks and other aspects of the chart which are too large to be drawn to scale.

9.4 Projection

9.4.1 **Recommendation.—** *A conformal projection on which a straight line approximates a great circle should be used.*

9.4.2 **Recommendation.—** *When the chart is drawn to scale, parallels and meridians should be shown at suitable intervals.*

9.4.3 Graduation marks shall be placed at consistent intervals along the neat lines, as appropriate.

9.5 Identification

Each sheet shall be identified by the name of the city or town, or area, which the aerodrome serves, the name of the aerodrome, and where appropriate, the runway designator(s) and the designator(s) of the standard departure route(s) — instrument.

9.6 Culture and topography

9.6.1 Information essential to safe compliance with the standard departure route — instrument shall be shown.

9.6.2 **Recommendation.—** *Significant topographical and cultural features should be shown where this will facilitate the transition from visual flight to instrument flight.*

9.6.3 Area Minimum Altitudes shall be shown in a manner best suited to the particular function of the chart and to the elevation characteristics of the area portrayed.

9.7 Magnetic variation

Magnetic variation used in determining the magnetic bearings, tracks and radials shall be shown.

9.8 Bearings, tracks and radials

9.8.1 Bearings, tracks and radials shall be magnetic, except as provided for in 9.8.2.

Note.— A note to this effect may be included on the chart.

9.8.2 **Recommendation.—** *In areas of high latitude, where it is determined by the appropriate authority that reference to Magnetic North is impractical, another suitable reference, i.e. True North or Grid North, should be used.*

9.8.3 Where bearings, tracks and radials are given with reference to True North or Grid North, this shall be clearly indicated. When Grid North is used its reference grid meridian shall be identified.

9.9 Aeronautical data

9.9.1 Aerodromes

9.9.1.1 The aerodrome of departure shall be shown by the runway pattern.

9.9.1.2 All aerodromes which affect the designated standard departure route — instrument shall be shown and identified. Where appropriate the aerodrome runway patterns shall be shown.

9.9.2 Prohibited, restricted and danger areas

Prohibited, restricted and danger areas which may affect the execution of the procedures shall be shown with their identification and vertical limits.

9.9.3 Air traffic services system

9.9.3.1 The components of the relevant air traffic services system shall be shown.

9.9.3.1.1 The components shall comprise the following:

1) a graphic portrayal of each standard departure route — instrument, including:

   a) route designator;

   b) significant points defining the route;

   c) track or radial along each segment of the route(s);

   d) distances between significant points;

   e) minimum flight altitudes along the route or route segments;

   f) altitude/flight level restrictions, where established;

   Note.— Where radar procedures are used to vector aircraft to or from a significant point on a standard departure route, they may be shown.

2) the radio navigation aid(s) associated with the route(s) including:

   a) plain language name;

   b) identification;

   c) frequency;

   d) geographical coordinates in degrees, minutes and seconds;

   e) for DME, the channel and the elevation of the DME site to the nearest 30 m (100 ft);

3) the name-codes of the significant points not marked by the site of a radio navigation aid, their geographical coordinates in degrees, minutes and seconds and the bearing to the nearest tenth of a degree and distance to the nearest two-tenths of a kilometre (tenth of a nautical mile) from the reference radio navigation aid;

4) applicable holding patterns;

5) transition altitude/height;

6) terrain clearance information, where appropriate. A note shall be included whenever close-in obstacles penetrating obstacle identification surface (OIS) exist but which were not considered for the published procedure design gradient;

   Note.— For close-in obstacles see PANS-OPS, Volume II, Figure II-3-11.

7) area speed restrictions, where established;

8) all compulsory and "on-request" reporting points;

9) radio communication procedures, including:

   a) call sign(s) of ATS unit(s);

   b) frequency;

   c) transponder setting, where appropriate.

9.9.3.2 **Recommendation.—** *A textual description of standard departure route(s) — instrument (SID) and communication failure procedures in relation to radar control should be provided and should, whenever feasible, be shown on the chart or on the same page which contains the chart.*

CHAPTER 10. STANDARD ARRIVAL CHART — INSTRUMENT (STAR) — ICAO

10.1 Function

This chart shall provide the flight crew with information to enable it to comply with the designated standard arrival route — instrument from the en-route phase to the approach phase.

Note 1.— Standard arrival routes — instrument are to be interpreted as including "standard descent profiles", "continuous descent approach", and other non-standard descriptions. In the case of a standard descent profile, the depiction of a cross-section is not required.

Note 2.— Provisions governing the identification of standard arrival routes are in Annex 11, Appendix 3; guidance material relating to the establishment of such routes is contained in the Air Traffic Services Planning Manual *(Doc 9426).*

10.2 Applicability

The Standard Arrival Chart — Instrument (STAR) — ICAO shall be made available wherever a standard arrival route — instrument has been established and cannot be shown with sufficient clarity on the Area Chart.

10.3 Coverage and scale

10.3.1 The coverage of the chart shall be sufficient to indicate the points where the en-route phase ends and the approach phase begins.

10.3.2 **Recommendation.—** *The chart should be drawn to scale.*

10.3.3 If the chart is drawn to scale, a scale-bar shall be shown.

10.3.4 When the chart is not drawn to scale the annotation "NOT TO SCALE" shall be shown and the symbol for scale break shall be used on tracks and other aspects of the chart which are too large to be drawn to scale.

10.4 Projection

10.4.1 **Recommendation.—** *A conformal projection on which a straight line approximates a great circle should be used.*

10.4.2 **Recommendation.—** *When the chart is drawn to scale, parallels and meridians should be shown at suitable intervals.*

10.4.3 Graduation marks shall be placed at consistent intervals along the neat lines, as appropriate.

10.5 Identification

Each sheet shall be identified by the name of the city or town, or area, which the aerodrome serves, the name of the aerodrome, and where appropriate, the runway designator(s) and the designator(s) of the standard arrival route(s) — instrument.

10.6 Culture and topography

10.6.1 Information essential to safe compliance with the standard arrival route — instrument shall be shown.

10.6.2 **Recommendation.—** *Significant topographical and cultural features should be shown where this will facilitate the transition from instrument flight to visual flight.*

10.6.3 Area Minimum Altitudes shall be shown in a manner best suited to the particular function of the chart and to the elevation characteristics of the area portrayed.

10.7 Magnetic variation

Magnetic variation used in determining the magnetic bearings, tracks and radials shall be shown.

10.8 Bearings, tracks and radials

10.8.1 Bearings, tracks and radials shall be magnetic, except as provided for in 10.8.2.

Note.— A note to this effect may be included on the chart.

10.8.2 **Recommendation.—** *In areas of high latitude, where it is determined by the appropriate authority that reference to Magnetic North is impractical, another suitable reference, i.e. True North or Grid North, should be used.*

10.8.3 Where bearings, tracks and radials are given with reference to True North or Grid North, this shall be clearly indicated. When Grid North is used its reference grid meridian shall be identified.

10.9 Aeronautical data

10.9.1 Aerodromes

10.9.1.1 The aerodrome of landing shall be shown by the runway pattern.

10.9.1.2 All aerodromes which affect the designated standard arrival route — instrument shall be shown and identified. Where appropriate the aerodrome runway patterns shall be shown.

10.9.2 Prohibited, restricted and danger areas

Prohibited, restricted and danger areas which may affect the execution of the procedures shall be shown with their identification and vertical limits.

10.9.3 Air traffic services system

10.9.3.1 The components of the relevant air traffic services system shall be shown.

10.9.3.1.1 The components shall comprise the following:

1) a graphic portrayal of each standard arrival route — instrument, including:

   a) route designator;

   b) significant points defining the route;

   c) track or radial along each segment of the route;

   d) distances between significant points;

   e) minimum flight altitudes along the route or route segments;

   f) altitude/flight level restrictions, where applicable;

   Note.— Where radar procedures are used to vector aircraft to or from a significant point on a standard arrival route they may be shown.

2) the radio navigation aid(s) associated with the route(s) including:

   a) plain language name;

   b) identification;

   c) frequency;

   d) geographical coordinates in degrees, minutes and seconds;

   e) for DME, the channel and the elevation of the DME site to the nearest 30 m (100 ft);

3) the name-codes of the significant points not marked by the site of a radio navigation aid, their geographical coordinates in degrees, minutes and seconds and the bearing to the nearest tenth of a degree and distance to the nearest two-tenths of a kilometre (tenth of a nautical mile) from the reference radio navigation aid;

4) applicable holding patterns;

5) transition altitude/height;

6) terrain clearance information, where appropriate;

7) area speed restrictions, where established;

8) all compulsory and "on-request" reporting points;

9) radio communication procedures, including:

   a) call sign(s) of ATS unit(s);

   b) frequency;

   c) transponder setting, where appropriate.

10.9.3.2 **Recommendation.—** *A textual description of standard arrival route(s) — instrument (STAR) and communication failure procedures in relation to radar control, should be provided and should whenever feasible, be shown on the chart or on the same page which contains the chart.*

CHAPTER 11. INSTRUMENT APPROACH CHART — ICAO

11.1 Function

This chart shall provide flight crews with information which will enable them to perform an approved instrument approach procedure to the runway of intended landing including the missed approach procedure and where applicable, associated holding patterns.

Note.— Detailed criteria for the establishment of instrument approach procedures are contained in the Procedures for Air Navigation Services — Aircraft Operations *(Doc 8168), Vol. II.*

11.2 Applicability

11.2.1 Instrument Approach Charts — ICAO shall be made available for all aerodromes used by international civil aviation where instrument approach procedures have been established by the State concerned.

11.2.2 A separate Instrument Approach Chart — ICAO shall normally be provided for each precision approach procedure established by the State.

11.2.3 A separate Instrument Approach Chart — ICAO shall normally be provided for each non-precision approach procedure established by the State.

Note.— A single precision or non-precision approach procedure chart may be provided to portray more than one approach procedure when the procedures for the intermediate approach, final approach and missed approach segments are identical.

11.2.4 When the values for track, time or altitude differ between categories of aircraft on other than the final approach segment of the instrument approach procedures and the listing of these differences on a single chart could cause clutter or confusion, more than one chart shall be provided.

Note.— For categories of aircraft, see Procedures for Air Navigation Services — Aircraft Operations *(Doc 8168), Vol. II, Part III, Chapter 1.*

11.2.5 Instrument Approach Charts — ICAO shall be revised whenever information essential to safe operation becomes out of date.

11.3 Coverage and scale

11.3.1 The coverage of the chart shall be sufficient to include all segments of the instrument approach procedure and such additional areas as may be necessary for the type of approach intended.

11.3.2 The scale selected shall ensure optimum legibility consistent with:

1) the procedure shown on the chart;

2) sheet size.

11.3.3 A scale indication shall be given.

11.3.3.1 Except where this is not practicable, a distance circle with a radius of 20 km (10 NM) centred on a DME located on or close to the aerodrome, or on the aerodrome reference point where no suitable DME is available, shall be shown; its radius shall be indicated on the circumference.

11.3.3.2 **Recommendation.—** *A distance scale should be shown directly below the profile.*

11.4 Format

Recommendation.— *The sheet size should be 210 × 148 mm (8.27 × 5.82 in).*

11.5 Projection

11.5.1 A conformal projection on which a straight line approximates a great circle shall be used.

11.5.2 **Recommendation.—** *Graduation marks should be placed at consistent intervals along the neat lines.*

11.6 Identification

11.6.1 The chart shall be identified by the name of the city or town, or area, which the aerodrome serves, the name of the aerodrome, the abbreviation of the type of radio navigation aid(s) on which the instrument approach procedure or the visual manoeuvring (circling) procedure is established and the designator of the runway where applicable.

11.6.2 Where the instrument approach procedure is limited to certain categories of aircraft this shall be shown in parentheses at the end of the identification.

11.7 Culture and topography

11.7.1 Topographical information pertinent to the safe execution of the instrument approach procedure, including the missed approach procedure, associated holding procedures and visual manoeuvring (circling) procedure when established, shall be shown. Such topographical information shall be named, only when necessary, to facilitate the understanding of such procedures. When shown, the minimum shall be a delineation of land masses and significant lakes and rivers.

11.7.2 Relief shall be shown in a manner best suited to the particular elevation characteristics of the area, except as provided for in 11.10.2.6.

11.8 Magnetic variation

11.8.1 **Recommendation.—** *The magnetic variation should be shown.*

11.8.2 When shown the value of the variation shall agree with that used in determining magnetic bearings, tracks and radials.

11.9 Bearings, tracks and radials

11.9.1 Bearings, tracks and radials shall be magnetic except as provided for in 11.9.2.

Note.— A note to this effect may be included on the chart.

11.9.2 **Recommendation.—** *In areas of high latitude where it is determined by the appropriate authority that reference to Magnetic North is impractical, another suitable reference, i.e. True North or Grid North, should be used.*

11.9.3 Where bearings, tracks and radials are given with reference to True North or Grid North, this shall be clearly indicated. When Grid North is used its reference grid meridian shall be identified.

11.10 Aeronautical data

11.10.1 Aerodromes

11.10.1.1 All aerodromes which show a distinctive pattern from the air shall be shown by the appropriate symbol. Abandoned aerodromes shall be identified as abandoned.

11.10.1.2 The runway pattern, at a scale sufficiently large to show it clearly, shall be shown for:

1) the aerodrome on which the procedure is based;

2) aerodromes affecting the traffic pattern or so situated as to be likely, under adverse weather conditions, to be mistaken for the aerodrome of intended landing.

11.10.1.3 The aerodrome elevation shall be shown in a prominent position on the chart.

11.10.1.4 The threshold elevation shall be shown or, where applicable, the highest elevation of the touchdown zone.

11.10.2 Obstacles

11.10.2.1 Significant obstacles shall be shown, except as provided for in 11.10.2.6.

11.10.2.2 **Recommendation.—** *If one or more obstacles are the determining factor of an obstacle clearance altitude/height, those obstacles should be identified.*

11.10.2.3 The elevation of the top of obstacles shall be shown to the nearest (next higher) metre or foot.

11.10.2.4 **Recommendation.—** *The heights of obstacles above a datum other than mean sea level (see 11.10.2.3) should be shown. When shown, they should be given in parentheses on the chart.*

11.10.2.5 When the heights of obstacles above a datum other than mean sea level are shown, the datum shall be the aerodrome elevation except that, at aerodromes having an instrument runway (or runways) with a threshold elevation more than 2 m (7 ft) below the aerodrome elevation, the chart datum shall be the threshold elevation of the runway to which the instrument approach is related.

11.10.2.6 **Recommendation.—** *As provided for under and as an alternative to the provisions in 11.7.2 and 11.10.2.1 the information on relief and significant obstacles should be combined with the area minimum altitude and portrayed on an area basis as appropriate.*

11.10.2.7 Where a datum other than mean sea level is used, it shall be stated in a prominent position on the chart.

11.10.2.8 Where an obstacle free zone has been established for a precision approach runway category I, this shall be indicated or described.

11.10.3 Prohibited, restricted and danger areas

Prohibited areas, restricted areas, and danger areas which may affect the execution of the procedures shall be shown with their identification and vertical limits.

11.10.4 Radio communication facilities and navigation aids

11.10.4.1 Radio navigation aids required for the procedures together with their frequencies, identifications and track-defining characteristics, if any, shall be shown.

11.10.4.2 The final approach fix (or final approach point for an ILS approach procedure) and other essential fixes or points comprising the procedure shall be shown and identified.

11.10.4.3 **Recommendation.—** *The final approach fix (or final approach point for an ILS approach procedure) should be identified with its geographical coordinates in degrees, minutes, seconds and hundredths of seconds.*

11.10.4.4 Radio navigation aids that might be used in diversionary procedures together with their track-defining characteristics, if any, shall be shown or indicated on the chart.

11.10.4.5 Radio communication frequencies, including call signs, that are required for the execution of the procedures shall be shown.

11.10.4.6 When required by the procedures, the distance to the aerodrome from each radio navigation aid concerned with the final approach shall be shown. When no track-defining aid indicates the bearing of the aerodrome, the bearing shall also be shown.

11.10.5 Minimum sector altitude

The minimum sector altitude established by the competent authority shall be shown, with a clear indication of the sector to which it applies.

11.10.6 Portrayal of procedure tracks

11.10.6.1 The plan view shall show the following information in the manner indicated:

a) the approach procedure track by an arrowed continuous line indicating the direction of flight;

b) the missed approach procedure track by an arrowed broken line;

c) any additional procedure track, other than those specified in a) and b), by an arrowed dotted line;

d) bearings, tracks, radials and distances or times required for the procedure;

e) where no track-defining aid is available, the magnetic bearing to the aerodrome from the radio navigation aids concerned with the final approach;

f) the boundaries of any sector in which visual manoeuvring (circling) is prohibited;

g) where specified the holding pattern and minimum holding altitude/height associated with the approach and missed approach;

h) caution notes where required, prominently displayed on the face of the chart.

11.10.6.2 **Recommendation.—** *The plan view should show the distance to the aerodrome from each radio navigation aid concerned with the final approach.*

11.10.6.3 A profile shall be provided normally below the plan view showing the following data:

a) the aerodrome by a solid block at aerodrome elevation;

b) the approach procedure track by an arrowed continuous line indicating the direction of flight;

c) the missed approach procedure track by an arrowed broken line and a description of the procedure;

d) any additional procedure track, other than those specified in b) and c) by an arrowed dotted line;

e) bearings, tracks, radials and distances or times required for the procedure;

f) altitude/heights required by the procedures, including transition altitude, where established;

g) limiting distance on procedure turn, when specified;

h) the intermediate approach fix or point, on procedures where no course reversal is authorized.

11.10.6.4 **Recommendation.—** *Heights required by procedures should be shown in parentheses, using the height datum selected in accordance with 11.10.2.5.*

Note 1.— A ground profile may be shown, and a line representing the aerodrome elevation extended across the whole width of the chart.

Note 2.— The ground profile may depict the highest points of elevation occurring within the procedure approach areas. In addition, significant obstacles which occur within 0.9 km (0.5 NM) outside these approach areas may be shown on the profile by a dashed line in addition to the normal line of the profile.

11.10.7 Aerodrome operating minima

11.10.7.1 Aerodrome operating minima when established by the State shall be shown.

11.10.7.2 The obstacle clearance altitudes/heights as appropriate shall be shown.

11.10.8 Supplementary information

11.10.8.1 When the missed approach point is defined by:

— a distance from the final approach fix, or

— a facility or a fix and the corresponding distance from the final approach fix,

the distance and a table showing ground speeds and times from the final approach fix to the missed approach point shall be shown.

11.10.8.2 **Recommendation.—** *When DME is available for use in the final approach segment, a table showing altitudes/heights for each 2 km or 1 NM as appropriate should be shown.*

Note.— For procedures in which DME is not required for use in the final approach segment but where a suitably located DME is available to provide advisory descent profile information, a table showing the altitudes/heights may be included.

11.10.8.3 **Recommendation.—** *A rate of descent table should be shown.*

11.10.8.4 Final approach descent gradient for VOR and NDB procedures with a final approach fix shall be shown.

11.10.8.5 On charts depicting ILS approach procedures the height of the ILS reference datum and the glide path angle shall be shown.

CHAPTER 12. VISUAL APPROACH CHART — ICAO

12.1 Function

This chart shall provide flight crews with information which will enable them to transit from the en-route/descent to approach phases of flight to the runway of intended landing by means of visual reference.

12.2 Applicability

The Visual Approach Chart — ICAO shall be made available in the manner prescribed in 1.3.2 for all aerodromes used by international civil aviation where:

1) only limited navigation facilities are available; or

2) radio communication facilities are not available; or

3) no adequate aeronautical charts of the aerodrome and its surroundings at 1:500 000 or greater scale are available; or

4) visual approach procedures have been established.

12.3 Scale

12.3.1 The scale shall be sufficiently large to permit depiction of significant features and indication of the aerodrome layout.

12.3.2 **Recommendation.—** *The scale should not be smaller than 1:500 000.*

Note.— A scale of 1:250 000 or 1:200 000 is preferred.

12.3.3 **Recommendation.—** *When an Instrument Approach Chart is available for a given aerodrome, the Visual Approach Chart should be drawn to the same scale.*

12.4 Format

Recommendation.— *The sheet size should be 210 × 148 mm (8.27 × 5.82 in).*

Note.— It would be advantageous to print the charts in several colours, selected to provide maximum legibility in varying degrees and kinds of light.

12.5 Projection

12.5.1 A conformal projection on which a straight line approximates a great circle shall be used.

12.5.2 **Recommendation.—** *Graduation marks should be placed at consistent intervals along the neat lines.*

12.6 Identification

The chart shall be identified by the name of the city or town which the aerodrome serves and the name of the aerodrome.

12.7 Culture and topography

12.7.1 Natural and cultural landmarks shall be shown (e.g. bluffs, cliffs, sand dunes, cities, towns, roads, railroads, isolated lighthouses, etc.).

12.7.1.1 **Recommendation.—** *Geographical place names should be included only when they are required to avoid confusion or ambiguity.*

12.7.2 Shore lines, lakes, rivers and streams shall be shown.

12.7.3 Relief shall be shown in a manner best suited to the particular elevation and obstacle characteristics of the area covered by the chart.

12.7.4 **Recommendation.—** *When shown, spot elevations should be carefully selected.*

Note.— The value of certain spot elevations/heights in relation to both mean sea level and aerodrome elevation may be given.

12.7.5 The figures relating to different reference levels shall be clearly differentiated in their presentation.

12.8 Magnetic variation

The magnetic variation shall be shown.

12.9 Bearings, tracks and radials

12.9.1 Bearings, tracks and radials shall be magnetic except as provided for in 12.9.2.

12.9.2 **Recommendation.—** *In areas of high latitude where it is determined by the appropriate authority that reference to Magnetic North is impractical another suitable reference, i.e. True North or Grid North, should be used.*

12.9.3 Where bearings, tracks or radials are given with reference to True North or Grid North, this shall be clearly indicated. When Grid North is used its reference grid meridian shall be identified.

12.10 Aeronautical data

12.10.1 Aerodromes

12.10.1.1 All aerodromes shall be shown by the runway pattern. Restrictions on the use of any landing direction shall be indicated. Where there is any risk of confusion between two neighbouring aerodromes this shall be indicated. Abandoned aerodromes shall be identified as abandoned.

12.10.1.2 The aerodrome elevation shall be shown in a prominent position on the chart.

12.10.2 Obstacles

12.10.2.1 Significant obstacles shall be shown and identified.

12.10.2.2 The elevation of the top of obstacles shall be shown to the nearest (next higher) metre or foot.

12.10.2.3 **Recommendation.—** *The heights of obstacles above the aerodrome elevation should be shown.*

12.10.2.3.1 When the heights of obstacles are shown, the height datum shall be stated in a prominent position on the chart and the heights shall be given in parentheses on the chart.

12.10.3 Prohibited, restricted and danger areas

Prohibited areas, restricted areas, and danger areas shall be depicted with their identification and vertical limits.

12.10.4 Designated airspace

Where applicable, control zones and aerodrome traffic zones shall be depicted with their vertical limits and the appropriate class of airspace.

12.10.5 Visual approach information

12.10.5.1 Visual approach procedures shall be shown where applicable.

12.10.5.2 Visual aids for navigation shall be shown as appropriate.

12.10.5.3 Location and type of the visual approach slope indicator systems with their nominal approach slope angle(s), minimum eye height(s) over the threshold of the on-slope signal(s), and where the axis of the system is not parallel to the runway centre line, the angle and direction of displacement, i.e. left or right, shall be shown.

12.10.6 Supplementary information

12.10.6.1 Radio navigation aids together with their frequencies and identifications shall be shown as appropriate.

12.10.6.2 Radio communication facilities with their frequencies shall be shown as appropriate.

CHAPTER 13. AERODROME/HELIPORT CHART — ICAO

13.1 Function

This chart shall provide flight crews with information which will facilitate the ground movement of aircraft:

a) from the aircraft stand to the runway; and

b) from the runway to the aircraft stand;

and helicopter movement:

a) from the helicopter stand to the touchdown and lift-off area and to the final approach and take-off area;

b) from the final approach and take-off area to the touchdown and lift-off area and to the helicopter stand;

c) along helicopter ground and air taxiways; and

d) along air transit routes;

it shall also provide essential operational information at the aerodrome/heliport.

13.2 Applicability

13.2.1 The Aerodrome/Heliport Chart — ICAO shall be made available in the manner prescribed in 1.3.2 for all aerodromes/heliports regularly used by international civil aviation.

13.2.2 **Recommendation.—** *The Aerodrome/Heliport Chart — ICAO should be made available also, in the manner prescribed in 1.3.2, for all other aerodromes/heliports available for use by international civil aviation.*

Note.— Under certain conditions an Aerodrome Ground Movement Chart — ICAO and an Aircraft Parking/Docking Chart — ICAO may have to be provided (see Chapters 14 and 15); in which case, the elements portrayed on these supplementary charts need not be duplicated on the Aerodrome/Heliport Chart — ICAO.

13.3 Coverage and scale

13.3.1 The coverage and scale shall be sufficiently large to show clearly all the elements listed in 13.6.1.

13.3.2 A linear scale shall be shown.

13.4 Identification

The chart shall be identified by the name of the city or town, or area, which the aerodrome/heliport serves and the name of the aerodrome/heliport.

13.5 Magnetic variation

True and Magnetic North arrows and annual change of the magnetic variation shall be shown.

13.6 Aerodrome/heliport data

13.6.1 This chart shall show:

a) geographical coordinates in degrees, minutes and seconds for the aerodrome/heliport reference point;

b) elevations of the aerodrome/heliport, runway thresholds, highest point of touchdown zones and apron (pre-flight altimeter check locations) where applicable;

c) all runways including those under construction with designation number, length, width, bearing strength, displaced thresholds, stopways, clearways, runway directions to the nearest degree magnetic, type of surface, and runway markings;

Note.— Bearing strengths may be shown in tabular form on the face or verso of the chart.

d) all aprons, with aircraft/helicopter stands, lighting, markings and other visual guidance and control aids, where applicable, including location and type of visual docking guidance systems, type of surface for heliports, and bearing strengths or aircraft type restrictions where the bearing strength is less than that of the associated runways;

Note.— Bearing strengths or aircraft type restrictions may be shown in tabular form on the face or verso of the chart.

e) geographical coordinates in degrees, minutes, seconds and hundredths of seconds for thresholds geometric centre of touchdown and lift-off area and/or thresholds of the final approach and take-off area (where appropriate) and aircraft stands;

f) all taxiways, helicopter air and ground taxiways with type of surface, helicopter air transit routes, with designations, width, lighting, markings, including taxi holding positions and stop bars, other visual guidance and control aids, and bearing strength or aircraft type restrictions where the bearing strength is less than that of the associated runways;

Note.— Bearing strengths or aircraft type restrictions may be shown in tabular form on the face or verso of the chart.

g) geographical coordinates in degrees, minutes, seconds and hundredths of seconds for appropriate taxiway centre line points;

h) where established, standard routes for taxiing aircraft with their designators;

i) the boundaries of the air traffic control service;

j) position of transmissometers;

k) approach and runway lighting;

l) location and type of the visual approach slope indicator systems with their nominal approach slope angle(s), minimum eye height(s) over the threshold of the on-slope signal(s), and where the axis of the system is not parallel to the runway centre line, the angle and direction of the displacement, i.e. left or right;

m) radio communication facilities;

n) significant obstacles to taxiing;

o) aircraft servicing areas and buildings of operational significance;

p) VOR check-point and radio frequency of the aid concerned;

q) any part of the depicted movement area permanently unsuitable for aircraft, clearly identified as such.

13.6.2 In addition to the items in 13.6.1 relating to heliports, the chart shall show:

a) heliport type;

Note.— Heliport types are identified in Annex 14, Volume II as surface-level, elevated or helideck.

b) touchdown and lift-off area including dimensions, slope, type of surface and bearing strength in tonnes;

c) final approach and take-off area including type, true bearing, designation number (where appropriate), length, width, slope and type of surface;

d) safety area including length, width and type of surface;

e) helicopter clearway including length and ground profile;

f) significant obstacles including type and elevation of the top of the obstacles to the nearest (next higher) metre or foot;

g) visual aids for approach procedures, marking and lighting of final approach and take-off area, and of touchdown and lift-off area;

h) declared distances for heliports, where relevant, including:

1) take-off distance available;

2) rejected take-off distance available;

3) landing distance available.

CHAPTER 14. AERODROME GROUND MOVEMENT CHART — ICAO

14.1 Function

This supplementary chart shall provide flight crews with detailed information to facilitate the ground movement of aircraft to and from the aircraft stands and the parking/docking of aircraft.

14.2 Applicability

Recommendation.— *The Aerodrome Ground Movement Chart — ICAO should be made available in the manner prescribed in 1.3.2 where, due to congestion of information, details necessary for the ground movement of aircraft along the taxiways to and from the aircraft stands cannot be shown with sufficient clarity on the Aerodrome/Heliport Chart — ICAO.*

14.3 Coverage and scale

14.3.1 The coverage and scale shall be sufficiently large to show clearly all the elements listed in 14.6.1.

14.3.2 **Recommendation.**— *A linear scale should be shown.*

14.4 Identification

The chart shall be identified by the name of the city or town which the aerodrome serves and the name of the aerodrome.

14.5 Magnetic variation

14.5.1 A True North arrow shall be shown.

14.5.2 **Recommendation.**— *Magnetic variation and its annual change should be shown.*

Note.— This chart need not be True North orientated.

14.6 Aerodrome data

This chart shall show in a similar manner all the information on the Aerodrome/Heliport Chart — ICAO relevant to the area depicted, including:

a) apron elevation;

b) aprons, with aircraft stands, bearing strengths or aircraft type restrictions, lighting, marking and other visual guidance and control aids, where applicable, including location and type of visual docking guidance systems;

c) geographical coordinates in degrees, minutes, seconds and hundredths of seconds for aircraft stands;

d) taxiways with designations, width, bearing strength or aircraft type restrictions where applicable, lighting, markings, including taxi holding positions and stop bars and other visual guidance and control aids;

e) where established, standard routes for taxiing aircraft, with their designators;

f) geographical coordinates in degrees, minutes, seconds and hundredths of seconds for appropriate taxiway centre line points;

g) the boundaries of the air traffic control service;

h) relevant radio communication facilities listed with their frequencies;

i) significant obstacles to taxiing;

j) aircraft servicing areas and buildings of operational significance;

k) VOR check-point and radio frequency of the aid concerned;

l) any part of the depicted movement area permanently unsuitable for aircraft, clearly identified as such.

CHAPTER 15. AIRCRAFT PARKING/DOCKING CHART — ICAO

15.1 Function

This supplementary chart shall provide flight crews with detailed information to facilitate the ground movement of aircraft between the taxiways and the aircraft stands and the parking/docking of aircraft.

15.2 Applicability

Recommendation.— *The Aircraft Parking/ Docking Chart — ICAO should be made available in the manner prescribed in 1.3.2 where, due to the complexity of the terminal facilities, the information cannot be shown with sufficient clarity on the Aerodrome/Heliport Chart — ICAO or on the Aerodrome Ground Movement Chart — ICAO.*

15.3 Coverage and scale

15.3.1 The coverage and scale shall be sufficiently large to show clearly all the elements listed in 15.6.

15.3.2 **Recommendation.—** *A linear scale should be shown.*

15.4 Identification

The chart shall be identified by the name of the city or town which the aerodrome serves and the name of the aerodrome.

15.5 Magnetic variation

15.5.1 A True North arrow shall be shown.

15.5.2 **Recommendation.—** *Magnetic variation and its annual change should be shown.*

Note.— This chart need not be True North orientated.

15.6 Aerodrome data

This chart shall show in a similar manner all the information on the Aerodrome/Heliport Chart — ICAO and the Aerodrome Ground Movement Chart — ICAO relevant to the area depicted, including:

a) apron elevation;

b) aprons with aircraft stands, bearing strengths or aircraft type restrictions, lighting, marking and other visual guidance and control aids, where applicable, including location and type of visual docking guidance systems;

c) geographical coordinates in degrees, minutes, seconds and hundredths of seconds for aircraft stands;

d) taxiway entries with designations, including taxi holding positions and stop bars;

e) geographical coordinates in degrees, minutes, seconds and hundredths of seconds for appropriate taxiway centre line points;

f) the boundaries of the air traffic control service;

g) relevant radio communication facilities listed with their frequencies;

h) significant obstacles to taxiing;

i) aircraft servicing areas and buildings of operational significance;

j) VOR check-point and radio frequency of the aid concerned;

k) any part of the depicted movement area permanently unsuitable for aircraft clearly identified as such.

CHAPTER 16. WORLD AERONAUTICAL CHART — ICAO 1:1 000 000

16.1 Function

This chart shall provide information to satisfy the requirements of visual air navigation.

Note.— This chart may also serve:

1) as a basic aeronautical chart:

a) when highly specialized charts lacking visual information do not provide essential data;

b) to provide complete world coverage at a constant scale with a uniform presentation of planimetric data;

c) in the production of other charts required by international civil aviation;

2) as a pre-flight planning chart.

16.2 Applicability

16.2.1 The World Aeronautical Chart — ICAO 1:1 000 000 shall be made available in the manner prescribed in 1.3.2 for all areas delineated in Appendix 5.

Note.— When operational or chart production considerations indicate that operational requirements can be effectively satisfied by Aeronautical Charts — ICAO 1:500 000 or Aeronautical Navigation Charts — ICAO Small Scale, either of these charts may be made available instead of the basic 1:1 000 000 chart.

16.2.2 **Recommendation.—** *To ensure complete coverage of all land areas and adequate continuity in any one co-ordinated series, the selection of a scale of other than 1:1 000 000 should be determined by regional agreement.*

16.3 Scales

16.3.1 Linear scales for kilometres and nautical miles arranged in the following order:

— kilometres,

— nautical miles,

with their zero points in the same vertical line shall be shown in the margin.

16.3.1.1 **Recommendation.—** *The length of the linear scales should represent at least 200 km (110 NM).*

16.3.2 A conversion scale (metres/feet) shall be shown in the margin.

16.4 Format

16.4.1 **Recommendation.—** *The title and marginal notes should be in one of the ICAO working languages.*

Note.— The language of the publishing country may be used in addition to the ICAO working language.

16.4.2 The information regarding the number of the adjoining sheets and the unit of measurement to express elevations shall be so located as to be clearly visible when the sheet is folded.

16.4.3 **Recommendation.—** *The method of folding should be as follows:*

Fold the chart on the long axis, near the mid-parallel of latitude, face out; with the bottom half of the chart face upward, fold inwards near the meridian, and fold both halves backward in accordion folds.

16.4.4 **Recommendation.—** *Whenever practicable, the sheet lines should conform with those shown in the index in Appendix 5.*

Note 1.— The area covered by a sheet may vary from the lines shown to satisfy particular requirements.

Note 2.— The value of adopting identical sheet lines for ICAO 1:1 000 000 Charts and the corresponding sheet of the International Map of the World (IMW), provided aeronautical requirements are not compromised, is recognized.

16.4.5 The sheet lines used shall be notified to ICAO for publication in the ICAO *Aeronautical Chart Catalogue* (Doc 7101).

16.4.6 **Recommendation.—** *Overlaps should be provided by extending the chart area on the top and right side beyond the area given on the index. This overlap area should contain all aeronautical, topographical, hydrographical and cultural information. The overlap should extend up to 28 km (15 NM) if possible but in any case from the limiting parallels and meridians of each chart to the neat line.*

16.5 Projection

16.5.1 The projections shall be as follows:

1) between the Equator and 80° latitude: the Lambert conformal conic projection, in separate bands for each tier of charts. The standard parallels for each 4° band shall be 40′ south of the northern parallel and 40′ north of the southern parallel;

2) between 80° and 90° latitude: the Polar stereographic projection with scale matching that of the Lambert conformal conic projection at latitude 80°, except that in the northern hemisphere the Lambert conformal conic projection may be used between 80° and 84° latitude and the Polar stereographic projection between 84° and 90° with the scales matching at 84° North.

16.5.2 Graticules and graduations shall be shown as follows:

1) Parallels:

Latitude	*Distance between parallels*	*Graduations on parallels*
0° to 72°	30′	1′
72° to 84°	30′	5′
84° to 89°	30′	1°
89° to 90°	30′	5° (Only on degree parallels from 72° to 89°)

2) Meridians:

Latitude	*Interval between meridians*	*Graduations on meridians*
0° to 52°	30′	1′
52° to 72°	30′	1′ (Only on even numbered meridians)
72° to 84°	1°	1′
84° to 89°	5°	1′
89° to 90°	15°	1′ (Only on every fourth meridian)

16.5.3 The graduation marks at 1′ and 5′ intervals shall extend away from the Greenwich Meridian and from the Equator. Each 10′ interval shall be shown by a mark on both sides of the graticule line.

16.5.3.1 **Recommendation.—** *The length of the graduation marks should be approximately 1.3 mm (0.05 in) for the 1′ intervals, and 2 mm (0.08 in) for the 5′ intervals and 2 mm (0.08 in) extending on both sides of the graticule line for the 10′ intervals.*

16.5.4 All meridians and parallels shall be numbered in the borders of the charts. In addition, each parallel shall be numbered within the body of the chart in such a manner that the parallel can be readily identified when the chart is folded.

Note.— Meridians may be numbered within the body of the chart.

16.5.5 The name and basic parameters of the projection shall be indicated in the margin.

16.6 Identification

Sheet numbering shall be in conformity with the index in Appendix 5.

Note.— The corresponding International Map of the World (IMW) sheet number may also be shown.

16.7 Culture and topography

16.7.1 Built-up areas

16.7.1.1 Cities, towns and villages shall be selected and shown according to their relative importance to visual air navigation.

16.7.1.2 **Recommendation.—** *Cities and towns of sufficient size should be indicated by the outline of their built-up areas and not of their established city limits.*

16.7.2 Railroads

16.7.2.1 All railroads having landmark value shall be shown.

Note 1.— In congested areas, some railroads may be omitted in the interest of legibility.

Note 2.— Railroads may be named where space permits.

16.7.2.2 **Recommendation.—** *Important tunnels should be shown.*

Note.— A descriptive note may be added.

16.7.3 Highways and roads

16.7.3.1 Road systems shall be shown in sufficient detail to indicate significant patterns from the air.

16.7.3.2 **Recommendation.—** *Roads should not be shown in built-up areas unless they can be distinguished from the air as definite landmarks.*

Note.— The numbers or names of important highways may be shown.

16.7.4 Landmarks

Recommendation.— *Natural and cultural landmarks, such as bridges, prominent transmission lines, permanent cable car installations, mine structures, forts, ruins, levees, pipelines, and rocks, bluffs, cliffs, sand dunes, isolated lighthouses, lightships, etc., when considered to be of importance for visual air navigation, should be shown.*

Note.— Descriptive notes may be added.

16.7.5 Political boundaries

International boundaries shall be shown. Undemarcated and undefined boundaries shall be distinguished by descriptive notes.

16.7.6 Hydrography

16.7.6.1 All water features compatible with the scale of the chart comprising shore lines, lakes, rivers and streams (including those non-perennial in nature), salt lakes, glaciers and ice caps shall be shown.

16.7.6.2 **Recommendation.—** *The tint covering large open water areas should be kept very light.*

Note.— A narrow band of darker tone may be used along the shore line to emphasize this feature.

16.7.6.3 **Recommendation.—** *Reefs and shoals including rocky ledges, tidal flats, isolated rocks, sand, gravel, stone and all similar areas should be shown by symbols when of significant landmark value.*

Note.— Groups of rocks may be shown by a few representative rock symbols within the area.

16.7.7 Contours

16.7.7.1 Contours shall be shown. The selection of intervals shall be governed by the requirement to depict clearly the relief features required in air navigation.

16.7.7.2 The values of the contours used shall be shown.

16.7.8 Hypsometric tints

16.7.8.1 When hypsometric tints are used the range of elevations for the tints shall be shown.

16.7.8.2 The scale of the hypsometric tints used on the chart shall be shown in the margin.

16.7.9 Spot elevations

16.7.9.1 Spot elevations shall be shown at selected critical points. The elevations selected shall always be the highest in the immediate vicinity and shall generally indicate the top of a peak, ridge, etc. Elevations in valleys and at lake surface levels which are of special value to the aviator shall be shown. The position of each selected elevation shall be indicated by a dot.

16.7.9.2 The elevation (in metres or feet) of the highest point on the chart and its geographical position to the nearest five minutes shall be indicated in the margin.

16.7.9.3 **Recommendation.—** *The spot elevation of the highest point in any sheet should be cleared of hypsometric tinting.*

16.7.10 Incomplete or unreliable relief

16.7.10.1 Areas that have not been surveyed for contour information shall be labelled "Relief data incomplete".

16.7.10.2 Charts on which spot elevations are generally unreliable shall bear a warning note prominently displayed on the face of the chart in the colour used for aeronautical information, as follows:

"Warning — The reliability of relief information on this chart is doubtful and elevations should be used with caution."

16.7.11 Escarpments

Recommendation.— *Escarpments should be shown when they are prominent landmarks or when cultural detail is very sparse.*

16.7.12 Wooded areas

16.7.12.1 **Recommendation.—** *Wooded areas should be shown.*

Note.— On high latitude charts, the approximate extreme northern or southern limits of tree growth may be shown.

16.7.12.2 Where shown, the approximate extreme northern or southern limits of tree growth shall be indicated by a dashed black line and shall be appropriately labelled.

16.7.13 Date of topographic information

The date of latest information shown on the topographic base shall be indicated in the margin.

16.8 Magnetic variation

16.8.1 Isogonic lines shall be shown.

16.8.2 The date of the isogonic information shall be indicated in the margin.

16.9 Aeronautical data

16.9.1 Aeronautical data shown shall be kept to a minimum consistent with the use of the chart for visual navigation and the revision cycle (see 16.9.6).

16.9.2 Aerodromes

16.9.2.1 Land and water aerodromes and heliports shall be shown with their names, to the extent that they do not produce undesirable congestion on the chart, priority being given to those of greatest aeronautical significance.

16.9.2.2 The aerodrome elevation, the lighting available, the type of runway surface and the length of the longest runway or channel, shown in abbreviated form for each aerodrome in conformity with the example given in Appendix 2, provided they do not cause undesirable clutter on the chart, shall be indicated.

16.9.2.3 Abandoned aerodromes which are still recognizable as aerodromes from the air shall be shown and identified as abandoned.

16.9.3 Obstacles

16.9.3.1 Significant obstacles shall be shown.

Note.— Obstacles of a height of 100 m (300 ft) or more above ground are normally regarded as significant obstacles.

16.9.3.2 When considered of importance to visual flight, prominent transmission lines and permanent cable car installations, which are significant obstacles, shall be shown.

16.9.4 Prohibited, restricted and danger areas

Prohibited, restricted and danger areas shall be shown.

16.9.5 Air traffic services system

Significant elements of the air traffic services system including, where practicable, control zones, aerodrome traffic zones, control areas, flight information regions and other airspaces in which VFR flights operate shall be shown together with the appropriate class of airspace.

16.9.6 Radio navigation aids

Radio navigation aids shall be shown by the appropriate symbol and named, but excluding their frequencies, coded designators, times of operation and other characteristics unless any or all of this information which is shown is kept up to date by means of new editions of the chart.

16.9.7 Supplementary information

16.9.7.1 Aeronautical ground lights together with their characteristics or their identifications or both shall be shown.

16.9.7.2 Marine lights on outer prominent coastal or isolated features of not less than 28 km (15 NM) visibility range shall be shown:

1) where they are not less distinguishable than more powerful marine lights in the vicinity;

2) where they are readily distinguishable from other marine or other types of lights in the vicinity of built-up coastal areas;

3) where they are the only lights of significance available.

CHAPTER 17. AERONAUTICAL CHART — ICAO 1:500 000

17.1 Function

This chart shall provide information to satisfy the requirements of visual air navigation for low speed, short- or medium-range operations at low and intermediate altitudes.

Note 1.— This chart may be used:

a) to serve as a basic aeronautical chart;

b) to provide a suitable medium for basic pilot and navigation training;

c) to supplement highly specialized charts which do not provide essential visual information;

d) in pre-flight planning.

Note 2.— It is intended that these charts be provided for land areas where charts of this scale are required for civil air operations employing visual air navigation independently or in support of other forms of air navigation.

Note 3.— Where States produce charts of this series covering their national territories, the entire area being portrayed is usually treated on a regional basis.

17.2 Applicability

Recommendation.— *The Aeronautical Chart — ICAO 1:500 000 should be made available in the manner prescribed in 1.3.2 for all areas delineated in Appendix 5.*

Note.— The selection of this scale as an alternative to the World Aeronautical Chart — ICAO 1:1 000 000 is covered by 16.2.1 and 16.2.2.

17.3 Scales

17.3.1 Linear scales for kilometres and nautical miles arranged in the following order:

— kilometres,

— nautical miles,

with their zero points in the same vertical line shall be shown in the margin.

17.3.1.1 **Recommendation.—** *The length of the linear scale should be not less than 200 mm (8 in).*

17.3.2 A conversion scale (metres/feet) shall be shown in the margin.

17.4 Format

17.4.1 The title and marginal notes shall be in one of the working languages of ICAO.

Note.— The language of the publishing country or any other language may be used in addition to the ICAO working language.

17.4.2 The information regarding the number of the adjoining sheets and the unit of measurement used to express elevation shall be so located as to be clearly visible when the sheet is folded.

17.4.3 **Recommendation.—** *The method of folding should be as follows:*

Fold the chart on the long axis near the mid-parallel of latitude, face out, with the bottom part of the chart face upward. Fold inwards near the meridian and fold both halves backward in accordion folds.

17.4.4 **Recommendation.—** *Whenever practicable, sheets should be quarter sheets of the World Aeronautical Chart — ICAO 1:1 000 000. An appropriate index to adjacent sheets, showing the relationship between the two chart series should be included on the face of the chart or on the reverse side.*

Note.— Sheet lines may be varied to satisfy particular requirements.

17.4.5 **Recommendation.—** *Overlaps should be provided by extending the chart area on the top and right side beyond the area given on the index. This overlap area should contain all aeronautical, topographical, hydrographical and cultural information. The overlap should extend up to 15 km (8 NM), if possible, but in any case from the limiting parallels and meridians of each chart to the neat line.*

17.5 Projection

17.5.1 A conformal (orthomorphic) projection shall be used.

17.5.2 **Recommendation.—** *The projection of the World Aeronautical Chart — ICAO 1:1 000 000 should be used.*

17.5.3 Parallels shall be shown at intervals of 30′.

17.5.3.1 Meridians shall normally be shown at intervals of 30′.

Note.— At high latitudes this interval may be increased.

17.5.4 Graduation marks shall be shown at 1′ intervals along each whole degree meridian and parallel, extending away from the Greenwich Meridian and from the Equator. Each 10′ interval shall be shown by a mark on both sides of the graticule line.

17.5.4.1 **Recommendation.—** *The length of the graduation marks should be approximately 1.3 mm (0.05 in) for the 1′ intervals, and 2 mm (0.08 in) for the 5′ intervals and 2 mm (0.08 in) extending on both sides of the graticule line for the 10′ intervals.*

17.5.5 All meridians and parallels shown shall be numbered in the borders of the chart.

17.5.5.1 **Recommendation.—** *Each meridian and parallel should be numbered within the body of the chart whenever this data is required operationally.*

17.5.6 The name and basic parameters of the projection shall be indicated in the margin.

17.6 Identification

17.6.1 Each sheet shall be identified by a name which should be that of the principal town or of a main geographical feature appearing on the sheet.

17.6.1.1 **Recommendation.—** *Where applicable, sheets should also be identified by the reference number of the corresponding World Aeronautical Chart — ICAO 1:1 000 000, with the addition of one or more of the following letter suffixes indicating the quadrant or quadrants:*

Letter	Chart quadrant
A	*North-West*
B	*North-East*
C	*South-East*
D	*South-West*

17.7 Culture and topography

17.7.1 Built-up areas

17.7.1.1 Cities, towns and villages shall be selected and shown according to their relative importance to visual air navigation.

17.7.1.2 **Recommendation.—** *Cities and towns of sufficient size should be shown by the outline of their built-up areas and not of their established city limits.*

17.7.2 Railroads

17.7.2.1 All railroads having landmark value shall be shown.

Note 1.— In congested areas, some railroads may be omitted in the interest of legibility.

Note 2.— Railroads may be named.

Note 3.— Rail stations may be shown.

17.7.2.2 Tunnels shall be shown when they serve as prominent landmarks.

Note.— A descriptive note may be added, if necessary, to accentuate this feature.

17.7.3 Highways and roads

17.7.3.1 Road systems shall be shown in sufficient detail to indicate significant patterns from the air.

Note.— Roads under construction may be shown.

17.7.3.2 **Recommendation.—** *Roads should not be shown in built-up areas unless they can be distinguished from the air as definite landmarks.*

Note.— The numbers or names of important highways may be shown.

17.7.4 Landmarks

Recommendation.— *Natural and cultural landmarks, such as bridges, mine structures, lookout towers, forts, ruins, levees, pipelines, prominent transmission lines, permanent cable car installations, and rocks, bluffs, cliffs, sand dunes, isolated lighthouses, lightships, etc., when considered to be of importance for visual air navigation, should be shown.*

Note.— Descriptive notes may be added.

17.7.5 Political boundaries

International boundaries shall be shown. Undemarcated or undefined boundaries shall be distinguished by descriptive notes.

Note.— Other boundaries may be shown.

17.7.6 Hydrography

17.7.6.1 All water features compatible with the scale of the chart comprising shore lines, lakes, rivers and streams (including those non-perennial in nature), salt lakes, glaciers and ice caps shall be shown.

17.7.6.2 **Recommendation.—** *The tint covering large open water areas should be kept very light.*

Note.— A narrow band of darker tone may be used along the shore line to emphasize this feature.

17.7.6.3 **Recommendation.—** *Reefs and shoals, including rocky ledges, tidal flats, isolated rocks, sand, gravel, stone and all similar areas should be shown by symbols when of significant landmark value.*

Note.— Groups of rocks may be shown by a few representative rock symbols within the area.

17.7.7 Contours

17.7.7.1 Contours shall be shown. The selection of intervals shall be governed by the requirement to depict clearly the relief features required in air navigation.

17.7.7.2 The values of the contours used shall be shown.

17.7.8 Hypsometric tints

17.7.8.1 When hypsometric tints are used, the range of elevations for the tints shall be shown.

17.7.8.2 The scale of the hypsometric tints used on the chart shall be shown in the margin.

17.7.9 Spot elevations

17.7.9.1 Spot elevations shall be shown at selected critical points. The elevation shall always be the highest in the immediate vicinity and shall generally indicate the top of a peak, ridge, etc. Selected elevations in valleys and at lake surface levels which are of navigational value shall be shown. The position of each selected elevation shall be indicated by a dot.

17.7.9.2 The elevation (in metres or feet) of the highest point on the chart and its geographical position to the nearest five minutes shall be indicated in the margin.

17.7.9.3 **Recommendation.—** *The spot elevation of the highest point on any sheet should be cleared of hypsometric tinting.*

17.7.10 Incomplete or unreliable relief

17.7.10.1 Areas that have not been surveyed for contour information shall be labelled "Relief data incomplete".

17.7.10.2 Charts on which spot elevations are generally unreliable shall bear a warning note prominently displayed on the face of the chart in the colour used for aeronautical information, as follows:

> "Warning — The reliability of relief information on this chart is doubtful and elevations should be used with caution."

17.7.11 Escarpments

Recommendation.— *Escarpments should be shown when they are prominent landmarks or when cultural detail is very sparse.*

17.7.12 Wooded areas

17.7.12.1 **Recommendation.—** *Wooded areas should be shown.*

Note.— On high latitude charts the approximate extreme northern or southern limits of tree growth may be shown.

17.7.12.2 Where shown, the approximate northern or southern limits of tree growth shall be indicated by a dashed black line and shall be appropriately labelled.

17.7.13 Date of topographic information

The date of latest information shown on the topographic base shall be indicated in the margin.

17.8 Magnetic variation

17.8.1 Isogonic lines shall be shown.

17.8.2 The date of the isogonic information shall be indicated in the margin.

17.9 Aeronautical data

17.9.1 Aeronautical information shall be shown consistent with the use of the chart and the revision cycle.

17.9.2 Aerodromes

17.9.2.1 Land and water aerodromes and heliports shall be shown with their names, to the extent that they do not produce undesirable congestion on the chart, priority being given to those of greatest aeronautical significance.

17.9.2.2 The aerodrome elevation, the lighting available, the type of runway surface and the length of the longest runway or channel, shown in abbreviated form for each aerodrome in conformity with the example given in Appendix 2, provided they do not cause undesirable clutter on the chart, shall be indicated.

17.9.2.3 Abandoned aerodromes which are still recognizable as aerodromes from the air shall be shown and identified as abandoned.

17.9.3 Obstacles

17.9.3.1 Significant obstacles shall be shown.

Note.— Obstacles of a height of 100 m (300 ft) or more above ground are normally regarded as significant obstacles.

17.9.3.2 When considered of importance to visual flight, prominent transmission lines and permanent cable car installations, which are significant obstacles, shall be shown.

17.9.4 Prohibited, restricted and danger areas

Prohibited, restricted and danger areas shall be shown.

17.9.5 Air traffic services system

Significant elements of the air traffic services system including, where practicable, control zones, aerodrome traffic zones, control areas, flight information regions and other airspaces in which VFR flights operate shall be shown together with the appropriate class of airspace.

17.9.6 Radio navigation aids

Radio navigation aids shall be shown by the appropriate symbol and named, but excluding their frequencies, coded designators, times of operation and other characteristics unless any or all of this information which is shown is kept up to date by means of new editions of the chart.

17.9.7 Supplementary information

17.9.7.1 Aeronautical ground lights together with their characteristics or their identifications or both shall be shown.

17.9.7.2 Marine lights on outer prominent coastal or isolated features of not less than 28 km (15 NM) visibility range shall be shown:

1) where they are not less distinguishable than more powerful marine lights in the vicinity;

2) where they are readily distinguishable from other marine or other types of lights in the vicinity of built-up coastal areas;

3) where they are the only lights of significance available.

CHAPTER 18. AERONAUTICAL NAVIGATION CHART — ICAO SMALL SCALE

18.1 Function

This chart shall:

1) serve as an air navigation aid for flight crews of long range aircraft at high altitudes;

2) provide selective check-points over extensive ranges for identification at high altitudes and speeds, which are required for visual confirmation of position;

3) provide for continuous visual reference to the ground during long range flights over areas lacking radio or other electronic navigation aids, or over areas where visual navigation is preferred or becomes necessary;

4) provide a general purpose chart series for long range flight planning and plotting.

18.2 Applicability

Recommendation.— *The Aeronautical Navigation Chart — ICAO Small Scale should be made available in the manner prescribed in 1.3.2 for all areas delineated in Appendix 5.*

Note.— The selection of this scale as an alternative to the World Aeronautical Chart — ICAO 1:1 000 000 is covered by 16.2.1 and 16.2.2.

18.3 Coverage and scale

18.3.1 **Recommendation.—** *The Aeronautical Navigation Chart — ICAO Small Scale should provide, as a minimum, complete coverage of the major land masses of the world.*

Note 1.— A sheet layout for this series is contained in the Aeronautical Chart Manual *(Doc 8697).*

Note 2.— The sheet size may represent the maximum press size available to the producing agency.

18.3.2 The scale shall be in the range of 1:2 000 000 to 1:5 000 000.

18.3.3 The scale of the chart shall be substituted in the title for the words "Small Scale".

18.3.4 Linear scales for kilometres and nautical miles arranged in the following order:

— kilometres,

— nautical miles,

with their zero points in the same vertical line shall be shown in the margin.

18.3.5 **Recommendation.—** *The length of the linear scale should be not less than 200 mm (8 in).*

18.3.6 A conversion scale (metres/feet) shall be shown in the margin.

18.4 Format

18.4.1 The title and marginal notes shall be in one of the working languages of ICAO.

Note.— The language of the publishing country or any other language may be used in addition to the ICAO working language.

18.4.2 The information regarding the number of the adjoining sheets and the unit of measurement to express elevations shall be so located as to be clearly visible when the sheet is folded.

Note.— There is no internationally agreed sheet numbering.

18.5 Projection

18.5.1 A conformal (orthomorphic) projection shall be used.

18.5.1.1 The name and basic parameters of the projection shall be shown in the margin.

18.5.2 Parallels shall be shown at intervals of 1°.

18.5.2.1 Graduations on the parallels shall be shown at sufficiently close intervals compatible with the latitude and the scale of the chart.

18.5.3 Meridians shall be shown at intervals compatible with the latitude and the scale of the chart.

18.5.3.1 Graduations on the meridians shall be shown at intervals not exceeding 5′.

18.5.4 The graduation marks shall extend away from the Greenwich Meridian and from the Equator.

18.5.5 All meridians and parallels shown shall be numbered in the borders of the chart. In addition, when required, meridians and parallels shall be numbered within the body of the chart in such a manner that they can be readily identified when the chart is folded.

18.6 Culture and topography

18.6.1 Built-up areas

18.6.1.1 Cities, towns and villages shall be selected and shown according to their relative importance to visual air navigation.

18.6.1.2 **Recommendation.—** *Cities and towns of sufficient size should be indicated by the outline of their built-up areas and not of their established city limits.*

18.6.2 Railroads

18.6.2.1 All railroads having landmark value shall be shown.

Note.— In congested areas, some railroads may be omitted in the interest of legibility.

18.6.2.2 **Recommendation.—** *Important tunnels should be shown.*

Note.— A descriptive note may be added.

18.6.3 Highways and roads

18.6.3.1 Road systems shall be shown in sufficient detail to indicate significant patterns from the air.

18.6.3.2 **Recommendation.—** *Roads should not be shown in built-up areas unless they can be distinguished from the air as definite landmarks.*

18.6.4 Landmarks

Recommendation.— *Natural and cultural landmarks, such as bridges, prominent transmission lines, permanent cable car installations, mine structures, forts, ruins, levees, pipelines and rocks, bluffs, cliffs, sand dunes, isolated lighthouses, lightships, etc., when considered to be of importance for visual air navigation, should be shown.*

Note.— Descriptive notes may be added.

18.6.5 Political boundaries

International boundaries shall be shown. Undemarcated and undefined boundaries shall be distinguished by descriptive notes.

18.6.6 Hydrography

18.6.6.1 All water features compatible with the scale of the chart comprising shore lines, lakes, rivers and streams (including those non-perennial in nature), salt lakes, glaciers and ice caps shall be shown.

18.6.6.2 **Recommendation.—** *The tint covering large open water areas should be kept very light.*

Note.— A narrow band of darker tone may be used along the shore line to emphasize this feature.

18.6.6.3 **Recommendation.—** *Reefs and shoals including rocky ledges, tidal flats, isolated rocks, sand, gravel, stone and all similar areas should be shown by a symbol when of significant landmark value.*

18.6.7 Contours

18.6.7.1 Contours shall be shown. The selection of intervals shall be governed by the requirement to depict clearly the relief features required in air navigation.

18.6.7.2 The values of the contours used shall be shown.

18.6.8 Hypsometric tints

18.6.8.1 When hypsometric tints are used the range of elevations for the tints shall be shown.

18.6.8.2 The scale of the hypsometric tints used on the chart shall be shown in the margin.

18.6.9 Spot elevations

18.6.9.1 Spot elevations shall be shown at selected critical points. The elevations selected shall always be the highest in the immediate vicinity, and shall generally indicate the top of a peak, ridge, etc. Elevations in valleys and at lake surface levels which are of value to visual air navigation shall be shown. The position of each selected elevation shall be indicated by a dot.

18.6.9.2 The elevation (in metres or feet) of the highest point on the chart and its geographical position to the nearest five minutes shall be indicated in the margin.

18.6.9.3 **Recommendation.—** *The spot elevation of the highest point in any sheet should be cleared of hypsometric tinting.*

18.6.10 Incomplete or unreliable relief

18.6.10.1 Areas that have not been surveyed for contour information shall be labelled "Relief data incomplete".

18.6.10.2 Charts on which spot elevations are generally unreliable shall bear a warning note prominently displayed on the face of the chart in the colour used for aeronautical information, as follows:

"Warning — The reliability of relief information on this chart is doubtful and elevations should be used with caution."

18.6.11 Escarpments

Recommendation.— *Escarpments should be shown when they are prominent landmarks or when cultural detail is very sparse.*

18.6.12 Wooded areas

Recommendation.— *Wooded areas of large extent should be shown.*

18.6.13 Date of topographic information

The date of latest information shown on the topographic base shall be indicated in the margin.

18.6.14 Colours

18.6.14.1 **Recommendation.—** *Subdued colours should be used for the chart background to facilitate plotting.*

18.6.14.2 **Recommendation.—** *Good colour contrast should be ensured to emphasize features important to visual air navigation.*

18.7 Magnetic variation

18.7.1 Isogonic lines shall be shown.

18.7.2 The date of isogonic information shall be indicated in the margin.

18.8 Aeronautical data

18.8.1 Aerodromes

Land and water aerodromes and heliports shall be shown with their names, to the extent that they do not produce undesirable congestion on the chart, priority being given to those of greatest aeronautical significance.

18.8.2 Obstacles

Significant obstacles shall be shown.

18.8.3 Prohibited, restricted and danger areas

Recommendation.— *Prohibited, restricted and danger areas should be shown when considered to be of importance to air navigation.*

18.8.4 Air traffic services system

Recommendation.— *Significant elements of the air traffic services system should be shown when considered to be of importance to air navigation.*

18.8.5 Radio navigation aids

Note.— Radio aids to navigation may be shown by the appropriate symbol and named.

CHAPTER 19. PLOTTING CHART — ICAO

19.1 Function

This chart shall provide a means of maintaining a continuous flight record of the aircraft position by various fixing methods and dead reckoning in order to maintain an intended flight path.

19.2 Applicability

Recommendation.— *This chart should be made available, in the manner prescribed in 1.3.2, to cover major air routes over oceanic areas and sparsely settled areas used by international civil aviation.*

Note.— In areas where the Enroute Chart — ICAO is provided there may be no requirement for a plotting chart.

19.3 Coverage and scale

19.3.1 **Recommendation.—** *Where practicable, the chart for a particular region should cover major air routes and their terminals on a single sheet.*

19.3.2 **Recommendation.—** *The scale should be governed by the area to be covered.*

Note.— Normally the scale will range from 1:3 000 000 to 1:7 500 000.

19.4 Format

Recommendation.— *The sheet should be of a size that can be adapted for use on a navigator's plotting table.*

19.5 Projection

19.5.1 **Recommendation.—** *A conformal projection on which a straight line approximates a great circle should be used.*

19.5.2 Parallels and meridians shall be shown.

19.5.2.1 **Recommendation.—** *The intervals should be arranged to permit accurate plotting to be carried out with a minimum of time and effort.*

19.5.2.2 Graduation marks shall be shown at consistent intervals along an appropriate number of parallels and meridians. The interval selected shall, regardless of scale, minimize the amount of interpolation required for accurate plotting.

19.5.2.3 **Recommendation.—** *Parallels and meridians should be numbered so that a number appears at least once every 15 cm (6 in) on the face of the chart.*

19.5.2.4 If a navigational grid is shown on charts covering the higher latitudes, it shall comprise lines parallel to the Meridian or anti-Meridian of Greenwich.

19.6 Identification

Each sheet shall be identified by chart series and number.

19.7 Culture and topography

19.7.1 Generalized shore lines of all open water areas, large lakes and rivers shall be shown.

19.7.2 Spot elevations for selected features constituting a hazard to air navigation shall be shown.

19.7.3 **Recommendation.—** *Particularly hazardous or prominent relief features should be emphasized.*

Note.— Large cities and towns may be shown.

19.8 Magnetic variation

19.8.1 Isogonals or, in higher latitudes, isogrivs, or both, shall be shown at consistent intervals throughout the chart. The interval selected shall, regardless of scale, minimize the amount of interpolation required.

19.8.2 The date of the isogonic information shall be shown.

19.9 Aeronautical data

19.9.1 The following aeronautical data shall be shown:

1) aerodromes regularly used by international commercial air transport together with their names;

2) selected radio aids to navigation that will contribute to position-finding together with their names and identifications;

3) lattices of long-range electronic aids to navigation, as required;

4) boundaries of flight information regions, control areas and control zones necessary to the function of the chart;

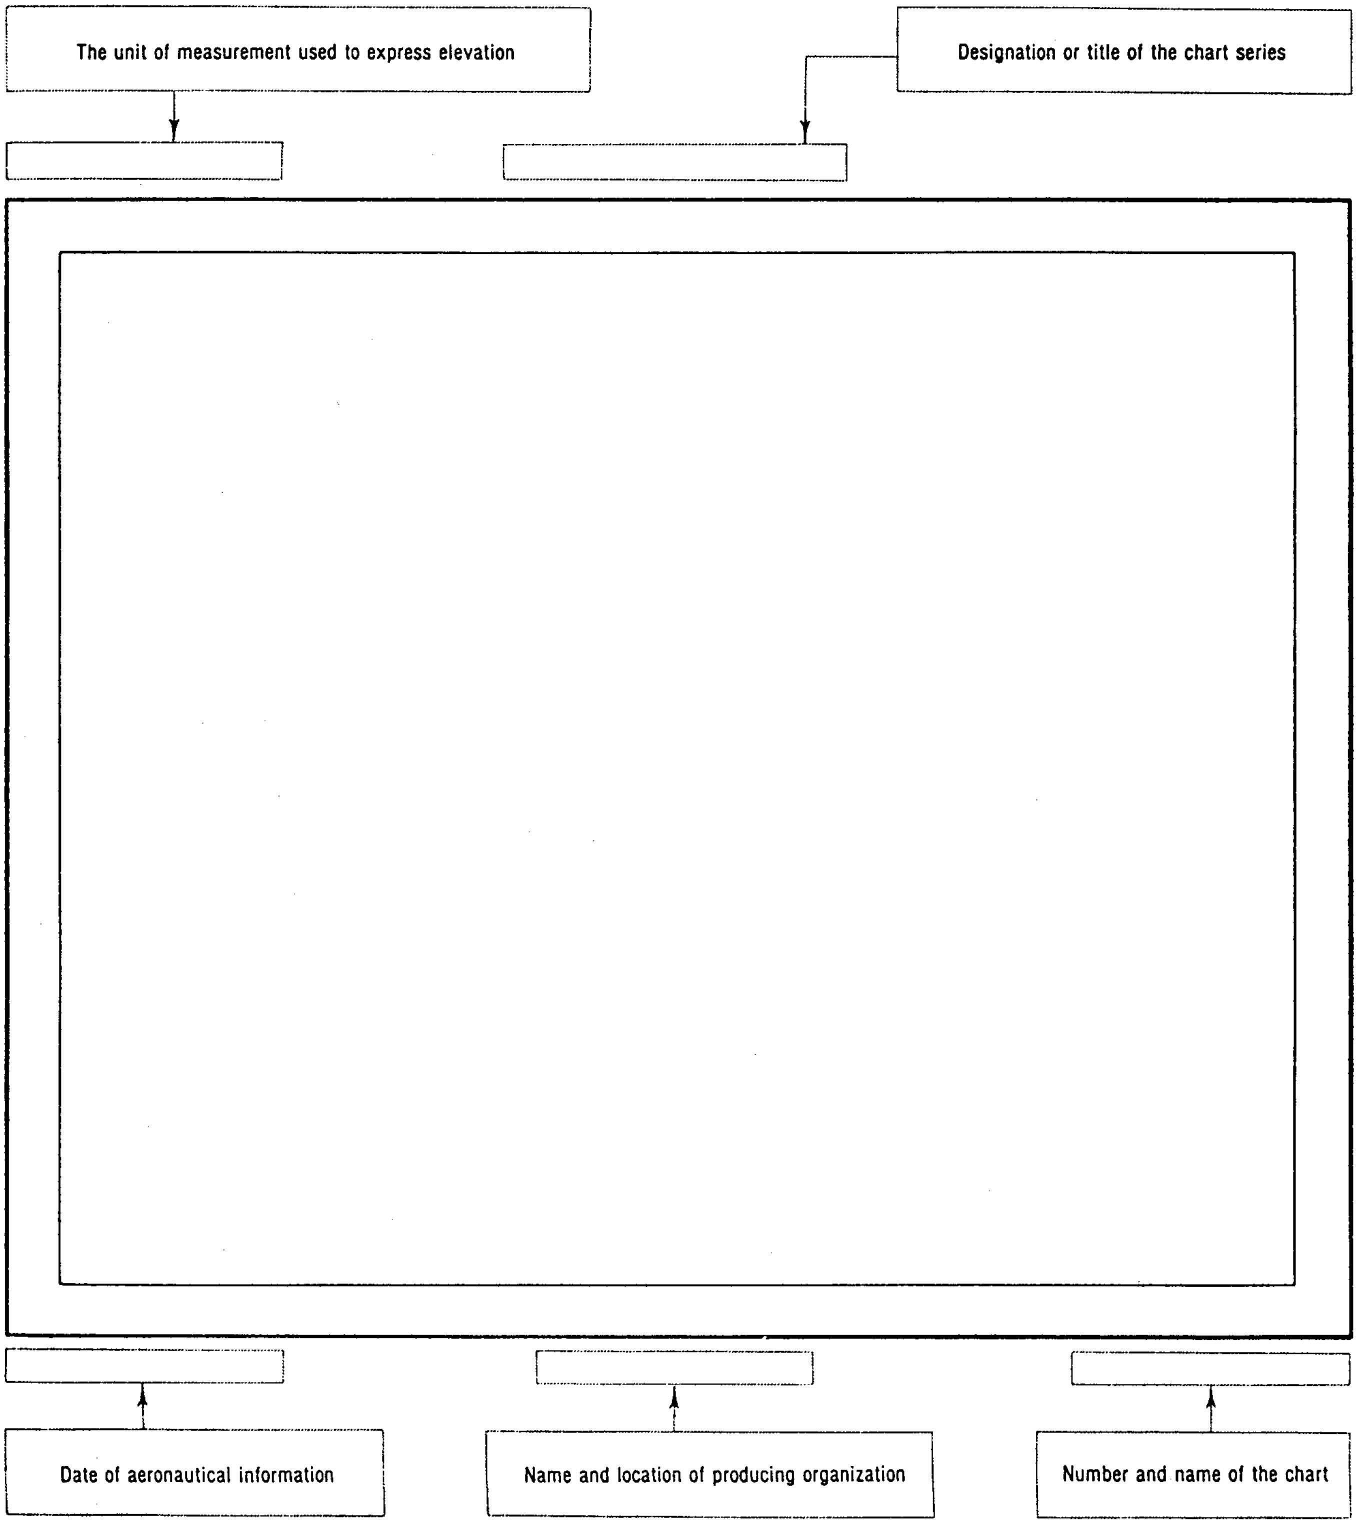
5) designated reporting points necessary to the function of the chart;

6) ocean station vessels.

Note.— Other aeronautical data may be shown provided that they do not detract from the legibility of essential information.

19.9.2 **Recommendation.—** *Aeronautical ground lights and marine lights useful for air navigation should be shown where other means of navigation are non-existent.*

APPENDIX 1. MARGINAL NOTE LAYOUT



APPENDIX 2. ICAO CHART SYMBOLS

9/11/95

TOPOGRAPHY

1 Contours (5000)

2 Approximate contours (5500)

3 Relief shown by hachures

4 Bluff, cliff or escarpment

5 Lava flow

6 Sand dunes

7 Sand area

8 Gravel

9 Levee or esker (Alternative)

10 Unusual land features appropriately labelled (Many Small Volcanoes; Rock Outcrop)

Active volcano

11 Mountain pass (5395)

12 Highest elevation on chart (Alternative: 17456; .17456)

13 Spot elevation (.6397; .8975)

14 Spot elevation (of doubtful accuracy) (.637c ±)

15 Coniferous trees

16 Other trees

17 Palms

18 Areas not surveyed for contour information or relief data incomplete — Caution

HYDROGRAPHY

19 Shore line (reliable)

20 Shore line (unreliable)

21 Tidal flats

22 Coral reefs and ledges

23 Large river (perennial)

24 Small river (perennial)

25 Rivers and streams (non-perennial) (Alternative)

26 Rivers and streams (unsurveyed)

27 Rapids

28 Falls

29 Canal

30 Abandoned canal
Note.— Dry canal having landmark value.

31 Lakes (perennial)

32 Lakes (non-perennial) (Alternative)

33 Salt lake

34 Salt pans (evaporator)

35 Swamp

36 Rice field (Alternative)

37 Spring, well or water hole — perennial; intermittent

38 Reservoir (Reservoir)

39 Dry lake bed (Alternative)

40 Wash (Alternative)

41 Shoals

42 Glaciers and ice caps

43 Danger line (2 m or one fathom line)

44 Charted isolated rock

45 Rock awash

46 Unusual water features appropriately labelled

CULTURE

BUILT-UP AREAS

47 City or large town

48 Town

49 Village

50 Buildings

RAILROADS

51 Railroad (single track)

52 Railroad (two or more tracks)

53 Railroad (under construction)

54 Railroad bridge

55 Railroad tunnel

56 Railroad station

HIGHWAYS AND ROADS

57 Dual highway

58 Primary road

59 Secondary road

60 Trail

61 Road bridge

62 Road tunnel

MISCELLANEOUS

63 Boundaries (international)

64 Other boundaries

65 Fence

66 Telegraph or telephone line (when a landmark)

67 Dam

68 Ferry

MISCELLANEOUS (Cont'd)

69 Pipeline

70 Oil or gas field

71 Tank farms

72 Coast guard station

73 Lookout tower

74 Mine

75 Forest ranger station

76 Race track or stadium

77 Ruins

78 Fort

79 Church

80 Mosque

81 Pagoda

82 Temple

AERODROMES

83 Civil Land

84 Civil Water

85 Military Land

86 Military Water

87 Joint civil and military Land

88 Joint civil and military Water

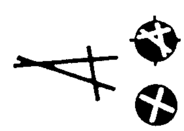
89 Emergency aerodrome or aerodrome with no facilities

90 Sheltered anchorage

91 Aerodrome for use on charts on which aerodrome classification is not required e.g. Enroute Charts

92 Heliport
Note.- Aerodrome for the exclusive use of helicopters

93 *Note.— Where required by the function of the chart, the runway pattern of the aerodrome may be shown in lieu of the aerodrome symbol, for example:*



AERODROMES *(Cont.)*

AERODROME DATA IN ABBREVIATED FORM WHICH MAY BE IN ASSOCIATION WITH AERODROME SYMBOLS

(Reference: 16.9.2.2 and 17.9.2.2)

94	Name of aerodrome Elevation given in the units of measurement (metres or feet) selected for use on the chart Length of longest runway in hundreds of metres or feet (whichever unit is selected for use on the chart) LIVINGSTONE 357 L H 95 Minimum lighting — obstacles, boundary or runway lights and lighted wind indicator or landing direction indicator Runway hard surfaced, normally all-weather *Note.— A dash (—) is to be inserted where L or H do not apply.*

AERODROME SYMBOLS FOR APPROACH CHARTS

95	Aerodromes affecting the traffic pattern on the aerodrome on which the procedure is based	
96	The aerodrome on which the procedure is based	

RADIO NAVIGATION AIDS*

97	Basic radio navigation aid symbol *Note.— This symbol may be used with or without a box to enclose the data.*		
98	Non-directional radio beacon	NDB	99	VHF omnidirectional radio range	VOR	
100	Distance measuring equipment	DME	
101	Collocated VOR and DME radio navigation aids	VOR/DME	
102	DME distance	Distance in kilometres (nautical miles) to DME Identification of radio navigation aid	15 km KAV
103	VOR radial	Radial bearing from, and identification of, VOR	R 090 KAV
104	UHF tactical air navigation aid	TACAN	
105	Collocated VOR and TACAN radio navigation aids	VORTAC	
106	Instrument landing system	ILS	 PLAN VIEW  PROFILE

107	Radio marker beacon	Elliptical	
		Bone Shape	
	Note.— Marker beacons may be shown by outline, or stipple, or both.		
108	Compass rose To be orientated on the chart in accordance with the alignment of the station (normally Magnetic North)		
Compass rose to be used as appropriate in combination with the following symbols:

VOR	
VOR/DME	
TACAN	VORTAC	

Note.— Additional points of compass may be added as required

Note.— Guidance material on the presentation of radio navigation aid data is given in the Aeronautical Chart Manual *(Doc 8697).*

AIR TRAFFIC SERVICES

109	Flight information region	FIR	
110	Aerodrome traffic zone	ATZ	
111	Control area Airway Controlled route	CTA AWY	Alternative
112	Uncontrolled route		
113	Advisory airspace	ADA	
114	Control zone	CTR	
115	Advisory route	ADR	Alternative
116	Scale-break (on ATS route)		Alternative
117	Reporting point	REP	Compulsory / On request
118	Change-over point To be superimposed on the appropriate route symbol at right angles to the route.	COP	26 / 36
119	ATS/MET reporting point	MRP	Compulsory / On request
120	Way-point	WPT	

AIRSPACE RESTRICTIONS

121	Restricted airspace (prohibited, restricted or danger area)	Common boundary of two areas
	Note.— The angle and density of rulings may be varied according to scale and the size, shape and orientation of the area.	
122	International boundary closed to passage of aircraft except through air corridor	

OBSTACLES

123	Obstacle	127	Exceptionally high obstacle (optional symbol)
124	Lighted obstacle	128	Exceptionally high obstacle — lighted (optional symbol)
125	Group obstacles		*Note.— For obstacles having a height of the order of 300 m (1 000 ft) above terrain.*
126	Lighted group obstacles	129	Elevation of top (italics) *52* (15) Height above specified datum (upright type in parentheses)

MISCELLANEOUS

130	Prominent transmission line	131	Isogonic line or isogonal — 3° E —	132	Ocean station vessel (normal position)

VISUAL AIDS

133	Marine light F	*Note 1.— Marine alternating lights are red and white unless otherwise indicated. Marine lights are white unless colours are stated.*
	Note 2.— Characteristics are to be indicated as follows:	Alt Alternating; B Blue; F Fixed; Fl Flashing; G Green; Gp Group; Occ Occulting; R Red; SEC Sector; sec Second; (U) Unwatched; W White
134	Aeronautical ground light	135 Lightship

9/11/95

SYMBOLS FOR AERODROME/HELIPORT CHARTS

136	Hard surface runway		
137	Unpaved runway

APPENDIX 3. COLOUR GUIDE

(Ref. 2.11.1)

CHART SYMBOLS

Culture, except highways and roads; outlines of large cities, grids and graticules; spot elevations; danger lines and off-shore rocks; names and lettering except for aeronautical and hydrographic features		BLACK
Built-up areas of cities		BLACK Stipple
Highways and roads	Optional colours	BLACK Half-tone
		RED
Built-up areas for cities (alternative to black stipple)		YELLOW
Contours and topographic features: Items 1 through 10 of Appendix 2. Hydrographic features: Items 39 through 41 of Appendix 2		BROWN
Shore lines, drainage, rivers, lakes, bathymetric contours and other hydrographic features including their names or description		BLUE
Open water areas		BLUE Half-tone
Salt lakes and salt pans		BLUE Stipple
Large non-perennial rivers and non-perennial lakes		BLUE Stipple
Aeronautical data, except for Enroute and Area Charts - ICAO, where different colours may be required. Both colours may be used on the same sheet but, where only one colour is used, dark blue is preferred	Optional colours	MAGENTA
		DARK BLUE

CHART SYMBOLS *(Cont.)*

Symbol		Colour
Woods		GREEN
Area minimum altitude envelopes		GREEN
Areas which have not been surveyed for contour information or relief data are incomplete	Optional colours	GOLDEN BUFF
		WHITE

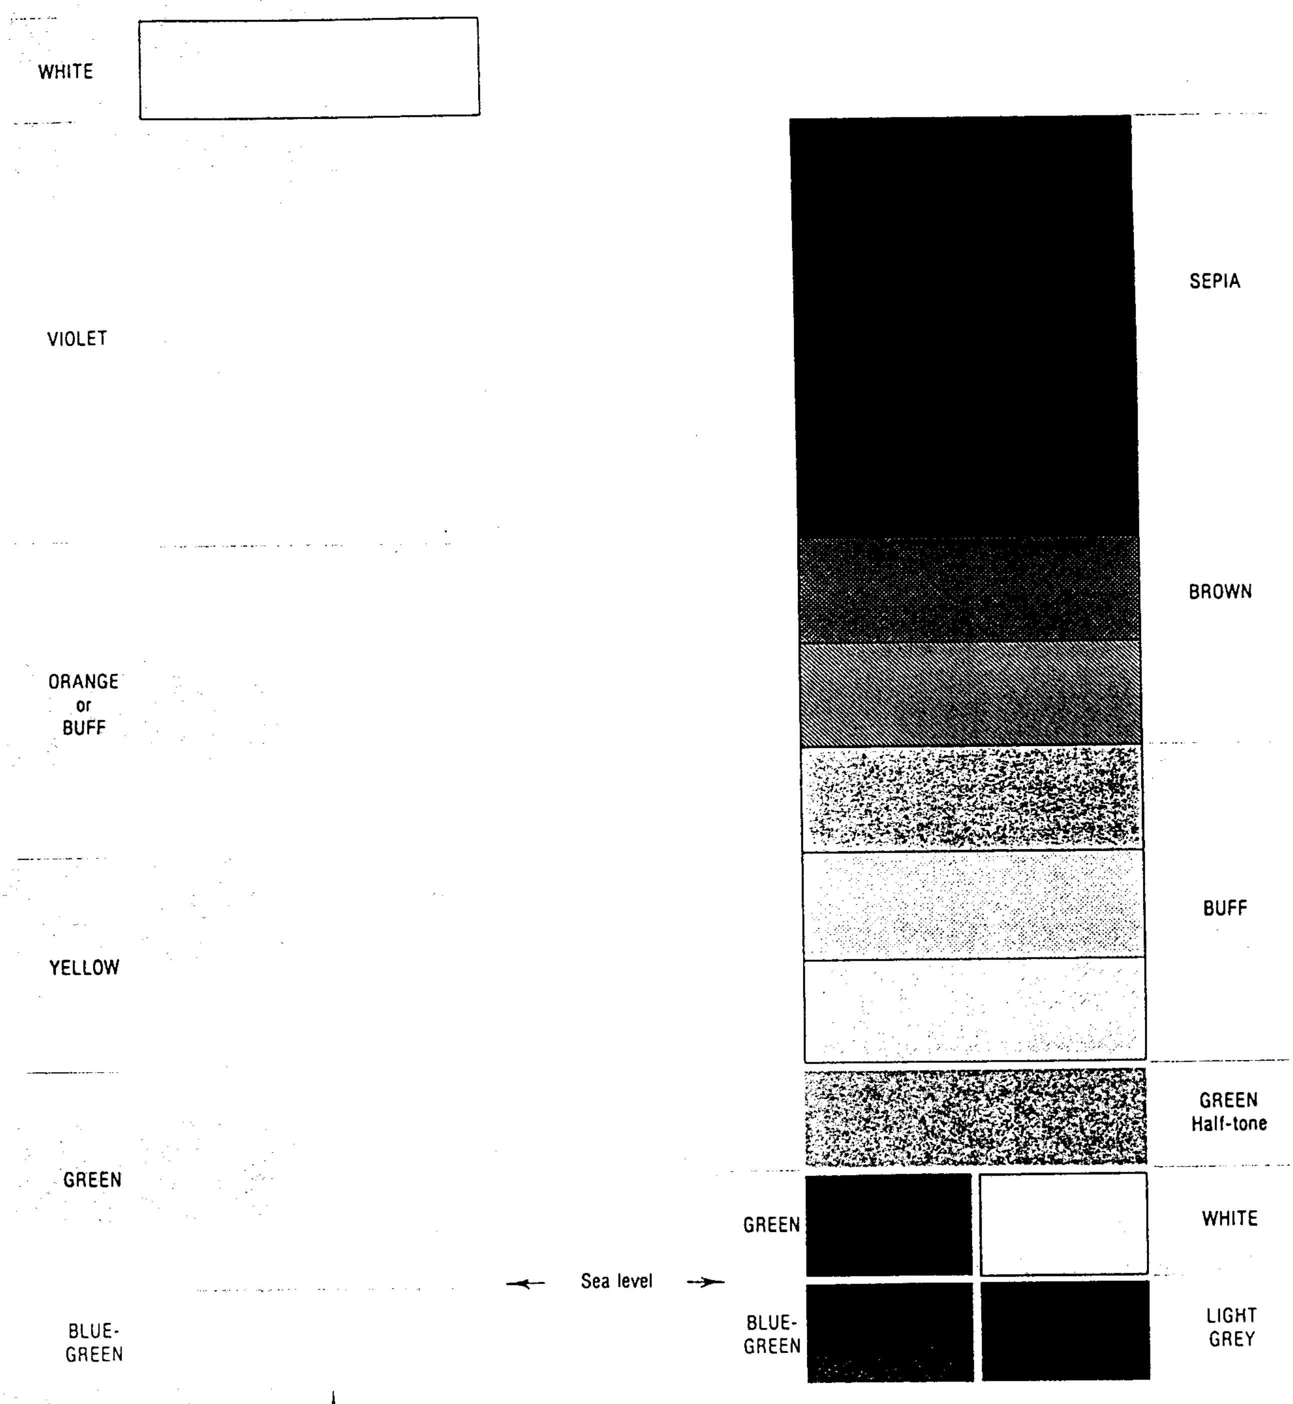
HYPSOMETRIC TINTS

Colour	Description		Colour
WHITE	Tint for extreme elevations		SEPIA
VIOLET			
ORANGE or BUFF	Tint for higher range elevations		BROWN
YELLOW	Tint for middle range elevations		BUFF
GREEN	Tint for lower range elevations	Optional colours	GREEN
			WHITE
BLUE GREEN	Tint for areas below sea level	Optional colours	BLUE-GREEN
			LIGHT GREY

Note.— Basic tints are identical to those specified for the International Map of the World

APPENDIX 4. HYPSOMETRIC TINT GUIDE

(Alternative systems, reference 2.12.2)



Note 1.— These tints are identical to those specified for the International Map of the World

Note 2.— Elevations have not been associated with tints of either system in order to allow for flexibility in their selection.

APPENDIX 5. SHEET LAYOUT INDEX FOR THE WORLD AERONAUTICAL CHART — ICAO 1:1 000 000

INTERNATIONAL STANDARDS

UNITS OF MEASUREMENT TO BE USED IN AIR AND GROUND OPERATIONS

ANNEX 5

TO THE CONVENTION ON INTERNATIONAL CIVIL AVIATION

FOURTH EDITION – JULY 1979

This edition incorporates all amendments adopted by the Council prior to 24 March 1979 and supersedes on 26 November 1981 all previous editions of Annex 5.

INTERNATIONAL CIVIL AVIATION ORGANIZATION

AMENDMENTS

The issue of amendments is announced regularly in the *ICAO Bulletin* and in the monthly *Supplement to the Catalogue of ICAO Publications*, which holders of this publication should consult. The space below is provided to keep a record of such amendments.

TABLE OF CONTENTS

FOREWORD

Historical Background

International Standards and Recommended Practices for Dimensional Units to be used in Air-Ground Communications were first adopted by the Council on 16 April 1948 pursuant to Article 37 of the Convention on International Civil Aviation (Chicago, 1944) and were designated as Annex 5 to the Convention. They became effective on 15 September 1948 and became applicable on 1 January 1949.

Table A shows the origin of subsequent amendments together with a list of the principal subjects involved and the dates on which the Annex and the amendments were adopted by the Council, when they became effective and when they became applicable.

Action by Contracting States

Notification of differences. The attention of Contracting States is drawn to the obligation imposed by Article 38 of the Convention by which Contracting States are required to notify the Organization of any differences between their national regulations and practices and the International Standards contained in this Annex and any amendments thereto. Further, Contracting States are invited to keep the Organization currently informed of any differences which may subsequently occur, or of the withdrawal of any differences previously notified. A specific request for notification of differences will be sent to Contracting States immediately after the adoption of each amendment to this Annex.

The attention of States is also drawn to the provisions of Annex 15 related to the publication of differences between their national regulations and practices and the related ICAO Standards and Recommended Practices through the Aeronautical Information Service, in addition to the obligation of States under Article 38 of the Convention.

Promulgation of information. The establishment and withdrawal of and changes to facilities, services and procedures affecting aircraft operations provided in accordance with the Standards specified in this Annex should be notified and take effect in accordance with the provisions of Annex 15.

Status of Annex Components

An Annex is made up of the following component parts, not all of which, however, are necessarily found in every Annex; they have the status indicated:

1.— *Material comprising the Annex proper:*

a) *Standards* and *Recommended Practices* adopted by the Council under the provisions of the Convention. They are defined as follows:

Standard: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as necessary for the safety or regularity of international air navigation and to which Contracting States will conform in accordance with the Convention; in the event of impossibility of compliance, notification to the Council is compulsory under Article 38.

Recommended Practice: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as desirable in the interest of safety, regularity or efficiency of international air navigation, and to which Contracting States will endeavour to conform in accordance with the Convention.

b) *Appendices* comprising material grouped separately for convenience but forming part of the Standards and Recommended Practices adopted by the Council.

c) *Definitions* of terms used in the Standards and Recommended Practices which are not self-explanatory in that they do not have accepted dictionary meanings. A definition does not have independent status but is an essential part of each Standard and Recommended Practice in which the term is used, since a change in the meaning of the term would affect the specification.

d) *Tables and Figures* which add to or illustrate a Standard or Recommended Practice and which are referred to therein, form part of the associated Standard or Recommended Practice and have the same status.

2.— *Material approved by the Council for publication in association with the Standards and Recommended Practices:*

a) *Forewords* comprising historical and explanatory material based on the action of the Council and including an explanation of the obligations of States with regard to the application of the Standards and Recommended Practices ensuing from the Convention and the Resolution of Adoption.

b) *Introductions* comprising explanatory material introduced at the beginning of parts, chapters or sections of the Annex to assist in the understanding of the application of the text.

c) *Notes* included in the text, where appropriate, to give factual information or references bearing on the Standards or Recommended Practices in question, but not constituting part of the Standards or Recommended Practices.

d) *Attachments* comprising material supplementary to the Standards and Recommended Practices, or included as a guide to their application.

Selection of Language

This Annex has been adopted in four languages — English, French, Russian and Spanish. Each Contracting State is requested to select one of those texts for the purpose of national implementation and for other effects provided for in the Convention, either through direct use or through translation into its own national language, and to notify the Organization accordingly.

Editorial Practices

The following practice has been adhered to in order to indicate at a glance the status of each statement: *Standards* have been printed in light face roman; *Notes* have been printed in light face italics, the status being indicated by the prefix *Note.*

Any reference to a portion of this document, which is identified by a number and/or title, includes all subdivisions of that portion.

Table A.—Amendments to Annex 5

Amendment(s)	*Source(s)*	*Subject(s)*	*Adopted Effective Applicable*
1st Edition	Council action in pursuance of Assembly Resolution A1-35		16 April 1948 15 September 1948 1 January 1949
1 to 11 (2nd Edition)	Air Navigation Commission	Reduction of the number of unit tables from five tables to two tables.	11 December 1951 1 May 1952 1 September 1952
12 (3rd Edition)	Air Navigation Commission	Provision for identical units in the ICAO Table and the Blue Table except in respect of those units for measurement of altitudes, elevations, heights and vertical speed.	8 December 1961 1 April 1962 1 July 1964
13 (4th Edition)	Council action in pursuance of Assembly Resolution A22-18, Appendix F	Change in the title of the Annex and increase in the scope to cover all aspects of air and ground operations; provision of standardized system of units based on the SI; identification of non-SI units permitted for use in international civil aviation; provision for termination of the use of certain non-SI units.	23 March 1979 23 July 1979 26 November 1981
14	Air Navigation Commission study	Establishment of a firm date for the termination of the unit bar and introduction of guidance material relating to Co-ordinated Universal Time (UTC) and the method of referencing date and time.	27 February 1984 30 July 1984 22 November 1984
15	Air Navigation Commission	New definition of the metre; introduction of the special name "sievert"; deletion of references to temporary non-SI units no longer to be used.	24 November 1986 19 April 1987 19 November 1987

INTERNATIONAL STANDARDS

CHAPTER 1. DEFINITIONS

When the following terms are used in the Standards concerning the units of measurement to be used in all aspects of international civil aviation air and ground operations, they have the following meanings:

Ampere (A). The ampere is that constant electric current which, if maintained in two straight parallel conductors of infinite length, of negligible circular cross-section, and placed 1 metre apart in vacuum, would produce between these conductors a force equal to 2×10^{-7} newton per metre of length.

Becquerel (Bq). The activity of a radionuclide having one spontaneous nuclear transition per second.

Candela (cd). The luminous intensity, in the perpendicular direction, of a surface of 1/600 000 square metre of black body at the temperature of freezing platinum under a pressure of 101 325 newtons per square metre.

Celsius temperature ($t°_C$). The Celsius temperature is equal to the difference $t°_C = T - T_0$ between two thermodynamic temperatures T and T_0 where T_0 equals 273.15 kelvin.

Coulomb (C). The quantity of electricity transported in 1 second by a current of 1 ampere.

Degree Celsius (°C). The special name for the unit kelvin for use in stating values of Celsius temperature.

Farad (F). The capacitance of a capacitor between the plates of which there appears a difference of potential of 1 volt when it is charged by a quantity of electricity equal to 1 coulomb.

Foot (ft). The length equal to 0.304 8 metre exactly.

Gray (Gy). The energy imparted by ionizing radiation to a mass of matter corresponding to 1 joule per kilogram.

Henry (H). The inductance of a closed circuit in which an electromotive force of 1 volt is produced when the electric current in the circuit varies uniformly at a rate of 1 ampere per second.

Hertz (Hz). The frequency of a periodic phenomenon of which the period is 1 second.

Joule (J). The work done when the point of application of a force of 1 newton is displaced a distance of 1 metre in the direction of the force.

Kelvin (K). A unit of thermodynamic temperature which is the fraction 1/273.16 of the thermodynamic temperature of the triple point of water.

Kilogram (kg). The unit of mass equal to the mass of the international prototype of the kilogram.

Knot (kt). The speed equal to 1 nautical mile per hour.

Litre (L). A unit of volume restricted to the measurement of liquids and gases which is equal to 1 cubic decimetre.

Lumen (lm). The luminous flux emitted in a solid angle of 1 steradian by a point source having a uniform intensity of 1 candela.

Lux (lx). The illuminance produced by a luminous flux of 1 lumen uniformly distributed over a surface of 1 square metre.

Metre (m). The distance travelled by light in a vacuum during 1/299 792 458 of a second.

Mole (mol). The amount of substance of a system which contains as many elementary entities as there are atoms in 0.012 kilogram of carbon-12.

Note.— *When the mole is used, the elementary entities must be specified and may be atoms, molecules, ions, electrons, other particles or specified groups of such particles.*

Nautical mile (NM). The length equal to 1 852 metres exactly.

Newton (N). The force which, when applied to a body having a mass of 1 kilogram gives it an acceleration of 1 metre per second squared.

Ohm (Ω). The electric resistance between two points of a conductor when a constant difference of potential of 1 volt, applied between these two points, produces in this conductor a current of 1 ampere, this conductor not being the source of any electromotive force.

Pascal (Pa). The pressure or stress of 1 newton per square metre.

Radian (rad). The plane angle between two radii of a circle which cut off on the circumference an arc equal in length to the radius.

Second (s). The duration of 9 192 631 770 periods of the radiation corresponding to the transition between the two hyperfine levels of the ground state of the caesium-133 atom.

Siemens (S). The electric conductance of a conductor in which a current of 1 ampere is produced by an electric potential difference of 1 volt.

Sievert (Sv). The unit of radiation dose equivalent corresponding to 1 joule per kilogram.

Steradian (sr). The solid angle which, having its vertex in the centre of a sphere, cuts off an area of the surface of the sphere equal to that of a square with sides of length equal to the radius of the sphere.

Tesla (T). The magnetic flux density given by a magnetic flux of 1 weber per square metre.

Tonne (t). The mass equal to 1 000 kilograms.

Volt (V). The unit of electric potential difference and electromotive force which is the difference of electric potential between two points of a conductor carrying a constant current of 1 ampere, when the power dissipated between these points is equal to 1 watt.

Watt (W). The power which gives rise to the production of energy at the rate of 1 joule per second.

Weber (Wb). The magnetic flux which, linking a circuit of one turn, produces in it an electromotive force of 1 volt as it is reduced to zero at a uniform rate in 1 second.

No. 15

CHAPTER 2. APPLICABILITY

Introductory Note.—This Annex contains specifications for the use of a standardized system of units of measurement in international civil aviation air and ground operations. This standardized system of units of measurement is based on the International System of Units (SI) and certain non-SI units considered necessary to meet the specialized requirements of international civil aviation. See Attachment A for details concerning the development of the SI.

2.1 Applicability

The Standards contained in this Annex shall be applicable to all aspects of international civil aviation air and ground operations.

CHAPTER 3. STANDARD APPLICATION OF UNITS OF MEASUREMENT

3.1 SI Units

3.1.1 The International System of Units developed and maintained by the General Conference of Weights and Measures (CGPM) shall, subject to the provisions of 3.2 and 3.3, be used as the standard system of units of measurement for all aspects of international civil aviation air and ground operations.

3.1.2 Prefixes

The prefixes and symbols listed in Table 3-1 shall be used to form names and symbols of the decimal multiples and sub-multiples of SI units.

Note 1.—As used herein the term SI unit is meant to include base units and derived units as well as their multiples and sub-multiples.

Note 2.—See Attachment B for guidance on the general application of prefixes.

3.2 Non-SI Units

3.2.1 Non-SI units for permanent use with the SI

The non-SI units listed in Table 3-2 shall be used either in lieu of, or in addition to, SI units as primary units of measurement but only as specified in Table 3-4.

Table 3-1. SI unit prefixes

Multiplication factor		*Prefix*	*Symbol*
1 000 000 000 000 000 000	= 10^{18}	exa	E
1 000 000 000 000 000	= 10^{15}	peta	P

Specific quantities in Table 3-4 related to	*Unit*	*Symbol*	*Definition (in terms of SI units)*
mass	tonne	t	$1\ t = 10^3\ kg$
plane angle	degree	°	$1° = (\pi/180)\ rad$
	minute	′	$1' = (1/160)° = (\pi/10\ 800)\ rad$
	second	″	$1'' = (1/60)' = (\pi/648\ 000)\ rad$
temperature	degree Celsius	°C	1 unit °C = 1 unit K[a)]
time	minute	min	1 min = 60 s
	hour	h	1 h = 60 min = 3 600 s
	day	d	1 d = 24 h = 86 400 s
	week, month, year	—	
volume	litre	L	$1\ L = 1\ dm^3 = 10^{-3} m^3$

a) See Attachment C, Table C-2 for conversion.

Table 3-3. Non-SI alternative units permitted for temporary use with the SI

Specific quantities in Table 3-4 related to	*Unit*	*Symbol*	*Definition (in terms of SI units)*
distance (long)	nautical mile	NM	1 NM = 1 852 m
distance (vertical)[a]	foot	ft	1 ft = 0.304 8 m
speed	knot	kt	1 kt = 0.514 444 m/s

a) altitude, elevation, height, vertical speed.

3.2.2 Non-SI alternative units permitted for temporary use with the SI

The non-SI units listed in Table 3-3 shall be permitted for temporary use as alternative units of measurement but only for those specific quantities listed in Table 3-4.

Note.—It is intended that the use of the non-SI alternative units listed in Table 3-3 and applied as indicated in Table 3-4 will eventually be discontinued in accordance with individual unit termination dates established by the Council. Termination dates, when established, will be given in Chapter 4.

3.3 Application of specific units

The application of units of measurement for certain quantities used in international civil aviation air and ground operations shall be in accordance with Table 3-4.

Note.— Table 3-4 is intended to provide standardization of units (including prefixes) for those quantities commonly used in air and ground operations. Basic Annex provisions apply for units to be used for quantities not listed.

a) As used in navigation, generally in excess of 4 000 m.
b) Such as aircraft fuel, hydraulic fluids, water, oil and high pressure oxygen vessels.
c) Visibility of less than 5 km may be given in m.
d) Airspeed is sometimes reported in flight operations in terms of the ratio MACH number.
e) The decibel (dB) is a ratio which may be used as a unit for expressing sound pressure level and sound power level. When used, the reference level must be specified.

CHAPTER 4. TERMINATION OF USE OF NON-SI ALTERNATIVE UNITS

Introductory Note.— The non-SI units listed in Table 3-3 have been retained temporarily for use as alternative units because of their wide-spread use and to avoid potential safety problems which could result from the lack of international co-ordination concerning the termination of their use. As termination dates are established by the Council, they will be reflected as Standards contained in this Chapter. It is expected that the establishment of such dates will be well in advance of actual termination. Any special procedures associated with specific unit termination will be circulated to all States separately from this Annex.

4.1 The use in international civil aviation operations of the alternative non-SI units listed in Table 3-3 shall be terminated on the dates listed in Table 4-1.

Table 4-1. Termination dates for non-SI alternative units

Non-SI alternative unit	*Termination date*
Knot Nautical mile	not established[a)]
Foot	not established[b)]

a) No termination date has yet been established for use of nautical mile and knot. For planning purposes any termination date for these units will not be before 31 December 1990.
b) No termination date has yet been established for use of the foot.

ATTACHMENTS TO ANNEX 5

ATTACHMENT A. DEVELOPMENT OF THE INTERNATIONAL SYSTEM OF UNITS (SI)

1. Historical background

1.1 The name SI is derived from "Système International d'Unités". The system has evolved from units of length and mass (metre and kilogram) which were created by members of the Paris Academy of Sciences and adopted by the French National Assembly in 1795 as a practical measure to benefit industry and commerce. The original system became known as the metric system. Physicists realized the advantages of the system and it was soon adopted in scientific and technical circles.

1.2 International standardization began with an 1870 meeting of 15 States in Paris that led to the International Metric Convention in 1875 and the establishment of a permanent International Bureau of Weights and Measures. A General Conference on Weights and Measures (CGPM) was also constituted to handle all international matters concerning the metric system. In 1889 the first meeting of the CGPM legalized the old prototype of the metre and the kilogram as the international standard for unit of length and unit of mass respectively. Other units were agreed in subsequent meetings and by its 10th Meeting in 1954, the CGPM had adopted a rationalized and coherent system of units based on the metre-kilogram-second-ampere (MKSA) system which had been developed earlier, plus the addition of the kelvin as the unit of temperature and the candela as the unit of luminous intensity. The 11th CGPM, held in 1960 and in which 36 States participated, adopted the name International System of Units (SI) and laid down rules for the prefixes, the derived and supplementary units and other matters, thus establishing comprehensive specifications for international units of measurement. The 12th CGPM in 1964 made some refinements in the system, and the 13th CGPM in 1967 redefined the second, renamed the unit of temperature as the kelvin (K) and revised the definition of the candela. The 14th CGPM in 1971 added a seventh base unit, the mole (mol) and approved the pascal (Pa) as a special name for the SI unit of pressure or stress, the newton (N) per square metre (m^2) and the siemens (S) as a special name for the unit of electrical conductance. In 1975 the CGPM adopted the becquerel (Bq) as the unit of the activity of radionuclides and the gray (Gy) as the unit for absorbed dose.

2. International Bureau of Weights and Measures

2.1 The Bureau International des Poids et Mesures (BIPM) was set up by the Metre Convention signed in Paris on 20 May 1875 by 17 States during the final session of the Diplomatic Conference of the Metre. This Convention was amended in 1921. BIPM has its headquarters near Paris and its upkeep is financed by the Member States of the Metre Convention. The task of BIPM is to ensure world-wide unification of physical measurements; it is responsible for:

— establishing the fundamental standards and scales for measurement of the principal physical quantities and maintaining the international prototypes;

— carrying out comparisons of national and international standards;

— ensuring the co-ordination of corresponding measuring techniques;

— carrying out and co-ordinating the determinations relating to the fundamental physical constants.

2.2 BIPM operates under the exclusive supervision of the International Committee of Weights and Measures (CIPM), which itself comes under the authority of the General Conference of Weights and Measures (CGPM). The International Committee consists of 18 members each belonging to a different State; it meets at least once every two years. The officers of this Committee issue an Annual Report on the administrative and financial position of BIPM to the Governments of the Member States of the Metre Convention.

2.3 The activities of BIPM, which in the beginning were limited to the measurements of length and mass and to metrological studies in relation to these quantities, have been extended to standards of measurement for electricity (1927), photometry (1937) and ionizing radiations (1960). To this end the original laboratories, built in 1876-78, were enlarged in 1929 and two new buildings were constructed in 1963-64 for the ionizing radiation laboratories. Some 30 physicists or technicians work in the laboratories of BIPM. They do metrological research, and also undertake measurement and certification of material standards of the above-mentioned quantities.

2.4 In view of the extension of the work entrusted to BIPM, CIPM has set up since 1927, under the name of Consultative Committees, bodies designed to provide it with information on matters which it refers to them for study and advice. These Consultative Committees, which may form temporary or permanent working groups to study special subjects, are responsible for co-ordinating the international work carried out in their respective fields and proposing recommendations concerning the amendment to be made to the definitions and values of units. In order to ensure world-wide uniformity in units of measurement, the International Committee accordingly acts directly or submits proposals for sanction by the General Conference.

2.5 The Consultative Committees have common regulations (*Procès-Verbaux CIPM,* 1963, 31, 97). Each Consultative Committee, the chairman of which is normally a member of CIPM, is composed of a delegate from each of the large metrology laboratories and specialized institutes, a list of which is drawn up by CIPM, as well as individual members also appointed by CIPM and one representative of BIPM. These Committees hold their meetings at irregular intervals; at present there are seven of them in existence as follows:

1. The Consultative Committee for Electricity (CCE), set up in 1927.

2. The Consultative Committee for Photometry and Radiometry (CCPR), which is the new name given in 1971 to the Consultative Committee for Photometry set up in 1933 (between 1930 and 1933 the preceding committee (CCE) dealt with matters concerning photometry).

3. The Consultative Committee for Thermometry (CCT), set up in 1937.

4. The Consultative Committee for the Definition of the Metre (CCDM), set up in 1952.

5. The Consultative Committee for the Definition of the Second (CCDS), set up in 1956.

6. The Consultative Committee for the Standards of Measurement of Ionizing Radiations (CCEMRI), set up in 1958. Since 1969 this Consultative Committee has consisted of four sections: Section I (measurement of X- and γ-rays); Section II (measurement of radionuclides); Section III (neutron measurements); Section IV (α-energy standards).

7. The Consultative Committee for Units (CCU), set up in 1964.

The proceedings of the General Conference, the International Committee, the Consultative Committees and the International Bureau are published under the auspices of the latter in the following series:

— *Comptes rendus des séances de la Conférence Générale des Poids et Mesures;*

— *Procès-Verbaux des séances du Comité International des Poids et Mesures;*

— *Sessions des Comités Consultatifs;*

— *Recueil de Travaux du Bureau International des Poids et Mesures* (this compilation brings together articles published in scientific and technical journals and books, as well as certain work published in the form of duplicated reports).

2.6 From time to time BIPM publishes a report on the development of the metric system throughout the world, entitled *Les récents progrès du Système Métrique*. The collection of the *Travaux et Mémoires du Bureau International des Poids et Mesures* (22 volumes published between 1881 and 1966) ceased in 1966 by a decision of the CIPM. Since 1965 the international journal *Metrologia,* edited under the auspices of CIPM, has published articles on the more important work on scientific metrology carried out throughout the world, on the improvement in measuring methods and standards, of units, etc, as well as reports concerning the activities, decisions and recommendations of the various bodies created under the Metre Convention.

3. International Organization for Standardization

The International Organization for Standardization (ISO) is a world-wide federation of national standards institutes which, although not a part of the BIPM, provides recommendations for the use of SI and certain other units. ISO Document 1000 and the ISO Recommendation R31 series of documents provide extensive detail on the application of the SI units. ICAO maintains liaison with ISO regarding the standardized application of SI units in aviation.

ATTACHMENT B. GUIDANCE ON THE APPLICATION OF THE SI

1. Introduction

1.1 The International System of Units is a complete, coherent system which includes three classes of units:

a) base units;

b) supplementary units; and

c) derived units.

1.2 The SI is based on seven units which are dimensionally independent and are listed in Table B-1.

Table B-1. SI base units

Quantity	*Unit*	*Symbol*
amount of a substance	mole	mol
electric current	ampere	A
length	metre	m
luminous intensity	candela	cd
mass	kilogram	kg
thermodynamic temperature	kelvin	K
time	second	s

1.3 The supplementary units of the SI are listed in Table B-2 and may be regarded either as base units or as derived units.

Table B-2. SI supplementary units

Quantity	*Unit*	*Symbol*
plane angle	radian	rad
solid angle	steradian	sr

1.4 Derived units of the SI are formed by combining base units, supplementary units and other derived units according to the algebraic relations linking the corresponding quantities. The symbols for derived units are obtained by means of the mathematical signs for multiplication, division and the use of exponents. Those derived SI units which have special names and symbols are listed in Table B-3.

Note.— The specific application of the derived units listed in Table B-3 and other units common to international civil aviation operations is given in Table 3-4.

Table B-3. SI derived units with special names

Quantity	*Unit*	*Symbol*	*Derivation*
absorbed dose (radiation)	gray	Gy	J/kg
activity of radionuclides	becquerel	Bq	l/s
capacitance	farad	F	C/V
conductance	siemens	S	A/V
dose equivalent (radiation)	sievert	Sv	J/kg
electric potential, potential difference, electromotive force	volt	V	W/A
electric resistance	ohm	Ω	V/A
energy, work, quantity of heat	joule	J	N·m
force	newton	N	$kg·m/s^2$
frequency (of a periodic phenomenon)	hertz	Hz	l/s
illuminance	lux	lx	lm/m^2
inductance	henry	H	Wb/A
luminous flux	lumen	lm	cd·sr
magnetic flux	weber	Wb	V·s
magnetic flux density	tesla	T	Wb/m^2
power, radiant flux	watt	W	J/s
pressure, stress	pascal	Pa	N/m^2
quantity of electricity, electric charge	coulomb	C	A·s

1.5 The SI is a rationalized selection of units from the metric system which individually are not new. The great advantage of SI is that there is only one unit for each physical quantity — the metre for length, kilogram (instead of gram) for mass, second for time, etc. From these elemental or base units, units for all other mechanical quantities are derived. These derived units are defined by simple relationships such as velocity equals rate of change of distance, acceleration equals rate of change of velocity, force is the product of mass and acceleration, work or energy is the product of force and distance, power is work done per unit time, etc. Some of these units have only generic names such as metre per second for velocity; others have special names such as newton (N) for force, joule (J) for work or energy, watt (W) for power. The SI units for force, energy and power are the same regardless of whether the process is mechanical, electrical, chemical or nuclear. A force of 1 newton applied for a distance of 1 metre can produce 1 joule of heat, which is identical with what 1 watt of electric power can produce in 1 second.

1.6 Corresponding to the advantages of SI, which result from the use of a unique unit for each physical quantity, are the advantages which result from the use of a unique and well-defined set of symbols and abbreviations. Such symbols and abbreviations eliminate the confusion that can arise from current practices in different disciplines such as the use of "b" for both the bar (a unit of pressure) and barn (a unit of area).

1.7 Another advantage of SI is its retention of the decimal relation between multiples and sub-multiples of the base units for each physical quantity. Prefixes are established for designating multiple and sub-multiple units from "exa" (10^{18}) down to "atto" (10^{-18}) for convenience in writing and speaking.

1.8 Another major advantage of SI is its coherence. Units might be chosen arbitrarily, but making an independent choice of a unit for each category of mutually comparable quantities would lead in general to the appearance of several additional numerical factors in the equations between the numerical values. It is possible, however, and in practice more convenient, to choose a system of units in such a way that the equations between numerical values, including the numerical factors, have exactly the same form as the corresponding equations between the quantities. A unit system defined in this way is called coherent with respect to the system of quantities and equations in question. Equations between units of a coherent unit system contain as numerical factors only the number 1. In a coherent system the product or quotient of any two unit quantities is the unit of the resulting quantity. For example, in any coherent system, unit area results when unit length is multiplied by unit length, unit velocity when unit length is divided by unit time, and unit force when unit mass is multiplied by unit acceleration.

Note.— Figure B-1 illustrates the relationship of the units of the SI.

2. Mass, force and weight

2.1 The principal departure of SI from the gravimetric system of metric engineering units is the use of explicitly distinct units from mass and force. In SI, the name kilogram is restricted to the unit of mass, and the kilogram-force (from which the suffix force was in practice often erroneously dropped) is not to be used. In its place the SI unit of force, the newton is used. Likewise, the newton rather than the kilogram-force is used to form derived units which include force, for example, pressure or stress (N/m^2 = Pa), energy (N · m = J), and power (N · m/s = W).

2.2 Considerable confusion exists in the use of the term weight as a quantity to mean either force or mass. In common use, the term weight nearly always means mass; thus, when one speaks of a person's weight, the quantity referred to is mass. In science and technology, the term weight of a body has usually meant the force that, if applied to the body, would give it an acceleration equal to the local acceleration of free fall. The adjective "local" in the phrase "local acceleration of free fall" has usually meant a location on the surface of the earth; in this context the "local acceleration of free fall" has the symbol g (sometimes referred to as "acceleration of gravity") with observed values of g differing by over 0.5 per cent at various points on the earth's surface and decreasing as distance from the earth is increased. Thus, because weight is a force = mass × acceleration due to gravity, a person's weight is conditional on his location, but mass is not. A person with a mass of 70 kg might experience a force (weight) on earth of 686 newtons (≈ 155 lbf) and a force (weight) of only 113 newtons (≈ 22 lbf) on the moon. Because of the dual use of the term weight as a quantity, the term weight should be avoided in technical practice except under circumstances in which its meaning is completely clear. When the term is used, it is important to know whether mass or force is intended and to use SI units properly by using kilograms for mass or newtons for force.

2.3 Gravity is involved in determining mass with a balance or scale. When a standard mass is used to balance the measured mass, the direct effect of gravity on the two masses is cancelled, but the indirect effect through the buoyancy of air or other fluid is generally not cancelled. In using a spring scale, mass is measured indirectly, since the instrument responds to the force of gravity. Such scales may be calibrated in mass units if the variation in acceleration of gravity and buoyancy corrections are not significant in their use.

3. Energy and torque

3.1 The vector product of force and moment arm is widely designated by the unit newton metre. This unit for bending moment or torque results in confusion with the unit for energy, which is also newton metre. If torque is expressed as newton metre per radian, the relationship to energy is clarified, since the product of torque and angular rotation is energy:

$$(N \cdot m/rad) \cdot rad = N \cdot m$$

3.2 If vectors were shown, the distinction between energy and torque would be obvious, since the orientation of force and length is different in the two cases. It is important to recognize this difference in using torque and energy, and the joule should never be used for torque.

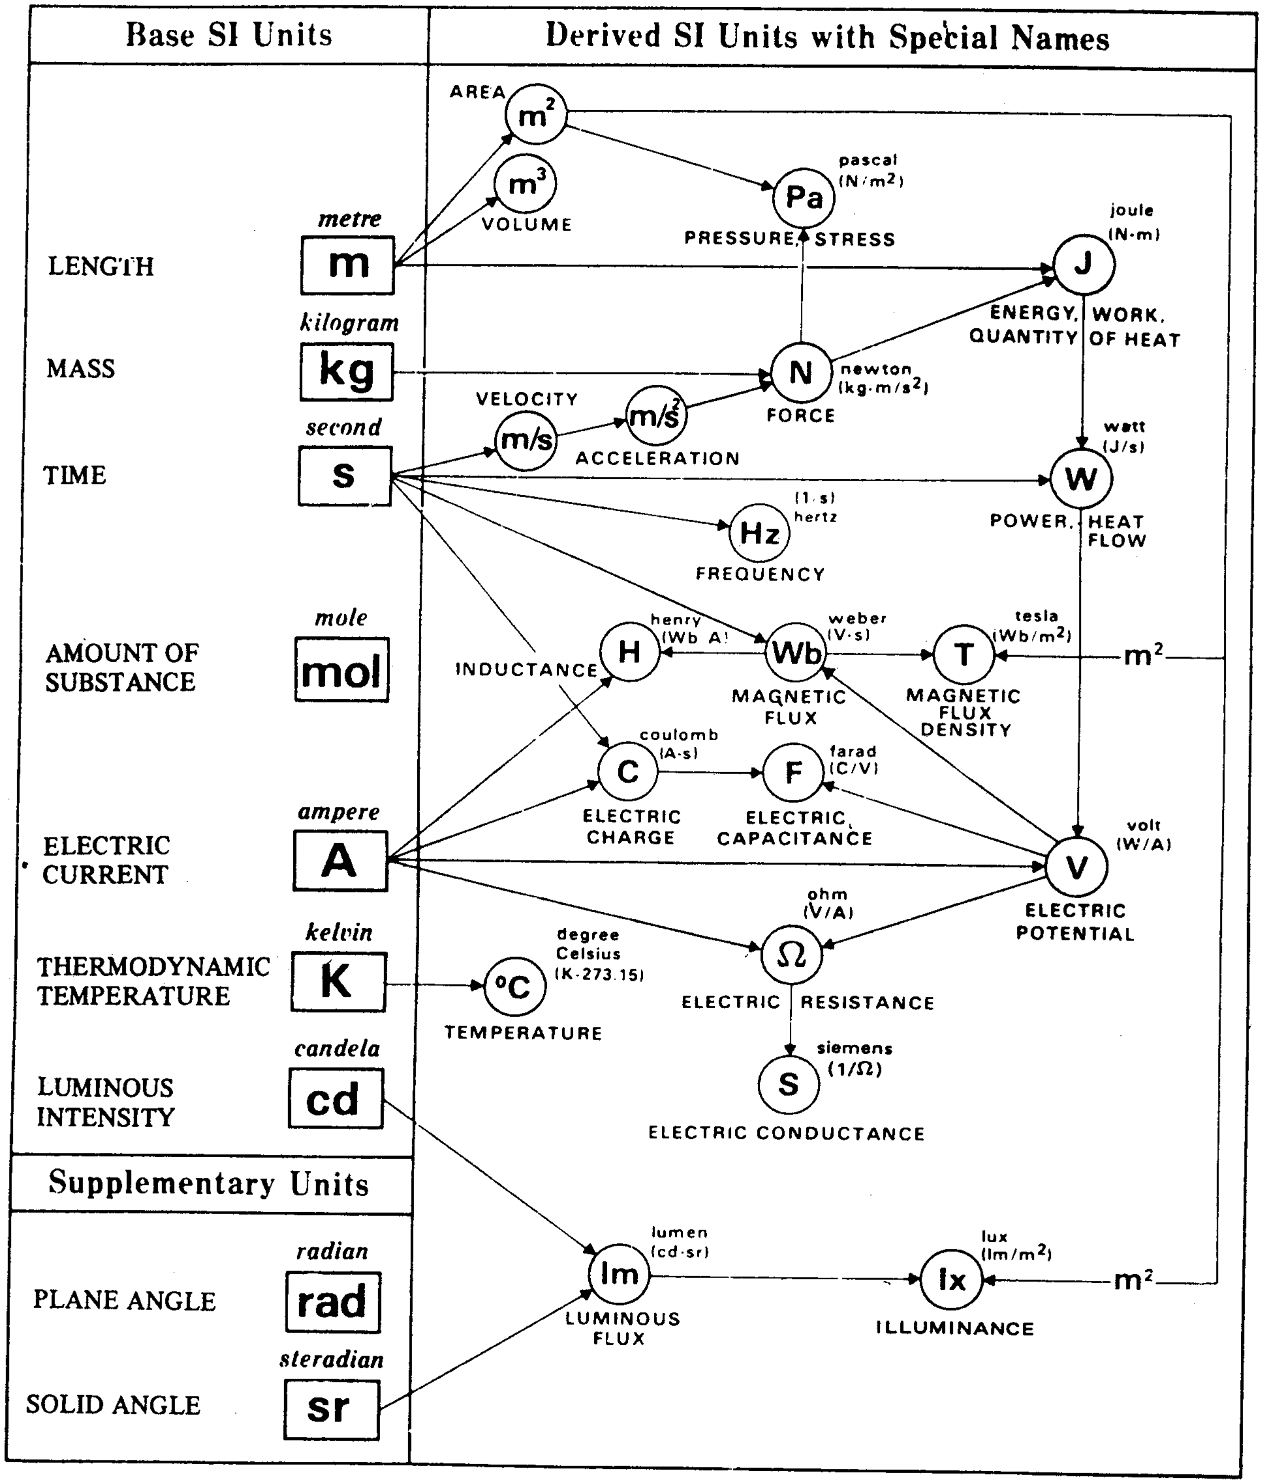

Figure B-1

26/11/81

4. SI prefixes

4.1 Selection of prefixes

4.1.1 In general the SI prefixes should be used to indicate orders of magnitude, thus eliminating non-significant digits and leading zeros in decimal fractions, and providing a convenient alternative to the powers-of-ten notation preferred in computation. For example:

12 300 mm becomes 12.3 m

12.3×10^3 m becomes 12.3 km

0.00123 μA becomes 1.23 nA

4.1.2 When expressing a quantity by a numerical value and a unit, prefixes should preferably be chosen so that the numerical value lies between 0.1 and 1 000. To minimize variety, it is recommended that prefixes representing powers of 1 000 be used. However, in the following cases, deviation from the above may be indicated:

a) in expressing area and volume, the prefixes hecto, deca, deci and centi may be required: for example, square hectometre, cubic centimetre;

b) in tables of values of the same quantity, or in a discussion of such values within a given context, it is generally preferable to use the same unit multiple throughout; and

c) for certain quantities in particular applications, one particular multiple is customarily used. For example, the hectopascal is used for altimeter settings and the millimetre is used for linear dimensions in mechanical engineering drawings even when the values lie outside the range 0.1 to 1 000.

4.2 Prefixes in compound units[1]

It is recommended that only one prefix be used in forming a multiple of a compound unit. Normally the prefix should be attached to a unit in the numerator. One exception to this occurs when the kilogram is one of the units. For example:

V/m, *not* mV/mm; MJ/kg, *not* kJ/g

4.3 Compound prefixes

Compound prefixes, formed by the juxtaposition of two or more SI prefixes, are not to be used. For example:

1 nm *not* 1mμm; 1 pF *not* 1μμF

If values are required outside the range covered by the prefixes, they should be expressed using powers of ten applied to the base unit.

4.4 Powers of units

An exponent attached to a symbol containing a prefix indicates that the multiple or sub-multiple of the unit (the unit with its prefix) is raised to the power expressed by the exponent. For example:

$$1\ \mathrm{cm}^3 = (10^{-2}\ \mathrm{m})^3 = 10^{-6}\ \mathrm{m}^3$$

$$1\ \mathrm{ns}^{-1} = (10^{-9}\ \mathrm{s})^{-1} = 10^{9}\ \mathrm{s}^{-1}$$

$$1\ \mathrm{mm}^2/\mathrm{s} = (10^{-3}\ \mathrm{m})^2/\mathrm{s} = 10^{-6}\ \mathrm{m}^2/\mathrm{s}$$

5. Style and usage

5.1 Rules for writing unit symbols

5.1.1 Unit symbols should be printed in Roman (upright) type regardless of the type style used in the surrounding text.

5.1.2 Unit symbols are unaltered in the plural.

5.1.3 Unit symbols are not followed by a period except when used at the end of a sentence.

5.1.4 Letter unit symbols are written in lower case (cd) unless the unit name has been derived from a proper name, in which case the first letter of the symbol is capitalized (W, Pa). Prefix and unit symbols retain their prescribed form regardless of the surrounding typography.

5.1.5 In the complete expression for a quantity, a space should be left between the numerical value and the unit symbol. For example, write 35 mm not 35mm, and 2.37 lm, not 2.37lm. When the quantity is used in an adjectival sense, a hyphen is often used, for example, 35-mm film.

Exception: No space is left between the numerical value and the symbols for degree, minute and second of plane angle, and degree Celsius.

5.1.6 No space is used between the prefix and unit symbols.

5.1.7 Symbols, not abbreviations, should be used for units. For example, use "A", not "amp", for ampere.

5.2 Rules for writing unit names

5.2.1 Spelled-out unit names are treated as common nouns in English. Thus, the first letter of a unit name is not capitalized except at the beginning of a sentence or in capitalized material such as a title, even though the unit name may be derived from a proper name and therefore be represented as a symbol by a capital letter (see 5.1.4). For example, normally write "newton" not "Newton" even though the symbol is N.

5.2.2 Plurals are used when required by the rules of grammar and are normally formed regularly, for example, henries for the plural of henry. The following irregular plurals are recommended:

Singular	*Plural*
lux	lux
hertz	hertz
siemens	siemens

1. A compound unit is a derived unit expressed in terms of two or more units, that is, not expressed with a single special name.

5.2.3 No space or hyphen is used between the prefix and the unit name.

5.3 Units formed by multiplication and division

5.3.1 *With unit names:*

Product, use a space (preferred) or hyphen:

newton metre *or* newton-metre

in the case of the watt hour the space may be omitted, thus:

watthour.

Quotient, use the word per and not a solidus:

metre per second *not* metre/second.

Powers, use the modifier squared or cubed placed after the unit name:

metre per second squared

In the case of area or volume, a modifier may be placed before the unit name:

square millimetre, cubic metre.

This exception also applies to derived units using area or volume:

watt per square metre.

Note.— To avoid ambiguity in complicated expressions, symbols are preferred to words.

5.3.2 *With unit symbols:*

Product may be indicated in either of the following ways:

Nm *or* N · m for newton metre.

Note.— When using for a prefix a symbol which coincides with the symbol for the unit, special care should be taken to avoid confusion. The unit newton metre for torque should be written, for example, Nm *or* N · m *to avoid confusion with* mN, *the millinewton.*

An exception to this practice is made for computer printouts, automatic typewriter work, etc., where the dot half high is not possible, and a dot on the line may be used.

Quotient, use one of the following forms:

$\mathrm{m/s}$ *or* $\mathrm{m \cdot s^{-1}}$ *or* $\frac{\mathrm{m}}{\mathrm{s}}$

In no case should more than one solidus be used in the same expression unless parentheses are inserted to avoid ambiguity. For example, write:

$\mathrm{J/(mol \cdot K)}$ *or* $\mathrm{J \cdot mol^{-1} \cdot K^{-1}}$ *or* $\mathrm{(J/mol)/K}$

but *not* J/mol/K.

5.3.3 Symbols and unit names should not be mixed in the same expression. Write:

joules per kilogram *or* J/kg *or* $\mathrm{J \cdot kg^{-1}}$

but *not* joules/kilogram *or* joules/kg *or* $\mathrm{joules \cdot kg^{-1}}$.

5.4 Numbers

5.4.1 The preferred decimal marker is a point on the line (period); however, the comma is also acceptable. When writing numbers less than one, a zero should be written before the decimal marker.

5.4.2 The comma is not to be used to separate digits. Instead, digits should be separated into groups of three, counting from the decimal point towards the left and the right, and using a small space to separate the groups. For example:

73 655   7 281   2.567 321   0.133 47

The space between groups should be approximately the width of the letter "i" and the width of the space should be constant even if, as is often the case in printing, variable-width spacing is used between the words.

5.4.3 The sign for multiplication of numbers is a cross (×) or a dot half high. However, if the dot half high is used as the multiplication sign, a point on the line must not be used as a decimal marker in the same expression.

5.4.4 Attachment of letters to a unit symbol as a means of giving information about the nature of the quantity under consideration is incorrect. Thus MWe for "megawatts electrical (power)", Vac for "volts ac" and kJt for "kilojoules thermal (energy)" are not acceptable. For this reason, no attempt should be made to construct SI equivalents of the abbreviations "psia" and "psig", so often used to distinguish between absolute and gauge pressure. If the context leaves any doubt as to which is meant, the word pressure must be qualified appropriately. For example:

". . . at a gauge pressure of 13 kPa".

or " . . . at an absolute pressure of 13 kPa".

ATTACHMENT C. CONVERSION FACTORS

1. General

1.1 The list of conversion factors which is contained in this Attachment is provided to express the definitions of miscellaneous units of measure as numerical multiples of SI units.

1.2 The conversion factors are presented for ready adaptation to computer read-out and electronic data transmission. The factors are written as a number greater than 1 and less than 10 with six or less decimal places. This number is followed by the letter E (for exponent), a plus or minus symbol, and two digits which indicate the power of 10 by which the number must be multiplied to obtain the correct value. For example:

3.523 907 E−02 is 3.523 907 × 10^{-2} *or* 0.035 239 07

Similarly,

3.386 389 E+03 is 3.386 389 × 10^{3} *or* 3 386.389

1.3 An asterisk (*) after the sixth decimal place indicates that the conversion factor is exact and that all subsequent digits are zero. Where less than six decimal places are shown, more precision is not warranted.

1.4 Further examples of use of the tables:

To convert from	*to*	*Multiply by*
pound-force per square foot	Pa	4.788 026 E+01
inch	m	2.540 000*E−02

thus:

1 lbf/ft^2 = 47.880 26 Pa

1 inch = 0.025 4 m (exactly)

2. Factors not listed

2.1 Conversion factors for compound units which are not listed herein can easily be developed from numbers given in the list by the substitution of converted units, as follows.

Example: To find conversion factor of lb·ft/s to kg·m/s:

first convert
1 lb to 0.453 592 4 kg
1 ft to 0.304 8 m

then substitute:
(0.453 592 4 kg) × (0.304 8 m)/s
= 0.138 255 kg·m/s
Thus the factor is 1.382 55 E−01.

Table C-1. Conversion factors to SI units
(Symbols of SI units given in parentheses)

To convert from	*to*	*Multiply by*
abampere	ampere (A)	1.000 000*E+01
abcoulomb	coulomb (C)	1.000 000*E+01
abfarad	farad (F)	1.000 000*E+09
abhenry	henry (H)	1.000 000*E−09
abmho	siemens (S)	1.000 000*E+09
abohm	ohm (Ω)	1.000 000*E−09
abvolt	volt (V)	1.000 000*E−08
acre (U.S. survey)	square metre (m^2)	4.046 873 E+03
ampere hour	coulomb (C)	3.600 000*E+03
are	square metre (m^2)	1.000 000*E+02
atmosphere (standard)	pascal (Pa)	1.013 250*E+05
atmosphere (technical = 1 kgf/cm^2)	pascal (Pa)	9.806 650*E+04
bar	pascal (Pa)	1.000 000*E+05
barrel (for petroleum, 42 U.S. liquid gal)	cubic metre (m^3)	1.589 873*E−01

* An asterisk (*) after the sixth decimal place indicates that the conversion factor is exact and that all subsequent digits are zero. Where less than six decimal places are shown, more precision is not warranted.

Kelvin temperature (t_K)	Celsius temperature ($t_{°C}$)	$t_{°C} = t_K - 273.15$
Rankine temperature ($t_{°R}$)	Kelvin temperature (t_K)	$t_K = t_{°R}/1.8$

ATTACHMENT D. CO-ORDINATED UNIVERSAL TIME

1. Co-ordinated Universal Time (UTC) has now replaced Greenwich Mean Time (GMT) as the accepted international standard for clock time. It is the basis for civil time in many States and is also the time used in the world-wide time signal broadcasts used in aviation. The use of UTC is recommended by such bodies as the General Conference on Weights and Measures (CGPM), the International Radio Consultative Committee (CCIR) and the World Administration Radio Conference (WARC).

2. The basis for all clock time is the time of apparent rotation of the sun. This is, however, a variable quantity which depends, among other things, on where it is measured on earth. A mean value of this time, based upon measurements in a number of places on the earth, is known as Universal Time. A different time scale, based upon the definition of the second, is known as International Atomic Time (TAI). A combination of these two scales results in Co-ordinated Universal Time. This consists of TAI adjusted as necessary by the use of leap seconds to obtain a close approximation (always within 0.5 seconds) of Universal Time.

ATTACHMENT E. PRESENTATION OF DATE AND TIME IN ALL-NUMERIC FORM

1. Introduction

The International Organization for Standardization (ISO) Standards 2014 and 3307 specify the procedures for writing the date and time in all-numeric form and ICAO will be using these procedures in its documents where appropriate in the future.

2. Presentation of Date

Where dates are presented in all-numeric form, ISO 2014 specifies that the sequence year-month-day should be used. The elements of the date should be:

— four digits to represent the year, except that the century digits may be omitted where no possible confusion could arise from such an omission. There is value in using the century digits during the period of familiarization with the new format to make it clear that the new order of elements is being used;

— two digits to represent the month;

— two digits to represent the day.

Where it is desired to separate the elements for easier visual understanding, only a space or a hyphen should be used as a separator. As an example, 25 August 1983 may be written as:

19830825 or 830825

or 1983-08-25 or 83-08-25

or 1983 08 25 or 83 08 25.

It should be emphasized that the ISO sequence should only be used where it is intended to use an all-numeric presentation. Presentations using a combination of figures and words may still be used if required (e.g. 25 August 1983).

3. Presentation of Time

3.1 Where the time of day is to be written in all-numeric form, ISO 3307 specifies that the sequence hours-minutes-seconds should be used.

3.2 Hours should be represented by two digits from 00 to 23 in the 24-hour timekeeping system and may be followed either by decimal fractions of an hour or by minutes and seconds. Where decimal fractions of an hour are used, the normal decimal separator should be used followed by the number of digits necessary to provide the required accuracy.

3.3 Minutes should likewise be represented by two digits from 00 to 59 followed by either decimal fractions of a minute or by seconds.

3.4 Seconds should also be represented by two digits from 00 to 59 and followed by decimal fractions of a second if required.

3.5 Where it is necessary to facilitate visual understanding a colon should be used to separate hours and minutes and minutes and seconds. For example, 20 minutes and 18 seconds past 3 o'clock in the afternoon may be written as:

152018 or 15:20:18 in hours, minutes and seconds

or 1520.3 or 15:20.3 in hours, minutes and decimal fractions of a minute

or 15.338 in hours and decimal fractions of an hour.

4. Combination Date and Time Groups

This presentation lends itself to a uniform method of writing date and time together where necessary. In such cases, the sequence of elements year-month-day-hour-minute-second should be used. It may be noted that not all the elements need be used in every case — in a typical application, for example, only the elements day-hour-minute might be used.

ANNEX 6 — PART I
INTERNATIONAL COMMERCIAL AIR TRANSPORT — AEROPLANES

FOREWORD

Historical background

Standards and Recommended Practices for the Operation of Aircraft — International Commercial Air Transport were first adopted by the Council on 10 December 1948 pursuant to the provisions of Article 37 of the Convention on International Civil Aviation (Chicago, 1944) and designated as Annex 6 to the Convention. They became effective on 15 July 1949. The Standards and Recommended Practices were based on recommendations of the Operations Division at its first session in April 1946, which were further developed at the second session of the Division in February 1947.

Amendments to the Annex, which included additional Standards and Recommended Practices as well as modifications to existing Standards, and which were based on recommendations of the Operations Division at its third and fourth sessions in February-March 1949 and March-April 1951, were adopted by the Council on 5 December 1950 (Amendments 1-127), 4 December 1951 (Amendments 128-131), 28 November 1952 (Amendments 132 and 133), 2 December 1952 (Amendment 134), 20 October 1953 (Amendment 135), 23 February 1956 (Amendment 136), 8 May 1956 (Amendment 137) and 15 May 1956 (Amendment 138), and became effective on 1 June 1951, 1 May 1952, 1 April 1953, 1 May 1953, 1 March 1954, 1 July 1956, 1 September 1956 and 15 September 1956 respectively.

The Third Air Navigation Conference (Montreal, September-October 1956) made, among other things, a complete review of Chapter 5 of the Annex. As a result of those recommendations, their submission to all Contracting States, and their review by the Air Navigation Commission, a complete new text of Chapter 5 was adopted by the Council as Amendment 139 on 13 June 1957 and became effective on 1 October 1957.

Additionally, the Council adopted Amendment 140 on 13 June 1957, containing amendments to Chapter 6 covering the marking of break-in points on aircraft and the characteristics of navigation lights, to Chapter 8 respecting the qualification of persons to certify aircraft as airworthy, to Chapter 9 respecting the route and aerodrome qualification of pilots and to Chapter 10 respecting requirements for licensing of flight operations officers, which became effective on 1 October 1957. Subsequent to the issuance of the fifth edition, Amendment 141 (4.1.1 and 4.1.2) was adopted by the Council on 12 May 1958 and became applicable on 1 December 1958. On 8 December 1959 the Council adopted Amendment 142 relating to the provisions in Chapter 6 for the carriage of portable emergency radio transmitters. The Amendment became effective on 1 May 1960 and applicable on 1 August 1960. On 2 December 1960 the Council adopted Amendment 143 relating to the provisions in Chapter 4 for co-ordination of operational instructions involving a change in the air traffic control flight plan. The Amendment became effective on 1 April 1961 and applicable on 1 July 1961. On 24 March 1961 the Council adopted Amendment 144 relating to the establishment of limitations upon flight duty periods and provision of rest periods for flight crew members, and the Attachment to the Annex of guidance material on the establishment of flight time and flight duty period limitations and rest periods. The Amendment became effective on 1 August 1961 and applicable on 1 October 1961. The Council on 24 March 1961 approved Amendment 145 containing the Note under 6.2.2 a). On 13 December 1961 the Council adopted Amendments 146, 147 and approved Amendment 148. These relate respectively to the modernizing of the specifications concerning the provision and use of oxygen supply systems, the installation of high intensity anti-collision lights on aeroplanes and to purely editorial changes respecting references to other documents. The Amendments became effective on 1 April 1962 and applicable on 1 July 1962. On 8 April 1963 the Council adopted Amendment 149. This Amendment related to the specification of the circumstances under which emergency and survival equipment shall be carried on long range over water flights. The Amendment became effective on 1 August 1963 and applicable on 1 November 1963.

As a result of the adoption of Amendment 150, a sixth edition of the Annex was published. This was necessitated by the extensive nature of the Amendment which followed recommendations of the Fourth Air Navigation Conference (Montreal, November-December 1965) for extensive revision of the Annex, chiefly with the aim of bringing it up to date to meet the operational needs of high performance turbo-jet aeroplanes. Furthermore, on the recommendation of the Conference, the applicability of the Annex is now limited to "aeroplanes" engaged in scheduled and non-scheduled international air transport operations. Previously this limitation applied only to non-scheduled international air transport operations. Amendment 150 was adopted by the Council on 14 December 1966, became effective on 14 April 1967 and applicable on 24 August 1967.

The Council, on 8 November 1967, adopted Amendment 151 which redefined "Aircraft" as a result of adoption by

Council of Amendment 2 to Annex 7 to the Convention and amended 5.2.7.2.2 to cater for three-engined aeroplanes. The Amendment became effective on 8 March 1968 and applicable on 22 August 1968.

Amendment 152 was adopted by the Council on 23 January 1969. Besides revising certain paragraphs in Chapters 4, 7 and 8 to give them more precision, the Amendment also adds a provision in Chapter 4 which prohibits, when passengers are being carried, the in-flight simulation of emergency situations affecting the flight characteristics of the aeroplane. The opportunity presented by this Amendment was also taken to introduce changes to the Annex as a consequence of the adoption by the Council of a companion document — International Standards and Recommended Practices — *Operation of Aircraft — Annex 6: Part II. — International General Aviation.* These changes consisted of designating this document, previously known as Annex 6, "Annex 6, Part I, First Edition". Amendment 152 became effective on 23 May 1969 and applicable on 18 September 1969.

Consequent to the adoption of Annex 6, Part III, *International Operations* — Helicopters, an amendment to the title was introduced to indicate that Annex 6, Part I was applicable only to aeroplanes.

Table A shows the origin of subsequent amendments together with a list of the principal subjects involved and the dates on which the Annex and the amendments were adopted by the Council, when they became effective and when they became applicable.

Applicability

The present edition of Annex 6, Part I, contains Standards and Recommended Practices adopted by the International Civil Aviation Organization as the minimum Standards applicable to the operation of aeroplanes by operators authorized to conduct international commercial air transport operations. These international commercial air transport operations include scheduled international air services and non-scheduled international air transport operations for remuneration or hire.

In conjunction, these two types of operations include all international air transport operations conducted for remuneration or hire by aeroplanes. The distinction between them lies in the fact that scheduled international air services are especially provided for in the Convention in contradistinction to international air transport operations in general, of which non-scheduled international air transport operations for remuneration or hire were considered most urgently to require the establishment of International Standards and Recommended Practices. It is no longer considered necessary to differentiate in the Standards and Recommended Practices between scheduled international air services and non-scheduled international air transport operations.

The purpose of Annex 6, Part I, is to contribute to the safety of international air navigation by providing criteria of safe operating practice and to contribute to the efficiency and regularity of international air navigation by encouraging States to facilitate the passage over their territories of aeroplanes in international commercial air transport belonging to other States that operate in conformity with such Standards.

Chapter 5

An element of the safety of an operation is the intrinsic safety of the aircraft, that is, its level of airworthiness. The level of airworthiness of an aircraft is, however, not fully defined by the application of the airworthiness Standards of Annex 8, but also requires the application of those Standards in the present Annex that are complementary to them.

As originally adopted and also as amended by Amendments 1 to 138, the Annex contained a chapter "Aeroplane Operating Limitations" which included general provisions applicable to the operation of all aeroplanes within the scope of the Annex, a section or sections applicable to aeroplanes certificated in ICAO categories according to the then existent Annex 8, and a section applicable to aeroplanes not so certificated.

At its fourth session, the Operations Division, collaborating with the Airworthiness Division, made, in addition to the proposals that resulted in Amendments 128 to 133, recommendations concerning the use of a performance code as an alternative to the one prescribed for ICAO Category A aeroplanes in which some essential climb values had the status of Recommended Practices. Further, the Airworthiness Division made recommendations concerning certain aspects of the certification in ICAO categories. As a result of those recommendations, the Council, on 2 December 1952, adopted Amendment 134 (which became effective 1 May 1953), and approved the incorporation of the alternative performance code as Attachment A, but stated its belief that since agreement had not yet been reached upon Standards covering performance, there existed no basis for certification in ICAO Category A. It urged the Contracting States to refrain from such certification pending the becoming effective of Standards on performance or until such time as the Council decides on the basic policy on airworthiness.

The Assembly at its seventh session (June 1953) endorsed the action already taken by the Council and the Air Navigation Commission to initiate a fundamental study of ICAO policy on international airworthiness and directed the Council to complete the study as rapidly as practicable.

In pursuing such study the Air Navigation Commission was helped by an international body of experts designated as the "Airworthiness Panel", which contributed to the preparation of the work of the Third Air Navigation Conference.

As a result of these studies a revised policy on international airworthiness was developed and it was approved by the Council in 1956. According to this policy the principle of certification in an ICAO Category was abandoned. Instead, Annex 8 included broad Standards which defined, for application by the competent national authorities, the complete minimum international basis for the recognition by States of certificates of airworthiness for the purpose of the flight of aircraft of other States into or over their territories, thereby achieving, among other purposes, protection of other aircraft, third persons and property. It was considered that this met the obligation of the Organization under Article 37 of the Convention to adopt international Standards of airworthiness.

It was recognized that the ICAO Standards of airworthiness would not replace national regulations and that national codes of airworthiness containing the full scope and extent of detail considered necessary by individual States would be necessary as the basis for the certification of individual aircraft. Each State would establish its own comprehensive and detailed code of airworthiness, or would select a comprehensive and detailed code established by another Contracting State. The level of airworthiness defined by this code would be indicated by the Standards, supplemented, if necessary, by Acceptable Means of Compliance.

A revised text consistent with the above principles was prepared for Chapter 5 of Annex 6. It included: a) broad Standards that were complementary to the Standards related to aeroplane performance in Annex 8; and b) two Acceptable Means of Compliance which illustrated by examples the level of performance intended by the broad Standards. To adopt a code giving an appreciably lower level of performance than that illustrated by these Acceptable Means of Compliance was considered to be a violation of the Standards in Chapter 5 of this Annex.

Present Policy on International Airworthiness. There had been some concern about the slow progress that had been made over the years with respect to developing supplementary airworthiness specifications in the form of Acceptable Means of Compliance. It was noted that the majority of the Acceptable Means of Compliance in Annexes 6 and 8 had been developed in 1957 and were therefore applicable to only those aeroplane types operating at that time. No effort had been made to update the specifications in these Acceptable Means of Compliance nor had there been any recommendations from the Airworthiness Committee for upgrading of any of the Provisional Acceptable Means of Compliance, which had been developed as potential material for full-fledged Acceptable Means of Compliance. The Air Navigation Commission therefore requested the Airworthiness Committee to review the progress made by it since its inception with a view to determining whether or not desired results had been achieved and to recommend any changes to improve the development of detailed airworthiness specifications.

The Airworthiness Committee at its Ninth Meeting (Montreal, November/December 1970) made a detailed study of the problems and recommended that the concept of developing airworthiness specifications in the form of Acceptable Means of Compliance and Provisional Acceptable Means of Compliance should be abandoned and a provision should be made for an Airworthiness Technical Manual to be prepared and published by ICAO to include guidance material intended to facilitate the development and uniformity of national airworthiness codes by Contracting States.

The Air Navigation Commission reviewed the recommendations of the Airworthiness Committee in the light of the history of the development of the airworthiness policy approved by the Council in 1956. It came to the conclusion that the basic objectives and principles on which the ICAO airworthiness policy had been based were sound and did not require any significant change. It was also concluded that the main reason for the slow progress in the development of airworthiness specifications in the form of Acceptable Means of Compliance and Provisional Acceptable Means of Compliance was the degree of mandatory status to the former implied by the following statement included in the Forewords of Annexes 6 and 8:

> "To adopt a code giving an appreciably lower level of airworthiness that that given in an Acceptable Means of Compliance would be a violation of the Standard supplement by that Acceptable Means of Compliance."

Several approaches were examined by the Air Navigation Commission to eliminate this difficulty. Finally it came to the conclusion that the idea of developing airworthiness specifications in the form of Acceptacle Means of Compliance and Provisional Acceptable Means of Compliance should be abandoned and ICAO should declare that the States' obligations, for the purpose of Article 33 of the Convention, shall be met by their compliance with the broad Standards in Annex 8 supplemented, as necessary, by airworthiness technical guidance material, devoid of all mandatory implications or obligations. Also the requirement that each Contracting State should either establish its own comprehensive and detailed code of airworthiness or select a comprehensive and detailed code established by another Contracting State, should be retained.

The Council on 15 March 1972 approved the above approach to form the basis for the present policy of ICAO in the field of airworthiness.

It also approved the issuance of the airworthiness guidance material under the title of "Airworthiness Technical Manual". It was understood that the guidance material would have no formal status and its main purpose would be to provide guidance to Contracting States in developing the detailed national airworthiness code mentioned in 2.2 of Part II of Annex 8.

With respect to Annex 6, Part I, it was agreed that the guidance material in the Acceptable Means of Compliance for Aeroplane Performance Operating Limitations should be edited suitably and retained in the Annex but in the form of an Attachment (green pages).

Performance Standards of Annex 8. Chapter 2, Part III, of Annex 8 contains aeroplane performance Standards that are complementary to the Standards in Chapter 5 of this Annex. Both state broad objectives. The Council has urged Contracting States not to impose on visiting aeroplanes, not exempted by Article 41, operational requirements other than those established by the State of Registry, provided that those requirements assure the level of performance equivalent to that intended by the Standards of Chapter 5 of this Annex and the complementary Standards of Chapter 2, Part III, of Annex 8.

In respect of aircraft exempted by Article 41, Chapter 5 of this Annex contains a Recommended Practice to the effect that the State of Registry should ensure that the level of performance specified in 5.2 applicable to aeroplanes not exempted should be met as far as practicable by those aeroplanes. The Council has urged Contracting States not to impose on visiting aircraft exempted by Article 41 requirements other than those established by the State of Registry provided that in establishing those requirements the State of Registry complied with the Recommended Practice. These recommendations complement one made by the Council in respect of aircraft exempted by Article 41, to the effect that Contracting States apply as far as practicable to aeroplanes over 5 700 kg mass intended for the carriage of passengers or cargo or mail in international air navigation, the Standards of Part III of Annex 8.

Action by Contracting States

Notification of differences. The attention of Contracting States is drawn to the obligation imposed by Article 38 of the Convention by which Contracting States are required to notify the Organization of any differences between their national regulations and practices and the International Standards contained in this Annex and any amendments thereto. Contracting States are invited to extend such notification to any differences from the Recommended Practices contained in this Annex, and any amendments thereto when the notification of such differences is important for the safety of air navigation. Further, Contracting States are invited to keep the Organization currently informed of any differences which may subsequently occur, or of the withdrawal of any differences previously notified. A specific request for notification of differences will be sent to Contracting States immediately after the adoption of each Amendment to this Annex.

Attention of States is also drawn to the provision of Annex 15 related to the publication of differences between their national regulations and practices and the related ICAO Standards and Recommended Practices through the Aeronautical Information Service, in addition to the obligation of States under Article 38 of the Convention.

Promulgation of information. The establishment and withdrawal of and changes to facilities, services and procedures affecting aircraft operations provided in accordance with the Standards and Recommended Practices specified in this Annex should be notified and take effect in accordance with the provisions of Annex 15.

Status of Annex components

An Annex is made up of the following component parts, not all of which, however, are necessarily found in every Annex; they have the status indicated:

1.—*Material comprising the Annex proper:*

a) *Standards* and *Recommended Practices* adopted by the Coui. il under the provisions of the Convention. They are defined as follows:

Standard: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as necessary for the safety or regularity of international air navigation and to which Contracting States will conform in accordance with the Convention; in the event of impossibility of compliance, notification to the Council is compulsory under Article 38.

Recommended Practice: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as desirable in the interest of safety, regularity or efficiency of international air navigation, and to which Contracting States will endeavour to conform in accordance with the Convention.

b) *Appendices* comprising material grouped separately for convenience but forming part of the Standards and Recommended Practices adopted by the Council.

c) *Definitions* of terms used in the Standards and Recommended Practices which are not self-explanatory in that they do not have accepted dictionary meanings. A definition does not have independent status but is an essential part of each Standard and Recommended Practice in which the term is used, since a change in the meaning of the term would affect the specification.

d) *Tables* and *Figures* which add to or illustrate a Standard or Recommended Practice and which are referred to therein, form part of the associated Standard or Recommended Practice and have the same status.

It is to be noted that some Standards in this Annex incorporate, by reference, other specifications having the status of Recommended Practices. In such cases, the text of the Recommended Practice becomes part of the Standard.

2.— *Material approved by the Council for publication in association with the Standards and Recommended Practices:*

a) *Forewords* comprising historical and explanatory material based on the action of the Council and including an explanation of the obligations of States with regard to the application of the Standards and Recommended Practices ensuing from the Convention and the Resolution of Adoption;

b) *Introductions* comprising explanatory material introduced at the beginning of parts, chapters or sections of the Annex to assist in the understanding of the application of the text;

c) *Notes* included in the text, where appropriate, to give factual information or references bearing on the Standards or Recommended Practices in question, but not constituting part of the Standards or Recommended Practices;

d) *Attachments* comprising material supplementary to the Standards and Recommended Practices, or included as a guide to their application.

Selection of language

This Annex has been adopted in five languages — English, Arabic, French, Russian and Spanish. Each Contracting State is requested to select one of those texts for the purpose of national implementation and for other effects provided for in the Convention, either through direct use or through translation into its own national language, and to notify the Organization accordingly.

Editorial practices

The following practice has been adhered to in order to indicate at a glance the status of each statement: *Standards* have been printed in light face roman; *Recommended Practices* have been printed in light face italics, the status being indicated by the prefix **Recommendation**; *Notes* have been printed in light face italics, the status being indicated by the prefix *Note*.

The following editorial practice has been followed in the writing of specifications: for Standards the operative verb "shall" is used, and for Recommended Practices the operative verb "should" is used.

The units of measurement used in this document are in accordance with the International System of Units (SI) as specified in Annex 5 to the Convention on International Civil Aviation. Where Annex 5 permits the use of non-SI alternative units these are shown in parentheses following the basic units. Where two sets of units are quoted it must not be assumed that the pairs of values are equal and interchangeable. It may, however, be inferred that an equivalent level of safety is achieved when either set of units is used exclusively.

Any reference to a portion of this document, which is identified by a number and/or title, includes all subdivisions of that portion.

Table A. Amendments to Annex 6

Amendment	*Source(s)*	*Subject(s)*	*Adopted* *Effective* *Applicable*
1st Edition	Derived from Sixth Edition of Annex 6, including Amendment 152		23 January 1969 23 May 1969 18 September 1969
1 (2nd Edition)	Sixth Air Navigation Conference	a) A shift in emphasis of the responsibility for the establishment of minimum en-route flight altitudes from the operator to the State flown over; b) the requirement for additional instruments in aeroplanes operated as controlled VFR flights in the en-route phase; and, of special importance; c) the permitting of aeroplanes, when unable to navigate by visual references to landmarks, to be navigated by equipment other than radio navigation equipment, e.g. solely by self-contained navigation means, provided that certain equipment capabilities are met, thus eliminating any requirement for the carriage of radio navigation equipment.	25 May 1970 25 September 1970 4 February 1971
2	Special Meeting on Aircraft Noise in the Vicinity of Aerodromes (1969) and the Second Meeting of the Supersonic Transport Panel	a) The weight of an aeroplane at the start of take-off or at the expected time of landing not to exceed, except in prescribed circumstances, the relative maximum weights at which compliance has been demonstrated with the applicable Noise Certification Standards; b) the carriage on board an aeroplane of a document attesting noise certification; c) all aeroplanes intended to be operated above 15 000 m (49 000 ft) to carry equipment to measure and indicate continuously the total cosmic radiation being received.	2 April 1971 2 August 1971 6 January 1972
3	Council action in pursuance of Assembly Resolution A17-10	Inclusion in the Annex of a Recommended Practice to the effect that, in all passenger-carrying aeroplanes, the flight crew compartment door should be capable of being locked from within the compartment.	10 December 1971 10 April 1972 7 December 1972
4 (3rd Edition)	Air Navigation Commission Review of the Annex	a) Deletion from Chapter 2 of the provision which allowed, in prescribed circumstances, certain specifications classed as Standards to have the status of Recommended Practices; b) introduction of the term "Aerodrome operating minima" in lieu of "Aerodrome meteorological minima"; c) introduction of the terms "Decision height", "Instrument meteorological conditions", "Runway visual range" and "Visual meteorological conditions"; d) Introduction of provisions to require the operator to provide a copy of its Operations Manual to the State of Registry and to incorporate in the Manual certain mandatory material; e) the inclusion of an updated list of the supplies, etc., to be carried aboard aircraft in first-aid kits; f) a change in the equivalent of 5 700 kg from 12 500 lb to 12 566 lb; g) the introduction of a reference to the need for certain types of aeroplanes to be equipped with a Mach number indicator; h) the introduction of a provision for cabin attendants to be seated and secured during certain prescribed flight phases.	27 June 1972 27 October 1972 1 March 1973

Amendment	Source(s)	Subject(s)	Adopted Effective Applicable
5	Seventh Air Navigation Conference	Inclusion in the Annex of definitions of "Flight recorder" and "Maximum weight" (of aircraft) and revision of the specifications for the carriage, recording parameters and operation of flight recorders.	29 May 1973 1 October 1973 23 May 1974
6	In pursuance of new policy on international airworthiness and action in pursuance of Assembly Resolution A18-16	Replacement of the Acceptable Means of Compliance on Aeroplane Performance Operating Limitations by guidance material on the subject in the form of an Attachment, and incorporation of provisions for emergency power supply to operate attitude indicating instruments on the total failure of the main electrical generating system. The opportunity presented by this Amendment was also taken to revise the Introductory Note to Chapter 3 of the Annex. The revision points to a practical method for States to discharge their functions in the cases of lease, charter, and interchange of aircraft in international operations.	30 October 1973 28 February 1974 23 May 1974
7	Council action in pursuance of Assembly Resolutions A17-10 and A18-10	Introduced provisions relating to practices to be followed in the event that an aircraft is being subjected to unlawful interference.	7 December 1973 7 April 1974 23 May 1974
8	Pursuant to an Air Navigation Commission study concerning the interception of civil aircraft	Introduced provisions designed to reduce the risk for intercepted aircraft.	4 February 1975 4 June 1975 9 October 1975
9	Accident Investigation and Prevention Divisional Meeting (1974). Fifth Meeting of the Supersonic Transport Panel. Consequent to amendments to Annexes 3 and 14	Introduced requirements for the safeguarding and preservation of flight recorder records of aeroplanes involved in accidents and incidents, provision and use of flight crew restraining devices, procedures to be followed in the event of excessive cosmic radiation exposure during flight, and the maintenance of records for crew members on total cosmic radiation dosages. The Amendment also provided amplification of the specifications for the type of timepiece required for operations in accordance with Instrument Flight Rules and controlled VFR flights and provided a cross-reference to guidance material on SST fuel supplies. The opportunity presented by this Amendment was also taken to introduce changes to the Annex as a result of the adoption by the Council of amendments to companion documents — Annex 3 and Annex 14. These changes consist of the elimination of reference to PANS-MET and the revision of the definitions of Aerodrome, Runway Visual Range, Take-off Run Available and Landing Distance Available.	7 April 1976 7 August 1976 30 December 1976
10	ASIA/PAC Regional Air Navigation Meeting (1973)	The requirement for the carriage of survival radio equipment over those areas in which search and rescue would be especially difficult to be determined by States rather than regional air navigation agreement.	16 June 1976 16 October 1976 6 October 1977
11	Seventh Air Navigation Conference and Air Navigation Commission Study	Required the operator to establish operational procedures designed to ensure that an aeroplane conducting precision approaches crosses the threshold by a safe margin.	23 June 1977 23 October 1977 23 February 1978
12	Air Navigation Commission Study	Required the fitting of ground proximity warning systems to certain aeroplanes.	15 December 1977 15 April 1978 10 August 1978
13	Air Navigation Commission Study	Required the fitting of seats with safety harness and their use by cabin attendants assigned emergency evacuation duties.	13 December 1978 13 April 1979 29 November 1979
14	Air Navigation Commission Study	New definition of "operational control" and introduction of requirements for navigation equipment to meet minimum navigational performance specifications (MNPS)	2 April 1980 2 August 1980 27 November 1980
15	Air Navigation Commission Study	Revision of the provisions relating to exterior lights to align with new provisions in Annexes 2 and 8, and requirements to include a check-list of emergency and safety equipment, including instructions for its use, in the Operations Manual.	22 March 1982 22 July 1982 25 November 1982

Amendment	*Source(s)*	*Subject(s)*	*Adopted Effective Applicable*
16 (4th Edition)	Third and Fourth meetings of the Operations Panel, AGA Divisional Meeting (1981), amendments consequent to adoption of Annex 18 and an Air Navigation Study	Introduced provisions related to aircraft operating procedures for noise abatement, development and use of instrument flight procedures, authority and competence to taxi aeroplanes and refuelling with passengers on board. Changes to the Annex were introduced as a result of adoption by the Council of Annex 18 in respect to the carriage of dangerous goods and requirements for crew training programmes in their carriage in commercial aeroplanes. The provisions in respect of aerodromes operating minima were revised to clarify the requirements and to include a requirement for RVR information. Units of measurement were brought in line with the provisions of Annex 5, and the Note in Chapter 3 concerning lease, charter and interchange was updated.	29 March 1983 29 July 1983 24 November 1983
17	Accident Prevention and Investigation Divisional Meeting, AIG (1979)	Revision of the provisions relating to flight recorders. Introduction of related guidance material in an attachment.	6 March 1985 29 July 1985 21 November 1985
18	Seventh meeting of the Obstacle Clearance Panel, Air Navigation Commission studies and a proposal by a State	Provision of climb performance data with all engines operating; extended range operations by aeroplanes with two power-units; the provision of obstacle data; take-off alignment distance accountability.	25 March 1986 27 July 1986 20 November 1986
19 (5th Edition)	Air Navigation Commission review of the Annex, Stage I. Third meeting of the Visual Flight Rules Operations Panel. Air Navigation Commission Study	a) Introduction of new definitions for commercial air transport operations, air operator certificate, master minimum equipment list and minimum equipment list. Introduction of revised definitions of aerial work and general aviation to Annex 6, Part I. Revision of the definition of alternate aerodrome to introduce take-off, en-route and destination alternate aerodromes; b) elimination of the differences between the specifications for scheduled and non-scheduled operations; c) introduction of the concept of the applicability of Annex 6, Part I to the operation of aeroplanes by operators authorized to conduct international commercial air transport operations; d) requirements for the issue of an air operator certificate and the introduction of guidance material; e) requirements for the development of minimum equipment lists and the introduction of guidance material; f) requirements for the specification of alternate aerodromes; g) requirement for the provision of an aircraft operating manual; h) requirement for the operator to establish an accident prevention and flight safety programme and specifications related to carry-on baggage; i) differentiation in Annex 6, Part I between operational and ATS flight plans; j) requirements for the pilot-in-command to demonstrate knowledge of long-range navigation procedures where appropriate; k) elimination of the term "controlled VFR flight" and recognition that a VFR flight may be a controlled flight; l) amendment to Chapter 13 — Security to make the recommendation on the provision of a lockable flight crew compartment door applicable to all aeroplanes rather than only passenger-carrying aeroplanes, to require guidance material to support the aeroplane search procedure checklist, and to require the operator to establish a training programme for employees in preventative measures and techniques in relation to acts of sabotage or unlawful interference; m) introduction of guidance material concerning flight data recording of important operational information in aeroplanes with electronic displays; n) revision of the requirements for the contents of the operations manual;	19 March 1990 30 July 1990 15 November 1990

Amendment	*Source(s)*	*Subject(s)*	*Adopted Effective Applicable*
		o) requirements concerning carry-on baggage; p) change of the expression "flight check system" to "checklist";	
20	Fifth meeting of the Operations Panel, Seventh and Eighth meetings of the Review of the General Concept of Separation Panel, Accident Investigation Divisional meeting (AIG/1992), Third meeting of the Continuing Airworthiness Panel, Air Navigation Commission studies	a) Revision of definitions of aerodrome operating minima, decision altitude/height, minimum descent altitude/height and obstacle clearance altitude/height; b) introduction of new definitions for emergency locator transmitters (ELTs), required navigation performance (RNP) and RNP type; c) introduction of the definition for the classification of instrument approach and landing operations; d) introduction of a reference to the *Continuing Airworthiness Manual;* e) revision of the requirements concerning the use of engraving metal foil flight data recorders; f) introduction of carriage requirements for emergency locator transmitters (ELTs) to replace provisions regarding survival radio equipment and emergency location beacon — ELBA; g) introduction of a requirement that the navigation equipment carried shall enable the aircraft to proceed in accordance with RNP types prescribed for the intended route(s) or areas(s), provisions to permit the uniform implementation of 300 m (1 000 ft) VSM above FL 290 and reference to the requirements relating to operations in RNP airspace in the operations manual; h) revision of the requirements concerning maintenance inspection, modifications and repairs and continuing airworthiness information.	21 March 1994 25 July 1994 10 November 1994
21 (6th Edition)	Air Navigation Commission studies, Fourteenth meeting of the Dangerous Goods Panel, editorial amendment, text alignment with Annex 6, Part II and/or Part III, consequential amendment	a) Introduction of new and revised definitions for cabin attendant, flight manual, large aeroplane, operations manual and small aeroplane; b) revision of the provisions concerning operating facilities, flight preparation, flight time, flight duty periods and rest periods for crew members, oxygen supply and extended range operations (ETOPS); c) new requirements for determining the length of the runway available; d) revised and new provisions concerning ground proximity warning systems (GPWS), medical supplies, oxygen equipment for aeroplanes on high altitude flights; e) revision of the provisions concerning aeroplanes operated in accordance with instrument flight rules (IFR); f) inclusion of references to the ICAO *Manual of Criteria for the Qualification of Flight Simulators* (Doc 9625) and new requirements for the flight crew training programme concerning knowledge and skills related to human performance and limitations; g) revision of the denomination of flight operations officer to align with Annex 1; h) revision of the contents of the operations manual and new provisions concerning aerodrome operating minima, oxygen supply, flight and duty time limitations, departure contingency procedures, instructions for mass and balance control and instructions and training requirements for the avoidance of controlled flight into terrain (CFIT) and policy for the use of ground proximity warning systems (GPWS); i) new provisions on flight time, flight duty periods and rest periods for cabin attendants and revision of the provisions concerning training; and j) revised and new requirements related to the incorporation of security into aircraft design.	8 March 1995 24 July 1995 9 November 1995

INTERNATIONAL STANDARDS AND RECOMMENDED PRACTICES

CHAPTER 1. DEFINITIONS

When the following terms are used in the Standards and Recommended Practices for operation of aircraft in international commercial air transport, they have the following meanings:

Aerial work. An aircraft operation in which an aircraft is used for specialized services such as agriculture, construction, photography, surveying, observation and patrol, search and rescue, aerial advertisement, etc.

Aerodrome. A defined area on land or water (including any buildings, installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of aircraft.

Aerodrome operating minima. The limits of usability of an aerodrome for:

a) take-off, expressed in terms of runway visual range and/or visibility and, if necessary, cloud conditions;

b) landing in precision approach and landing operations, expressed in terms of visibility and/or runway visual range and decision altitude/height (DA/H) as appropriate to the category of the operation; and

c) landing in non-precision approach and landing operations, expressed in terms of visibility and/or runway visual range, minimum descent altitude/height (MDA/H) and, if necessary, cloud conditions.

Aeroplane. A power-driven heavier-than-air aircraft, deriving its lift in flight chiefly from aerodynamic reactions on surfaces which remain fixed under given conditions of flight.

Aircraft. Any machine that can derive support in the atmosphere from the reactions of the air other than the reactions of the air against the earth's surface.

Air operator certificate (AOC). A certificate authorizing an operator to carry out specified commercial air transport operations.

Alternate aerodrome. An aerodrome to which an aircraft may proceed when it becomes either impossible or inadvisable to proceed to or to land at the aerodrome of intended landing. Alternate aerodromes include the following:

Take-off alternate. An alternate aerodrome at which an aircraft can land should this become necessary shortly after take-off and it is not possible to use the aerodrome of departure.

En-route alternate. An aerodrome at which an aircraft would be able to land after experiencing an abnormal or emergency condition while en route.

Destination alternate. An alternate aerodrome to which an aircraft may proceed should it become either impossible or inadvisable to land at the aerodrome of intended landing.

Note.— The aerodrome from which a flight departs may also be an en-route or a destination alternate aerodrome for that flight.

Cabin attendant. A crew member who performs, in the interest of safety of passengers, duties assigned by the operator or the pilot-in-command of the aircraft, but who shall not act as a flight crew member.

Commercial air transport operation. An aircraft operation involving the transport of passengers, cargo or mail for remuneration or hire.

Crew member. A person assigned by an operator to duty on an aircraft during flight time.

Cruising level. A level maintained during a significant portion of a flight.

Dangerous goods. Articles or substances which are capable of posing significant risk to health, safety or property when transported by air.

Note.— Dangerous goods are classified in Annex 18, Chapter 3.

Decision altitude (DA) or decision height (DH). A specified altitude or height in the precision approach at which a missed approach must be initiated if the required visual reference to continue the approach has not been established.

Note 1.— Decision altitude (DA) is referenced to mean sea level and decision height (DH) is referenced to the threshold elevation.

Note 2.— The required visual reference means that section of the visual aids or of the approach area which should have been in view for sufficient time for the pilot to have made an assessment of the aircraft position and rate of change of position, in relation to the desired flight path. In Category III operations with a decision height the required visual reference is that specified for the particular procedure and operation.

Note 3.— For convenience where both expressions are used they may be written in the form "decision altitude/ height" and abbreviated "DA/H".

Emergency locator transmitter (ELT). A generic term describing equipment which broadcast distinctive signals on designated frequencies and, depending on application, may either sense a crash and operate automatically or be manually activated. An ELT may be any of the following:

Automatic fixed ELT (ELT(AF)). An ELT which is permanently attached to an aircraft.

Automatic portable ELT (ELT(AP)). An ELT which is rigidly attached to an aircraft but readily removable from the aircraft after a crash.

Automatically deployable ELT (ELT(AD)). An ELT which is rigidly attached to an aircraft and deployed automatically in response to a crash. Manual deployment is also provided.

Survival ELT (ELT(S)). An ELT which is removable from an aircraft, stowed so as to facilitate its ready use in an emergency and activated by survivors. Automatic activation may apply.

Flight crew member. A licensed crew member charged with duties essential to the operation of an aircraft during flight time.

Flight duty period. The total time from the moment a flight crew member commences duty, immediately subsequent to a rest period and prior to making a flight or a series of flights, to the moment the flight crew member is relieved of all duties having completed such flight or series of flights.

Flight manual. A manual, associated with the certificate of airworthiness, containing limitations within which the aircraft is to be considered airworthy, and instructions and information necessary to the flight crew members for the safe operation of the aircraft.

Flight plan. Specified information provided to air traffic services units, relative to an intended flight or portion of a flight of an aircraft.

Flight recorder. Any type of recorder installed in the aircraft for the purpose of complementing accident/incident investigation.

Flight time. The total time from the moment an aircraft first moves under its own power for the purpose of taking off until the moment it comes to rest at the end of the flight.

Note.— Flight time as here defined is synonymous with the term "block to block" time or "chock to chock" time in general usage which is measured from the time an aircraft moves from the loading point until it stops at the unloading point.

General aviation operation. An aircraft operation other than a commercial air transport operation or an aerial work operation.

Instrument approach and landing operations. Instrument approach and landing operations using instrument approach procedures are classified as follows:

Non-precision approach and landing operations. An instrument approach and landing which does not utilize electronic glide path guidance.

Precision approach and landing operations. An instrument approach and landing using precision azimuth and glide path guidance with minima as determined by the category of operation.

Categories of precision approach and landing operations:

Category I (CAT I) operation. A precision instrument approach and landing with a decision height not lower than 60 m (200 ft) and with either a visibility not less than 800 m or a runway visual range not less than 550 m.

Category II (CAT II) operation. A precision instrument approach and landing with a decision height lower than 60 m (200 ft), but not lower than 30 m (100 ft), and a runway visual range not less than 350 m.

Category IIIA (CAT IIIA) operation. A precision instrument approach and landing with:

a) a decision height lower than 30 m (100 ft) or no decision height; and

b) a runway visual range not less than 200 m.

Category IIIB (CAT IIIB) operation. A precision instrument approach and landing with:

a) a decision height lower than 15 m (50 ft) or no decision height; and

b) a runway visual range less than 200 m but not less than 50 m.

Category IIIC (CAT IIIC) operation. A precision instrument approach and landing with no decision height and no runway visual range limitations.

Note.— Where decision height (DH) and runway visual range (RVR) fall into different categories of operation, the instrument approach and landing operation would be conducted in accordance with the requirements of the most demanding category (e.g. an operation with a DH in the range of CAT IIIA but with an RVR in the range of CAT IIIB would be considered a CAT IIIB operation or an operation with a DH in the range of CAT II but with an RVR in the range of CAT I would be considered a CAT II operation.

Instrument meteorological conditions (IMC). Meteorological conditions expressed in terms of visibility, distance from cloud, and ceiling*, less than the minima specified for visual meteorological conditions.

Note.— The specified minima for visual meteorological conditions are contained in Chapter 4 of Annex 2.

Large aeroplane. An aeroplane of a maximum certificated take-off mass of over 5 700 kg.

Master minimum equipment list (MMEL). A list established for a particular aircraft type by the manufacturer with the approval of the State of Manufacture containing items, one or more of which is permitted to be unserviceable at the commencement of a flight. The MMEL may be associated with special operating conditions, limitations or procedures.

Maximum mass. Maximum certificated take-off mass.

Minimum descent altitude (MDA) or minimum descent height (MDH). A specified altitude or height in a non-precision approach or circling approach below which descent must not be made without the required visual reference.

Note 1.— Minimum descent altitude (MDA) is referenced to mean sea level and minimum descent height (MDH) is referenced to the aerodrome elevation or to the threshold elevation if that is more than 2 m (7 ft) below the aerodrome elevation. A minimum descent height for a circling approach is referenced to the aerodrome elevation.

Note 2.— The required visual reference means that section of the visual aids or of the approach area which should have been in view for sufficient time for the pilot to have made an assessment of the aircraft position and rate of change of position, in relation to the desired flight path. In the case of a circling approach the required visual reference is the runway environment.

Note 3.— For convenience when both expressions are used they may be written in the form "minimum descent altitude/height" and abbreviated "MDA/H".

Minimum equipment list (MEL). A list which provides for the operation of aircraft, subject to specified conditions, with particular equipment inoperative, prepared by an operator in conformity with, or more restrictive than, the MMEL established for the aircraft type.

Night. The hours between the end of evening civil twilight and the beginning of morning civil twilight or such other period between sunset and sunrise, as may be prescribed by the appropriate authority.

Note.— Civil twilight ends in the evening when the centre of the sun's disc is 6 degrees below the horizon and begins in the morning when the centre of the sun's disc is 6 degrees below the horizon.

Obstacle clearance altitude (OCA) or obstacle clearance height (OCH). The lowest altitude, or the lowest height above the elevation of the relevant runway threshold or the aerodrome elevation as applicable, used in establishing compliance with appropriate obstacle clearance criteria.

Note 1.— Obstacle clearance altitude is referenced to mean sea level and obstacle clearance height is referenced to the threshold elevation or in the case of non-precision approaches to the aerodrome elevation or the threshold elevation if that is more than 2 m (7 ft) below the aerodrome elevation. An obstacle clearance height for a circling approach is referenced to the aerodrome elevation.

Note 2.— For convenience when both expressions are used they may be written in the form "obstacle clearance altitude/height" and abbreviated "OCA/H".

Operational control. The exercise of authority over the initiation, continuation, diversion or termination of a flight in the interest of the safety of the aircraft and the regularity and efficiency of the flight.

Operational flight plan. The operator's plan for the safe conduct of the flight based on considerations of aeroplane performance, other operating limitations and relevant expected conditions on the route to be followed and at the aerodromes concerned.

Operations manual. A manual containing procedures, instructions and guidance for use by operational personnel in the execution of their duties.

Operator. A person, organization or enterprise engaged in or offering to engage in an aircraft operation.

Pilot-in-command. The pilot responsible for the operation and safety of the aircraft during flight time.

---

* As defined in Annex 2.

Pressure-altitude. An atmospheric pressure expressed in terms of altitude which corresponds to that pressure in the Standard Atmosphere**.

Required navigation performance (RNP). A statement of the navigation performance accuracy necessary for operation within a defined airspace.

Rest period. Any period of time on the ground during which a flight crew member is relieved of all duties by the operator.

RNP type. A containment value expressed as a distance in nautical miles from the intended position within which flights would be for at least 95 per cent of the total flying time.

Example. — RNP 4 represents a navigation accuracy of plus or minus 7.4 km (4 NM) on a 95 per cent containment basis.

Runway visual range. The range over which the pilot of an aircraft on the centre line of a runway can see the runway surface markings or the lights delineating the runway or identifying its centre line.

Small aeroplane. An aeroplane of a maximum certificated take-off mass of 5 700 kg or less.

State of Registry. The State on whose register the aircraft is entered.

Note.— In the case of the registration of aircraft of an international operating agency on other than a national basis, the States constituting the agency are jointly and severally bound to assume the obligations which, under the Chicago Convention, attach to a State of Registry. See, in this regard, the Council Resolution of 14 December 1967 on Nationality and Registration of Aircraft Operated by International Operating Agencies *(Doc 8722).*

State of the Operator. The State in which the operator's principal place of business is located or, if there is no such place of business, the operator's permanent residence.

Synthetic flight trainer. Any one of the following three types of apparatus in which flight conditions are simulated on the ground:

A flight simulator, which provides an accurate representation of the flight deck of a particular aircraft type to the extent that the mechanical, electrical, electronic, etc., aircraft systems control functions, the normal environment of flight crew members, and the performance and flight characteristics of that type of aircraft are realistically simulated;

A flight procedures trainer, which provides a realistic flight deck environment, and which simulates instrument responses, simple control functions of mechanical, electrical, electronic, etc., aircraft systems, and the performance and flight characteristics of aircraft of a particular class;

A basic instrument flight trainer, which is equipped with appropriate instruments, and which simulates the flight deck environment of an aircraft in flight in instrument flight conditions.

Visual meteorological conditions (VMC). Meteorological conditions expressed in terms of visibility, distance from cloud, and ceiling,* equal to or better than specified minima.

Note.— The specified minima are contained in Chapter 4 of Annex 2.

---

* As defined in Annex 2.
** As defined in Annex 8.

CHAPTER 2. APPLICABILITY

The Standards and Recommended Practices contained in Annex 6, Part I, shall be applicable to the operation of aeroplanes by operators authorized to conduct international commercial air transport operations.

Note 1.— Standards and Recommended Practices applicable to international general aviation operations with aeroplanes are to be found in Annex 6, Part II.

Note 2.— Standards and Recommended Practices applicable to international commercial air transport operations or international general aviation operations with helicopters are to be found in Annex 6, Part III.

CHAPTER 3. GENERAL

Note 1.— Although the Convention on International Civil Aviation allocates to the State of Registry certain functions which that State is entitled to discharge, or obligated to discharge, as the case may be, the Assembly recognized, in Resolution A23-13 that the State of Registry may be unable to fulfil its responsibilities adequately in instances where aircraft are leased, chartered or interchanged — in particular without crew — by an operator of another State and that the Convention may not adequately specify the rights and obligations of the State of an operator in such instances until such time as Article 83 bis *of the Convention enters into force. Accordingly, the Council urged that if, in the abovementioned instances, the State of Registry finds itself unable to discharge adequately the functions allocated to it by the Convention, it delegate to the State of the Operator, subject to acceptance by the latter State, those functions of the State of Registry that can more adequately be discharged by the State of the Operator. It is understood that pending entry into force of Article 83* bis *of the Convention the foregoing action will only be a matter of practical convenience and will not affect either the provisions of the Chicago Convention prescribing the duties of the State of Registry or any third State.*

Note 2.— In the case of international operations effected jointly with aeroplanes not all of which are registered in the same Contracting State, nothing in this Part prevents the States concerned entering into an agreement for the joint exercise of the functions placed upon the State of Registry by the provisions of this Part.

3.1 An operator shall ensure that all employees when abroad know that they must comply with the laws, regulations and procedures of those States in which operations are conducted.

3.2 An operator shall ensure that all pilots are familiar with the laws, regulations and procedures, pertinent to the performance of their duties, prescribed for the areas to be traversed, the aerodromes to be used and the air navigation facilities relating thereto. The operator shall ensure that other members of the flight crew are familiar with such of these laws, regulations and procedures as are pertinent to the performance of their respective duties in the operation of the aeroplane.

3.3 An operator or a designated representative shall have responsibility for operational control.

Note.— The rights and obligations of a State in respect to the operation of aeroplanes registered in that State are not affected by this provision.

3.4 If an emergency situation which endangers the safety of the aeroplane or persons necessitates the taking of action which involves a violation of local regulations or procedures, the pilot-in-command shall notify the appropriate local authority without delay. If required by the State in which the incident occurs, the pilot-in-command shall submit a report on any such violation to the appropriate authority of such State; in that event, the pilot-in-command shall also submit a copy of it to the State of the Operator. Such reports shall be submitted as soon as possible and normally within ten days.

3.5 Operators shall ensure that pilots-in-command have available on board the aeroplane all the essential information concerning the search and rescue services in the area over which the aeroplane will be flown.

Note.— This information may be made available to the pilot by means of the operations manual or such other means as is considered appropriate.

3.6 An operator shall establish and maintain an accident prevention and flight safety programme.

Note.— Guidance on accident prevention is contained in the Accident Prevention Manual *(Doc 9422) and in the manual* Preparation of an Operations Manual *(Doc 9376).*

3.7 Dangerous goods.

Note 1.— Provisions for carriage of dangerous goods are contained in Annex 18.

Note 2 — Article 35 of the Convention refers to certain classes of cargo restrictions.

CHAPTER 4. FLIGHT OPERATIONS

4.1 Operating facilities

4.1.1 An operator shall ensure that a flight will not be commenced unless it has been ascertained by every reasonable means available that the ground and/or water facilities available and directly required on such flight, for the safe operation of the aeroplane and the protection of the passen-gers, are adequate for the type of operation under which the flight is to be conducted and are adequately operated for this purpose.

Note.— "Reasonable means" in this Standard is intended to denote the use, at the point of departure, of information available to the operator either through official information published by the aeronautical information services or readily obtainable from other sources.

4.1.2 An operator shall ensure that any inadequacy of facilities observed in the course of operations is reported to the authority responsible for them, without undue delay.

4.1.3 Subject to their published conditions of use, aerodromes and their facilities shall be kept continuously available for flight operations during their published hours of operations, irrespective of weather conditions.

4.2 Operational certification and supervision

4.2.1 The air operator certificate

4.2.1.1 An operator shall not engage in commercial air transport operations unless in possession of a valid air operator certificate or equivalent document issued by the State of the Operator.

4.2.1.2 The air operator certificate or equivalent document shall authorize the operator to conduct commercial air transport operations in accordance with such conditions and limitations as may be specified.

4.2.1.3 The issue of an air operator certificate or equivalent document by the State of the Operator shall be dependent upon the operator demonstrating an adequate organ-ization, method of control and supervision of flight operations, training programme and maintenance arrangements consistent with the nature and extent of the operations specified.

Note.— Attachment F contains guidance on the issue of an air operator certificate.

4.2.1.4 The continued validity of an air operator certificate or equivalent document shall depend upon the operator maintaining the requirements of 4.2.1.3 under the supervision of the State of the Operator..

4.2.1.5 The air operator certificate or equivalent document shall contain at least the following:

a) operator's identification (name, location);

b) date of issue and period of validity;

c) description of the types of operations authorized;

d) the type(s) of aircraft authorized for use; and

e) authorized areas of operation or routes.

4.2.2 Operations manual

4.2.2.1 An operator shall provide, for the use and guidance of operations personnel concerned, an operations manual in accordance with 11.1. The operations manual shall be amended or revised as is necessary to ensure that the information contained therein is kept up to date. All such amendments or revisions shall be issued to all personnel that are required to use this manual.

4.2.2.2 An operator shall provide the State of the Operator with a copy of the operations manual together with all amendments and/or revisions to it and shall incorporate in it such mandatory material as the State of the Operator may require.

4.2.3 Operating instructions — general

4.2.3.1 An operator shall ensure that all operations personnel are properly instructed in their particular duties and responsibilities and the relationship of such duties to the operation as a whole.

4.2.3.2 An aeroplane shall not be taxied on the movement area of an aerodrome unless the person at the controls:

a) has been duly authorized by the operator or a designated agent;

b) is fully competent to taxi the aeroplane;

c) is qualified to use the radio telephone; and

d) has received instruction from a competent person in respect of aerodrome layout, routes, signs, marking, lights, air traffic control (ATC) signals and instructions, phraseology and procedures, and is able to conform to the operational standards required for safe aeroplane movement at the aerodrome.

4.2.3.3 **Recommendation.—** *The operator should issue operating instructions and provide information on aeroplane climb performance with all engines operating to enable the pilot-in-command to determine the climb gradient that can be achieved during the departure phase for the existing take-off conditions and intended take-off technique. This information should be included in the operations manual.*

4.2.4 In-flight simulation of emergency situations

An operator shall ensure that when passengers or cargo are being carried, no emergency or abnormal situations shall be simulated.

4.2.5 Checklists

The checklists provided in accordance with 6.1.3 shall be used by flight crews prior to, during and after all phases of operations, and in emergency, to ensure compliance with the operating procedures contained in the aircraft operating manual and the flight manual or other documents associated with the certificate of airworthiness and otherwise in the operations manual.

4.2.6 Minimum flight altitudes

4.2.6.1 An operator shall be permitted to establish minimum flight altitudes for those routes flown for which minimum flight altitudes have been established by the State flown over or the responsible State, provided that they shall not be less than those established by that State.

4.2.6.2 An operator shall specify the method by which it is intended to determine minimum flight altitudes for operations conducted over routes for which minimum flight altitudes have not been established by the State flown over or the responsible State, and shall include this method in the operations manual. The minimum flight altitudes determined in accordance with the above method shall not be lower than specified in Annex 2.

4.2.6.3 **Recommendation.—** *The method for establishing the minimum flight altitudes should be approved by the State of the Operator.*

4.2.6.4 **Recommendation.—** *The State of the Operator should approve such method only after careful consideration of the probable effects of the following factors on the safety of the operation in question:*

a) the accuracy and reliability with which the position of the aeroplane can be determined;

b) the inaccuracies in the indications of the altimeters used;

c) the characteristics of the terrain (e.g. sudden changes in the elevation);

d) the probability of encountering unfavourable meteorological conditions (e.g. severe turbulence and descending air currents);

e) possible inaccuracies in aeronautical charts; and

f) airspace restrictions.

4.2.7 Aerodrome operating minima

4.2.7.1 The State of the Operator shall require that the operator establish aerodrome operating minima for each aerodrome to be used in operations, and shall approve the method of determination of such minima. Such minima shall not be lower than any that may be established for such aerodromes by the State in which the aerodrome is located, except when specifically approved by that State.

Note.— This Standard does not require the State in which the aerodrome is located to establish aerodrome operating minima.

4.2.7.2 The State of the Operator shall require that in establishing the aerodrome operating minima which will apply to any particular operation, full account shall be taken of:

a) the type, performance and handling characteristics of the aeroplane;

b) the composition of the flight crew, their competence and experience;

c) the dimensions and characteristics of the runways which may be selected for use;

d) the adequacy and performance of the available visual and non-visual ground aids;

e) the equipment available on the aeroplane for the purpose of navigation and/or control of the flight path during the approach to landing and the missed approach;

f) the obstacles in the approach and missed approach areas and the obstacle clearance altitude/height for the instrument approach procedures;

g) the means used to determine and report meteorological conditions; and

h) the obstacles in the climb-out areas and necessary clearance margins.

Note.— Guidance on the establishment of aerodrome operating minima is contained in the Manual of All-Weather Operations *(Doc 9365).*

4.2.7.3 **Recommendation.—** *For aeroplane landing operations, aerodrome operating minima below 800 m visibility should not be authorized unless RVR information is provided.*

4.2.8 Threshold crossing height for precision approaches

An operator shall establish operational procedures designed to ensure that an aeroplane being used to conduct precision approaches crosses the threshold by a safe margin, with the aeroplane in the landing configuration and attitude.

4.2.9 Fuel and oil records

4.2.9.1 An operator shall maintain fuel and oil records to enable the State of the Operator to ascertain that, for each flight, the requirements of 4.3.6 have been complied with.

4.2.9.2 Fuel and oil records shall be retained by the operator for a period of three months.

4.2.10 Crew

4.2.10.1 *Pilot-in-command.* For each flight, the operator shall designate one pilot to act as pilot-in-command.

4.2.10.2 *Flight time, flight duty periods and rest periods.* An operator shall formulate rules to limit flight time and flight duty periods and for the provision of adequate rest periods for all its crew members. These rules shall be in accordance with the regulations established by the State of the Operator, or approved by that State, and included in the operations manual.

4.2.10.3 An operator shall maintain current records of the flight time, flight duty periods and rest periods of all its crew members.

Note.— Guidance on the establishment of limitations is given in Attachment A.

4.2.10.4 For each flight of an aeroplane above 15 000 m (49 000 ft), the operator shall maintain records so that the total cosmic radiation dose received by each crew member over a period of 12 consecutive months can be determined.

Note.— Guidance on the maintenance of cumulative radiation records is given in Circular 126 — Guidance Material on SST Aircraft Operations.

4.2.11 Passengers

4.2.11.1 An operator shall ensure that passengers are made familiar with the location and use of:

a) seat belts;

b) emergency exits;

c) life jackets, if the carriage of life jackets is prescribed;

d) oxygen dispensing equipment, if the provision of oxygen for the use of passengers is prescribed; and

e) other emergency equipment provided for individual use, including passenger emergency briefing cards.

4.2.11.2 The operator shall inform the passengers of the location and general manner of use of the principal emergency equipment carried for collective use.

4.2.11.3 In an emergency during flight, passengers shall be instructed in such emergency action as may be appropriate to the circumstances.

4.2.11.4 The operator shall ensure that during take-off and landing and whenever, by reason of turbulence or any emergency occurring during flight, the precaution is considered necessary, all passengers on board an aeroplane shall be secured in their seats by means of the seat belts or harnesses provided.

4.3 Flight preparation

4.3.1 A flight shall not be commenced until flight preparation forms have been completed certifying that the pilot-in-command is satisfied that:

a) the aeroplane is airworthy;

b) the instruments and equipment prescribed in Chapter 6, for the particular type of operation to be undertaken, are installed and are sufficient for the flight;

c) a maintenance release as prescribed in 8.7 has been issued in respect of the aeroplane;

d) the mass of the aeroplane and centre of gravity location are such that the flight can be conducted safely, taking into account the flight conditions expected;

e) any load carried is properly distributed and safely secured;

f) a check has been completed indicating that the operating limitations of Chapter 5 can be complied with for the flight to be undertaken; and

g) the Standards of 4.3.3 relating to operational flight planning have been complied with.

4.3.2 Completed flight preparation forms shall be kept by an operator for a period of three months.

4.3.3 Operational flight planning

4.3.3.1 An operational flight plan shall be completed for every intended flight. The operational flight plan shall be approved and signed by the pilot-in-command and, where applicable, signed by the flight operations officer/flight dispatcher, and a copy shall be filed with the operator or a designated agent, or, if these procedures are not possible, it shall be left with the aerodrome authority or on record in a suitable place at the point of departure.

Note.— The duties of a flight operations officer/flight dispatcher are contained in 4.6.

4.3.3.2 The operations manual must describe the content and use of the operational flight plan.

4.3.4 Alternate aerodromes

4.3.4.1 *Take-off alternate aerodrome*

4.3.4.1.1 A take-off alternate aerodrome shall be selected and specified in the operational flight plan if the weather conditions at the aerodrome of departure are at or below the applicable aerodrome operating minima or it would not be possible to return to the aerodrome of departure for other reasons.

4.3.4.1.2 The take-off alternate aerodrome shall be located within the following distance from the aerodrome of departure:

a) aeroplanes having two power-units. Not more than a distance equivalent to a flight time of one hour at the single-engine cruise speed; and

b) aeroplanes having three or more power-units. Not more than a distance equivalent to a flight time of two hours at the one-engine inoperative cruise speed.

4.3.4.1.3 For an aerodrome to be selected as a take-off alternate the available information shall indicate that, at the estimated time of use, the conditions will be at or above the aerodrome operating minima for that operation.

4.3.4.2 *En-route alternate aerodromes*

En-route alternate aerodromes, required by 4.7 for extended range operations by aeroplanes with two turbine power-units, shall be selected and specified in the operational and air traffic services (ATS) flight plans.

4.3.4.3 *Destination alternate aerodromes*

For a flight to be conducted in accordance with the instrument flight rules, at least one destination alternate aerodrome shall be selected and specified in the operational and ATS flight plans, unless:

a) the duration of the flight and the meteorological conditions prevailing are such that there is reasonable certainty that, at the estimated time of arrival at the aerodrome of intended landing, and for a reasonable period before and after such time, the approach and landing may be made under visual meteorological conditions; or

b) the aerodrome of intended landing is isolated and there is no suitable destination alternate aerodrome.

4.3.5 Weather conditions

4.3.5.1 A flight to be conducted in accordance with the visual flight rules shall not be commenced unless current meteorological reports or a combination of current reports and forecasts indicate that the meteorological conditions along the route or that part of the route to be flown under the visual flight rules will, at the appropriate time, be such as to render compliance with these rules possible.

4.3.5.2 A flight to be conducted in accordance with instrument flight rules shall not be commenced unless information is available which indicates that conditions at the aerodrome of intended landing or, where a destination alternate is required, at least one destination alternate aerodrome will, at the estimated time of arrival, be at or above the aerodrome operating minima.

Note.— It is the practice in some States to declare, for flight planning purposes, higher minima for an aerodrome when nominated as a destination alternate than for the same aerodrome when planned as that of intended landing.

4.3.5.3 A flight to be operated in known or expected icing conditions shall not be commenced unless the aeroplane is certificated and equipped to cope with such conditions.

4.3.6 Fuel and oil supply

Note.— Fuel and oil reserves for supersonic aeroplanes will require special consideration to account for the particular operating characteristics of this type of aeroplane. Guidance on fuel supplies for supersonic aeroplanes is given in Circular 126 — Guidance Material on SST Aircraft Operations.

4.3.6.1 *All aeroplanes.* A flight shall not be commenced unless, taking into account both the meteorological conditions and any delays that are expected in flight, the aeroplane carries sufficient fuel and oil to ensure that it can safely complete the flight. In addition, a reserve shall be carried to provide for contingencies.

4.3.6.2 *Propeller-driven aeroplanes.* The fuel and oil carried in order to comply with 4.3.6.1 shall, in the case of propeller-driven aeroplanes, be at least the amount sufficient to allow the aeroplane:

4.3.6.2.1 When a destination alternate aerodrome is required, either:

a) to fly to the aerodrome to which the flight is planned thence to the most critical (in terms of fuel consumption) alternate aerodrome specified in the operational and ATS flight plans and thereafter for a period of 45 minutes; or

b) to fly to the alternate aerodrome via any predetermined point and thereafter for 45 minutes, provided that this shall not be less than the amount required to fly to the aerodrome to which the flight is planned and thereafter for:

1) 45 minutes plus 15 per cent of the flight time planned to be spent at the cruising level(s), or

2) two hours,

whichever is less.

4.3.6.2.2 When a destination alternate aerodrome is not required:

a) in terms of 4.3.4.3 a), to fly to the aerodrome to which the flight is planned and thereafter for a period of 45 minutes; or

b) in terms of 4.3.4.3 b), to fly to the aerodrome to which the flight is planned and thereafter for:

1) 45 minutes plus 15 per cent of the flight time planned to be spent at the cruising level(s), or

2) two hours,

whichever is less.

4.3.6.3 *Aeroplanes equipped with turbo-jet engines.* The fuel and oil carried in order to comply with 4.3.6.1 shall, in the case of turbo-jet aeroplanes, be at least the amount sufficient to allow the aeroplane:

4.3.6.3.1 When a destination alternate aerodrome is required, either:

a) to fly to and execute an approach, and a missed approach, at the aerodrome to which the flight is planned, and thereafter:

1) to fly to the alternate aerodrome specified in the operational and ATS flight plans; and then

2) to fly for 30 minutes at holding speed at 450 m (1 500 ft) above the alternate aerodrome under standard temperature conditions, and approach and land; and

3) to have an additional amount of fuel sufficient to provide for the increased consumption on the occurrence of any of the potential contingencies specified by the operator to the satisfaction of the State of the Operator; or

b) to fly to the alternate aerodrome via any predetermined point and thereafter for 30 minutes at 450 m (1 500 ft) above the alternate aerodrome, due provision having been made for an additional amount of fuel sufficient to provide for the increased consumption on the occurrence of any of the potential contingencies specified by the operator to the satisfaction of the State of the Operator; provided that fuel shall not be less than the amount of fuel required to fly to the aerodrome to which the flight is planned and thereafter for two hours at normal cruise consumption.

4.3.6.3.2 When a destination alternate aerodrome is not required:

a) in terms of 4.3.4.3 a), to fly to the aerodrome to which the flight is planned and additionally:

1) to fly 30 minutes at holding speed at 450 m (1 500 ft) above the aerodrome to which the flight is planned under standard temperature conditions; and

2) to have an additional amount of fuel, sufficient to provide for the increased consumption on the occurrence of any of the potential contingencies specified by the operator to the satisfaction of the State of the Operator; and

b) in terms of 4.3.4.3 b), to fly to the aerodrome to which the flight is planned and thereafter for a period of two hours at normal cruise consumption.

4.3.6.4 In computing the fuel and oil required in 4.3.6.1 at least the following shall be considered:

a) meteorological conditions forecast;

b) expected air traffic control routings and traffic delays;

c) for IFR flight, one instrument approach at the destination aerodrome, including a missed approach;

d) the procedures prescribed in the operations manual for loss of pressurization, where applicable, or failure of one power unit while en route; and

e) any other conditions that may delay the landing of the aeroplane or increase fuel and/or oil consumption.

Note.— Nothing in 4.3.6 precludes amendment of a flight plan in flight in order to re-plan the flight to another aerodrome, provided that the requirements of 4.3.6 can be complied with from the point where the flight has been replanned.

4.3.7 Refuelling with passengers on board

4.3.7.1 An aeroplane shall not be refuelled when passengers are embarking, on board or disembarking unless it is properly attended by qualified personnel ready to initiate and direct an evacuation of the aeroplane by the most practical and expeditious means available.

4.3.7.2 When refuelling with passengers embarking, on board or disembarking, two-way communication shall be maintained by the aeroplane's inter-communication system or other suitable means between the ground crew supervising the refuelling and the qualified personnel on board the aeroplane.

Note 1.— The provisions of 4.3.7.1 do not necessarily require the deployment of integral aeroplane stairs or the opening of emergency exits as a prerequisite to refuelling.

Note 2.— Provisions concerning aircraft refuelling are contained in Annex 14 and guidance on safe refuelling practices is contained in the Airport Services Manual, *(Doc 9137), Parts 1 and 8.*

Note 3.— Additional precautions are required when refuelling with fuels other than aviation kerosene or when refuelling results in a mixture of aviation kerosene with other aviation turbine fuels, or when an open line is used.

4.3.8 Oxygen supply

Note.— Approximate altitudes in the Standard Atmosphere corresponding to the values of absolute pressure used in the text are as follows:

Absolute pressure	Metres	Feet
700 hPa	*3 000*	*10 000*
620 hPa	*4 000*	*13 000*
376 hPa	*7 600*	*25 000*

4.3.8.1 A flight to be operated at flight altitudes at which the atmospheric pressure in personnel compartments will be less than 700 hPa shall not be commenced unless sufficient stored breathing oxygen is carried to supply:

a) all crew members and 10 per cent of the passengers for any period in excess of 30 minutes that the pressure in compartments occupied by them will be between 700 hPa and 620 hPa; and

b) the crew and passengers for any period that the atmospheric pressure in compartments occupied by them will be less than 620 hPa.

4.3.8.2 A flight to be operated with a pressurized aeroplane shall not be commenced unless a sufficient quantity of stored breathing oxygen is carried to supply all the crew members and passengers, as is appropriate to the circumstances of the flight being undertaken, in the event of loss of pressurization, for any period that the atmospheric pressure in any compartment occupied by them would be less than 700 hPa. In addition, when an aeroplane is operated at flight altitudes at which the atmospheric pressure is less than 376 hPa, or which, if operated at flight altitudes at which the atmospheric pressure is more than 376 hPa and cannot descend safely within four minutes to a flight altitude at which the atmospheric pressure is equal to 620 hPa, there shall be no less than a 10-minute supply for the occupants of the passenger compartment.

4.4 In-flight procedures

4.4.1 Aerodrome operating minima

4.4.1.1 A flight shall not be continued towards the aerodrome of intended landing, unless the latest available information indicates that at the expected time of arrival, a landing can be effected at that aerodrome or at least one destination alternate aerodrome, in compliance with the operating minima established in accordance with 4.2.7.1.

4.4.1.2 Except in case of emergency, an aeroplane shall not continue its approach-to-land at any aerodrome beyond a point at which the limits of the operating minima specified for that aerodrome would be infringed.

4.4.2 Meteorological observations

Note.— The procedures for making meteorological observations on board aircraft in flight and for recording and reporting them are contained in Annex 3, the PANS-RAC (Doc 4444) and the appropriate Regional Supplementary Procedures *(Doc 7030).*

4.4.3 Hazardous flight conditions

Hazardous flight conditions encountered, other than those associated with meteorological conditions, shall be reported to the appropriate aeronautical station as soon as possible. The reports so rendered shall give such details as may be pertinent to the safety of other aircraft.

4.4.4 Flight crew members at duty stations

4.4.4.1 *Take-off and landing.* All flight crew members required to be on flight deck duty shall be at their stations.

4.4.4.2 *En route.* All flight crew members required to be on flight deck duty shall remain at their stations except when their absence is necessary for the performance of duties in connexion with the operation of the aeroplane or for physiological needs.

4.4.4.3 *Seat belts.* All flight crew members shall keep their seat belts fastened when at their stations.

4.4.4.4 *Safety harness.* Any flight crew member occupying a pilot's seat shall keep the safety harness fastened during the take-off and landing phases; all other flight crew members shall keep their safety harnesses fastened during the take-off and landing phases unless the shoulder straps interfere with the performance of their duties, in which case the shoulder straps may be unfastened but the seat belt must remain fastened.

Note.— Safety harness includes shoulder straps and a seat belt which may be used independently.

4.4.5 Use of oxygen

4.4.5.1 All flight crew members, when engaged in performing duties essential to the safe operation of an aeroplane in flight, shall use breathing oxygen continuously whenever the circumstances prevail for which its supply has been required in 4.3.8.1 or 4.3.8.2.

4.4.5.2 All flight crew members of pressurized aeroplanes operating above an altitude where the atmospheric pressure is less than 376 hPa shall have available at the flight duty station a quick-donning type of oxygen mask which will readily supply oxygen upon demand.

4.4.6 Safeguarding of cabin attendants and passengers in pressurized aeroplanes in the event of loss of pressurization

Recommendation.— *Cabin attendants should be safeguarded so as to ensure reasonable probability of their retaining consciousness during any emergency descent which may be necessary in the event of loss of pressurization and, in addition, they should have such means of protection as will enable them to administer first aid to passengers during stabilized flight following the emergency. Passengers should be safeguarded by such devices or operational procedures as will ensure reasonable probability of their surviving the effects of hypoxia in the event of loss of pressurization.*

Note.— It is not envisaged that cabin attendants will always be able to provide assistance to passengers during emergency descent procedures which may be required in the event of loss of pressurization.

4.4.7 In-flight operational instructions

Operational instructions involving a change in the ATS flight plan shall, when practicable, be co-ordinated with the appropriate ATS unit before transmission to the aeroplane.

Note.— When the above co-ordination has not been possible, operational instructions do not relieve a pilot of the responsibility for obtaining an appropriate clearance from an ATS unit, if applicable, before making a change in flight plan.

4.4.8 Instrument flight procedures

4.4.8.1 One or more instrument approach procedures designed in accordance with the classification of instrument approach and landing operations shall be approved and promulgated by the State in which the aerodrome is located to serve each instrument runway or aerodrome utilized for instrument flight operations.

4.4.8.2 All aeroplanes operated in accordance with instrument flight rules shall comply with the instrument flight procedures approved by the State in which the aerodrome is located.

Note 1.— Definitions for the classification of instrument approach and landing operations are in Chapter 1.

Note 2.— Operational procedures recommended for the guidance of operations personnel involved in instrument flight operations are described in PANS-OPS (Doc 8168), Volume I.

Note 3.— Criteria for the construction of instrument flight procedures for the guidance of procedure specialists are provided in PANS-OPS (Doc 8168), Volume II.

4.4.9 Aeroplane operating procedures for noise abatement

4.4.9.1 **Recommendation.—** *Aeroplane operating procedures for noise abatement should comply with the provisions of PANS-OPS (Doc 8168), Volume I, Part V.*

4.4.9.2 **Recommendation.—** *Noise abatement procedures specified by an operator for any one aeroplane type should be the same for all aerodromes.*

4.5 Duties of pilot-in-command

4.5.1 The pilot-in-command shall be responsible for the operation and safety of the aeroplane and for the safety of all persons on board, during flight time.

4.5.2 The pilot-in-command shall ensure that the checklists specified in 4.2.5 are complied with in detail.

4.5.3 The pilot-in-command shall be responsible for notifying the nearest appropriate authority by the quickest available means of any accident involving the aeroplane, resulting in serious injury or death of any person or substantial damage to the aeroplane or property.

Note.— A definition of the term "serious injury" is contained in Annex 13 and an explanation of the term "substantial damage" is given in the Accident/Incident Reporting Manual (ADREP Manual) *(Doc 9156).*

4.5.4 The pilot-in-command shall be responsible for reporting all known or suspected defects in the aeroplane, to the operator, at the termination of the flight.

4.5.5 The pilot-in-command shall be responsible for the journey log book or the general declaration containing the information listed in 11.5.1.

Note.— By virtue of Resolution A10-36 of the Tenth Session of the Assembly (Caracas, June-July 1956) "the General Declaration, [described in Annex 9] when prepared so as to contain all the information required by Article 34 [of the Convention on International Civil Aviation] with respect to the journey log book, may be considered by Contracting States to be an acceptable form of journey log book".

4.6 Duties of flight operations officer/ flight dispatcher

4.6.1 A flight operations officer/flight dispatcher when employed in conjunction with a method of flight supervision in accordance with 4.2.1 shall:

a) assist the pilot-in-command in flight preparation and provide the relevant information required;

b) assist the pilot-in-command in preparing the operational and ATS flight plans, sign when applicable and file the ATS flight plan with the appropriate ATS unit;

c) furnish the pilot-in-command while in flight, by appropriate means, with information which may be necessary for the safe conduct of the flight; and

d) in the event of an emergency, initiate such procedures as may be outlined in the operations manual.

4.6.2 A flight operations officer/flight dispatcher shall avoid taking any action that would conflict with the procedures established by:

a) air traffic control;

b) the meteorological service; or

c) the communications service.

4.7 Additional requirements for extended range operations by aeroplanes with two turbine power-units

4.7.1 Unless the operation has been specifically approved by the State of the Operator, an aeroplane with two turbine power-units shall not, except as provided in 4.7.4, be operated on a route where the flight time at single engine cruise speed to an adequate en-route alternate aerodrome exceeds a threshold time established for such operations by that State.

Note 1.— Guidance on the value of the threshold time is contained in Attachment E.

Note 2.— In the context of the approval of operations at which the requirements of 5.2.11 can be met, guidance material on adequate and suitable alternate aerodromes is contained in Attachment E.

4.7.2 In approving the operation, the State of the Operator shall ensure that:

a) the airworthiness certification of the aeroplane type;

b) the reliability of the propulsion system; and

c) the operator's maintenance procedures, operating practices, flight dispatch procedures and crew training programmes;

provide the over-all level of safety intended by the provisions of Annexes 6 and 8. In making this assessment, account shall be taken of the route to be flown, the anticipated operating conditions and the location of adequate en-route alternate aerodromes.

Note 1.— Guidance on compliance with the requirements of this provision is contained in Attachment E.

Note 2.— The Airworthiness Technical Manual *(Doc 9051) contains guidance on the level of performance and reliability of aeroplane systems intended by 4.7.2.*

Note 3.— The Continuing Airworthiness Manual (Doc 9642) *contains guidance on continuing airworthiness aspects of the requirements of 4.7.2.*

4.7.3 A flight to be conducted in accordance with 4.7.1 shall not be commenced unless, during the possible period of arrival, the required en-route alternate aerodrome(s) will be available and the available information indicates that conditions at those aerodromes will be at or above the aerodrome operating minima approved for the operation.

4.7.4 **Recommendation.—** *The State of the Operator of an aeroplane type with two turbine power-units which, prior to 25 March 1986 was authorized and operating on a route where the flight time at single engine cruise speed to an adequate en-route alternate aerodrome exceeded the threshold time established for such operations in accordance with 4.7.1 should give consideration to permitting such an operation to continue on that route after that date.*

4.8 Carry-on baggage

The operator shall ensure that all baggage carried onto an aeroplane and taken into the passenger cabin is adequately and securely stowed.

CHAPTER 5. AEROPLANE PERFORMANCE OPERATING LIMITATIONS

5.1 General

5.1.1 Aeroplanes shall be operated in accordance with a comprehensive and detailed code of performance established by the State of Registry in compliance with the applicable Standards of this chapter.

5.1.2 Single engine aeroplanes shall only be operated in conditions of weather and light, and over such routes and diversions therefrom, that permit a safe forced landing to be executed in the event of engine failure.

5.1.3 **Recommendation.**— *For aeroplanes for which Part III of Annex 8 is not applicable because of the exemption provided for in Article 41 of the Convention, the State of Registry should ensure that the level of performance specified in 5.2 should be met as far as practicable.*

5.2 Applicable to aeroplanes certificated in accordance with Part III of Annex 8

5.2.1 The Standards contained in 5.2.2 to 5.2.11 inclusive are applicable to the aeroplanes to which Part III of Annex 8 is applicable.

Note.— The following Standards do not include quantitative specifications comparable to those found in national airworthiness codes. In accordance with 5.1.1, they are to be supplemented by national requirements prepared by Contracting States.

5.2.2 The level of performance defined by the appropriate parts of the comprehensive and detailed national code referred to in 5.1.1 for the aeroplanes designated in 5.2.1 shall be at least substantially equivalent to the over-all level embodied in the Standards of this chapter.

Note.— Attachment C contains guidance material which indicates by examples the level of performance intended by the Standards and Recommended Practices of this chapter.

5.2.3 An aeroplane shall be operated in compliance with the terms of its certificate of airworthiness and within the approved operating limitations contained in its flight manual.

5.2.4 The State of Registry shall take such precautions as are reasonably possible to ensure that the general level of safety contemplated by these provisions is maintained under all expected operating conditions, including those not covered specifically by the provisions of this chapter.

5.2.5 A flight shall not be commenced unless the performance information provided in the flight manual indicates that the Standards of 5.2.6 to 5.2.11 can be complied with for the flight to be undertaken.

5.2.6 In applying the Standards of this chapter, account shall be taken of all factors that significantly affect the performance of the aeroplane (such as: mass, elevation, or the pressure-altitude appropriate to the elevation of the aerodrome, temperature, wind, runway gradient and condition of runway, i.e. presence of slush, water and/or ice, for landplanes, water surface condition for seaplanes). Such factors shall be taken into account directly as operational parameters or indirectly by means of allowances or margins, which may be provided in the scheduling of performance data or in the comprehensive and detailed code of performance in accordance with which the aeroplane is being operated.

5.2.7 Mass limitations

a) The mass of the aeroplane at the start of take-off shall not exceed the mass at which 5.2.8 is complied with, nor the mass at which 5.2.9, 5.2.10 and 5.2.11 are complied with, allowing for expected reductions in mass as the flight proceeds, and for such fuel jettisoning as is envisaged in applying 5.2.9 and 5.2.10 and, in respect of alternate aerodromes, 5.2.7 c) and 5.2.11.

b) In no case shall the mass at the start of take-off exceed the maximum take-off mass specified in the flight manual for the elevation or the pressure-altitude appropriate to the elevation of the aerodrome, and, if used as a parameter to determine the maximum take-off mass, any other local atmospheric condition.

c) In no case shall the estimated mass for the expected time of landing at the aerodrome of intended landing and at any destination alternate aerodrome, exceed the maximum landing mass specified in the flight manual for the elevation or the pressure-altitude appropriate to the elevation of those aerodromes, and if used as a parameter to determine the maximum landing mass, any other local atmospheric condition.

d) In no case shall the mass at the start of take-off, or at the expected time of landing at the aerodrome of intended landing and at any destination alternate aerodrome, exceed the relevant maximum masses at which compliance has been demonstrated with the applicable noise certification Standards in Annex 16, Volume I, unless otherwise authorized in exceptional circumstances for a certain aerodrome or a runway where there is no noise disturbance problem, by the competent authority of the State in which the aerodrome is situated.

5.2.8 *Take-off.* The aeroplane shall be able, in the event of a critical power-unit failing at any point in the take-off, either to discontinue the take-off and stop within the accelerate-stop distance available, or to continue the take-off and clear all obstacles along the flight path by an adequate margin until the aeroplane is in a position to comply with 5.2.9.

Note.— "An adequate margin" referred to in this provision is illustrated by the appropriate examples included in Attachment C.

5.2.8.1 In determining the length of the runway available, account shall be taken of the loss, if any, of runway length due to alignment of the aeroplane prior to take-off.

5.2.9 *En route — one power-unit inoperative.* The aeroplane shall be able, in the event of the critical power-unit becoming inoperative at any point along the route or planned diversions therefrom, to continue the flight to an aerodrome at which the Standard of 5.2.11 can be met, without flying below the minimum flight altitude at any point.

5.2.10 *En route — two power-units inoperative.* In the case of aeroplanes having three or more power-units, on any part of a route where the location of en-route alternate aerodromes and the total duration of the flight are such that the probability of a second power-unit becoming inoperative must be allowed for if the general level of safety implied by the Standards of this chapter is to be maintained, the aeroplane shall be able, in the event of any two power-units becoming inoperative, to continue the flight to an en-route alternate aerodrome and land.

5.2.11 *Landing.* The aeroplane shall, at the aerodrome of intended landing and at any alternate aerodrome, after clearing all obstacles in the approach path by a safe margin, be able to land, with assurance that it can come to a stop or, for a seaplane, to a satisfactorily low speed, within the landing distance available. Allowance shall be made for expected variations in the approach and landing techniques, if such allowance has not been made in the scheduling of performance data.

5.3 Obstacle data

5.3.1 Obstacle data shall be provided to enable the operator to develop procedures to comply with 5.2.8.

Note.— See Annex 4 and Annex 15 for methods of presentation of certain obstacle data.

5.3.2 The operator shall take account of charting accuracy when assessing compliance with 5.2.8.

CHAPTER 6. AEROPLANE INSTRUMENTS, EQUIPMENT, AND FLIGHT DOCUMENTS

Note.— Specifications for the provision of aeroplane communication and navigation equipment are contained in Chapter 7.

6.1 General

6.1.1 In addition to the minimum equipment necessary for the issuance of a certificate of airworthiness, the instruments, equipment and flight documents prescribed in the following paragraphs shall be installed or carried, as appropriate, in aeroplanes according to the aeroplane used and to the circumstances under which the flight is to be conducted.

6.1.2 The operator shall include in the operations manual a minimum equipment list (MEL), approved by the State of the Operator which will enable the pilot-in-command to determine whether a flight may be commenced or continued from any intermediate stop should any instrument, equipment or systems become inoperative.

Note.— Attachment G contains guidance on the minimum equipment list.

6.1.3 The operator shall provide operations staff and flight crew with an aircraft operating manual, for each aircraft type operated, containing the normal, abnormal and emergency procedures relating to the operation of the aircraft. The manual shall include details of the aircraft systems and of the checklists to be used.

6.2 All aeroplanes on all flights

6.2.1 An aeroplane shall be equipped with instruments which will enable the flight crew to control the flight path of the aeroplane, carry out any required procedural manoeuvres and observe the operating limitations of the aeroplane in the expected operating conditions.

6.2.2 An aeroplane shall be equipped with:

a) accessible and adequate medical supplies appropriate to the number of passengers the aeroplane is authorized to carry;

Recommendation.— *Medical supplies should comprise:*

1) one or more first-aid kits; and

2) a medical kit, for the use of medical doctors or other qualified persons in treating in-flight medical emergencies for aeroplanes authorized to carry more than 250 passengers.

Note.— Guidance on the types, number, location and contents of the medical supplies is given in Attachment B.

b) portable fire extinguishers of a type which, when discharged, will not cause dangerous contamination of the air within the aeroplane. At least one shall be located in:

1) the pilot's compartment; and

2) each passenger compartment that is separate from the pilot's compartment and that is not readily accessible to the flight crew;

Note.— Any portable fire extinguisher so fitted in accordance with the certificate of airworthiness of the aeroplane may count as one prescribed.

c) 1) a seat or berth for each person over an age to be determined by the State of the Operator;

2) a seat belt for each seat and restraining belts for each berth; and

3) a safety harness for each flight crew seat. The safety harness for each pilot seat shall incorporate a device which will automatically restrain the occupant's torso in the event of rapid deceleration;

Recommendation.— *The safety harness for each pilot seat should incorporate a device to prevent a suddenly incapacitated pilot from interfering with the flight controls.*

Note.— Safety harness includes shoulder straps and a seat belt which may be used independently.

d) means of ensuring that the following information and instructions are conveyed to passengers:

1) when seat belts are to be fastened;

2) when and how oxygen equipment is to be used if the carriage of oxygen is required;

3) restrictions on smoking;

4) location and use of life jackets or equivalent individual floatation devices where their carriage is required; and

5) location and method of opening emergency exits; and

e) spare electrical fuses of appropriate ratings for replacement of those accessible in flight.

6.2.3 An aeroplane shall carry:

a) the operations manual prescribed in 4.2.2, or those parts of it that pertain to flight operations;

b) the flight manual for the aeroplane, or other documents containing performance data required for the application of Chapter 5 and any other information necessary for the operation of the aeroplane within the terms of its certificate of airworthiness, unless these data are available in the operations manual; and

c) current and suitable charts to cover the route of the proposed flight and any route along which it is reasonable to expect that the flight may be diverted.

6.2.4 Marking of break-in points

6.2.4.1 If areas of the fuselage suitable for break-in by rescue crews in emergency are marked on an aeroplane such areas shall be marked as shown below (see figure following). The colour of the markings shall be red or yellow, and if necessary they shall be outlined in white to contrast with the background.

6.2.4.2 If the corner markings are more than 2 m apart, intermediate lines 9 cm x 3 cm shall be inserted so that there is no more than 2 m between adjacent markings.

Note.— This Standard does not require any aeroplane to have break-in areas.

6.3 Flight recorders

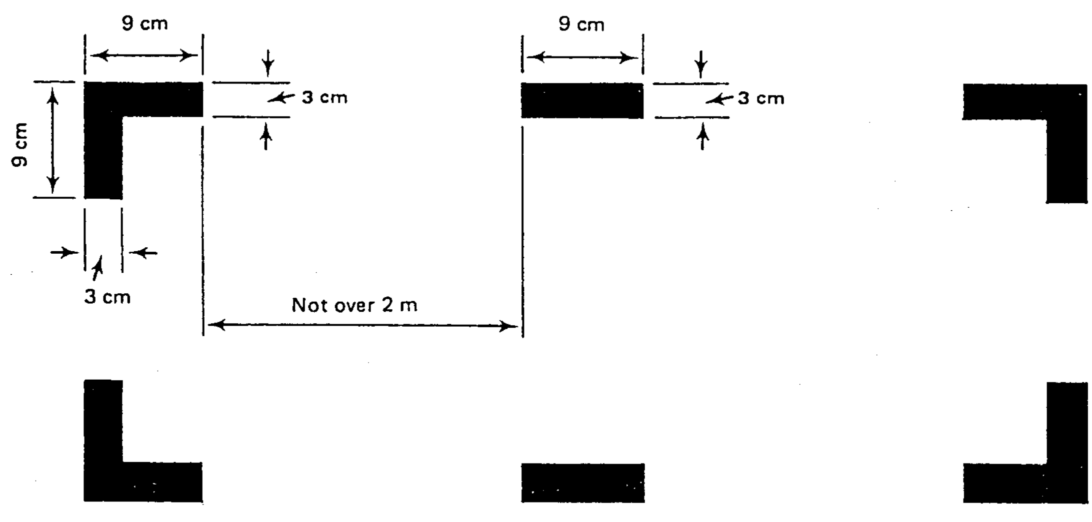
Note 1.— Flight recorders comprise two systems, a flight data recorder and a cockpit voice recorder.

Note 2.— Detailed guidance on flight recorders is contained in Attachment D.

6.3.1 Flight data recorders — types

6.3.1.1 A Type I flight data recorder shall record the parameters required to determine accurately the aeroplane flight path, speed, attitude, engine power, configuration and operation.

6.3.1.2 Types II and IIA flight data recorders shall record the parameters required to determine accurately the aeroplane flight path, speed, attitude, engine power and configuration of lift and drag devices.



MARKING OF BREAK-IN POINTS (see 6.2.4)

6.3.1.3 The use of engraving metal foil flight data recorders shall be discontinued by 1 January 1995.

6.3.2 Flight data recorders — duration

All flight data recorders shall be capable of retaining the information recorded during at least the last 25 hours of their operation, except for the Type IIA flight data recorder which shall be capable of retaining the information recorded during at least the last 30 minutes of its operation.

6.3.3 Flight data recorders — aeroplanes for which the individual certificate of airworthiness is first issued on or after 1 January 1989

6.3.3.1 All aeroplanes of a maximum certificated take-off mass of over 27 000 kg shall be equipped with a Type I flight data recorder.

6.3.3.2 All aeroplanes of a maximum certificated take-off mass of over 5 700 kg, up to and including 27 000 kg, shall be equipped with a Type II flight data recorder.

6.3.3.3 **Recommendation.—** *All multi-engine turbine powered aeroplanes of a maximum certificated take-off mass of 5 700 kg or less for which the individual certificate of airworthiness is first issued on or after 1 January 1990 should be equipped with a Type IIA flight data recorder.*

6.3.4 Flight data recorders — aeroplanes for which the individual certificate of airworthiness is first issued on or after 1 January 1987 but before 1 January 1989

6.3.4.1 All turbine engine aeroplanes of a maximum certificated take-off mass of over 5 700 kg, except those in 6.3.4.3, shall be equipped with a flight data recorder which shall record time, altitude, airspeed, normal acceleration and heading.

6.3.4.2 **Recommendation.—** *All turbine engine aeroplanes of a maximum certificated take-off mass of over 5 700 kg, except those in 6.3.4.3, should be equipped with a flight data recorder which shall record time, altitude, airspeed, normal acceleration, heading and such additional parameters as are necessary to determine pitch attitude, roll attitude, radio transmission keying and power on each engine.*

6.3.4.3 All turbine engine aeroplanes of a maximum certificated take-off mass of over 27 000 kg that are of types of which the prototype was certificated by the appropriate national authority after 30 September 1969 shall be equipped with a Type II flight data recorder.

6.3.5 Flight data recorders — aeroplanes for which the individual certificate of airworthiness is first issued before 1 January 1987

6.3.5.1 All turbine engine aeroplanes of a maximum certificated take-off mass of over 5 700 kg shall be equipped with a flight data recorder which shall record time, altitude, airspeed, normal acceleration and heading.

6.3.5.2 **Recommendation.—** *All turbine engine aeroplanes of a maximum certificated take-off mass of over 27 000 kg that are of types of which the prototype was certificated by the appropriate national authority after 30 September 1969 should be equipped with a flight data recorder which should record, in addition to time, altitude, airspeed, normal acceleration and heading, such additional parameters as are necessary to meet the objectives of determining:*

a) the attitude of the aeroplane in achieving its flight path; and

b) the basic forces acting upon the aeroplane resulting in the achieved flight path and the origin of such basic forces.

6.3.6 Cockpit voice recorders — aeroplanes for which the individual certificate of airworthiness is first issued on or after 1 January 1987

6.3.6.1 All aeroplanes of a maximum certificated take-off mass of over 5 700 kg shall be equipped with a cockpit voice recorder, the objective of which is the recording of the aural environment on the flight deck during flight time.

6.3.6.2 **Recommendation.—** *All multi-engine turbine powered aeroplanes of a maximum certificated take-off mass of 5 700 kg or less for which the individual certificate of airworthiness is first issued on or after 1 January 1990 should be equipped with a cockpit voice recorder, the objective of which is the recording of the aural environment on the flight deck during flight time.*

6.3.7 Cockpit voice recorders — aeroplanes for which the individual certificate of airworthiness is first issued before 1 January 1987

6.3.7.1 All turbine engine aeroplanes of a maximum certificated take-off mass of over 27 000 kg that are of types of which the prototype was certificated by the appropriate national authority after 30 September 1969 shall be equipped with a cockpit voice recorder, the objective of which is the recording of the aural environment on the flight deck during flight time.

6.3.7.2 **Recommendation.—** *All turbine engine aeroplanes of a maximum certificated take-off mass of over*

5 700 kg up to and including 27 000 kg that are of types of which the prototype was certificated by the appropriate national authority after 30 September 1969 should be equipped with a cockpit voice recorder, the objective of which is the recording of the aural environment on the flight deck during flight time.

6.3.8 Cockpit voice recorders — duration

6.3.8.1 A cockpit voice recorder shall be capable of retaining the information recorded during at least the last 30 minutes of its operation.

6.3.8.2 **Recommendation.—** *A cockpit voice recorder, installed in aeroplanes of a maximum certificated take-off mass of over 5 700 kg for which the individual certificate of airworthiness is first issued on or after 1 January 1990, should be capable of retaining the information recorded during at least the last two hours of its operation.*

6.3.9 Flight recorders — construction and installation

Flight recorders shall be constructed, located and installed so as to provide maximum practical protection for the recordings in order that the recorded information may be preserved, recovered and transcribed.

6.3.10 Flight recorders — operation

6.3.10.1 Flight recorders shall not be switched off during flight time.

6.3.10.2 **Recommendation.—** *To preserve flight recorder records, flight recorders should be de-activated upon completion of flight time following an accident or incident, and not re-activated prior to removal of these records.*

6.4 All aeroplanes operated as VFR flights

6.4.1 All aeroplanes when operated as VFR flights shall be equipped with:

a) a magnetic compass;

b) an accurate timepiece indicating the time in hours, minutes and seconds;

c) a sensitive pressure altimeter;

d) an airspeed indicator; and

e) such additional instruments or equipment as may be prescribed by the appropriate authority.

6.4.2 VFR flights which are operated as controlled flights shall be equipped in accordance with 6.9.

6.5 All aeroplanes on flights over water

6.5.1 Seaplanes

All seaplanes for all flights shall be equipped with:

a) one life jacket, or equivalent individual floatation device, for each person on board, stowed in a position easily accessible from the seat or berth of the person for whose use it is provided;

b) equipment for making the sound signals prescribed in the International Regulations for Preventing Collisions at Sea, where applicable; and

c) one sea anchor (drogue).

Note.— "Seaplanes" includes amphibians operated as seaplanes.

6.5.2 Landplanes

6.5.2.1 Landplanes shall carry the equipment prescribed in 6.5.2.2:

a) when flying over water and at a distance of more than 93 km (50 NM) away from the shore, in the case of landplanes operated in accordance with 5.2.9 or 5.2.10;

b) when flying en route over water beyond gliding distance from the shore, in the case of all other landplanes; and

c) when taking off or landing at an aerodrome where, in the opinion of the State of the Operator, the take-off or approach path is so disposed over water that in the event of a mishap there would be a likelihood of a ditching.

6.5.2.2 The equipment referred to in 6.5.2.1 shall comprise one life jacket or equivalent individual floatation device for each person on board, stowed in a position easily accessible from the seat or berth of the person for whose use it is provided.

Note.— "Landplanes" includes amphibians operated as landplanes.

6.5.3 All aeroplanes on long range over water flights

6.5.3.1 In addition to the equipment prescribed in 6.5.1 or 6.5.2 whichever is applicable, the following equipment shall be installed in all aeroplanes when used over routes on which the aeroplane may be over water and at more than a distance corresponding to 120 minutes at cruising speed or 740 km (400 NM), whichever is the lesser, away from land suitable for making an emergency landing in the case of aircraft operated in accordance with 5.2.9 or 5.2.10, and 30 minutes or 185 km (100 NM), whichever is the lesser, for all other aeroplanes:

a) life-saving rafts in sufficient numbers to carry all persons on board, stowed so as to facilitate their ready use in emergency, provided with such life-saving equipment including means of sustaining life as is appropriate to the flight to be undertaken; and

b) equipment for making the pyrotechnical distress signals described in Annex 2.

6.5.3.2 Each life jacket and equivalent individual floatation device, when carried in accordance with 6.5.1 a), 6.5.2.1 and 6.5.2.2, shall be equipped with a means of electric illumination for the purpose of facilitating the location of persons, except where the requirement of 6.5.2.1 c) is met by the provision of individual floatation devices other than life jackets.

6.6 All aeroplanes on flights over designated land areas

Aeroplanes, when operated across land areas which have been designated by the State concerned as areas in which search and rescue would be especially difficult, shall be equipped with such signalling devices and life-saving equipment (including means of sustaining life) as may be appropriate to the area overflown.

6.7 All aeroplanes on high altitude flights

Note.— Approximate altitude in the Standard Atmosphere corresponding to the value of absolute pressure used in this text is as follows:

Absolute pressure	Metres	Feet
700 hPa	*3 000*	*10 000*
620 hPa	*4 000*	*13 000*
376 hPa	*7 600*	*25 000*

6.7.1 An aeroplane intended to be operated at flight altitudes at which the atmospheric pressure is less than 700 hPa in personnel compartments shall be equipped with oxygen storage and dispensing apparatus capable of storing and dispensing the oxygen supplies required in 4.3.8.1.

6.7.2 An aeroplane intended to be operated at flight altitudes at which the atmospheric pressure is less than 700 hPa but which is provided with means of maintaining pressures greater than 700 hPa in personnel compartments shall be provided with oxygen storage and dispensing apparatus capable of storing and dispensing the oxygen supplies required in 4.3.8.2.

6.7.3 Pressurized aeroplanes newly introduced into service on or after 1 July 1962 and intended to be operated at flight altitudes at which the atmospheric pressure is less than 376 hPa shall be equipped with a device to provide positive warning to the pilot of any dangerous loss of pressurization.

6.7.4 **Recommendation.—** *Pressurized aeroplanes introduced into service before 1 July 1962 and intended to be operated at flight altitudes at which the atmospheric pressure is less than 376 hPa should be equipped with a device to provide positive warning to the pilot of any dangerous loss of pressurization.*

6.7.5 An aeroplane intended to be operated at flight altitudes at which the atmospheric pressure is less than 376 hPa, or which, if operated at flight altitudes at which the atmospheric pressure is more than 376 hPa, cannot descend safely within four minutes to a flight altitude at which the atmospheric pressure is equal to 620 hPa and for which the individual certificate of airworthiness was issued on or after 9 November 1998, shall be provided with automatically deployable oxygen equipment to satisfy the requirements of 4.3.8.2. The total number of oxygen dispensing units shall exceed the number of passenger and cabin attendant seats by at least 10 per cent.

6.7.6 **Recommendation.—** *An aeroplane intended to be operated at flight altitudes at which the atmospheric pressure is less than 376 hPa, or which, if operated at flight altitudes at which the atmospheric pressure is more than 376 hPa cannot descend safely within four minutes to a flight altitude at which the atmospheric pressure is equal to 620 hPa, and for which the individual certificate of airworthiness is issued before 9 November 1998, should be provided with automatically deployable oxygen equipment to satisfy the requirements of 4.3.8.2. The total number of oxygen dispensing units should exceed the number of passenger and cabin attendant seats by at least 10 per cent.*

6.8 All aeroplanes in icing conditions

All aeroplanes shall be equipped with suitable anti-icing and/or de-icing devices when operated in circumstances in which icing conditions are reported to exist or are expected to be encountered.

6.9 All aeroplanes operated in accordance with instrument flight rules

6.9.1 All aeroplanes when operated in accordance with the instrument flight rules, or when the aeroplane cannot be maintained in a desired attitude without reference to one or more flight instruments, shall be equipped with:

a) a magnetic compass;

b) an accurate timepiece indicating the time in hours, minutes and seconds;

c) two sensitive pressure altimeters;

Note.— A sensitive altimeter of any type fitted in accordance with the airworthiness standards may be included in the two here prescribed. Due to the long history of misreadings, the use of drum-pointer altimeters is not recommended.

d) an airspeed indicating system with means of preventing malfunctioning due to either condensation or icing;

e) a turn and slip indicator;

f) an attitude indicator (artificial horizon);

g) a heading indicator (directional gyroscope);

Note.— The requirements of e), f) and g) above may be met by combinations of instruments or by integrated flight director systems provided that the safeguards against total failure, inherent in the three separate instruments, are retained.

h) a means of indicating whether the power supply to the gyroscopic instrument is adequate;

i) a means of indicating in the flight crew compartment the outside air temperature;

j) a rate-of-climb and descent indicator; and

k) such additional instruments or equipment as may be prescribed by the appropriate authority.

6.9.2 All aeroplanes over 5 700 kg — Emergency power supply for electrically operated attitude indicating instruments

6.9.2.1 All aeroplanes of a maximum certificated take-off mass of over 5 700 kg newly introduced into service after 1 January 1975 shall be fitted with an emergency power supply, independent of the main electrical generating system, for the purpose of operating and illuminating, for a minimum period of 30 minutes, an attitude indicating instrument (artificial horizon), clearly visible to the pilot-in-command. The emergency power supply shall be automatically operative after the total failure of the main electrical generating system and clear indication shall be given on the instrument panel that the attitude indicator(s) is being operated by emergency power.

6.9.2.2 Those instruments that are used by any one pilot shall be so arranged as to permit the pilot to see their indications readily from his or her station, with the minimum practicable deviation from the position and line of vision normally assumed when looking forward along the flight path.

6.10 All aeroplanes when operated at night

All aeroplanes, when operated at night shall be equipped with:

a) all equipment specified in 6.9;

b) the lights required by Annex 2 for aircraft in flight or operating on the movement area of an aerodrome;

Note.— Specifications for lights meeting the requirements of Annex 2 for navigation lights are contained in the Appendix. The general characteristics of lights are specified in Annex 8. Detailed specifications for lights meeting the requirements of Annex 2 for aircraft in flight or operating on the movement area of an aerodrome are contained in the Airworthiness Technical Manual *(Doc 9051).*

c) two landing lights;

Note.— Aeroplanes not certificated in accordance with Annex 8 which are equipped with a single landing light having two separately energized filaments will be considered to have complied with 6.10 c).

d) illumination for all instruments and equipment that are essential for the safe operation of the aeroplane that are used by the flight crew;

e) lights in all passenger compartments; and

f) an electric torch for each crew member station.

6.11 Pressurized aeroplanes when carrying passengers — weather radar

Recommendation.— *Pressurized aeroplanes when carrying passengers should be equipped with operative weather radar whenever such aeroplanes are being operated in areas where thunderstorms or other potentially hazardous weather conditions, regarded as detectable with airborne weather radar, may be expected to exist along the route either at night or under instrument meteorological conditions.*

6.12 All aeroplanes operated above 15 000 m (49 000 ft) — radiation indicator

All aeroplanes intended to be operated above 15 000 m (49 000 ft) shall carry equipment to measure and indicate continuously the dose rate of total cosmic radiation being received (i.e. the total of ionizing and neutron radiation of galactic and solar origin) and the cumulative dose on each flight. The display unit of the equipment shall be readily visible to a flight crew member.

Note.— The equipment is calibrated on the basis of assumptions acceptable to the appropriate national authorities.

6.13 All aeroplanes complying with the noise certification Standards in Annex 16, Volume I

An aeroplane shall carry a document attesting noise certification.

Note.— The attestation may be contained in any document, carried on board, approved by the State of Registry.

6.14 Mach number indicator

All aeroplanes with speed limitations expressed in terms of Mach number, shall be equipped with a Mach number indicator.

Note.— This does not preclude the use of the airspeed indicator to derive Mach number for ATS purposes.

6.15 Turbine engine aeroplanes — ground proximity warning system (GPWS)

6.15.1 All turbine engine aeroplanes of a maximum certificated take-off mass in excess of 15 000 kg or authorized to carry more than 30 passengers, for which the individual certificate of airworthiness was first issued on or after 1 July 1979, shall be equipped with a ground proximity warning system.

6.15.2 **Recommendation.—** *All turbine engine aeroplanes of a maximum certificated take-off mass in excess of 15 000 kg or authorized to carry more than 30 passengers, for which the individual certificate of airworthiness was first issued before 1 July 1979, should be equipped with a ground proximity warning system.*

6.15.3 All turbine engine aeroplanes of a maximum certificated take-off mass in excess of 5 700 kg or authorized to carry more than nine passengers shall be equipped with a ground proximity warning system on or after 1 January 1999.

6.15.4 A ground proximity warning system shall provide automatically a timely and distinctive warning to the flight crew when the aeroplane is in potentially hazardous proximity to the earth's surface.

6.15.5 On or after 1 January 1999, a ground proximity warning system shall provide, as a minimum, warnings of the following circumstances:

1) excessive descent rate;

2) excessive terrain closure rate;

3) excessive altitude loss after take-off or go-around;

4) unsafe terrain clearance while not in landing configuration;

   a) gear not locked down;

   b) flaps not in a landing position; and

5) excessive descent below the instrument glide path.

6.16 Aeroplanes carrying passengers — cabin attendants' seats

6.16.1 Aeroplanes for which the individual certificate of airworthiness was first issued on or after 1 January 1981

All aeroplanes shall be equipped with a forward or rearward facing (within 15 degrees of the longitudinal axis of the aeroplane) seat, fitted with a safety harness for the use of each cabin attendant required to satisfy the intent of 12.1 in respect of emergency evacuation.

6.16.2 Aeroplanes for which the individual certificate of airworthiness was first issued before 1 January 1981

Recommendation.— *All aeroplanes should be equipped with a forward or rearward facing (within 15 degrees of the longitudinal axis of the aeroplane) seat, fitted with a safety harness for the use of each cabin attendant required to satisfy the intent of 12.1 in respect of emergency evacuation.*

Note 1.— Guidance material on emergency evacuation provisions is contained in the Airworthiness Technical Manual, *Part III, Section 4, Chapter 1.*

Note 2.— Safety harness includes shoulder straps and a seat belt which may be used independently.

6.16.3 Cabin attendants' seats provided in accordance with 6.16.1 and 6.16.2 shall be located near floor level and other emergency exits as required by the State of Registry for emergency evacuation.

6.17 Emergency locator transmitter (ELT)

6.17.1 All aeroplanes operated on long range over water flights as described in 6.5.3 shall be equipped with at least two ELT(S).

6.17.2 Aeroplanes on flights over designated land areas as described in 6.6 shall be equipped with at least one ELT(S).

6.17.3 **Recommendation.—** *All aeroplanes should carry an automatically activated ELT.*

6.17.4 ELT equipment carried to satisfy the requirements of 6.17.1, 6.17.2 and 6.17.3 shall operate in accordance with the relevant provisions of Annex 10, Volume I.

CHAPTER 7. AEROPLANE COMMUNICATION AND NAVIGATION EQUIPMENT

7.1 Communication equipment

7.1.1 An aeroplane shall be provided with radio communication equipment capable of:

a) conducting two-way communication for aerodrome control purposes;

b) receiving meteorological information at any time during flight; and

c) conducting two-way communication at any time during flight with at least one aeronautical station and with such other aeronautical stations and on such frequencies as may be prescribed by the appropriate authority.

Note.— The requirements of 7.1.1 are considered fulfilled if the ability to conduct the communications specified therein is established during radio propagation conditions which are normal for the route.

7.1.2 The radio communication equipment required in accordance with 7.1.1 shall provide for communications on the aeronautical emergency frequency 121.5 MHz.

7.2 Navigation equipment

7.2.1 An aeroplane shall be provided with navigation equipment which will enable it to proceed:

a) in accordance with its operational flight plan;

b) in accordance with prescribed RNP types; and

c) in accordance with the requirements of air traffic services;

except when, if not so precluded by the appropriate authority, navigation for flights under the visual flight rules is accomplished by visual reference to landmarks.

Note.— Information on RNP and associated procedures is contained in the Manual on Required Navigation Performance (RNP) *(Doc 9613).*

7.2.2 For flights in defined portions of airspace where, based on Regional Air Navigation Agreement, minimum navigation performance specifications (MNPS) are prescribed, an aeroplane shall be provided with navigation equipment which:

a) continuously provides indications to the flight crew of adherence to or departure from track to the required degree of accuracy at any point along that track; and

b) has been authorized by the State of the Operator for MNPS operations concerned.

Note.— The prescribed minimum navigation performance specifications and the procedures governing their application are published in Regional Supplementary Procedures *(Doc 7030).*

7.2.3 For flights in defined portions of airspace where, based on Regional Air Navigation Agreement, a vertical separation minimum (VSM) of 300 m (1 000 ft) is applied above FL 290, an aeroplane:

a) shall be provided with equipment which is capable of:

1) indicating to the flight crew the flight level being flown;

2) automatically maintaining a selected flight level;

3) providing an alert to the flight crew when a deviation occurs from the selected flight level. The threshold for the alert shall not exceed ± 90 m (300 ft); and

4) automatically reporting pressure-altitude; and

b) shall be authorized by the State of the operator for operation in the airspace concerned.

7.2.4 The aeroplane shall be sufficiently provided with navigation equipment to ensure that, in the event of the failure of one item of equipment at any stage of the flight, the remaining equipment will enable the aeroplane to navigate in accordance with 7.2.1 and where applicable 7.2.2 and 7.2.3.

Note.— Guidance material relating to aircraft equipment necessary for flight in airspace where a 300 m (1 000 ft) VSM is applied above FL 290 is contained in the Manual on Implementation of a 300 m (1 000 ft) Vertical Separation Minimum Between FL 290 and FL 410 Inclusive (Doc 9574).

7.2.5 On flights in which it is intended to land in instrument meteorological conditions an aeroplane shall be provided with radio equipment capable of receiving signals providing guidance to a point from which a visual landing can be effected. This equipment shall be capable of providing such guidance at each aerodrome at which it is intended to land in instrument meteorological conditions and at any designated alternate aerodromes.

7.3 Installation

The equipment installation shall be such that the failure of any single unit required for either communications or navigation purposes or both will not result in the failure of another unit required for communications or navigation purposes.

CHAPTER 8. AEROPLANE MAINTENANCE

Note on the application of this chapter.— For the purpose of this chapter "aeroplane" includes: powerplants, propellers, components, accessories, instruments, equipment and apparatus including emergency equipment.

8.1 General

8.1.1 An operator shall ensure that there is provided an organization, including trained staff, workshops and other equipment and facilities, to maintain all aeroplanes in an airworthy condition when in use.

8.1.2 When the performance of the maintenance required in 8.1 is assigned, either partially or wholly, to a maintenance organization approved by the State of Registry of the aeroplane concerned, the operator's responsibility for compliance with Standards 8.2, 8.3 and 8.4, which follow, shall be modified according to the extent to which maintenance is assigned.

8.2 Maintenance manual

8.2.1 An operator shall ensure that there is provided, for the use and guidance of maintenance organizations and personnel, a maintenance manual containing the information specified in 11.3.

8.2.2 An operator shall ensure that the maintenance manual is amended or revised as is necessary to keep the information contained therein up to date.

8.2.3 Copies of all revisions and amendments of a maintenance manual shall be furnished promptly to all organizations or persons to whom the manual has been issued.

8.3 Training

An operator shall ensure that all maintenance personnel are instructed regarding the maintenance methods to be employed, in particular when new or unfamiliar equipment is introduced into service.

8.4 Inspection

An operator shall ensure that there is provided a system of inspection to ensure that all maintenance, overhaul, modifications and repairs which affect airworthiness, are effected as prescribed in the maintenance manual or otherwise as made mandatory by the State of Registry.

8.5 Qualification to certify as airworthy

Each person charged with the responsibility of certifying as to the airworthiness of an aeroplane shall be qualified in accordance with Annex 1.

8.6 Modifications and repairs

All modifications and repairs shall comply with airworthiness requirements acceptable to the State of Registry. Procedures shall be established to ensure that the substantiating data supporting compliance with the airworthiness requirements are retained.

8.7 Maintenance release

A maintenance release shall be completed and signed by a person or persons qualified in accordance with Annex 1 to certify that the maintenance work has been completed satisfactorily and in accordance with the methods prescribed in the maintenance manual.

8.8 Records

8.8.1 An operator shall ensure that the following records are kept:

a) the total time in service (hours, calendar time and cycles, as appropriate) of the aeroplane and all life limited components;

b) the current status of compliance with all mandatory continuing airworthiness information;

c) appropriate details of modifications and repairs to the aeroplane and its major components;

d) the time in service (hours, calendar time and cycles, as appropriate) since last overhaul of the aeroplane or its components subject to a mandatory overhaul life;

e) the current aeroplane inspection status such that compliance with the maintenance manual can be established; and

f) the detailed maintenance records to show that all requirements in the maintenance manual for issuance of a maintenance release have been met.

8.8.2 The records in 8.8.1 a) to e) shall be kept for a period of 90 days after the end of the operating life of the unit to which they refer, and the records in 8.8.1 f) for a period of one year after the issuance of the maintenance release.

8.8.3 The records shall be transferred to the new operator in the event of any change of operator.

8.9 Continuing airworthiness information

8.9.1 The operator of an aeroplane over 5 700 kg maximum certificated take-off mass shall monitor and assess maintenance and operational experience with respect to airworthiness and provide the information as prescribed by the State of Registry and report through the system specified in Annex 8, Part II, 4.2.5 and 4.2.8.

8.9.2 The operator of an aeroplane over 5 700 kg maximum certificated take-off mass shall obtain and assess airworthiness information and recommendations available from the organization responsible for the type design and shall implement resulting actions considered necessary in accordance with a procedure acceptable to the State of Registry.

Note.— Guidance on interpretation of "the organization responsible for the type design" is contained in Part II, Section 1, Chapter 2 of the Airworthiness Technical Manual *(Doc 9051).*

CHAPTER 9. AEROPLANE FLIGHT CREW

9.1 Composition of the flight crew

9.1.1 The number and composition of the flight crew shall not be less than that specified in the operations manual. The flight crews shall include flight crew members in addition to the minimum numbers specified in the flight manual or other documents associated with the certificate of airworthiness, when necessitated by considerations related to the type of aeroplane used, the type of operation involved and the duration of flight between points where flight crews are changed.

9.1.2 Radio operator

The flight crew shall include at least one member who holds a valid licence, issued or rendered valid by the State of Registry, authorizing operation of the type of radio transmitting equipment to be used.

9.1.3 Flight engineer

When a separate flight engineer's station is incorporated in the design of an aeroplane, the flight crew shall include at least one flight engineer especially assigned to that station, unless the duties associated with that station can be satisfactorily performed by another flight crew member, holding a flight engineer licence, without interference with regular duties.

9.1.4 Flight navigator

The flight crew shall include at least one member who holds a flight navigator licence in all operations where, as determined by the State of the Operator, navigation necessary for the safe conduct of the flight cannot be adequately accomplished by the pilots from the pilot station.

9.2 Flight crew member emergency duties

An operator shall, for each type of aeroplane, assign to all flight crew members the necessary functions they are to perform in an emergency or in a situation requiring emergency evacuation. Annual training in accomplishing these functions shall be contained in the operator's training programme and shall include instruction in the use of all emergency and life-saving equipment required to be carried, and drills in the emergency evacuation of the aeroplane.

9.3 Flight crew member training programmes

9.3.1 An operator shall establish and maintain a ground and flight training programme, approved by the State of the Operator, which ensures that all flight crew members are adequately trained to perform their assigned duties. Ground and flight training facilities and properly qualified instructors as determined by the State of the Operator shall be provided. The training programme shall consist of ground and flight training in the type(s) of aeroplane on which the flight crew member serves, and shall include proper flight crew co-ordination and training in all types of emergency or abnormal situations or procedures caused by powerplant, airframe or systems malfunctions, fire or other abnormalities. The training programme shall also include training in knowledge and skills related to human performance and limitations and in the transport of dangerous goods. The training for each flight crew member, particularly that relating to abnormal or emergency pro-cedures, shall ensure that all flight crew members know the functions for which they are responsible and the relation of these functions to the functions of other crew members. The training programme shall be given on a recurrent basis, as determined by the State of the Operator and shall include an examination to determine competence.

Note 1.— Paragraph 4.2.4 prohibits the in-flight simulation of emergency or abnormal situations when passengers or cargo are being carried.

Note 2.— Flight training may, to the extent deemed appropriate by the State of the Operator, be given in aeroplane synthetic flight trainers approved by the State for that purpose.

Note 3.— The scope of the recurrent training required by 9.2 and 9.3 may be varied and need not be as extensive as the initial training given in a particular type of aeroplane.

Note 4.— The use of correspondence courses and written examinations as well as other means may, to the extent deemed feasible by the State of the Operator, be utilized in meeting the requirements for periodic ground training.

Note 5.— Provisions for training in the transport of dangerous goods are contained in Annex 18.

9.3.2 The requirement for recurrent flight training in a particular type of aeroplane shall be considered fulfilled by:

a) the use, to the extent deemed feasible by the State of the Operator, of aeroplane synthetic flight trainers approved by that State for that purpose; or

b) the completion within the appropriate period of the proficiency check required by 9.4.4 in that type of aeroplane.

9.4 Qualifications

9.4.1 Recent experience — pilot-in-command

An operator shall not assign a pilot to act as pilot-in-command of an aeroplane unless, on the same type of aeroplane within the preceding 90 days, that pilot has made at least three take-offs and landings.

9.4.2 Recent experience — co-pilot

An operator shall not assign a co-pilot to serve at the flight controls during take-off and landing unless, on the same type of aeroplane within the preceding 90 days, that co-pilot has served as pilot-in-command or co-pilot at the flight controls or has otherwise demonstrated competence to act as co-pilot.

9.4.3 Pilot-in-command route and airport qualification

9.4.3.1 An operator shall not utilize a pilot as pilot-in-command of an aeroplane on a route or route segment for which that pilot is not currently qualified until such pilot has complied with 9.4.3.2 and 9.4.3.3.

9.4.3.2 Each such pilot shall demonstrate to the operator an adequate knowledge of:

a) the route to be flown, and the aerodromes which are to be used. This shall include knowledge of:

1) the terrain and minimum safe altitudes;

2) the seasonal meteorological conditions;

3) the meteorological, communication and air traffic facilities, services and procedures;

4) the search and rescue procedures; and

5) the navigational facilities and procedures, including any long-range navigation procedures, associated with the route along which the flight is to take place; and

b) procedures applicable to flight paths over heavily populated areas and areas of high air traffic density, obstructions, physical layout, lighting, approach aids and arrival, departure, holding and instrument approach procedures, and applicable operating minima.

Note.— That portion of the demonstration relating to arrival, departure, holding and instrument approach procedures may be accomplished in an appropriate training device which is adequate for this purpose.

9.4.3.3 A pilot-in-command shall have made an actual approach into each aerodrome of landing on the route, accompanied by a pilot who is qualified for the aerodrome, as a member of the flight crew or as an observer on the flight deck, unless:

a) the approach to the aerodrome is not over difficult terrain and the instrument approach procedures and aids available are similar to those with which the pilot is familiar, and a margin to be approved by the State of the Operator is added to the normal operating minima, or there is reasonable certainty that approach and landing can be made in visual meteorological conditions; or

b) the descent from the initial approach altitude can be made by day in visual meteorological conditions; or

c) the operator qualifies the pilot-in-command to land at the aerodrome concerned by means of an adequate pictorial presentation; or

d) the aerodrome concerned is adjacent to another aerodrome at which the pilot-in-command is currently qualified to land.

9.4.3.4 The operator shall maintain a record, sufficient to satisfy the State of the Operator of the qualification of the pilot and of the manner in which such qualification has been achieved.

9.4.3.5 An operator shall not continue to utilize a pilot as a pilot-in-command on a route unless, within the preceding 12 months, the pilot has made at least one trip between the terminal points of that route as a pilot member of the flight crew, or as a check pilot, or as an observer on the flight deck. In the event that more than 12 months elapse in which a pilot has not made such a trip on a route in close proximity and over similar terrain, prior to again serving as a pilot-in-command on that route, that pilot must requalify in accordance with 9.4.3.2 and 9.4.3.3.

9.4.4 Pilot proficiency checks

An operator shall ensure that piloting technique and the ability to execute emergency procedures is checked in such a way as to demonstrate the pilot's competence. Where the operation may be conducted under instrument flight rules, an operator shall ensure that the pilot's competence to comply with such rules is demonstrated to either a check pilot of the operator or to a representative of the State of the Operator. Such checks shall be performed twice within any period of one year. Any two such checks which are similar and which occur within a period of four consecutive months shall not alone satisfy this requirement.

Note 1.— Flight simulators approved by the State of the Operator may be used for those parts of the checks for which they are specifically approved.

Note 2.— See ICAO Manual of Criteria for the Qualification of Flight Simulators *(Doc 9625).*

9.5 Flight crew equipment

A flight crew member assessed as fit to exercise the privileges of a licence subject to the use of suitable correcting lenses, shall have a spare set of the correcting lenses readily available when exercising those privileges.

9.6 Flight time, flight duty periods and rest periods

The State of the Operator shall establish regulations specifying the limitations applicable to the flight time and flight duty periods for flight crew members. These regulations shall also make provision for adequate rest periods and shall be such as to ensure that fatigue occurring either in a flight or successive flights or accumulated over a period of time due to these and other tasks, does not endanger the safety of a flight.

Note.— Guidance on the establishment of limitations is given in Attachment A.

CHAPTER 10. FLIGHT OPERATIONS OFFICER/FLIGHT DISPATCHER

10.1 A flight operations officer/flight dispatcher, when employed in conjunction with an approved method of flight supervision requiring the services of licensed flight operations officers/flight dispatchers, shall be licensed in accordance with the provisions of Annex 1.

Note.— The above provisions do not necessarily require a flight operations officer/flight dispatcher to hold the licence specified in Annex 1. In accordance with 4.2.1 the method of flight supervision is subject to approval by the State of the Operator which may accept proof of qualifications other than the holding of the licence.

10.2 **Recommendation.—** *A flight operations officer/ flight dispatcher should not be assigned to duty unless that officer has:*

a) made within the preceding 12 months, at least a one-way qualification flight on the flight deck of an aeroplane over any area in which that individual is authorized to exercise flight supervision. The flight should include landings at as many aerodromes as practicable;

b) demonstrated to the operator a knowledge of:

1) the contents of the operations manual described in 11.1;

2) the radio equipment in the aeroplanes used; and

3) the navigation equipment in the aeroplanes used;

c) demonstrated to the operator a knowledge of the following details concerning operations for which the officer is responsible and areas in which that individual is authorized to exercise flight supervision:

1) the seasonal meteorological conditions and the sources of meteorological information;

2) the effects of meteorological conditions on radio reception in the aeroplanes used;

3) the peculiarities and limitations of each navigation system which is used by the operation; and

4) the aeroplane loading instructions; and

d) demonstrated to the operator the ability to perform the duties specified in 4.6.

10.3 **Recommendation.—** *A flight operations officer/ flight dispatcher assigned to duty should maintain complete familiarization with all features of the operation which are pertinent to such duties.*

10.4 **Recommendation.—** *A flight operations officer/ flight dispatcher should not be assigned to duty after 12 consecutive months of absence from such duty, unless the provisions of 10.2 are met.*

CHAPTER 11. MANUALS, LOGS AND RECORDS

11.1 Operations manual

An operations manual, which may be issued in separate parts corresponding to specific aspects of operations, provided in accordance with 4.2.2 shall contain at least the following:

1) instructions outlining the responsibilities of operations personnel pertaining to the conduct of flight operations;

2) the flight crew for each type of operation including the designation of the succession of command;

3) rules limiting the flight time and flight duty periods and providing for adequate rest periods for flight crew members and cabin attendants;

4) the in-flight and the emergency duties assigned to each crew member;

5) checklist of emergency and safety equipment and instructions for its use;

6) minimum flight altitudes:

   a) the method for determining minimum flight altitudes; and

   b) the minimum flight altitudes for each route to be flown;

7) aerodrome operating minima:

   a) the methods for determining aerodrome operating minima;

   b) operating minima for each of the aerodromes that are likely to be used as aerodromes of intended landing or as alternate aerodromes and the increase of aerodrome operating minima in accordance with subparagraph 7 a) above, in case of degradation of approach or aerodrome facilities; and;

   c) conditions required to commence or to continue an instrument approach;

8) the circumstances in which a radio listening watch is to be maintained;

9) a list of the navigational equipment to be carried including any requirements relating to operations in RNP airspace;

10) specific instructions for the computation of the quantities of fuel and oil to be carried, having regard to all circumstances of the operation including the possibility of the failure of one or more powerplants while en route;

11) the minimum equipment list for the aeroplane types operated and specific operations authorized, including any requirements relating to operations in RNP airspace;

12) a route guide to ensure that the flight crew will have, for each flight, information relating to communication facilities, navigation aids, aerodromes, and such other information as the operator may deem necessary for the proper conduct of flight operations;

13) the conditions under which oxygen shall be used and the amount of oxygen determined in accordance with 4.3.8.2;

14) procedures, as prescribed in Annex 12, for pilots-in-command observing an accident;

15) the ground-air visual signal code for use by survivors, as contained in Annex 12;

16) information and instructions relating to the interception of civil aircraft including:

   a) procedures, as prescribed in Annex 2, for pilots-in-command of intercepted aircraft; and

   b) visual signals for use by intercepting and intercepted aircraft, as contained in Annex 2;

17) for aeroplanes intended to be operated above 15 000 m (49 000 ft):

   a) information which will enable the pilot to determine the best course of action to take in the event of exposure to solar cosmic radiation; and

   b) procedures in the event that a decision to descend is taken, covering:

      i) the necessity of giving the appropriate ATS unit prior warning of the situation and of obtaining a provisional descent clearance; and

ii) the action to be taken in the event that communication with the ATS unit cannot be established or is interrupted.

Note.— Guidance material on the information to be provided is contained in Circular 126 — Guidance Material on SST Aircraft Operations.

18) information and instructions on the carriage of dangerous goods, including action to be taken in the event of an emergency;

19) emergency evacuation procedures;

20) safety precautions during refuelling with passengers on board;

21) operating instructions and information on climb performance with all engines operating, if provided in accordance with 4.2.3.3;

22) the normal, abnormal and emergency procedures to be used by the flight crew, the checklists relating thereto and aircraft systems information as required by 6.1.3;

23) where relevant to the operations, the long-range navigation procedures to be used;

24) the specifications for the operational flight plan;

25) details of the flight crew training programme and requirements;

26) details of the cabin attendant duties training programme as required by 12.4;

27) security instructions and guidance;

28) details of the accident prevention and flight safety programme provided in accordance with 3.6;

29) departure contingency procedures;

30) instructions for mass and balance control; and

31) instructions and training requirements for the avoidance of controlled flight into terrain and policy for the use of the ground proximity warning system (GPWS).

11.2 Flight manual

Note.— The flight manual contains the information specified in Annex 8.

The flight manual shall be updated by implementing changes made mandatory by the State of Registry.

11.3 Maintenance manual

A maintenance manual provided in accordance with 8.2 shall contain the following information in respect of the aeroplanes operated:

a) procedures for servicing and maintenance;

b) an aeroplane maintenance programme, approved by the State of Registry, containing maintenance tasks and intervals at which these tasks are to be performed;

c) the responsibilities of the various classes of skilled maintenance personnel;

d) the servicing and maintenance methods which may be prescribed by, or which require the prior approval of, the State of Registry; and

e) the procedure for preparing the maintenance release, the circumstances under which this release is to be issued and the personnel required to sign it.

11.4 Maintenance release

A maintenance release shall contain a certification as to the satisfactory completion of maintenance work carried out in accordance with the methods prescribed in the maintenance manual.

11.5 Journey log book

11.5.1 **Recommendation.—** *The aeroplane journey log book should contain the following items and the corresponding roman numerals:*

I — *Aeroplane nationality and registration.*

II — *Date.*

III — *Names of crew members.*

IV — *Duty assignments of crew members.*

V — *Place of departure.*

VI — *Place of arrival.*

VII — *Time of departure.*

VIII — *Time of arrival.*

IX — *Hours of flight.*

X — *Nature of flight (private, aerial work, scheduled or non-scheduled).*

XI — *Incidents, observations, if any.*

XII — *Signature of person in charge.*

11.5.2 **Recommendation.**— *Entries in the journey log book should be made currently and in ink or indelible pencil.*

11.5.3 **Recommendation.**— *Completed journey log book should be retained to provide a continuous record of the last six months' operations.*

11.6 Records of emergency and survival equipment carried

Operators shall at all times have available for immediate communication to rescue co-ordination centres, lists containing information on the emergency and survival equipment carried on board any of their aeroplanes engaged in international air navigation. The information shall include, as applicable, the number, colour and type of life rafts and pyrotechnics, details of emergency medical supplies, water supplies and the type and frequencies of the emergency portable radio equipment.

Note.— The following additional manuals and records are associated with this Annex but are not included in this chapter:

Fuel and oil records — see 4.2.9

Maintenance records — see 8.8

Flight time records — see 4.2.10.2

Flight preparation forms — see 4.3

Operational flight plan — see 4.3.3.1 and 4.3.3.2

Pilot route and aerodrome qualification records — see 9.4.3.4

11.7 Flight recorder records

11.7.1 An operator shall ensure, to the extent possible, in the event an aircraft becomes involved in an accident, the preservation of all related flight recorder records, and if necessary the associated flight recorders, and their retention in safe custody pending their disposition as determined in accordance with Annex 13.

11.7.2 **Recommendation.**— *An operator should ensure, to the extent possible, in the event an aircraft becomes involved in an incident, the preservation of all related flight recorder records, and if necessary the associated flight recorders, and their retention in safe custody pending their disposition as determined in accordance with Annex 13.*

CHAPTER 12. CABIN ATTENDANTS

12.1 Assignment of emergency duties

An operator shall establish, to the satisfaction of the State of the Operator, the minimum number of cabin attendants required for each type of aeroplane, based on seating capacity or the number of passengers carried, in order to effect a safe and expeditious evacuation of the aeroplane, and the necessary functions to be performed in an emergency or a situation requiring emergency evacuation. The operator shall assign these functions for each type of aeroplane.

12.2 Cabin attendants at emergency evacuation stations

Each cabin attendant assigned to emergency evacuation duties shall occupy a seat provided in accordance with 6.16 during take-off and landing and whenever the pilot-in-command so directs.

12.3 Protection of cabin attendants during flight

Each cabin attendant shall be seated with seat belt or, when provided, safety harness fastened during take-off and landing and whenever the pilot-in-command so directs.

Note.— The foregoing does not preclude the pilot-in-command from directing the fastening of the seat belt only, at times other than during take-off and landing.

12.4 Training

An operator shall establish and maintain a training programme, approved by the State of the Operator, to be completed by all persons before being assigned as a cabin attendant. Cabin attendants shall complete a recurrent training programme annually. These training programmes shall ensure that each person is:

a) competent to execute those safety duties and functions which the cabin attendant is assigned to perform in the event of an emergency or in a situation requiring emergency evacuation;

b) drilled and capable in the use of emergency and life-saving equipment required to be carried, such as life jackets, life rafts, evacuation slides, emergency exits, portable fire extinguishers, oxygen equipment and first-aid kits;

c) when serving on aeroplanes operated above 3 000 m (10 000 ft), knowledgeable as regards the effect of lack of oxygen and, in the case of pressurized aeroplanes, as regards physiological phenomena accompanying a loss of pressurization;

d) aware of other crew members' assignments and functions in the event of an emergency so far as is necessary for the fulfillment of the cabin attendant's own duties; and

e) aware of the types of dangerous goods which may, and may not, be carried in a passenger cabin and has completed the dangerous goods training programme required by Annex 18.

12.5 Flight time, flight duty periods and rest periods

The State of the Operator shall establish regulations specifying the limits applicable to flight time, flight duty periods and rest periods for cabin attendants.

Note.— Guidance on the establishment of limitations is given in Attachment A.

CHAPTER 13. SECURITY*

13.1 Security of the flight crew compartment

In all aeroplanes which are equipped with a flight crew compartment door, this door shall be capable of being locked. It shall be lockable from within the compartment only.

13.2 Aeroplane search procedure checklist

An operator shall ensure that there is on board a checklist of the procedures to be followed in searching for a bomb in case of suspected sabotage. The checklist shall be supported by guidance on the course of action to be taken should a bomb or suspicious object be found and information on the least-risk bomb location specific to the aeroplane.

13.3 Training programmes

13.3.1 An operator shall establish and maintain a training programme which enables crew members to act in the most appropriate manner to minimize the consequences of acts of unlawful interference.

13.3.2 An operator shall also establish and maintain a training programme to acquaint appropriate employees with preventive measures and techniques in relation to passengers, baggage, cargo, mail, equipment, stores and supplies intended for carriage on an aeroplane so that they contribute to the prevention of acts of sabotage or other forms of unlawful interference.

13.4 Reporting acts of unlawful interference

Following an act of unlawful interference the pilot-in-command shall submit, without delay, a report of such an act to the designated local authority.

13.5 Miscellaneous

13.5.1 **Recommendation.—** *Specialized means of attenuating and directing the blast should be provided for use at the least-risk bomb location.*

13.5.2 **Recommendation.—** *Where an operator accepts the carriage of weapons removed from passengers, the aeroplane should have provision for stowing such weapons in a place so that they are inaccessible to any person during flight time.*

* In the context of this Chapter, the word "security" is used in the sense of prevention of illicit acts against civil aviation.

APPENDIX. LIGHTS TO BE DISPLAYED BY AEROPLANES

(Note.— See Chapter 6)

1. Terminology

When the following terms are used in this Appendix, they have the following meanings:

Angles of coverage.

a) Angle of coverage A is formed by two intersecting vertical planes making angles of 70 degrees to the right and 70 degrees to the left respectively, looking aft along the longitudinal axis to a vertical plane passing through the longitudinal axis.

b) Angle of coverage F is formed by two intersecting vertical planes making angles of 110 degrees to the right and 110 degrees to the left respectively, looking forward along the longitudinal axis to a vertical plane passing through the longitudinal axis.

c) Angle of coverage L is formed by two intersecting vertical planes, one parallel to the longitudinal axis of the aeroplane, and the other 110 degrees to the left of the first, when looking forward along the longitudinal axis.

d) Angle of coverage R is formed by two intersecting vertical planes, one parallel to the longitudinal axis of the aeroplane, and the other 110 degrees to the right of the first, when looking forward along the longitudinal axis.

Horizontal plane. The plane containing the longitudinal axis and perpendicular to the plane of symmetry of the aeroplane.

Longitudinal axis of the aeroplane. A selected axis parallel to the direction of flight at a normal cruising speed, and passing through the centre of gravity of the aeroplane.

Making way. An aeroplane on the surface of the water is "making way" when it is under way and has a velocity relative to the water.

Under command. An aeroplane on the surface of the water is "under command" when it is able to execute manoeuvres as required by the International Regulations for Preventing Collisions at Sea for the purpose of avoiding other vessels.

Under way. An aeroplane on the surface of the water is "under way" when it is not aground or moored to the ground or to any fixed object on the land or in the water.

Vertical planes. Planes perpendicular to the horizontal plane.

Visible. Visible on a dark night with a clear atmosphere.

2. Navigation lights to be displayed in the air

Note.— The lights specified herein are intended to meet the requirements of Annex 2 for navigation lights.

As illustrated in Figure 1, the following unobstructed navigation lights shall be displayed:

a) a red light projected above and below the horizontal plane through angle of coverage L;

b) a green light projected above and below the horizontal plane through angle of coverage R;

c) a white light projected above and below the horizontal plane rearward through angle of coverage A.

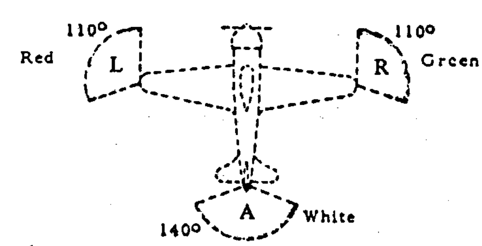


Figure 1

3. Lights to be displayed on the water

3.1 General

Note.— The lights specified herein are intended to meet the requirements of Annex 2 for lights to be displayed by aeroplanes on the water.

The International Regulations for Preventing Collisions at Sea require different lights to be displayed in each of the following circumstances:

a) when under way;

b) when towing another vessel or aeroplane;

c) when being towed;

d) when not under command and not making way;

e) when making way but not under command;

f) when at anchor;

g) when aground.

The lights required by aeroplanes in each case are described below.

3.2 When under way

As illustrated in Figure 2, the following appearing as steady unobstructed lights:

a) a red light projected above and below the horizontal through angle of coverage L;

b) a green light projected above and below the horizontal through angle of coverage R;

c) a white light projected above and below the horizontal through angle of coverage A; and

d) a white light projected through angle of coverage F.

The lights described in a), b) and c) should be visible at a distance of at least 3.7 km (2 NM). The light described in d) should be visible at a distance of 9.3 km (5 NM) when fitted to an aeroplane of 20 m or more in length or visible at a distance of 5.6 km (3 NM) when fitted to an aeroplane of less than 20 m in length.

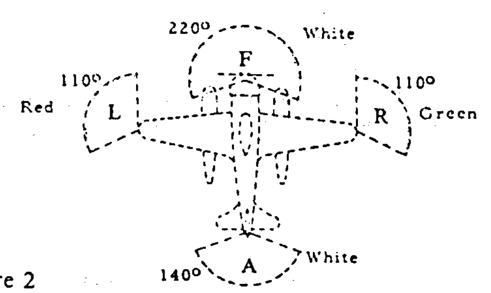

Figure 2

9/11/95

3.3 When towing another vessel or aeroplane

As illustrated in Figure 3, the following appearing as steady, unobstructed lights:

a) the lights described in 3.2 above;

b) a second light having the same characteristics as the light described in 3.2 d) and mounted in a vertical line at least 2 m above or below it; and

c) a yellow light having otherwise the same characteristics as the light described in 3.2 c) and mounted in a vertical line at least 2 m above it.

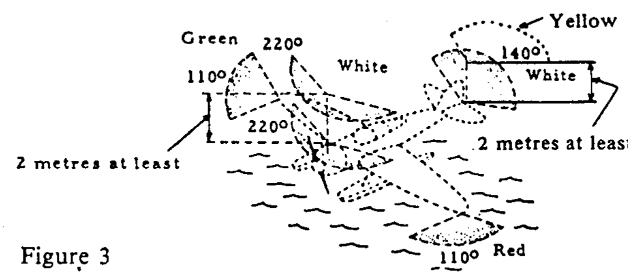

Figure 3

3.4 When being towed

The lights described in 3.2 a), b) and c) appearing as steady, unobstructed lights.

3.5 When not under command and not making way

As illustrated in Figure 4, two steady red lights placed where they can best be seen, one vertically over the other and not less than 1 m apart, and of such a character as to be visible all around the horizon at a distance of at least 3.7 km (2 NM).

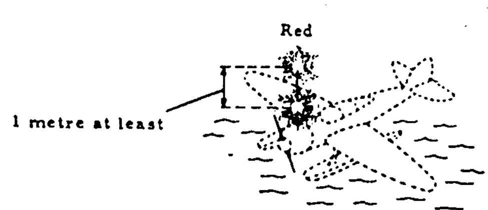

Figure 4

3.6 When making way but not under command

As illustrated in Figure 5, the lights described in 3.5 plus the lights described in 3.2 a), b) and c).

Note.— The display of lights prescribed in 3.5 and 3.6 above is to be taken by other aircraft as signals that the aeroplane showing them is not under command and cannot therefore get out of the way. They are not signals of aeroplanes in distress and requiring assistance.

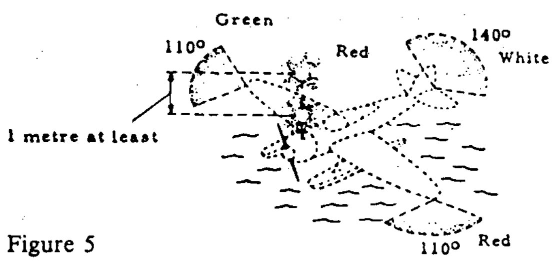

Figure 5

3.7 When at anchor

a) If less than 50 m in length, where it can best be seen, a steady white light (Figure 6), visible all around the horizon at a distance of at least 3.7 km (2 NM).

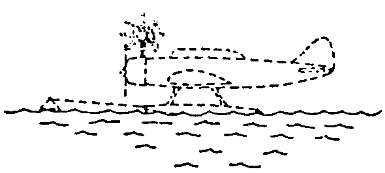

Figure 6

b) If 50 m or more in length, where they can best be seen, a steady white forward light and a steady white rear light (Figure 7) both visible all around the horizon at a distance of at least 5.6 km (3 NM).

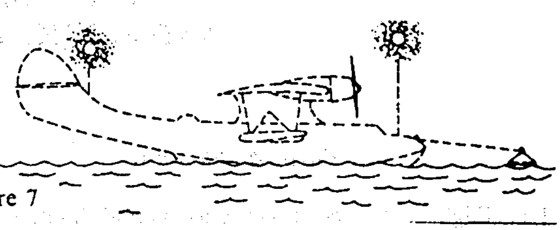

Figure 7

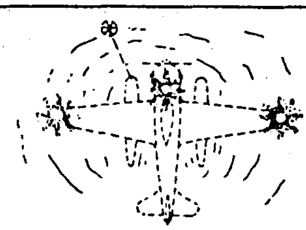
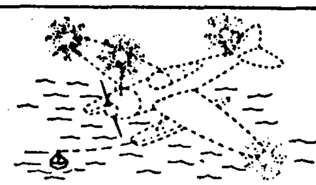
c) If 50 m or more in span a steady white light on each side (Figures 8 and 9) to indicate the maximum span and visible, so far as practicable, all around the horizon at a distance of at least 1.9 km (1 NM).



Less than 50 metres in length; 50 metres or more in span

Figure 8



50 metres or more in length; 50 metres or more in span

Figure 9

3.8 When aground

The lights prescribed in 3.7 and in addition two steady red lights in vertical line, at least 1 m apart so placed as to be visible all around the horizon.

ATTACHMENT A. FLIGHT TIME AND FLIGHT DUTY PERIOD LIMITATIONS

Supplementary to 4.2.10.3

1. Purpose and scope

1.1 Flight time and flight duty period limitations are established for the sole purpose of reducing the probability that fatigue of flight crew members may adversely affect the safety of flight.

1.2 In order to guard against this, two types of fatigue must be taken into account, namely, transient fatigue and cumulative fatigue. Transient fatigue may be described as fatigue which is normally experienced by a healthy individual following a period of work, exertion or excitement, and it is normally dispelled by a single sufficient period of sleep. On the other hand cumulative fatigue may occur after delayed or incomplete recovery from transient fatigue or as the after-effect of more than a normal amount of work, exertion or excitement without sufficient opportunity for recuperation.

1.3 Limitations based on the provisions of this Part will provide safeguards against both kinds of fatigue because they will recognize:

1.3.1 The necessity to limit flight time in such a way as to guard against both kinds of fatigue.

1.3.2 The necessity to limit time spent on duty on the ground immediately prior to a flight or at intermediate points during a series of flights in such a way as to guard particularly against transient fatigue.

1.3.3 The necessity to provide flight crew members with adequate opportunity to recover from fatigue.

1.3.4 The necessity of taking into account other related tasks the flight crew member may be required to perform in order to guard particularly against cumulative fatigue.

2. Definitions

2.1 Flight time

The definition of flight time is of necessity very general but in the context of limitations it is, of course, intended to apply to flight crew members in accordance with the relevant definition of a flight crew member. Pursuant to that latter definition, licensed crew personnel travelling as passengers cannot be considered flight crew members, although this should be taken into account in arranging rest periods.

2.2 Flight duty periods

2.2.1 The definition of flight duty period is intended to cover a continuous period of duty which always includes a flight or a series of flights. It is meant to include all duties a flight crew member may be required to carry out from the moment he reports at his place of employment on the day of a flight until he is relieved of duties, having completed the flight or series of flights. It is considered necessary that this period should be subject to limitations because a flight crew member's activities within the limits of such period would eventually induce fatigue — transient or cumulative — which could endanger the safety of a flight. There is on the other hand (from the point of view of flight safety) insufficient reason to establish limitations for any other time during which a flight crew member is performing a task assigned to him by the operator. Such task should, therefore, only be taken into account when making provisions for rest periods as one among many factors which could lead to fatigue.

2.2.2 The definition does not imply the inclusion of such periods as time taken for a flight crew member to travel from home to the place of employment.

2.2.3 An important safeguard may be established if States and operators recognize the right of a crew member to refuse further flight duty when suffering from fatigue of such a nature as to affect adversely the safety of flight.

2.3 Rest periods

The definition of rest period implies an absence of duty and is intended to be for the purpose of recovering from fatigue; the way in which this recovery is achieved is the responsibility of the individual.

3. Types of limitations

3.1 Limitations are broadly divided by time; for example, the majority of States reporting to ICAO prescribe daily, monthly and yearly flight time limitations, and a considerable number also prescribe quarterly flight time limitations. It will probably be sufficient to prescribe flight duty period limitations on a daily basis. It must be understood, however, that these limitations will vary considerably taking into account a variety of situations.

3.2 In formulating regulations or rules governing flight time limitations the size of the crew complement and the extent to which the various tasks to be performed can be divided among the crew members should be taken into account; and in the case where adequate facilities for relief are provided in the aircraft in such a way that a crew member may have horizontal rest and a degree of privacy, flight duty periods could be extended. Adequate rest facilities on the ground are required at places where relief periods are to be given. Also States or operators should give due weight to the following factors: traffic density; navigational and communication facilities; rhythm of work/sleep cycle; number of landings and take-offs; aircraft handling and performance characteristics and weather conditions.

Note.— Circular 52, Flight Crew Fatigue and Flight Time Limitations, *contains extracts of some States' regulations for implementation of 4.2.10.3 of this Part.*

ATTACHMENT B. FIRST-AID MEDICAL SUPPLIES

Supplementary to 6.2.2 a)

TYPES, NUMBER, LOCATION AND CONTENTS OF MEDICAL SUPPLIES

1. Types

Two types of medical supplies should be provided: first-aid kit(s) for carriage in all aeroplanes and a medical kit for carriage where the aeroplane is authorized to carry more than 250 passengers.

2. Number of first-aid kits

The number of first-aid kits should be appropriate to the number of passengers which the aeroplane is authorized to carry:

Passenger	*First-aid kits*
0 – 50	1
51 – 150	2
151 – 250	3
More than 250	4

3. Location

3.1 It is essential that the required first-aid kits be distributed as evenly as practicable throughout the passenger cabin. They should be readily accessible to cabin attendants, and, in view of the possible use of medical supplies outside the aeroplane in an emergency situation, they should be located near an exit.

3.2 The medical kit, when carried, should be stored in an appropriate secure location.

4. Contents

4.1 Different factors must be taken into consideration in deciding the contents of first-aid kits and medical kits. The following are typical contents of first-aid and medical kits for carriage aboard an aeroplane.

4.1.1 *First-aid kit:*

— a handbook on first aid
— "ground-air visual signal code for use by survivors" as contained in Annex 12
— materials for treating injuries
— ophthalmic ointment
— a decongestant nasal spray
— insect repellant
— emollient eye drops
— sunburn cream
— water-miscible antiseptic/skin cleanser
— materials for treatment of extensive burns
— oral drugs as follows: analgesic, antispasmodic, central nervous system stimulant, circulatory stimulant, coronary vasodilator, antidiarrhoeic and motion sickness medications
— an artificial plastic airway and splints.

4.1.2 *Medical kit:*

Equipment
— one pair of sterile surgical gloves
— sphygmomanometer
— stethoscope
— sterile scissors
— haemostatic forceps
— haemostatic bandages or tourniquet
— sterile equipment for suturing wounds
— disposable syringes and needles
— disposable scalpel handle and blade

Drugs
— coronary vasodilators
— analgesics
— diuretics
— anti-allergics
— steroids
— sedatives
— ergometrine
— where compatible with regulations of the appropriate authority, a narcotic drug in injectable form
— injectable broncho dilator.

Note.— The United Nations Conference for Adoption of a Single Convention on Narcotic Drugs in March 1961 adopted such a Convention, Article 32 of which contains special provisions concerning the carriage of drugs in medical kits of aircraft engaged in international flight.

ATTACHMENT C. AEROPLANE PERFORMANCE OPERATING LIMITATIONS

Example 1

Purpose and scope

The purpose of the following example is to illustrate the level of performance intended by the provisions of Chapter 5 as applicable to the types of aeroplanes described below.

The Standards and Recommended Practices in Annex 6 effective on 14 July 1949 contained specifications similar to those adopted by some Contracting States for inclusion in their national performance codes. A very substantial number of civil transport aeroplanes have been manufactured and are being operated in accordance with these codes. Those aeroplanes are powered with reciprocating engines including turbo-compound design. They embrace twin-engined and four-engined aeroplanes over a mass range from approximately 4 200 kg to 70 000 kg over a stalling speed range, V_{S_0} from approximately 100 to 175 km/h (55 to 95 kt) and over a wing loading range from approximately 120 to 360 kg/m^2. Cruising speeds range over 555 km/h (300 kt). Those aeroplanes have been used in a very wide range of altitude, air temperature and humidity conditions. At a later date, the code was applied with respect to the evaluation of certification of the so-called "first generation" of turboprop and turbo-jet aeroplanes.

Although only past experience can warrant the fact that this example illustrates the level of performance intended by the Standards and Recommended Practices of Chapter 5, it is considered to be applicable over a wide range of aeroplane characteristics and atmospheric conditions. Reservation should however be made concerning the application of this example with respect to conditions of high air temperatures. In certain extreme cases, it has been found desirable to apply additional temperature and/or humidity accountability, particularly for the obstacle limited take-off flight path.

This example is not intended for application to aeroplanes having short take-off and landing (STOL) or vertical take-off and landing (VTOL) capabilities.

No detailed study has been made of the applicability of this example to operations in all-weather conditions. The validity of this example has not therefore been established for operations which may involve low decision heights and be associated with low minima operating techniques and procedures.

1. Definitions

CAS (Calibrated airspeed). The calibrated airspeed is equal to the airspeed indicator reading corrected for position and instrument error. (As a result of the sea level adiabatic compressible flow correction to the airspeed instrument dial, CAS is equal to the true airspeed (TAS) in Standard Atmosphere at sea level.)

Declared distances.

a) *Take-off run available (TORA).* The length of runway declared available and suitable for the ground run of an aeroplane taking off.

b) *Take-off distance available (TODA).* The length of the take-off run available plus the length of the clearway, if provided.

c) *Accelerate-stop distance available (ASDA).* The length of the take-off run available plus the length of the stopway, if provided.

d) *Landing distance available (LDA).* The length of runway which is declared available and suitable for the ground run of an aeroplane landing.

Note.— The calculation of declared distances is described in Annex 14, Attachment A.

Height. The vertical distance of a level, a point, or an object considered as a point, measured from a specified datum.

Note.— For the purposes of this example, the point referred to above is the lowest part of the aeroplane and the specified datum is the take-off or landing surface, whichever is applicable.

Landing surface. That part of the surface of an aerodrome, which the aerodrome authority has declared available for the normal ground or water run of aircraft landing in a particular direction.

Take-off surface. That part of the surface of an aerodrome which the aerodrome authority has declared available for the normal ground or water run of aircraft taking off in a particular direction.

V_{S_0}. A stalling speed or minimum steady flight speed in the landing configuration. *(Note.— See 2.4.)*

V_{S_1}. A stalling speed or minimum steady flight speed. *(Note.— See 2.5.)*

Note.— See Chapter 1 and Annexes 8 and 14 for other definitions.

2. Stalling speed — minimum steady flight speed

2.1 For the purpose of this example, the stalling speed is the speed at which an angle of attack greater than that of maximum lift is reached, or, if greater, the speed at which a large amplitude pitching or rolling motion, not immediately controllable, is encountered, when the manoeuvre described in 2.3 is executed.

Note.— It should be noted that an uncontrollable pitching motion of small amplitude associated with pre-stall buffeting does not necessarily indicate that the stalling speed has been reached.

2.2 The minimum steady flight speed is that obtained while maintaining the elevator control in the most rearward possible position when the manoeuvre described in 2.3 is executed. This speed would not apply when the stalling speed defined in 2.1 occurs before the elevator control reaches its stops.

2.3 Determination of stalling speed — Minimum steady flight speed

2.3.1 The aeroplane is trimmed for a speed of approximately $1.4V_{S_1}$. From a value sufficiently above the stalling speed to ensure that a steady rate of decrease is obtainable, the speed is reduced in straight flight at a rate not exceeding 0.5 m/s^2 (1 kt/s) until the stalling speed or the minimum steady flight speed, defined in 2.1 and 2.2, is reached.

2.3.2 For the purpose of measuring stalling speed and minimum steady flight speed, the instrumentation is such that the probable error of measurement is known.

2.4 V_{S_0}

V_{S_0} denotes the stalling speed if obtained in flight tests conducted in accordance with 2.3, or the minimum steady flight speed, CAS, as defined in 2.2, with:

a) engines at not more than sufficient power for zero thrust at a speed not greater than 110 per cent of the stalling speed;

b) propeller pitch controls in the position recommended for normal use during take-off;

c) landing gear extended;

d) wing flaps in the landing position;

e) cowl flaps and radiator shutters closed or nearly closed;

f) centre of gravity in that position within the permissible landing range which gives the maximum value of stalling speed or of minimum steady flight speed;

g) aeroplane mass equal to the mass involved in the specification under consideration.

2.5 V_{S_1}

V_{S_1} denotes the stalling speed if obtained in flight tests conducted in accordance with 2.3, or the minimum steady flight speed, CAS, as defined in 2.2, with:

a) engines at not more than sufficient power for zero thrust at a speed not greater than 110 per cent of the stalling speed;

b) propeller pitch controls in the position recommended for normal use during take-off;

c) aeroplane in the configuration in all other respects and at the mass prescribed in the specification under consideration.

3. Take-off

3.1 Mass

The mass of the aeroplane at take-off is not to exceed the maximum take-off mass specified in the flight manual for the altitude at which the take-off is to be made.

3.2 Performance

The performance of the aeroplane as determined from the information contained in the flight manual is such that:

a) the accelerate-stop distance required does not exceed the accelerate-stop distance available;

b) the take-off distance required does not exceed the take-off distance available;

c) the take-off path provides a vertical clearance of not less than 15.2 m up to D = 500 m (50 ft up to D = 1 500 ft) and 15.2 + 0.01 [D – 500] m (50 + 0.01 [D – 1 500] ft) thereafter, above all obstacles lying within 60 m plus half the wing span of the aeroplane plus 0.125D on either side of the flight path, except that obstacles lying beyond 1 500 m on either side of the flight path need not be cleared.

The distance D is the horizontal distance that the aeroplane has travelled from the end of the take-off distance available.

Note.— This need not be carried beyond the point at which the aeroplane would be able, without further gaining in height, to commence a landing procedure at the aerodrome of take-off or, alternatively, has attained the minimum safe altitude for commencing flight to another aerodrome.

However, the lateral obstacle clearance is liable to be reduced (below the values stated above) when, and to the extent that, this is warranted by special provisions or conditions which assist the pilot to avoid inadvertent lateral deviations from the intended flight path. For example, particularly in poor weather conditions, a precise radio aid may assist the pilot to maintain the intended flight path. Also, when the take-off is made in sufficiently good visibility conditions, it may, in some cases, be possible to avoid obstacles which are clearly visible but may be within the lateral limits noted in c) above.

Note 1.— The procedures used in defining the accelerate-stop distance required, the take-off distance required and the take-off flight path are described in the Appendix to this example.

Note 2.— In some national codes similar to this example, the specification for "performance" at take-off is such that no credit can be taken for any increase in length of accelerate-stop distance available and take-off distance available beyond the length specified in Section 1 for take-off run available. Those codes specify a vertical clearance of not less than 15.2 m (50 ft) above all obstacles lying within 60 m on either side of the flight path while still within the confines of the aerodrome, and 90 m on either side of the flight path when outside those confines. It is to be observed that those codes are such that they do not provide for an alternative to the method of elements (see the Appendix to this example) in the determination of the take-off path. It is considered that those codes are compatible with the general intent of this example.

3.3 Conditions

For the purpose of 3.1 and 3.2, the performance is that corresponding to:

a) the mass of the aeroplane at the start of take-off;

b) an altitude equal to the elevation of the aerodrome;

and for the purpose of 3.2:

c) the ambient temperature at the time of take-off for 3.2 a) and b) only;

d) the runway slope in the direction of take-off (landplanes);

e) not more than 50 per cent of the reported wind component opposite to the direction of take-off, and not less than 150 per cent of the reported wind component in the direction of take-off. In certain cases of operation of seaplanes, it has been found necessary to take account of the reported wind component normal to the direction of take-off.

3.4 Critical point

In applying 3.2 the critical point chosen for establishing compliance with 3.2 a) is not nearer to the starting point than that used for establishing compliance with 3.2 b) and 3.2 c).

3.5 Turns

In case the flight path includes a turn with bank greater than 15 degrees, the clearances specified in 3.2 c) are increased by an adequate amount during the turn, and the distance D is measured along the intended track.

4. En route

4.1 One power-unit inoperative

4.1.1 At all points along the route or planned diversion therefrom, the aeroplane is capable, at the minimum flight altitudes en route, of a steady rate of climb with one power-unit inoperative, as determined from the flight manual, of at least

1) $K\left(\frac{V_{S_0}}{185.2}\right)^2$ m/s, V_{S_0} being expressed in km/h;

2) $K\left(\frac{V_{S_0}}{100}\right)^2$ m/s, V_{S_0} being expressed in kt;

3) $K\left(\frac{V_{S_0}}{100}\right)^2$ ft/min, V_{S_0} being expressed in kt;

and K having the following value:

$K = 4.04 - \frac{5.40}{N}$ in the case of 1) and 2); and

$K = 797 - \frac{1\ 060}{N}$ in the case of 3)

where N is the number of power units installed.

It should be noted that minimum flight altitudes are usually considered to be not less than 300 m (1 000 ft) above terrain along and adjacent to the flight path.

4.1.2 As an alternative to 4.1.1 the aeroplane is operated at an all power-unit operating altitude such that, in the event of a power-unit failure, it is possible to continue the flight to an aerodrome where a landing can be made in accordance with 5.3, the flight path clearing all terrain and obstructions along the route within 8 km (4.3 NM) on either side of the intended track by at least 600 m (2 000 ft). In addition, if such a procedure is utilized, the following provisions are complied with:

a) the rate of climb, as determined from the flight manual for the appropriate mass and altitude, used in calculating the flight path is diminished by an amount equal to

1) $K \left(\frac{V_{S_0}}{185.2}\right)^2$ m/s, V_{S_0} being expressed in km/h;

2) $K \left(\frac{V_{S_0}}{100}\right)^2$ m/s, V_{S_0} being expressed in kt;

3) $K \left(\frac{V_{S_0}}{100}\right)^2$ ft/min, V_{S_0} being expressed in kt;

and K having the following value:

$K = 4.04 - \frac{5.40}{N}$ in the case of 1) and 2); and

$K = 797 - \frac{1\ 060}{N}$ in the case of 3)

where N is the number of power units installed;

b) the aeroplane complies with 4.1.1 at 300 m (1 000 ft) above the aerodrome used as an alternate in this procedure;

c) after the power-unit failure considered, account is taken of the effect of winds and temperatures on the flight path;

d) it is assumed that the mass of the aeroplane as it proceeds along its intended track is progressively reduced by normal consumption of fuel and oil;

e) it is customary to assume such fuel jettisoning as is consistent with reaching the aerodrome in question.

4.2 Two power-units inoperative
(applicable only to aeroplanes with four power-units)

The possibility of two power-units becoming inoperative when the aeroplane is more than 90 minutes at all power-units operating cruising speed from an en-route alternate aerodrome is catered for. This is done by verifying that at whatever such point such a double failure may occur, the aeroplane in the configuration and with the engine power specified in the flight manual can thereafter reach the alternate aerodrome without coming below the minimum flight altitude. It is customary to assume such fuel jettisoning as is consistent with reaching the aerodrome in question.

5. Landing

5.1 Mass

The calculated mass for the expected time of landing at the aerodrome of intended landing or any destination alternate aerodrome is not to exceed the maximum specified in the flight manual for the elevation of that aerodrome.

5.2 Landing distance

5.2.1 *Aerodrome of intended landing*

The landing distance at the aerodrome of the intended landing, as determined from the flight manual, is not to exceed 60 per cent of the landing distance available on:

a) the most suitable landing surface for a landing in still air; and, if more severe,

b) any other landing surface that may be required for landing because of expected wind conditions at the time of arrival.

5.2.2 *Alternate aerodromes*

The landing distance at any alternate aerodrome, as determined from the flight manual, is not to exceed 70 per cent of the landing distance available on:

a) the most suitable landing surface for a landing in still air; and, if more severe,

b) any other landing surface that may be required for landing because of expected wind conditions at the time of arrival.

Note.— The procedure used in determining the landing distance is described in the Appendix to this example.

5.3 Conditions

For the purpose of 5.2, the landing distances are not to exceed those corresponding to:

a) the calculated mass of the aeroplane for the expected time of landing;

b) an altitude equal to the elevation of the aerodrome;

c) for the purpose of 5.2.1 a) and 5.2.2 a), still air;

d) for the purpose of 5.2.1 b) and 5.2.2 b), not more than 50 per cent of the expected wind component along the landing path and opposite to the direction of landing and not less than 150 per cent of the expected wind component in the direction of landing.

APPENDIX TO EXAMPLE 1 ON AEROPLANE PERFORMANCE OPERATING LIMITATIONS — PROCEDURES USED IN DETERMINING TAKE-OFF AND LANDING PERFORMANCE

1. General

1.1 Unless otherwise specified, Standard Atmosphere and still air conditions are applied.

1.2 Engine powers are based on a water vapour pressure corresponding to 80 per cent relative humidity in standard conditions. When performance is established for temperature above standard, the water vapour pressure for a given altitude is assumed to remain at the value stated above for standard atmospheric conditions.

1.3 Each set of performance data required for a particular flight condition is determined with the powerplant accessories absorbing the normal amount of power appropriate to that flight condition.

1.4 Various wing flap positions are selected. These positions are permitted to be made variable with mass, altitude and temperature in so far as this is considered consistent with acceptable operating practices.

1.5 The position of the centre of gravity is selected within the permissible range so that the performance achieved in the configuration and power indicated in the specification under consideration is a minimum.

1.6 The performance of the aeroplane is determined in such a manner that under all conditions the approved limitations for the powerplant are not exceeded.

1.7 The determined performance is so scheduled that it can serve directly in showing compliance with the aeroplane performance operating limitations.

2. Take-off

2.1 General

2.1.1 The take-off performance data are determined:

a) for the following conditions:

1) sea level;

2) aeroplane mass equal to the maximum take-off mass at sea level;

3) level, smooth, dry and hard take-off surfaces (landplanes);

4) smooth water of declared density (seaplanes);

b) over selected ranges of the following variables:

1) atmospheric conditions, namely: altitude and also pressure-altitude and temperature;

2) aeroplane mass;

3) steady wind velocity parallel to the direction of take-off;

4) steady wind velocity normal to the direction of take-off (seaplanes);

5) uniform take-off surface slope (landplanes);

6) type of take-off surface (landplanes);

7) water surface condition (seaplanes);

8) density of water (seaplanes);

9) strength of current (seaplanes).

2.1.2 The methods of correcting the performance data to obtain data for adverse atmospheric conditions include appropriate allowance for any increased airspeeds and cowl flap or radiator shutter openings necessary under such conditions to maintain engine temperatures within appropriate limits.

2.1.3 For seaplanes appropriate interpretations of the term landing gear, etc., are made to provide for the operation of retractable floats, if employed.

2.2 Take-off safety speed

2.2.1 The take-off safety speed is an airspeed (CAS) so selected that it is not less than:

a) $1.20V_{S_1}$, for aeroplanes with two power-units;

b) $1.15V_{S_1}$, for aeroplanes having more than two power-units;

c) 1.10 times the minimum control speed, V_{MC} established as prescribed in 2.3;

where V_{S_1} is appropriate to the configuration, as described in 2.3.1 b), c) and d).

2.3 Minimum control speed

2.3.1 The minimum control speed, V_{MC}, is determined not to exceed a speed equal to $1.2V_{S_1}$, where V_{S_1} corresponds with the maximum certificated take-off mass with:

a) maximum take-off power on all power-units;

b) landing gear retracted;

c) wing flaps in take-off position;

d) cowl flaps and radiator shutters in the position recommended for normal use during take-off;

e) aeroplane trimmed for take-off;

f) aeroplane airborne and ground effect negligible.

2.3.2 The minimum control speed is such that, when any one power-unit is made inoperative at that speed, it is possible to recover control of the aeroplane with the one power-unit still inoperative and to maintain the aeroplane in straight flight at that speed either with zero yaw or with a bank not in excess of 5 degrees.

2.3.3 From the time at which the power-unit is made inoperative to the time at which recovery is complete, exceptional skill, alertness, or strength on the part of the pilot is not required to prevent any loss of altitude other than that implicit in the loss of performance or any change of heading in excess of 20 degrees, nor does the aeroplane assume any dangerous attitude.

2.3.4 It is demonstrated that to maintain the aeroplane in steady straight flight at this speed after recovery and before retrimming does not require a rudder control force exceeding 800 N and does not make it necessary for the flight crew to reduce the power of the remaining power-units.

2.4 Critical point

2.4.1 The critical point is a selected point at which, for the purpose of determining the accelerate-stop distance and the take-off path, failure of the critical power-unit is assumed to occur. The pilot is provided with a ready and reliable means of determining when the critical point has been reached.

2.4.2 If the critical point is located so that the airspeed at that point is less than the take-off safety speed, it is demonstrated that, in the event of sudden failure of the critical power-unit at all speeds down to the lowest speed corresponding with the critical point, the aeroplane is controllable satisfactorily and that the take-off can be continued safely, using normal piloting skill, without reducing the thrust of the remaining power-units.

2.5 Accelerate-stop distance required

2.5.1 The accelerate-stop distance required is the distance required to reach the critical point from a standing start and, assuming the critical power-unit to fail suddenly at this point, to stop if a landplane, or to bring the aeroplane to a speed of approximately 6 km/h (3 kt) if a seaplane.

2.5.2 Use of braking means in addition to, or in lieu of, wheel brakes is permitted in determining this distance, provided that they are reliable and that the manner of their employment is such that consistent results can be expected under normal conditions of operation, and provided that exceptional skill is not required to control the aeroplane.

2.5.3 The landing gear remains extended throughout this distance.

2.6 Take-off path

2.6.1 *General*

2.6.1.1 The take-off path is determined either by the method of elements, 2.6.2, or by the continuous method, 2.6.3, or by any acceptable combination of the two.

2.6.1.2 Adjustment of the provisions of 2.6.2.1 c) 1) and 2.6.3.1 c) is permitted when the take-off path would be affected by the use of an automatic pitch changing device, provided that a level of performance safety exemplified by 2.6 is demonstrated.

2.6.2 *Method of elements*

2.6.2.1 In order to define the take-off path, the following elements are determined:

a) The distance required to accelerate the aeroplane from a standing start to the point at which the take-off safety speed is first attained, subject to the following provisions:

1) the critical power-unit is made inoperative at the critical point;

2) the aeroplane remains on or close to the ground;

3) the landing gear remains extended.

b) The horizontal distance traversed and the height attained by the aeroplane operating at the take-off safety speed during the time required to retract the landing gear, retraction being initiated at the end of a) with:

1) the critical power-unit inoperative, its propeller windmilling, and the propeller pitch control in the position recommended for normal use during take-off, except that, if the completion of the retraction of the landing gear occurs later than the completion of the stopping of the propeller initiated in accordance with c) 1), the propeller may be assumed to be stopped throughout the remainder of the time required to retract the landing gear;

2) the landing gear extended.

c) When the completion of the retraction of the landing gear occurs earlier than the completion of the stopping of the propeller, the horizontal distance traversed and the height attained by the aeroplane in the time elapsed from the end of b) until the rotation of the inoperative propeller has been stopped, when:

1) the operation of stopping the propeller is initiated not earlier than the instant the aeroplane has attained a total height of 15.2 m (50 ft) above the take-off surface;

2) the aeroplane speed is equal to the take-off safety speed;

3) the landing gear is retracted;

4) the inoperative propeller is windmilling with the propeller pitch control in the position recommended for normal use during take-off.

d) The horizontal distance traversed and the height attained by the aeroplane in the time elapsed from the end of c) until the time limit on the use of take-off power is reached, while operating at the take-off safety speed, with:

1) the inoperative propeller stopped;

2) the landing gear retracted.

The elapsed time from the start of the take-off need not extend beyond a total of 5 minutes.

e) The slope of the flight path with the aeroplane in the configuration prescribed in d) and with the remaining power-unit(s) operating within the maximum continuous power limitations, where the time limit on the use of take-off power is less than 5 minutes.

2.6.2.2 If satisfactory data are available, the variations in drag of the propeller during feathering and of the landing gear throughout the period of retraction are permitted to be taken into account in determining the appropriate portions of the elements.

2.6.2.3 During the take-off and subsequent climb represented by the elements, the wing flap control setting is not changed, except that changes made before the critical point has been reached, and not earlier than 1 minute after the critical point has been passed, are permitted: in this case, it is demonstrated that such changes can be accomplished without undue skill, concentration, or effort on the part of the pilot.

2.6.3 *Continuous method*

2.6.3.1 The take-off path is determined from an actual take-off during which:

a) the critical power-unit is made inoperative at the critical point;

b) the climb-away is not initiated until the take-off safety speed has been reached and the airspeed does not fall below this value in the subsequent climb;

c) retraction of the landing gear is not initiated before the aeroplane reaches the take-off safety speed;

d) the wing flap control setting is not changed, except that changes made before the critical point has been reached, and not earlier than 1 minute after the critical point has been passed, are permitted; in this case, it is demonstrated that such changes can be accomplished without undue skill, concentration, or effort on the part of the pilot;

e) the operation of stopping the propeller is not initiated until the aeroplane has cleared a point 15.2 m (50 ft) above the take-off surface.

2.6.3.2 Suitable methods are provided and employed to take into account, and to correct for, any vertical gradient of wind velocity which may exist during the take-off.

2.7 Take-off distance required

The take-off distance required is the horizontal distance along the take-off flight path from the start of the take-off to a point where the aeroplane attains a height of 15.2 m (50 ft) above the take-off surface.

2.8 Temperature accountability

Operating correction factors for take-off mass and take-off distance are determined to account for temperature above and below those of the Standard Atmosphere. These factors are obtained as follows:

a) For any specific aeroplane type the average full temperature accountability is computed for the range of mass and altitudes above sea level, and for ambient temperatures expected in operation. Account is taken of the temperature effect both on the aerodynamic characteristics of the aeroplane and on the engine power. The full temperature accountability is expressed per degree of temperature in terms of a mass correction, a take-off distance correction and a change, if any, in the position of the critical point.

b) Where 2.6.2 is used to determine the take-off path, the operating correction factors for the aeroplane mass and take-off distance are at least one half of the full accountability values. Where 2.6.3 is used to determine the take-off path, the operating correction factors for the aeroplane mass and take-off distance are equal to the full accountability values. With both methods, the position of the critical point is further corrected by the average amount necessary to assure that the aeroplane can stop within the runway length at the ambient temperature, except that the speed at the critical point is not less than a minimum at which the aeroplane can be controlled with the critical power-unit inoperative.

3. Landing

3.1 General

3.1.1 The landing performance is determined:

a) for the following conditions:

1) sea level;

2) aeroplane mass equal to the maximum landing mass at sea level;

3) level, smooth, dry and hard landing surfaces (landplanes);

4) smooth water of declared density (seaplanes);

b) over selected ranges of the following variables:

1) atmospheric conditions, namely: altitude and also pressure-altitude and temperature;

2) aeroplane mass;

3) steady wind velocity parallel to the direction of landing;

4) uniform landing-surface slope (landplanes);

5) type of landing surface (landplanes);

6) water surface condition (seaplanes);

7) density of water (seaplanes);

8) strength of current (seaplanes).

3.2 Landing distance

3.2.1 The landing distance is the horizontal distance between that point on the landing surface at which the aeroplane is brought to a complete stop or, for seaplanes, to a speed of approximately 6 km/h (3 kt) and that point on the landing surface which the aeroplane cleared by 15.2 m (50 ft).

3.3 Landing technique

3.3.1 In determining the landing distance:

a) immediately before reaching the 15.2 m (50 ft) height, a steady approach is maintained, landing gear fully extended, with an airspeed of not less than $1.3V_{S_0}$;

b) the nose of the aeroplane is not depressed in flight nor the forward thrust increased by application of engine power after reaching the 15.2 m (50 ft) height;

c) the wing flap control is set in the landing position, and remains constant during the final approach, flare out and touch down, and on the landing surface at air speeds above $0.9V_{S_0}$. When the aeroplane is on the landing surface and the airspeed has fallen to less than $0.9V_{S_0}$, change of the wing-flap-control setting is permitted;

d) the landing is made in a manner such that there is no excessive vertical acceleration, no excessive tendency to bounce, and no display of any uncontrollable or otherwise undesirable ground (water) handling characteristics, and such that its repetition does not require either an exceptional degree of skill on the part of the pilot, or exceptionally favourable conditions;

e) wheel brakes are not used in a manner such as to produce excessive wear of brakes or tires, and the operating pressures on the braking system are not in excess of those approved.

3.3.2 In addition to, or in lieu of, wheel brakes, other reliable braking means are permitted to be used in determining the landing distance, provided that the manner of their employment is such that consistent results can be expected under normal conditions of operation and that exceptional skill is not required to control the aeroplane.

3.3.3 The gradient of the steady approach and the details of the technique used in determining the landing distance, together with such variations in the technique as are recommended for landing with the critical power-units inoperative, and any appreciable variation in landing distance resulting therefrom, are entered in the flight manual.

Example 2

Purpose and scope

The purpose of the following example is to illustrate the level of performance intended by the provisions of Chapter 5 as applicable to the types of aeroplanes described below.

This material was contained in substance in Attachment A to the now superseded edition of Annex 6 which became effective on 1 May 1953. It is based on the type of requirements developed by the Standing Committee on Performance* with such detailed changes as are necessary to make it reflect as closely as possible a performance code that has been used nationally.

A substantial number of civil transport aeroplanes have been manufactured and are being operated in accordance with these codes. Those aeroplanes are powered with reciprocating engines, turbo-propellers and turbo-jets. They embrace twin-engined and four-engined aeroplanes over a mass range from approximately 5 500 kg to 70 000 kg over a stalling speed range, V_{S_0}, from approximately 110 to 170 km/h (60 to 90 kt) and over a wing loading range from approximately 120 to 350 kg/m^2. Cruising speeds range up to 740 km/h (400 kt). Those aeroplanes have been used in a very wide range of altitude, air temperature and humidity conditions.

Although only past experience can warrant the fact that this example illustrates the level of performance intended by the Standards and Recommended Practices of Chapter 5, it is considered to be applicable, except for some variations in detail as necessary to fit particular cases, over a much wider range of aeroplane characteristics. Reservation should, however, be made concerning one point. The landing distance specification of this example, not being derived from the same method as other specifications, is valid only for the range of conditions stated for Example 1 in this Attachment.

This example is not intended for application to aeroplanes having short take-off and landing (STOL) or vertical take-off and landing (VTOL) capabilities.

No detailed study has been made of the applicability of this example to operations in all-weather conditions. The validity of this example has not therefore been established for operations which may involve low decision heights and be associated with low weather minima operating techniques and procedures.

1. Definitions

Declared distances.

a) *Take-off run available (TORA).* The length of runway declared available and suitable for the ground run of an aeroplane taking off.

b) *Take-off distance available (TODA).* The length of the take-off run available plus the length of the clearway, if provided.

* The ICAO Standing Committee on Performance, established as a result of recommendations of the Airworthiness and Operations Divisions at their Fourth Sessions, in 1951, met four times between 1951 and 1953. Its Final Report is Doc 7401-AIR/OPS/612.

c) *Accelerate-stop distance available (ASDA).* The length of the take-off run available plus the length of the stopway, if provided.

d) *Landing distance available (LDA).* The length of runway which is declared available and suitable for the ground run of an aeroplane landing.

Note.— The calculation of declared distances is described in Annex 14, Attachment A.

Declared temperature. A temperature selected in such a way that when used for performance purposes, over a series of operations, the average level of safety is not less than would be obtained by using official forecast temperatures.

Expected. Used in relation to various aspects of performance (e.g. rate or gradient of climb) this term means the standard performance for the type, in the relevant conditions (e.g. mass, altitude and temperature).

Height. The vertical distance of a level, a point, or an object considered as a point, measured from a specified datum.

Note.— For the purposes of this example, the point referred to above is the lowest part of the aeroplane and the specified datum is the take-off or landing surface, whichever is applicable.

Landing surface. That part of the surface of an aerodrome which the aerodrome authority has declared available for the normal ground or water run of aircraft landing in a particular direction.

Net gradient. The net gradient of climb throughout these requirements is the expected gradient of climb diminished by the manoeuvre performance (i.e. that gradient of climb necessary to provide power to manoeuvre) and by the margin (i.e. that gradient of climb necessary to provide for those variations in performance which are not expected to be taken explicit account of operationally).

Reference humidity. The relationship between temperature and reference humidity is defined as follows:

— at temperatures at and below ISA, 80 per cent relative humidity,

— at temperatures at and above ISA + 28°C, 34 per cent relative humidity,

— at temperatures between ISA and ISA + 28°C, the relative humidity varies linearly between the humidity specified for those temperatures.

Take-off surface. That part of the surface of an aerodrome which the aerodrome authority has declared available for the normal ground or water run of aircraft taking off in a particular direction.

TAS (True airspeed). The speed of the aeroplane relative to undisturbed air.

Note.— See Chapter 1 and Annexes 8 and 14 for other definitions.

2. Take-off

2.1 Mass

The mass of the aeroplane at take-off is not to exceed the maximum take-off mass specified in the flight manual for the altitude and temperature at which the take-off is to be made.

2.2 Performance

The performance of the aeroplane, as determined from the information contained in the flight manual, is such that:

a) the accelerate-stop distance required does not exceed the accelerate-stop distance available;

b) the take-off run required does not exceed the take-off run available;

c) the take-off distance required does not exceed the take-off distance available;

d) the net take-off flight path starting at a point 10.7 m (35 ft) above the ground at the end of the take-off distance required provides a vertical clearance of not less than 6 m (20 ft) plus 0.005D above all obstacles lying within 60 m plus half the wing span of the aeroplane plus 0.125D on either side of the intended track until the relevant altitude laid down in the operations manual for an en-route flight has been attained; except that obstacles lying beyond 1 500 m on either side of the flight path need not be cleared.

The distance D is the horizontal distance that the aeroplane has travelled from the end of the take-off distance available.

Note.— This need not be carried beyond the point at which the aeroplane would be able, without further gaining in height, to commence a landing procedure at the aerodrome of take-off or, alternatively, has attained the minimum safe altitude for commencing flight to another aerodrome.

However, the lateral obstacle clearance is liable to be reduced (below the values stated above) when, and to the extent that, this is warranted by special provisions or conditions which assist the pilot to avoid inadvertent lateral deviations from the intended flight path. For example, particularly in poor weather conditions, a precise radio aid may assist the pilot to maintain the intended flight path. Also, when the take-off is made in sufficiently good visibility conditions, it may, in some cases, be possible to avoid obstacles which are clearly visible but may be within the lateral limits noted in d) above.

Note.— The procedures used in determining the accelerate-stop distance required, the take-off run required, the take-off distance required and the net take-off flight path are described in the Appendix to this example.

2.3 Conditions

For the purpose of 2.1 and 2.2, the performance is that corresponding to:

a) the mass of the aeroplane at the start of take-off;

b) an altitude equal to the elevation of the aerodrome;

c) either the ambient temperature at the time of take-off, or a declared temperature giving an equivalent average level of performance;

and for the purpose of 2.2:

d) the surface slope in the direction of take-off (land-planes);

e) not more than 50 per cent of the reported wind component opposite to the direction of take-off, and not less than 150 per cent of the reported wind component in the direction of take-off. In certain cases of operation of seaplanes, it has been found necessary to take account of the reported wind component normal to the direction of take-off.

2.4 Power failure point

In applying 2.2 the power failure point chosen for establishing compliance with 2.2 a) is not nearer to the starting point than that used for establishing compliance with 2.2 b) and 2.2 c).

2.5 Turns

The net take-off flight path may include turns, provided that:

a) the radius of steady turn assumed is not less than that scheduled for this purpose in the flight manual;

b) if the planned change of direction of the take-off flight path exceeds 15 degrees, the clearance of the net take-off flight path above obstacles is at least 30 m (100 ft) during and after the turn, and the appropriate allowance, as prescribed in the flight manual, is made for the reduction in assumed gradient of climb during the turn;

c) the distance D is measured along the intended track.

3. En route

3.1 All power-units operating

At each point along the route and planned diversion therefrom, the all power-units operating performance ceiling appropriate to the aeroplane mass at that point, taking into account the amount of fuel and oil expected to be consumed, is not less than the minimum altitude (see 4.2.6 of this Part) or, if greater, the planned altitude which it is intended to maintain with all power-units operating, in order to ensure compliance with 3.2 and 3.3.

3.2 One power-unit inoperative

From each point along the route and planned diversions therefrom, it is possible in the event of one power-unit becoming inoperative to continue the flight to an en-route alternate aerodrome where a landing can be made in accordance with 4.2 and, on arrival at the aerodrome, the net gradient of climb is not less than zero at a height of 450 m (1 500 ft) above the elevation of the aerodrome.

3.3 Two power-units inoperative
(applicable only to aeroplanes with four power-units)

For each point along the route or planned diversions therefrom, at which the aeroplane is more than 90 minutes' flying time at all power-units operating cruising speed from an en-route alternate aerodrome, the two power-units inoperative net flight path is such that a height of at least 300 m (1 000 ft) above terrain can be maintained until arrival at such an aerodrome.

Note.— The net flight path is that attainable from the expected gradient of climb or descent diminished by 0.2 per cent.

3.4 Conditions

The ability to comply with 3.1, 3.2 and 3.3 is assessed:

a) either on the basis of forecast temperatures, or on the basis of declared temperatures giving an equivalent average level of performance;

b) on the forecast data on wind velocity versus altitude and locality assumed for the flight plan as a whole;

c) in the case of 3.2 and 3.3, on the scheduled gradient of climb or gradient of descent after power failure appropriate to the mass and altitude at each point considered;

d) on the basis that, if the aeroplane is expected to gain altitude at some point in the flight after power failure has occurred, a satisfactory positive net gradient of climb is available;

e) in the case of 3.2 on the basis that the minimum altitude (see 4.2.6 of this Part), appropriate to each point between the place at which power failure is assumed to occur and the aerodrome at which it is intended to alight, is exceeded;

f) in the case of 3.2, making reasonable allowance for indecision and navigational error in the event of power-unit failure at any point.

4. Landing

4.1 Mass

The calculated mass for the expected time of landing at the aerodrome of intended landing or any destination alternate aerodrome is not to exceed the maximum specified in the flight manual for the altitude and temperature at which the landing is to be made.

4.2 Landing distance required

The landing distance required at the aerodrome of the intended landing or at any alternate aerodrome, as determined from the flight manual, is not to exceed the landing distance available on:

a) the most suitable landing surface for a landing in still air; and, if more severe,

b) any other landing surface that may be required for landing because of expected wind conditions at the time of arrival.

4.3 Conditions

For the purpose of 4.2, the landing distance required is that corresponding to:

a) the calculated mass of the aeroplane for the expected time of landing;

b) an altitude equal to the elevation of the aerodrome;

c) the expected temperature at which landing is to be made or a declared temperature giving an equivalent average level of performance;

d) the surface slope in the direction of landing;

e) for the purpose of 4.2 a), still air;

f) for the purpose of 4.2 b), not more than 50 per cent of the expected wind component along the landing path and opposite to the direction of landing and not less than 150 per cent of the expected wind component in the direction of landing.

APPENDIX TO EXAMPLE 2 ON AEROPLANE PERFORMANCE OPERATING LIMITATIONS — PROCEDURES USED IN DETERMINING TAKE-OFF AND LANDING PERFORMANCE

1. General

1.1 Unless otherwise stated, reference humidity and still air conditions are applied.

1.2 The performance of the aeroplane is determined in such a manner that the approved airworthiness limitations for the aeroplane and its systems are not exceeded.

1.3 The wing flap positions for showing compliance with the performance specifications are selected.

Note.— Alternative wing flap positions are made available, if so desired, in such a manner as to be consistent with acceptably simple operating techniques.

1.4 The position of the centre of gravity is selected within the permissible range so that the performance achieved in the configuration and power indicated in the specification under consideration is a minimum.

1.5 The performance of the aeroplane is determined in such a manner that under all conditions the approved limitations for the powerplant are not exceeded.

1.6 While certain configurations of cooling gills have been specified based upon maximum anticipated temperature, the use of other positions is acceptable provided that an equivalent level of safety is maintained.

1.7 The determined performance is so scheduled that it can serve directly in showing compliance with the aeroplane performance operating limitations.

2. Take-off

2.1 General

2.1.1 The following take-off data are determined for sea level pressure and temperature in the Standard Atmosphere, and reference humidity conditions, with the aeroplane at the corresponding maximum take-off mass for a level, smooth, dry and hard take-off surface (landplanes) and for smooth water of declared density (seaplanes):

a) take-off safety speed and any other relevant speed;

b) power failure point; } associated with items d), e), f)

c) power failure point criterion, e.g. airspeed indicator reading; } associated with items d), e), f)

d) accelerate-stop distance required;

e) take-off run required;

f) take-off distance required;

g) net take-off flight path;

h) radius of a steady Rate 1 (180 degrees per minute) turn made at the airspeed used in establishing the net take-off flight path, and the corresponding reduction in gradient of climb in accordance with the conditions of 2.9.

2.1.2 The determination is also made over selected ranges of the following variables:

a) aeroplane mass;

b) pressure-altitude at the take-off surface;

c) outside air temperature;

d) steady wind velocity parallel to the direction of take-off;

e) steady wind velocity normal to the direction of take-off (seaplanes);

f) take-off surface slope over the take-off distance required (landplanes);

g) water surface condition (seaplanes);

h) density of water (seaplanes);

i) strength of current (seaplanes);

j) power failure point (subject to provisions of 2.4.3).

2.1.3 For seaplanes appropriate interpretations of the term landing gear, etc., are made to provide for the operation of retractable floats, if employed.

2.2 Take-off safety speed

2.2.1 The take-off safety speed is an airspeed (CAS) so selected that it is not less than:

a) $1.20V_{S_1}$, for aeroplanes with two power-units;

b) $1.15V_{S_1}$, for aeroplanes having more than two power-units;

c) 1.10 times the minimum control speed, V_{MC}, established as prescribed in 2.3;

d) the minimum speed prescribed in 2.9.7.6;

where V_{S_1} is appropriate to the take-off configuration.

Note.— See Example 1 for definition of V_{S_1}.

2.3 Minimum control speed

2.3.1 The minimum control speed is such that, when any one power-unit is made inoperative at that speed, it is possible to recover control of the aeroplane with the one power-unit still inoperative and to maintain the aeroplane in straight flight at that speed either with zero yaw or with a bank not in excess of 5 degrees.

2.3.2 From the time at which the power-unit is made inoperative to the time at which recovery is complete, exceptional skill, alertness, or strength, on the part of the pilot is not required to prevent any loss of altitude other than that implicit in the loss of performance or any change of heading in excess of 20 degrees, nor does the aeroplane assume any dangerous attitude.

2.3.3 It is demonstrated that to maintain the aeroplane in steady straight flight at this speed after recovery and before retrimming does not require a rudder control force exceeding 800 N and does not make it necessary for the flight crew to reduce the power of the remaining power-units.

2.4 Power failure point

2.4.1 The power failure point is the point at which sudden complete loss of power from the power-unit, critical from the performance aspect in the case considered, is assumed to occur. If the airspeed corresponding to this point is less than the take-off safety speed, it is demonstrated that, in the event of sudden failure of the critical power-unit at all speeds down to the lowest speed corresponding with the power failure point, the aeroplane is controllable satisfactorily and that the take-off can be continued safely, using normal piloting skill, without:

a) reducing the thrust of the remaining power-units; and

b) encountering characteristics which would result in unsatisfactory controllability on wet runways.

2.4.2 If the critical power-unit varies with the configuration, and this variation has a substantial effect on performance, either the critical power-unit is considered separately for each element concerned, or it is shown that the established performance provides for each possibility of single power-unit failure.

2.4.3 The power failure point is selected for each take-off distance required and take-off run required, and for each accelerate-stop distance required. The pilot is provided with a ready and reliable means of determining when the applicable power failure point has been reached.

2.5 Accelerate-stop distance required

2.5.1 The accelerate-stop distance required is the distance required to reach the power failure point from a standing start and, assuming the critical power-unit to fail suddenly at this point, to stop if a landplane, or to bring the aeroplane to a speed of approximately 9 km/h (5 kt) if a seaplane.

2.5.2 Use of braking means in addition to, or in lieu of, wheel brakes is permitted in determining this distance, provided that they are reliable and that the manner of their employment is such that consistent results can be expected under normal conditions of operation, and provided that exceptional skill is not required to control the aeroplane.

2.6 Take-off run required

The take-off run required is the greater of the following:

1.15 times the distance required with all power-units operating to accelerate from a standing start to take-off safety speed;

1.0 times the distance required to accelerate from a standing start to take-off safety speed assuming the critical power-unit to fail at the power failure point.

2.7 Take-off distance required

2.7.1 The take-off distance required is the distance required to reach a height of:

10.7 m (35 ft), for aeroplanes with two power-units,

15.2 m (50 ft), for aeroplanes with four power-units,

above the take-off surface, with the critical power-unit failing at the power failure point.

2.7.2 The heights mentioned above are those which can be just cleared by the aeroplane when following the relevant flight path in an unbanked attitude with the landing gear extended.

Note.— Paragraph 2.8 and the corresponding operating requirements, by defining the point at which the net take-off flight path starts as the 10.7 m (35 ft) height point, ensure that the appropriate net clearances are achieved.

2.8 Net take-off flight path

2.8.1 The net take-off flight path is the one-power-unit-inoperative flight path which starts at a height of 10.7 m (35 ft) at the end of the take-off distance required and extends to a height of at least 450 m (1 500 ft) calculated in accordance with the conditions of 2.9, the expected gradient of climb being diminished at each point by a gradient equal to:

0.5 per cent, for aeroplanes with two power-units,

0.8 per cent, for aeroplanes with four power-units.

2.8.2 The expected performance with which the aeroplane is credited in the take-off wing flap, take-off power condition, is available at the selected take-off safety speed and is substantially available at 9 km/h (5 kt) below this speed.

2.8.3 In addition the effect of significant turns is scheduled as follows:

Radius. The radius of a steady Rate 1 (180 degrees per minute) turn in still air at the various true airspeeds corresponding to the take-off safety speeds for each wing-flap setting used in establishing the net take-off flight path below the 450 m (1 500 ft) height point, is scheduled.

Performance change. The approximate reduction in performance due to the above turns is scheduled and corresponds to a change in gradient of

$\left[0.5\left(\frac{V}{185.2}\right)^2\right]$ % where V is the true airspeed in km/h; and

$\left[0.5\left(\frac{V}{100}\right)^2\right]$ % where V is the true airspeed in knots; and

2.9 Conditions

2.9.1 *Air speed*

2.9.1.1 In determining the take-off distance required, the selected take-off safety speed is attained before the end of the take-off distance required is reached.

2.9.1.2 In determining the net take-off flight path below a height of 120 m (400 ft), the selected take-off safety speed is maintained, i.e. no credit is taken for acceleration before this height is reached.

2.9.1.3 In determining the net take-off flight path above a height of 120 m (400 ft), the airspeed is not less than the selected take-off safety speed. If the aeroplane is accelerated after reaching a height of 120 m (400 ft) and before reaching a height of 450 m (1 500 ft), the acceleration is assumed to take place in level flight and to have a value equal to the true acceleration available diminished by an acceleration equivalent to a climb gradient equal to that specified in 2.8.1.

2.9.1.4 The net take-off flight path includes transition to the initial en-route configuration and airspeed. During all transition stages, the above provisions regarding acceleration are complied with.

2.9.2 *Wing flaps*

2.9.2.1 The wing flaps are in the same position (take-off position) throughout, except:

a) that the flaps may be moved at heights above 120 m (400 ft), provided that the airspeed specifications of 2.9.1 are met and that the take-off safety speed applicable to subsequent elements is appropriate to the new flap position;

b) the wing flaps may be moved before the earliest power failure point is reached, if this is established as a satisfactory normal procedure.

2.9.3 *Landing gear*

2.9.3.1 In establishing the accelerate-stop distance required and the take-off run required, the landing gear are extended throughout.

2.9.3.2 In establishing the take-off distance required, retraction of the landing gear is not initiated until the selected take-off safety speed has been reached, except that, when the selected take-off safety speed exceeds the minimum value prescribed in 2.2 retraction of the landing gear may be initiated when a speed greater than the minimum value prescribed in 2.2 has been reached.

2.9.3.3 In establishing the net take-off flight path, the retraction of the landing gear is assumed to have been initiated not earlier than the point prescribed in 2.9.3.2.

2.9.4 *Cooling*

For that part of the net take-off flight path before the 120 m (400 ft) height point, plus any transition element which starts at the 120 m (400 ft) height point, the cowl flap position is such that, starting the take-off at the maximum temperatures permitted for the start of take-off, the relevant maximum temperature limitations are not exceeded in the maximum anticipated air temperature conditions. For any subsequent part of the net take-off flight path, the cowl flap position and airspeed are such that the appropriate temperature limitations would not be exceeded in steady flight in the maximum anticipated air temperatures. The cowl flaps of all power-units at the start of the take-off are as above, and the cowl flaps of the inoperative power-unit may be assumed to be closed upon reaching the end of the take-off distance required.

2.9.5 *Power unit conditions*

2.9.5.1 From the starting point to the power failure point, all power-units may operate at maximum take-off power conditions. The operative power-units do not operate at maximum take-off power limitations for a period greater than that for which the use of maximum take-off power is permitted.

2.9.5.2 After the period for which the take-off power may be used, maximum continuous power limitations are not exceeded. The period for which maximum take-off power is used is assumed to begin at the start of the take-off run.

2.9.6 *Propeller conditions*

At the starting point, all propellers are set in the condition recommended for take-off. Propeller feathering or pitch coarsening is not initiated (unless it is by automatic or auto-selective means) before the end of the take-off distance required.

2.9.7 *Technique*

2.9.7.1 In that part of the net take-off flight path prior to the 120 m (400 ft) height point, no changes of configuration or power are made which have the effect of reducing the gradient of climb.

2.9.7.2 The aeroplane is not flown or assumed to be flown in a manner which would make the gradient of any part of the net take-off flight path negative.

2.9.7.3 The technique chosen for those elements of the flight path conducted in steady flight, which are not the subject of numerical climb specifications, are such that the net gradient of climb is not less than 0.5 per cent.

2.9.7.4 All information which it may be necessary to furnish to the pilot, if the aeroplane is to be flown in a manner consistent with the scheduled performance, is obtained and recorded.

2.9.7.5 The aeroplane is held on, or close to the ground until the point at which it is permissible to initiate landing gear retraction has been reached.

2.9.7.6 No attempt is made to leave the ground until a speed has been reached which is at least:

15 per cent above the minimum possible unstick speed with all power-units operating;

7 per cent above the minimum possible unstick speed with the critical power-unit inoperative;

except that these unstick speed margins may be reduced to 10 per cent and 5 per cent, respectively, when the limitation is due to landing gear geometry and not to ground stalling characteristics.

Note.— Compliance with this specification is determined by attempting to leave the ground at progressively lower speeds (by normal use of the controls except that up-elevator is applied earlier and more coarsely than is normal) until it has been shown to be possible to leave the ground at a speed which complies with these specifications, and to complete the take-off. It is recognized that during the test manoeuvre, the usual margin of control associated with normal operating techniques and scheduled performance information will not be available.

2.10 Methods of derivation

2.10.1 *General*

The take-off field lengths required are determined from measurements of actual take-offs and ground runs. The net take-off flight path is determined by calculating each section separately on the basis of performance data obtained in steady flight.

2.10.2 *Net take-off flight path*

Credit is not taken for any change in configuration until that change is complete, unless more accurate data are available to substantiate a less conservative assumption; ground effect is ignored.

2.10.3 *Take-off distance required*

Satisfactory corrections for the vertical gradient of wind velocity are made.

3. Landing

3.1 General

3.1.1 The landing distance required is determined:

a) for the following conditions:

1) sea level;

2) aeroplane mass equal to the maximum landing mass at sea level;

3) level, smooth, dry and hard landing surfaces (landplanes);

4) smooth water of declared density (seaplanes);

b) over selected ranges of the following variables:

1) atmospheric conditions, namely: altitude, or pressure-altitude and temperature;

2) aeroplane mass;

3) steady wind velocity parallel to the direction of landing;

4) uniform landing surface slope (landplanes);

5) nature of landing surface (landplanes);

6) water surface condition (seaplanes);

7) density of water (seaplanes);

8) strength of current (seaplanes).

3.2 Landing distance required

The landing distance required is the measured horizontal distance between that point on the landing surface at which the aeroplane is brought to a complete stop or, for seaplanes, to a speed of approximately 9 km/h (5 kt) and that point on the landing surface which the aeroplane cleared by 15.2 m (50 ft) multiplied by a factor of 1/0.7.

Note.— Some States have found it necessary to use a factor of 1/0.6 instead of 1/0.7.

3.3 Landing technique

3.3.1 In determining the measured landing distance:

a) immediately before reaching the 15.2 m (50 ft) height, a steady approach is maintained, landing gear fully extended, with an airspeed of at least $1.3V_{S_0}$;

Note.— See Example 1 for definition of V_{S_0}.

b) the nose of the aeroplane is not depressed in flight nor the forward thrust increased by application of engine power after reaching the 15.2 m (50 ft) height;

c) the power is not reduced in such a way that the power used for establishing compliance with the balked landing climb requirement would not be obtained within 5 seconds if selected at any point down to touch down;

d) reverse pitch or reverse thrust are not used when establishing the landing distance using this method and field length factor. Ground fine pitch is used if the effective drag/weight ratio in the airborne part of the landing distance is not less satisfactory than that of conventional piston-engine aeroplane;

Note.— This does not mean that reverse pitch or reverse thrust, or use of ground fine pitch, are to be discouraged.

e) the wing flap control is set in the landing position, and remains constant during the final approach, flare out and touch down, and on the landing surface at airspeeds above $0.9V_{S_0}$. When the aeroplane is on the landing surface and the airspeed has fallen to less than $0.9V_{S_0}$, change of the wing-flap-control setting is acceptable;

f) the landing is made in a manner such that there is no excessive vertical acceleration, no excessive tendency to bounce, and no display of any other undesirable handling characteristics, and such that its repetition does not require either an exceptional degree of skill on the part of the pilot, or exceptionally favourable conditions;

g) wheel brakes are not used in a manner such as to produce excessive wear of brakes or tires, and the operating pressures on the braking system are not in excess of those approved.

3.3.2 The gradient of the steady approach and the details of the technique used in determining the landing distance, together with such variations in the technique as are recommended for landing with the critical engine inoperative, and any appreciable variation in landing distance resulting therefrom, are entered in the flight manual.

Example 3

Purpose and scope

The purpose of the following example is to illustrate the level of performance intended by the provisions of Chapter 5 as applicable to turbine-powered subsonic transport type aeroplanes over 5 700 kg maximum certificated take-off mass having two or more engines. However, where relevant, it can be applied to all turbine or piston-engined subsonic aeroplanes having two, three or four engines. This example is shown to be compatible with principal national airworthiness codes in effect in 1969.

No study has been made of the applicability of this material to turbine-powered subsonic aeroplanes having characteristics other than those of the transport aeroplanes introduced into service up to 1969.

This example is not intended for application to aeroplanes having short take-off and landing (STOL) or vertical take-off and landing (VTOL) capabilities.

No detailed study has been made of the applicability of this example to operations in all-weather conditions. The validity of this example has not therefore been established for operations which may involve low decision heights and be associated with low minima operating techniques and procedures.

1. General

1.1 The provisions of 1 to 5 are to be complied with, unless deviations therefrom are specifically authorized by the State of Registry on the ground that the special circumstances of a particular case make a literal observance of these provisions unnecessary for safety.

1.2 Compliance with 1 to 5 is to be established using performance data in the flight manual and in accordance with other applicable operating requirements. In no case may the limitations in the flight manual be exceeded. However, additional limitations may be applied when operational conditions not included in the flight manual are encountered.

1.3 The procedures scheduled in the flight manual are to be followed except where operational circumstances require the use of modified procedures in order to maintain the intended level of safety.

Note.— See Part III, Section 1 of the Airworthiness Technical Manual *(Doc 9051) for the related airworthiness performance guidance material.*

2. Aeroplane take-off performance limitations

2.1 No aeroplane is taken off at a mass which exceeds the take-off mass specified in the flight manual for the altitude of the aerodrome and for the ambient temperature existing at the time of the take-off.

2.2 No aeroplane is taken off at a mass such that, allowing for normal consumption of fuel and oil in flight to the aerodrome of destination and to the destination alternate aerodromes, the mass on arrival will exceed the landing mass specified in the flight manual for the altitude of each of the aerodromes involved and for the ambient temperatures anticipated at the time of landing.

2.3 No aeroplane is taken off at a mass which exceeds the mass at which, in accordance with the minimum distances for take-off scheduled in the flight manual, compliance with 2.3.1 to 2.3.3 inclusive is shown. These distances correspond with the altitude of the aerodrome, the runway, stopway and clearway to be used, the runway slope, the stopway slope, the clearway plane slope, and the ambient temperature and wind existing at the time of take-off.

2.3.1 The take-off run required does not exceed the length of the runway.

2.3.2 The accelerate-stop distance required does not exceed the length of the runway plus the length of the stopway, where present.

2.3.3 The take-off distance required does not exceed the length of the runway, plus the length of the clearway, where present, except that the sum of the lengths of the runway and the clearway is in no case considered as being greater than 1.5 times the length of the runway.

2.4 Credit is not taken for the length of the stopway or the length of the clearway unless they comply with the relevant specifications in Annex 14.

Note.— In determining the length of the runway available, account is taken of the loss, if any, of runway length due to alignment of the aeroplane prior to take-off.

3. Take-off obstacle clearance limitations

3.1 No aeroplane is taken off at a mass in excess of that shown in the flight manual to correspond with a net take-off flight path which clears all obstacles either by at least a height of 10.7 m (35 ft) vertically or at least 90 m plus 0.125D laterally, where D is the horizontal distance the aeroplane has travelled from the end of take-off distance available, except as provided in 3.1.1 to 3.1.3 inclusive. In determining the allowable deviation of the net take-off flight path in order to avoid obstacles by at least the distances specified, it is assumed that the aeroplane is not banked before the clearance of the net take-off flight path above obstacles is at least 15.2 m (50 ft) and that the bank thereafter does not exceed 15 degrees. The net take-off flight path considered is for the altitude of the aerodrome and for the ambient temperature and wind component existing at the time of take-off.

3.1.1 Where the intended track does not include any change of heading greater than 15 degrees,

a) for operations conducted in VMC by day, or

b) for operations conducted with navigation aids such that the pilot can maintain the aeroplane on the intended track with the same precision as for operations specified in a),

obstacles at a distance greater than 300 m on either side of the intended track need not be cleared.

3.1.2 Where the intended track does not include any change of heading greater than 15 degrees for operations conducted in IMC, or in VMC by night, except as provided in 3.1.1 b); and where the intended track includes changes of heading greater than 15 degrees for operations conducted in VMC by day, obstacles at a distance greater than 600 m on either side of the intended track need not be cleared.

3.1.3 Where the intended track includes changes of heading greater than 15 degrees for operations conducted in IMC, or in VMC by night, obstacles at a distance greater than 900 m on either side of the intended track need not be cleared.

4. En-route limitations

4.1 General

4.1.1 At no point along the intended track, is an aeroplane having three or more engines to be more than 90 minutes at normal cruising speed away from an aerodrome at which the distance specifications for alternate aerodromes (see 5.2) are complied with and where it is expected that a safe landing can be made, unless it complies with 4.3.1.1.

Note.— For the authorization of extended range operations by aeroplanes with two turbine engines, see 4.7 of this Part.

4.2. One engine inoperative

4.2.1 No aeroplane is taken off at a mass in excess of that which, in accordance with the one-engine-inoperative en-route net flight path data shown in the flight manual, permits compliance either with 4.2.1.1 or 4.2.1.2 at all points along the route. The net flight path has a positive slope at 450 m (1 500 ft) above the aerodrome where the landing is assumed to be made after engine failure. The net flight path used is for the ambient temperatures anticipated along the route. In meteorological conditions where icing protection systems are to be operable, the effect of their use on the net flight path data is taken into account.

4.2.1.1 The slope of the net flight path is positive at an altitude of at least 300 m (1 000 ft) above all terrain and obstructions along the route within 9.3 km (5 NM) on either side of the intended track.

4.2.1.2 The net flight path is such as to permit the aeroplane to continue flight from the cruising altitude to an aerodrome where a landing can be made in accordance with 5.2, the net flight path clearing vertically, by at least 600 m (2 000 ft), all terrain and obstructions along the route within 9.3 km (5 NM) on either side of the intended track. The provisions of 4.2.1.2.1 to 4.2.1.2.5 inclusive are applied.

4.2.1.2.1 The engine is assumed to fail at the most critical point along the route, allowance being made for indecision and navigational error.

4.2.1.2.2 Account is taken of the effects of winds on the flight path.

4.2.1.2.3 Fuel jettisoning is permitted to an extent consistent with reaching the aerodrome with satisfactory fuel reserves, if a safe procedure is used.

4.2.1.2.4 The aerodrome, where the aeroplane is assumed to land after engine failure, is specified in the operational flight plan and it meets the appropriate aerodrome operating minima.

4.2.1.2.5 The consumption of fuel and oil after the engine becomes inoperative is that which is accounted for in the net flight path data shown in the flight manual.

4.3 Two engines inoperative

4.3.1 Aeroplanes which do not comply with 4.1 comply with 4.3.1.1.

4.3.1.1 No aeroplane is taken off at a mass in excess of that which according to the two-engines-inoperative en-route net flight path data shown in the flight manual, permits the aeroplane to continue flight from the point where two engines are assumed to fail simultaneously, to an aerodrome at which the landing distance specification for alternate aerodromes (see 5.2) is complied with and where it is expected that a safe landing can be made. The net flight path clears vertically, by at least 600 m (2 000 ft) all terrain and obstructions along the route within 9.3 km (5 NM) on either side of the intended track. The net flight path considered is for the ambient temperatures anticipated along the route. In altitudes and meteorological conditions where icing protection systems are to be operable, the effect of their use on the net flight path data is taken into account. The provisions of 4.3.1.1.1 to 4.3.1.1.5 inclusive apply.

4.3.1.1.1 The two engines are assumed to fail at the most critical point of that portion of the route where the aeroplane is at more than 90 minutes at normal cruising speed away from an aerodrome at which the landing distance specification for alternate aerodromes (see 5.2) is complied with and where it is expected that a safe landing can be made.

4.3.1.1.2 The net flight path has a positive slope at 450 m (1 500 ft) above the aerodrome where the landing is assumed to be made after the failure of two engines.

4.3.1.1.3 Fuel jettisoning is permitted to an extent consistent with 4.3.1.1.4, if a safe procedure is used.

4.3.1.1.4 The aeroplane mass at the point where the two engines are assumed to fail is considered to be not less than that which would include sufficient fuel to proceed to the aerodrome and to arrive there at an altitude of at least 450 m (1 500 ft) directly over the landing area and thereafter to fly for 15 minutes at cruise power and/or thrust.

4.3.1.1.5 The consumption of fuel and oil after the engines become inoperative is that which is accounted for in the net flight path data shown in the flight manual.

5. Landing limitations

5.1 Aerodrome of destination

5.1.1 No aeroplane is taken off at a mass in excess of that which, in accordance with the landing distances required as shown in the flight manual for the altitude of the aerodrome of intended destination, permits the aeroplane to be brought to rest at the aerodrome of intended destination within the effective length of the runway, this length being as declared by the aerodrome authorities with regard to the obstructions in the approach. The mass of the aeroplane is assumed to be reduced by the mass of the fuel and oil expected to be consumed in flight to the aerodrome of intended destination. Compliance is shown with 5.1.1.3 and with either 5.1.1.4 or 5.1.1.5.

5.1.1.1 The runway slope is assumed to be zero, unless the runway is usable in only one direction.

5.1.1.2 A runway condition (wet or dry) not more favourable than that expected is taken into account.

Note.— National authorities will need to develop suitable methods for dealing with accountability for wet and dry runways.

5.1.1.3 It is assumed that the aeroplane is landed on the most favourable runway and in the most favourable direction in still air.

5.1.1.4 It is assumed that the aeroplane is landed on the runway which is the most suitable for the wind conditions anticipated at the aerodrome at the time of landing, taking due account of the probable wind speed and direction, of the ground handling characteristics of the aeroplane, and of other conditions (i.e. landing aids, terrain, etc.).

5.1.1.5 If full compliance with 5.1.1.4 is not shown, the aeroplane may be taken off if a destination alternate aerodrome is designated which permits compliance with 5.2.

5.2 Destination alternate aerodrome

5.2.1 No aerodrome is designated as a destination alternate aerodrome unless the aeroplane, at the mass anticipated at the time of arrival at such aerodrome, can comply with 5.1, in accordance with the landing distance required as shown in the flight manual for the altitude of the alternate aerodrome and in accordance with other applicable operating requirements for the alternate aerodrome.

ATTACHMENT D. FLIGHT RECORDERS

Supplementary to 6.3

Introduction

The material in this Attachment concerns flight recorders intended for installation in aeroplanes engaged in international air navigation. Flight recorders comprise two systems — a flight data recorder and a cockpit voice recorder. Flight data recorders are classified as Type I, Type II and Type IIA depending upon the number of parameters to be recorded and the duration required for retention of the recorded information.

1. Flight data recorder (FDR)

1.1 General requirements

1.1.1 The recorder is to record continuously during flight time.

1.1.2 The recorder container is to:

a) be painted a distinctive orange or yellow colour;

b) carry reflective material to facilitate its location; and

c) have securely attached an automatically activated underwater locating device.

1.1.3 The recorder is to be installed so that:

a) the probability of damage to the recording is minimized. To meet this requirement it should be located as far aft as practicable. In the case of pressurized aeroplanes it should be located in the vicinity of the rear pressure bulkhead;

b) it receives its electrical power from a bus that provides the maximum reliability for operation of the recorder without jeopardizing service to essential or emergency loads; and

c) there is an aural or visual means for pre-flight checking that the recorder is operating properly.

1.2 Parameters to be recorded

1.2.1 *Type I flight data recorder.* This recorder will be capable of recording, as appropriate to the aeroplane, at least the 32 parameters in Table D-1. However, other parameters may be substituted with due regard to the aeroplane type and the characteristics of the recording equipment.

1.2.2 *Types II and IIA flight data recorders.* These recorders will be capable of recording, as appropriate to the aeroplane, at least the first 15 parameters in Table D-1. However, other parameters may be substituted with due regard to the aeroplane type and the characteristics of the recording equipment.

1.3 Additional information

1.3.1 A Type IIA recorder, in addition to a 30-minute recording duration, is to retain sufficient information from the preceding take-off for calibration purposes.

1.3.2 The measurement range, recording interval and accuracy of parameters on installed equipment is usually verified by methods approved by the appropriate certificating authority.

1.3.3 The manufacturer usually provides the national certificating authority with the following information in respect of the flight data recorder:

a) manufacturer's operating instructions, equipment limitations and installation procedures;

b) parameter origin or source and equations which relate counts to units of measurement; and

c) manufacturer's test reports.

1.3.4 The operator usually supplies position error curves for pitot-static parameters, at various angles of attack and side slip, for the calibration and read-out of the recordings.

2. Cockpit voice recorder (CVR)

2.1 General requirements

2.1.1 The recorder is to be designed so that it will record at least the following:

a) voice communication transmitted from or received in the aeroplane by radio;

b) aural environment on the flight deck;

c) voice communication of flight crew members on the flight deck using the aeroplane's interphone system;

d) voice or audio signals identifying navigation or approach aids introduced in the headset or speaker; and

e) voice communication of flight crew members using the passenger address system, if installed.

2.1.2 The recorder container is to:

a) be painted a distinctive orange or yellow colour;

b) carry reflective material to facilitate its location; and

c) have securely attached an automatically activated underwater locating device.

2.1.3 To aid in voice and sound discrimination, microphones in the cockpit are to be located in the best position for recording voice communications originating at the pilot and co-pilot stations and voice communications of other crew members on the flight deck when directed to those stations. This can best be achieved by wiring suitable boom microphones to record continuously on separate channels.

2.1.4 The recorder is to be installed so that:

a) the probability of damage to the recording is minimized. To meet this requirement it should be located as far aft as practicable. In the case of pressurized aeroplanes it should be located in the vicinity of the rear pressure bulkhead;

b) it receives its electrical power from a bus that provides the maximum reliability for operation of the recorder without jeopardizing service to essential or emergency loads;

c) there is an aural or visual means for pre-flight checking of the recorder for proper operation; and

d) if the recorder has a bulk erasure device, the installation should be designed to prevent operation of the device during flight time or crash impact.

2.2 Performance requirements

2.2.1 The recorder will be capable of recording on at least four tracks simultaneously except for the recorder in 6.3.6.2. To ensure accurate time correlation between tracks, the recorder is to record in an in-line format. If a bi-directional configuration is used, the in-line format and track allocation should be retained in both directions.

2.2.2 The preferred track allocation is as follows:

Track 1 — co-pilot headphones and live boom microphone

Track 2 — pilot headphones and live boom microphone

Track 3 — area microphone

Track 4 — time reference plus the third and fourth crew members' headphone and live microphone, if applicable.

Note.— Track 1 is located closest to the base of the recording head.

2.2.3 The recorder, when tested by methods approved by the appropriate certificating authority, will be demonstrated to be suitable for the environmental extremes over which it is designed to operate.

2.2.4 Means will be provided for an accurate time correlation between the flight data recorder and cockpit voice recorder. One method of achieving this is by superimposing the FDR time signal on Track 4 of the CVR.

2.3 Additional information

2.3.1 The manufacturer usually provides the national certificating authority with the following information in respect of the cockpit voice recorder:

a) manufacturer's operating instructions, equipment limitations and installation procedures; and

b) manufacturer's test reports.

Table D-1
Parameters for Flight Data Recorders

Serial number	Parameter	Measurement range	Recording interval (seconds)	Accuracy limits (sensor input compared to FDR read-out)
1	Time (UTC when available, otherwise elapsed time)	24 hours	4	±0.125% per hour
2	Pressure-altitude	–300 m (–1 000 ft) to maximum certificated altitude of aircraft +1 500 m (+5 000 ft)	1	±30 m to ±200 m (±100 ft to ±700 ft)
3	Indicated airspeed	95 km/h (50 kt) to max V_{S_0} *(Note 1)* V_{S_0} to 1.2 V_D *(Note 2)*	1	±5% ±3%
4	Heading	360°	1	±2°
5	Normal acceleration	–3 g to +6 g	0.125	±1% of maximum range excluding datum error of ±5%
6	Pitch attitude	±75°	1	±2°
7	Roll attitude	±180°	1	±2°
8	Radio transmission keying	On-off (one discrete)	1	
9	Power on each engine *(Note 3)*	Full range	1 (per engine)	±2%
10	Trailing edge flap or cockpit control selection	Full range or each discrete position	2	±5% or as pilot's indicator
11	Leading edge flap or cockpit control selection	Full range or each discrete position	2	±5% or as pilot's indicator
12	Thrust reverser position	Stowed, in transit, and reverse	1 (per engine)	
13	Ground spoiler/speed brake selection	Full range or each discrete position	1	±2% unless higher accuracy uniquely required
14	Outside air temperature	Sensor range	2	±2°C
15	Autopilot/auto throttle/AFCS mode and engagement status	A suitable combination of discretes	1	

Note.— The preceding 15 parameters satisfy the requirements for a Type II FDR.

Serial number	Parameter	Measurement range	Recording interval (seconds)	Accuracy limits (sensor input compared to FDR read-out)
16	Longitudinal acceleration	±1 g	0.25	±1.5% max range excluding datum error of ±5%
17	Lateral acceleration	±1 g	0.25	±1.5% max range excluding datum error of ±5%
18	Pilot input and/or control surface position-primary controls (pitch, roll, yaw) *(Note 4)*	Full range	1	±2° unless higher accuracy uniquely required
19	Pitch trim position	Full range	1	±3% unless higher accuracy uniquely required
20	Radio altitude	–6 m to 750 m (–20 ft to 2 500 ft)	1	±0.6 m (±2 ft) or ±3% whichever is greater below 150 m (500 ft) and ±5% above 150 m (500 ft)

Serial number	Parameter	Measurement range	Recording interval (seconds)	Accuracy limits (sensor input compared to FDR read-out)
21	Glide path deviation	Signal range	1	±3%
22	Localizer deviation	Signal range	1	±3%
23	Marker beacon passage	Discrete	1	
24	Master warning	Discrete	1	
25	NAV 1 and 2 frequency selection *(Note 5)*	Full range	4	As installed
26	DME 1 and 2 distance *(Notes 5 and 6)*	0 – 370 km	4	As installed
27	Landing gear squat switch status	Discrete	1	
28	GPWS (ground proximity warning system)	Discrete	1	
29	Angle of attack	Full range	0.5	As installed
30	Hydraulics, each system (low pressure)	Discrete	2	
31	Navigation data (latitude/longitude, ground speed and drift angle) *(Note 7)*	As installed	1	As installed
32	Landing gear or gear selector position	Discrete	4	As installed

Note.— The preceding 32 parameters satisfy the requirements for a Type I FDR.

Notes.—

1. V_{S_0} stalling speed or minimum steady flight speed in the landing configuration.
2. V_D design diving speed.
3. Record sufficient inputs to determine power.
4. For aeroplanes with conventional control systems "or" applies. For aeroplanes with non-mechanical control systems "and" applies. In aeroplanes with split surfaces, a suitable combination of inputs is acceptable in lieu of recording each surface separately.
5. If signal available in digital form.
6. Recording of latitude and longitude from INS or other navigation system is a preferred alternative.
7. If signals readily available.

If further recording capacity is available, recording of the following additional information should be considered:

a) operational information from electronic display systems, such as electronic flight instrument systems (EFIS), electronic centralized aircraft monitor (ECAM) and engine indication and crew alerting system (EICAS). Use the following order of priority:

1) parameters selected by the flight crew relating to the desired flight path, e.g. barometric pressure setting, selected altitude, selected airspeed, decision height, and autoflight system engagement and mode indications if not recorded from another source;

2) display system selection/status, e.g. SECTOR, PLAN, ROSE, NAV, WXR, COMPOSITE, COPY, ETC.;

3) warnings and alerts;

4) the identity of displayed pages for emergency procedures and checklists;

b) retardation information including brake application for use in the investigation of landing overruns and rejected take-offs; and

c) additional engine parameters (EPR, N1, EGT, fuel flow, etc.).

ATTACHMENT E. EXTENDED RANGE OPERATIONS BY AEROPLANES WITH TWO TURBINE POWER-UNITS

Supplementary to 4.7

1. Purpose and scope

1.1 Introduction

The purpose of this Attachment is to give guidance on the value of the threshold time which is to be established in compliance with 4.7.1 of this Part and also to give guidance on the means of achieving the required level of safety envisaged by 4.7.2 of this Part where operations beyond the established threshold are approved.

1.2 Threshold time

It should be understood that the threshold time established in accordance with 4.7.1 is not an operating limit, but is a flight time from an adequate en-route alternate aerodrome beyond which the State of the Operator must give particular consideration to the aeroplane and the operation before granting authorization. Pending the acquisition of additional data for such operations by twin-engined commercial transport aeroplanes and taking into account the level of safety intended by 4.7.2, it is suggested that the threshold time be 60 minutes.

1.3 Basic concepts

In order to maintain the required level of safety on routes where an aeroplane with two power-units is permitted to operate beyond the threshold time, it is necessary that:

a) the airworthiness certification of the aeroplane type specifically permits operations beyond the threshold time, taking into account the aeroplane system design and reliability aspects;

b) the reliability of the propulsion system is such that the risk of double power-unit failure from independent causes is extremely remote;

c) any necessary special maintenance requirements are fulfilled;

d) specific flight dispatch requirements are met;

e) necessary in-flight operational procedures are established; and

f) specific operational authorization is granted by the State of the Operator.

2. Glossary of terms

Where the following terms are used in this Attachment, they have the meaning indicated:

Adequate alternate aerodrome. An adequate alternate aerodrome is one at which the landing performance requirements can be met and which is expected to be available, if required, and which has the necessary facilities and services, such as air traffic control, lighting, communications, meteorological services, navigation aids, rescue and fire-fighting services and one suitable instrument approach procedure.

Aeroplane system. An aeroplane system includes all elements of equipment necessary for the control and performance of a particular major function. It includes both the equipment specifically provided for the function in question and other basic related aeroplane equipment such as that required to supply power for the equipment operation. As used herein the power-unit is not considered to be an aeroplane system.

Extended range operation. Any flight by an aeroplane with two turbine power-unit where the flight time at the one power-unit inoperative cruise speed (in ISA and still air conditions), from a point on the route to an adequate alternate aerodrome, is greater than the threshold time approved by the State of the Operator.

Power-unit. A system consisting of an engine and all ancillary parts installed on the engine prior to installation on the aeroplane to provide and control power/thrust and for the extraction of energy for aeroplane systems, but not including independent short-period thrust-producing devices.

Propulsion system. A system consisting of a power-unit and all other equipment utilized to provide those functions necessary to sustain, monitor and control the power/thrust output of any one power-unit following installation on the airframe.

Suitable alternate aerodrome. A suitable alternate aerodrome is an adequate aerodrome where, for the anticipated time of use, weather reports, or forecasts, or any combination thereof, indicate that the weather conditions will be at or above the required aerodrome operating minima, and the runway surface condition reports indicate that a safe landing will be possible.

3. Airworthiness certification requirements for extended range operations

During the airworthiness certification procedure for an aeroplane type intended for extended range operations, special attention should be paid to ensuring that the required level of safety will be maintained under conditions which may be encountered during such operations, e.g. flight for extended periods following failure of an engine and/or essential systems. Information or procedures specifically related to extended range operations should be incorporated into the aeroplane flight manual, maintenance manual or other appropriate document.

Note.— Criteria for aeroplane systems performance and reliability for extended range operations are contained in the Airworthiness Technical Manual *(Doc 9051).*

4. Propulsion system maturity and reliability

4.1 Basic elements to be considered for the authorization of extended range operations are the maturity and reliability of the propulsion system. These should be such that the risk of complete loss of power from independent causes is extremely remote.

4.2 The only way to assess the maturity of the propulsion system and its reliability in service is to exercise engineering judgement, taking account of the world-wide experience with the power-unit.

4.3 For a propulsion system whose reliability has already been assessed, each national authority must evaluate the ability of the operator to maintain that level of reliability, taking into account the operator's record of reliability *vis-à-vis* power-units of closely related types.

5. Airworthiness modifications and maintenance programme requirements

Each operator's maintenance programme should ensure that:

a) the titles and numbers of all airworthiness modifications, additions and changes which were made to qualify aeroplane systems for extended range operations are provided to the State of Registry and, where applicable, to the State of the Operator;

b) any changes to maintenance and training procedures, practices or limitations established in the qualification for extended range operations are submitted to the State of the Operator and, where applicable, to the State of Registry before such changes are adopted;

c) a reliability reporting programme is developed and implemented prior to approval and continued after approval;

d) prompt implementation of required modifications and inspections which could affect propulsion system reliability is undertaken;

e) procedures are established which prevent an aeroplane from being dispatched for an extended range operation after power-unit shutdown or primary system failure on a previous flight until the cause of such failure has been positively identified and the necessary corrective action is completed. Confirmation that such corrective action has been effective may, in some cases, require the successful completion of a subsequent flight prior to dispatch on an extended range operation; and

f) a procedure is established to ensure that the airborne equipment will continue to be maintained at the level of performance and reliability required for extended range operations.

6. Flight dispatch requirements

In applying the general flight dispatch requirements of Chapter 4 particular attention should be paid to the conditions which might prevail during extended range operations, e.g. extended flight with one power-unit inoperative, major systems degradation, reduced flight altitude, etc. In addition to the requirement of 4.7.3, at least the following aspects should be considered:

a) pre-flight system serviceability;

b) communication and navigation facilities and capabilities;

c) fuel requirements; and

d) availability of relevant performance information.

7. Operational principles

An aeroplane which is engaged in an extended range operation should normally, in the event of:

a) shutdown of a power-unit, fly to and land at the nearest (in terms of the least flying time) aerodrome suitable for landing;

b) a single or multiple primary aeroplane system failure, fly to and land at the nearest suitable aerodrome unless it has been demonstrated, in view of the flight consequences of the failure and the probability and consequences of subsequent failures, that no substantial degradation of safety results from continuation of the planned flight; and

c) changes impacting the status of items on the minimum equipment list, the communications and navigation facilities, fuel and oil supply, en-route alternate aerodromes or aeroplane performance, make appropriate adjustments to the flight plan.

8. Operational authorization

In authorizing the operation of an aeroplane with two power-units on an extended range route in accordance with 4.7.2, the State of the Operator should, in addition to the requirements previously set forth in this Attachment, ensure that:

a) the operator's past experience and compliance record is satisfactory;

b) the operator has demonstrated that the flight can continue to a safe landing under the anticipated degraded operating conditions which would arise from:

1) total loss of thrust from one power-unit; or

2) total loss of power-unit generated electric power; or

3) any other condition which the State of the Operator considers to be equivalent in airworthiness and performance risk;

c) that the operator's crew training programme is adequate for the proposed operation; and

d) that documentation accompanying the authorization covers all relevant aspects.

ATTACHMENT F. AIR OPERATOR CERTIFICATE OR EQUIVALENT DOCUMENT

Supplementary to 4.2.1

1. The State regulations and rules for the operational certification of operators and the conduct of subsequent commercial air transport operations should be in conformity with the Annexes to the Convention on International Civil Aviation and have sufficient detail to ensure that compliance will result in the desired level of safety.

2. The State regulations should provide a framework of positive control and guidance but also allow the operator sufficient flexibility to develop and update instructions for the detailed guidance of personnel essential to the conduct of operations.

3. The State regulations should require the operator to submit detailed information on the organization, method of control and supervision of flight operations, training programme and maintenance arrangements as a basis for operational certification. As required by this Part, the operator's material should be submitted in the form of an operations manual and a maintenance manual containing at least the material specified in 11.1 and 11.3 and such other material as the State may require.

4. The State, in addition to assessing the operator's ability and competence, should guide the operator in regulatory, organizational and procedural matters. The State of the Operator should be satisfied concerning the operator's eligibility for operational certification. This includes the ability and competence to conduct safe and efficient operations and proof of compliance with applicable regulations.

5. The State should establish a system for both the certification and the continued surveillance of the operator to ensure that the required standards of operation are maintained.

Note.— Guidance on the operations manual is given in the manual Preparation of an Operations Manual *(Doc 9376).*

ATTACHMENT G. MINIMUM EQUIPMENT LIST (MEL)

Supplementary to 6.1.2

1. If deviations from the requirements of States in the certification of aircraft were not permitted an aircraft could not be flown unless all systems and equipment were operable. Experience has proved that some unserviceability can be accepted in the short term when the remaining operative systems and equipment provide for continued safe operations.

2. The State should indicate through approval of a minimum equipment list those systems and items of equipment that may be inoperative for certain flight conditions with the intent that no flight can be conducted with inoperative systems and equipment other than those specified.

3. A minimum equipment list, approved by the State of the Operator, is therefore necessary for each aircraft, based on the master minimum equipment list established for the aircraft type by the organization responsible for the type design in conjunction with the State of Design.

4. The State of the Operator should require the operator to prepare a minimum equipment list designed to allow the operation of an aircraft with certain systems or equipment inoperative provided an acceptable level of safety is maintained.

5. The minimum equipment list is not intended to provide for operation of the aircraft for an indefinite period with inoperative systems or equipment. The basic purpose of the minimum equipment list is to permit the safe operation of an aircraft with inoperative systems or equipment within the framework of a controlled and sound programme of repairs and parts replacement.

6. Operators are to ensure that no flight is commenced with multiple minimum equipment list items inoperative without determining that any interrelationship between inoperative systems or components will not result in an unacceptable degradation in the level of safety and/or undue increase in the flight crew workload.

7. The exposure to additional failures during continued operation with inoperative systems or equipment must also be considered in determining that an acceptable level of safety is being maintained. The minimum equipment list may not deviate from requirements of the flight manual limitations section, emergency procedures or other airworthi-ness requirements of the State of Registry or of the State of the Operator unless the appropriate airworthiness authority or the flight manual provides otherwise.

8. Systems or equipment accepted as inoperative for a flight should be placarded where appropriate and all such items should be noted in the aircraft technical log to inform the flight crew and maintenance personnel of the inoperative system or equipment.

9. For a particular system or item of equipment to be accepted as inoperative, it may be necessary to establish a maintenance procedure, for completion prior to flight, to de-activate or isolate the system or equipment. It may similarly be necessary to prepare an appropriate flight crew operating procedure.

10. The responsibilities of the pilot-in-command in accepting an aeroplane for operation with deficiencies in accordance with a minimum equipment list are specified in 4.3.1.

ANNEX 6 — PART II
INTERNATIONAL GENERAL AVIATION — AEROPLANES

FOREWORD

Historical background

Standards and Recommended Practices for the Operation of Aircraft — International General Aviation were first adopted by the Council on 2 December 1968 pursuant to the provisions of Article 37 of the Convention on International Civil Aviation (Chicago, 1944) and designated as Annex 6, Part II, to the Convention. They became effective on 2 April 1969 and applicable on 18 September 1969.

Annex 6, Part II, was developed in the following manner: the Fifteenth Session of the Assembly, Montreal, June-July 1965, adopted Resolution A15-15: "Consideration of the needs of international general aviation in relation to the scope of ICAO technical activities". Subsequently, the Fourth Air Navigation Conference (Montreal, November-December 1965) recommended a series of factors which it considered should be taken into account in extending the scope of Annex 6 to meet the needs of general aviation in accordance with the directives of Assembly Resolution A15-15.

The Fourth Air Navigation Conference recommended that the International Standards and Recommended Practices to be developed for International General Aviation Operations exclude for the present aerial work operations. It was however clearly the view of the conference that the Annex should be framed in such a manner as to facilitate its extension to cover aerial work operations at a later date, should such extension prove desirable.

Based on the above considerations, draft International Standards and Recommended Practices for the Operation of International General Aviation Aircraft were developed by the Air Navigation Commission and, after amendment following the usual consultation with the Member States of the Organization, were adopted by the Council so as to become, together with the Foreword approved by the Council, the text of this Annex. In developing this material the Air Navigation Commission was guided by the following philosophies:

Presentation and conformity with Annex 6, Part I. The Annex should be, as nearly as practicable, equivalent in scope and conform as closely as possible to Annex 6 (now Annex 6, Part I).

Applicability. Although the definition of general aviation originally used in this Annex encompassed aerial work operations, these were specifically excluded from the provisions of this Annex by Chapter 2 — Applicability.

Level of safety. The Annex should ensure an acceptable level of safety to third parties (third parties meaning persons on the ground and persons in the air in other aircraft). Also, as some international general aviation operations will be performed:

a) by crews less experienced and less skilled;

b) by less reliable equipment;

c) to less rigorous standards; and

d) with greater freedom of action than in commercial air transport operations;

it has to be accepted that the passenger in international general aviation aircraft will not necessarily enjoy the same level of safety as the fare-paying passenger in commercial air transport. However, it was recognized that in ensuring an acceptable degree of safety for third parties, an acceptable level of safety for flight crews and passengers would be achieved.

Freedom of Action. The maximum freedom of action consistent with maintaining an acceptable level of safety should be granted to international general aviation.

Responsibility. The responsibility that devolves upon the operator in Annex 6, Part I, should, in Part II of the Annex, fall upon the pilot-in-command. Precedent for this course of action exists in Annex 2.

Consequent to the adoption of Annex 6, Part III, *International Operations — Helicopters*, an amendment to the title was introduced to indicate that Annex 6, Part II was applicable only to aeroplanes.

In 1986 the Air Navigation Commission commenced a review of Annex 6, Part II and concluded that the definition of general aviation should be revised to exclude aerial work thus recognizing that aerial work was a distinct aspect of civil aviation and recognizing the exclusion of aerial work from the applicability of Annex 6, Part II. As with the Fourth Air Navigation Conference in 1965, the Air Navigation

Commission was not aware of any degree of international aerial work operations which would necessitate the development of international Standards and Recommended Practices. The revised definitions for general aviation and aerial work and the revised applicability chapter were submitted to States in the usual manner and approved by the Council in March 1990.

Table A shows the origin of amendments together with a list of the principal subjects involved and the dates on which the Annex and the amendments were adopted by the Council, when they became effective and when they became applicable.

Applicability

The Standards and Recommended Practices of Annex 6, Part II are applicable to international general aviation operations with aeroplanes.

The Standards and Recommended Practices represent minimum provisions and, together with those of Annex 6 — Operation of Aircraft: Part I — International Commercial Air Transport — Aeroplanes, now cover the operation of all aeroplanes in international civil aviation, except in aerial work operations.

It will be noted that the Standards and Recommended Practices contained in Annex 6, Part II, when applied to the operation of large aeroplanes, are less stringent than those in Annex 6, Part I, applicable to the same or similar aeroplanes when used in commercial air transport operations. Nevertheless, it is considered that, in conjunction with existing provisions in Annexes 1 and 8, Annex 6, Part II, ensures an adequate level of safety for the operations envisaged for the large aeroplanes in question. In this connexion attention is drawn to the point that the entire performance standards of Annex 8 are applicable to all aeroplanes of over 5 700 kg mass intended for the carriage of passengers or cargo or mail for international air navigation, of which the prototype was submitted for certification on or after 13 December 1964. Moreover, by virtue of Annex 1 the holder of a private pilot licence, piloting an aircraft in excess of 5 700 kg unless as the sole occupant thereof is required to have a type rating entered on his licence. Since the certificates of airworthiness of the types of aeroplanes in question would preclude solo flight in all normal circumstances, it may be accepted that the private pilot of these aeroplanes must have a type rating entered on his licence.

Action by Contracting States

Notification of differences. The attention of Contracting States is drawn to the obligation imposed by Article 38 of the Convention by which Contracting States are required to notify the Organization of any differences between their national regulations and practices and the International Standards contained in this Annex and any amendments thereto. Contracting States are invited to extend such notification to any differences from the Recommended Practices contained in this Annex, and any amendments thereto, when the notification of such differences is important for the safety of air navigation. Further, Contracting States are invited to keep the Organization currently informed of any differences which may subsequently occur, or of the withdrawal of any differences previously notified. A specific request for notification of differences will be sent to Contracting States immediately after the adoption of each amendment to this Annex.

The attention of States is also drawn to the provision of Annex 15 related to the publication of differences between their national regulations and practices and the related ICAO Standards and Recommended Practices through the Aeronautical Information Service, in addition to the obligation of States under Article 38 of the Convention.

Promulgation of information. The establishment and withdrawal of and changes to facilities, services and procedures affecting aircraft operations provided in accordance with the Standards and Recommended Practices specified in this Annex should be notified and take effect in accordance with the provisions of Annex 15.

Status of Annex components

An Annex is made up of the following component parts, not all of which, however, are necessarily found in every Annex; they have the status indicated:

1.—Material comprising the Annex proper:

a) *Standards* and *Recommended Practices* adopted by the Council under the provisions of the Convention. They are defined as follows:

Standard: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as necessary for the safety or regularity of international air navigation and to which Contracting States will conform in accordance with the Convention; in the event of impossibility of compliance, notification to the Council is compulsory under Article 38.

Recommended Practice: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as desirable in the interest of safety, regularity or efficiency of international air navigation, and to which Contracting States will endeavour to conform in accordance with the Convention.

b) *Appendices* comprising material grouped separately for convenience but forming part of the Standards and Recommended Practices adopted by the Council.

c) *Definitions* of terms used in the Standards and Recommended Practices which are not self-explanatory in that they do not have accepted dictionary meanings. A definition does not have independent status but is an essential part of each Standard and Recommended Practice in which the term is used, since a change in the meaning of the term would affect the specification.

d) *Tables* and *Figures* which add to or illustrate a Standard or Recommended Practice and which are referred to therein, form part of the associated Standard or Recommended Practice and have the same status.

It is to be noted that some Standards in this Annex incorporate, by reference, other specifications having the status of Recommended Practices. In such cases, the text of the Recommended Practice becomes part of the Standard.

2.— *Material approved by the Council for publication in association with the Standards and Recommended Practices:*

a) *Forewords* comprising historical and explanatory material based on the action of the Council and including an explanation of the obligations of States with regard to the application of the Standards and Recommended Practices ensuing from the Convention and the Resolution of Adoption;

b) *Introductions* comprising explanatory material introduced at the beginning of parts, chapters or sections of the Annex to assist in the understanding of the application of the text;

c) *Notes* included in the text, where appropriate, to give factual information or references bearing on the Standards or Recommended Practices in question, but not constituting part of the Standards or Recommended Practices;

d) *Attachments* comprising material supplementary to the Standards and Recommended Practices, or included as a guide to their application.

Selection of language

This Annex has been adopted in five languages — English, Arabic, French, Russian and Spanish. Each Contracting State is requested to select one of those texts for the purpose of national implementation and for other effects provided for in the Convention, either through direct use or through translation into its own national language, and to notify the Organization accordingly.

Editorial practices

The following practice has been adhered to in order to indicate at a glance the status of each statement: *Standards* have been printed in light face roman; *Recommended Practices* have been printed in light face italics, the status being indicated by the prefix **Recommendation**; *Notes* have been printed in light face italics, the status being indicated by the prefix *Note*.

The following editorial practice has been followed in the writing of specifications: for Standards the operative verb "shall" is used, and for Recommended Practices the operative verb "should" is used.

The units of measurement used in this document are in accordance with the International System of Units (SI) as specified in Annex 5 to the Convention on International Civil Aviation. Where Annex 5 permits the use of non-SI alternative units these are shown in parentheses following the basic units. Where two sets of units are quoted it must not be assumed that the pairs of values are equal and interchangeable. It may, however, be inferred that an equivalent level of safety is achieved when either set of units is used exclusively.

Any reference to a portion of this document, which is identified by a number and/or title, includes all subdivisions of that portion.

Table A. Amendments to Annex 6, Part II

Amendment	Source(s)	Subject(s)	Adopted Effective Applicable
1st Edition	Fifteenth Session of the Assembly (Resolution A15-15) and Fourth Air Navigation Conference		2 December 1968 2 April 1969 18 September 1969
1	Sixth Air Navigation Conference	a) The requirement for additional instruments in aeroplanes operated as controlled VFR flights in the en-route phase; and b) the permitting of aeroplanes, when unable to navigate by visual references to landmarks, to be navigated by equipment other than radio navigation equipment, e.g. solely by self-contained navigation means, provided that certain equipment capabilities are met, thus eliminating any requirement for the carriage of radio navigation equipment.	1 June 1970 1 October 1970 4 February 1971
2 (2nd Edition)	Special Meeting on Aircraft Noise in the Vicinity of Aerodromes	The inclusion of a specification for aeroplanes to be operated within the weight limitations imposed by the applicable Noise Certification Standards, except in prescribed circumstances, and to carry a document attesting noise certification.	2 April 1971 2 August 1971 6 January 1972
3	Seventh Air Navigation Conference	The inclusion of a Recommended Practice covering the design, carriage and installation of Emergency Location Beacons — Aircraft (ELBA) in such aeroplanes and on such flights as may be determined by the appropriate authority.	29 May 1973 1 October 1973 23 May 1974
4	Revision of Annex 12, the Air Navigation Commission's Study concerning interception of civil aircraft and the Council action in pursuance of Assembly Resolution A18-16	a) Provisions for the marking of break-in points on aircraft; b) provisions for reducing the risk for intercepted aircraft; c) the revision of the Introductory Note to Chapter 3 of the Annex. The revision points to a practical method for States to discharge their functions in the cases of lease, charter and interchange of aircraft in international operations.	4 February 1975 4 June 1975 9 October 1975
5	Studies by the Air Navigation Commission, Amendment 60 to Annex 3 and Amendment 30 to Annex 14	Requirements for the provision and use of flight crew safety harnesses; amplification of specifications for the type of timepiece required for operations in accordance with Instrument Flight Rules and controlled VFR flights; and revision of the definitions of Aerodrome and Meteorological information.	7 April 1976 7 August 1976 30 December 1976
6	ASIA/PAC Regional Air Navigation Meeting	The requirement for the carriage of survival radio equipment over those areas in which search and rescue would be especially difficult to be determined by States rather than regional air navigation agreement.	16 June 1976 16 October 1976 6 October 1977
7	Air Navigation Commission Study	Recommendation for the fitting of ground proximity warning systems to certain aeroplanes.	15 December 1977 15 April 1978 10 August 1978

Amendment	*Source(s)*	*Subject(s)*	*Adopted Effective Applicable*
8	Air Navigation Commission Study	Introduction of requirements for navigation equipment to meet minimum navigational performance specifications (MNPS).	2 April 1980 2 August 1980 27 November 1980
9	Air Navigation Commission Study	Revision of the provisions relating to exterior lights to align with new provisions in Annexes 2 and 8.	22 March 1982 22 July 1982 25 November 1982
10 (3rd Edition)	Seventh meeting of the Obstacle Clearance Panel, AGA Divisional Meeting (1981), amendments consequential to adoption of Annexes 5 and 18	Introduced provisions related to development and use of instrument approach procedures, authority and competence to taxi aeroplanes. Changes to the requirements for the carriage of dangerous goods as a result of adoption by the Council of Annex 18. Units of measurement were brought in line with the provisions of Annex 5 and the *Note* in Chapter 3 concerning lease, charter and interchange was updated. The term "aerodrome operating minima" was introduced in lieu of "aerodrome meteorological minima", and definitions of "decision altitude/height" and "minimum descent altitude/height" entered in Chapter 1.	20 May 1983 20 September 1983 24 November 1983
11	Accident Prevention and Investigation Divisional Meeting, AIG (1979)	Introduction of provisions relating to flight recorders. Introduction of related guidance material in an attachment.	8 March 1985 29 July 1985 21 November 1985
12	Air Navigation Commission	Carriage of information on board aircraft; communication equipment on 121.5 MHz.	14 March 1986 27 July 1986 20 November 1986
13	Seventh meeting of the Obstacle Clearance Panel, Air Navigation Commission studies	Supply and use of oxygen and pressurization failure warning; refuelling with passengers on board; provision of climb performance data with all engines operating.	14 March 1986 27 July 1986 20 November 1986
14 (4th Edition)	Air Navigation Commission review of the Annex, Stage I. Third meeting of the Visual Flight Rules Operations Panel. Air Navigation Commission Study	a) Revision of the definitions of aerial work and general aviation. Revision of the definition of alternate aerodrome to introduce take-off, en-route and destination alternate aerodromes. Introduction of a new definition for a commercial air transport operation and the definitions for flight plan and flight recorder; b) deletion of the reference to aerial work from the applicability; c) alignment with Annex 6, Part I, particularly with respect to flight recorder records subsequent to accidents or incidents and the requirement for a Mach number indicator; d) elimination of the term "controlled VFR flight"; e) introduction of guidance material concerning flight data recording of important operational information in aeroplanes with electronic displays.	19 March 1990 30 July 1990 15 November 1990

Amendment	*Source(s)*	*Subject(s)*	*Adopted Effective Applicable*
15	Fifth meeting of the Operations Panel, Seventh and Eighth meetings of the Review of the General Concept of Separation Panel, Accident Investigation Divisional Meeting (AIG/1992), Air Navigation Commission studies	a) Revision of definitions of aerodrome operating minima, decision altitude/height, minimum descent altitude/height and introduction of definition of obstacle clearance altitude/height; b) introduction of new definitions for emergency locator transmitters (ELTs) required navigation performance (RNP) and RNP type; c) introduction of the definition for the classification of instrument approach and landing operations; d) revision of the requirements concerning the use of engraving metal foil flight data recorders; e) introduction of carriage requirements for emergency locator transmitters (ELTs) to replace provisions regarding survival radio equipment and emergency location beacon — ELBA; f) introduction of a requirement that the navigation equipment carried shall enable the aircraft to proceed in accordance with RNP types prescribed for the intended route(s) or area(s) and provisions to permit the uniform implementation of 300 m (1 000 ft) VSM above FL 290.	21 March 1994 25 July 1994 10 November 1994
16 (5th Edition)	Air Navigation Commission studies, Fourteenth meeting of the Dangerous Goods Panel, editorial amendment, text alignment with Annex 6, Part I and/or Part III, consequential amendment	a) Introduction of revised definitions; b) inclusion of references to Article 35 of the Convention; c) revision of the provisions concerning operating facilities, briefing, aeroplane airworthiness and safety precautions, destination alternate aerodromes, limitations imposed by weather conditions, use of oxygen and safety harness; d) new provisions concerning all aeroplanes on all flights, all aeroplanes operated as VFR flights and ground proximity warning systems (GPWS); e) revision of the provisions concerning aeroplanes operated in accordance with instrument flight rules (IFR); f) revision of the provisions concerning the composition of the flight crew; and g) revision of the provisions concerning the carriage and use of oxygen.	10 March 1995 24 July 1995 9 November 1995

INTERNATIONAL STANDARDS AND RECOMMENDED PRACTICES

CHAPTER 1. DEFINITIONS

When the following terms are used in the Standards, Recommended Practices and Definitions for the operation of aeroplanes in international general aviation, they have the following meanings:

Aerial work. An aircraft operation in which an aircraft is used for specialized services such as agriculture, construction, photography, surveying, observation and patrol, search and rescue, aerial advertisement, etc.

Aerodrome. A defined area on land or water (including any buildings, installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of aircraft.

Aerodrome operating minima. The limits of usability of an aerodrome for:

a) take-off, expressed in terms of runway visual range and/or visibility and, if necessary, cloud conditions;

b) landing in precision approach and landing operations, expressed in terms of visibility and/or runway visual range and decision altitude/height (DA/H) as appropriate to the category of the operation; and

c) landing in non-precision approach and landing operations, expressed in terms of visibility and/or runway visual range, minimum descent altitude/height (MDA/H) and, if necessary, cloud conditions.

Aeroplane. A power-driven heavier-than-air aircraft, deriving its lift in flight chiefly from aerodynamic reactions on surfaces which remain fixed under given conditions of flight.

Aircraft. Any machine that can derive support in the atmosphere from the reactions of the air other than the reactions of the air against the earth's surface.

Alternate aerodrome. An aerodrome to which an aircraft may proceed when it becomes either impossible or inadvisable to proceed to or to land at the aerodrome of intended landing. Alternate aerodromes include the following:

Take-off alternate. An alternate aerodrome at which an aircraft can land should this become necessary shortly after take-off and it is not possible to use the aerodrome of departure.

En-route alternate. An aerodrome at which an aircraft would be able to land after experiencing an abnormal or emergency condition while en route.

Destination alternate. An alternate aerodrome to which an aircraft may proceed should it become impossible or inadvisable to land at the aerodrome of intended landing.

Note.— The aerodrome from which a flight departs may also be an en-route or a destination alternate aerodrome for that flight.

Commercial air transport operation. An aircraft operation involving the transport of passengers, cargo or mail for remuneration or hire.

Dangerous goods. Articles or substances which are capable of posing significant risk to health, safety or property when transported by air.

Note 1.— Dangerous goods are classified in Annex 18, Chapter 3.

Decision altitude (DA) or decision height (DH). A specified altitude or height in the precision approach at which a missed approach must be initiated if the required visual reference to continue the approach has not been established.

Note 1.— Decision altitude (DA) is referenced to mean sea level and decision height (DH) is referenced to the threshold elevation.

Note 2.— The required visual reference means that section of the visual aids or of the approach area which should have been in view for sufficient time for the pilot to have made an assessment of the aircraft position and rate of change of position, in relation to the desired flight path. In Category III operations with a decision height the required visual reference is that specified for the particular procedure and operation.

Note 3.— For convenience where both expressions are used they may be written in the form "decision altitude/height" and abbreviated "DA/H".

Emergency locator transmitter (ELT). A generic term describing equipment which broadcast distinctive signals on designated frequencies and, depending on application, may either sense a crash and operate automatically or be manually activated. An ELT may be any of the following:

Automatic fixed ELT (ELT(AF)). An ELT which is permanently attached to an aircraft.

Automatic portable ELT (ELT(AP)). An ELT which is rigidly attached to an aircraft but readily removable from the aircraft after a crash.

Automatically deployable ELT (ELT(AD)). An ELT which is rigidly attached to an aircraft and deployed automatically in response to a crash. Manual deployment is also provided.

Survival ELT (ELT(S)). An ELT which is removable from an aircraft, stowed so as to facilitate its ready use in an emergency and activated by survivors. Automatic activation may apply.

Flight crew member. A licensed crew member charged with duties essential to the operation of an aircraft during flight time.

Flight manual. A manual, associated with the certificate of airworthiness, containing limitations within which the aircraft is to be considered airworthy, and instructions and information necessary to the flight crew members for the safe operation of the aircraft.

Flight plan. Specified information provided to air traffic services units, relative to an intended flight or portion of a flight of an aircraft.

Flight recorder. Any type of recorder installed in the aircraft for the purpose of complementing accident/incident investigation.

Flight time. The total time from the moment an aircraft first moves under its own power for the purpose of taking off until the moment it comes to rest at the end of the flight.

Note.— Flight time as here defined is synonymous with the term "block to block" time or "chock to chock" time in general usage which is measured from the time an aircraft moves from the loading point until it stops at the unloading point.

General aviation operation. An aircraft operation other than a commercial air transport operation or an aerial work operation.

Instrument approach and landing operations. Instrument approach and landing operations using instrument approach procedures are classified as follows:

Non-precision approach and landing operations. An instrument approach and landing which does not utilize electronic glide path guidance.

Precision approach and landing operations. An instrument approach and landing using precision azimuth and glide path guidance with minima as determined by the category of operation.

Categories of precision approach and landing operations:

Category I (CAT I) operation. A precision instrument approach and landing with a decision height not lower than 60 m (200 ft) and with either a visibility not less than 800 m or a runway visual range not less than 550 m.

Category II (CAT II) operation. A precision instrument approach and landing with a decision height lower than 60 m (200 ft), but not lower than 30 m (100 ft), and a runway visual range not less than 350 m.

Category IIIA (CAT IIIA) operation. A precision instrument approach and landing with:

a) a decision height lower than 30 m (100 ft) or no decision height; and

b) a runway visual range not less than 200 m.

Category IIIB (CAT IIIB) operation. A precision instrument approach and landing with:

a) a decision height lower than 15 m (50 ft) or no decision height; and

b) a runway visual range less than 200 m but not less than 50 m.

Category IIIC (CAT IIIC) operation. A precision instrument approach and landing with no decision height and no runway visual range limitations.

Note.— Where decision height (DH) and runway visual range (RVR) fall into different categories of operation, the instrument approach and landing operation would be conducted in accordance with the requirements of the most demanding category (e.g. an operation with a DH in the range of CAT IIIA but with an RVR in the range of CAT IIIB would be considered a CAT IIIB operation or an operation with a DH in the range of CAT II but with an RVR in the range of CAT I would be considered a CAT II operation).

Instrument meteorological conditions (IMC). Meteorological conditions expressed in terms of visibility, distance from cloud, and ceiling*, less than the minima specified for visual meteorological conditions.

Note.— The specified minima for visual meteorological conditions are contained in Chapter 4 of Annex 2.

*As defined in Annex 2.

Meteorological information. Meteorological report, analysis, forecast, and any other statement relating to existing or expected meteorological conditions.

Minimum descent altitude (MDA) or minimum descent height (MDH). A specified altitude or height in a non-precision approach or circling approach below which descent must not be made without the required visual reference.

Note 1.— Minimum descent altitude (MDA) is referenced to mean sea level and minimum descent height (MDH) is referenced to the aerodrome elevation or to the threshold elevation if that is more than 2 m (7 ft) below the aerodrome elevation. A minimum descent height for a circling approach is referenced to the aerodrome elevation.

Note 2.— The required visual reference means that section of the visual aids or of the approach area which should have been in view for sufficient time for the pilot to have made an assessment of the aircraft position and rate of change of position, in relation to the desired flight path. In the case of a circling approach the required visual reference is the runway environment.

Note 3.— For convenience when both expressions are used they may be written in the form "minimum descent altitude/height" and abbreviated "MDA/H".

Night. The hours between the end of evening civil twilight and the beginning of morning civil twilight or such other period between sunset and sunrise, as may be prescribed by the appropriate authority.

Note.— Civil twilight ends in the evening when the centre of the sun's disc is 6 degrees below the horizon and begins in the morning when the centre of the sun's disc is 6 degrees below the horizon.

Obstacle clearance altitude (OCA) or obstacle clearance height (OCH). The lowest altitude or the lowest height above the elevation of the relevant runway threshold or the aerodrome elevation as applicable, used in establishing compliance with appropriate obstacle clearance criteria.

Note 1.— Obstacle clearance altitude is referenced to mean sea level and obstacle clearance height is referenced to the threshold elevation or in the case of non-precision approaches to the aerodrome elevation or the threshold elevation if that is more than 2 m (7 ft) below the aerodrome elevation. An obstacle clearance height for a circling approach is referenced to the aerodrome elevation.

Note 2.— For convenience when both expressions are used they may be written in the form "obstacle clearance altitude/height" and abbreviated "OCA/H".

Pilot-in-command. The pilot responsible for the operation and safety of the aircraft during flight time.

Required navigation performance (RNP). A statement of the navigation performance accuracy necessary for operation within a defined airspace.

RNP type. A containment value expressed as a distance in nautical miles from the intended position within which flights would be for at least 95 per cent of the total flying time.

Example.— RNP 4 represents a navigation accuracy of plus or minus 7.4 km (4 NM) on a 95 per cent containment basis.

State of Registry. The State on whose register the aircraft is entered.

Note.— In the case of the registration of aircraft of an international operating agency on other than a national basis, the States constituting the agency are jointly and severally bound to assume the obligations which, under the Chicago Convention, attach to a State of Registry. See, in this regard, the Council Resolution of 14 December 1967 on Nationality and Registration of Aircraft Operated by International Operating Agencies *(Doc 8722).*

Visual meteorological conditions (VMC). Meteorological conditions expressed in terms of visibility, distance from cloud, and ceiling, equal to or better than specified minima.

Note.— The specified minima are contained in Annex 2.

CHAPTER 2. APPLICABILITY

The Standards and Recommended Practices contained in Annex 6, Part II shall be applicable to international general aviation operations with aeroplanes.

Note 1.— Standards and Recommended Practices applicable to the operation of aeroplanes by operators authorized to conduct international commercial air transport operations are to be found in Annex 6, Part I.

Note 2.— Standards and Recommended Practices applicable to international commercial air transport operations or international general aviation operations with helicopters are to be found in Annex 6, Part III.

CHAPTER 3. GENERAL

Note.— Although the Convention on International Civil Aviation allocates to the State of Registry certain functions which that State is entitled to discharge, or obligated to discharge, as the case may be, the Assembly recognized, in Resolution A23-13, that the State of Registry may be unable to fulfil its responsibilities adequately in instances where aircraft are leased, chartered or interchanged — in particular without crew — by an operator of another State and that the Convention may not adequately specify the rights and obligations of the State of an operator in such instances until such time as Article 83 bis *of the Convention enters into force. Accordingly, the Council urged that if, in the above-mentioned instances, the State of Registry finds itself unable to discharge adequately the functions allocated to it by the Convention, it delegate to the State of the Operator, subject to acceptance by the latter State, those functions of the State of Registry that can more adequately be discharged by the State of the Operator. It is understood that pending entry into force of Article 83* bis *of the Convention the foregoing action will only be a matter of practical convenience and will not affect either the provisions of the Chicago Convention prescribing the duties of the State of Registry or any third State.*

3.1 The pilot-in-command shall comply with the relevant laws, regulations and procedures of the States in which the aeroplane is operated.

Note 1.— Compliance with more restrictive measures, not in contravention of the provisions of 3.1, may be required by the State of Registry.

Note 2.— Rules covering flight over the high seas are contained in Annex 2.

3.2 The pilot-in-command shall be responsible for the operation and safety of the aeroplane and for the safety of all persons on board, during flight time.

3.3 If an emergency situation which endangers the safety of the aeroplane or persons necessitates the taking of action which involves a violation of local regulations or procedures, the pilot-in-command shall notify the appropriate local authority without delay. If required by the State in which the incident occurs, the pilot-in-command shall submit a report on any such violation to the appropriate authority of such State; in that event, the pilot-in-command shall also submit a copy of it to the State of Registry. Such reports shall be submitted as soon as possible and normally within ten days.

3.4 The pilot-in-command shall be responsible for notifying the nearest appropriate authority by the quickest available means of any accident involving the aeroplane resulting in serious injury or death of any person or substantial damage to the aeroplane or property.

Note.— A definition of the term "serious injury" is contained in Annex 13, and an explanation of the term "substantial damage" is given in the Accident/Incident Reporting Manual (ADREP Manual) *(Doc 9156).*

3.5 **Recommendation.—** The pilot-in-command should have available on board the aeroplane essential information concerning the search and rescue services in the areas over which it is intended the aeroplane will be flown.

3.6 Dangerous goods.

Note 1.— Provisions for carriage of dangerous goods are contained in Annex 18

Note 2.— Article 35 of the Convention refers to certain classes of cargo restrictions.

CHAPTER 4. FLIGHT PREPARATION AND IN-FLIGHT PROCEDURES

4.1 Adequacy of operating facilities

The pilot-in-command shall not commence a flight unless it has been ascertained by every reasonable means available that the ground and/or water areas and facilities available and directly required for such flight and for the safe operation of the aeroplane are adequate, including communication facilities and navigation aids.

Note.— "Reasonable means" in this Standard is intended to denote the use, at the point of departure, of information available to the pilot-in-command either through official information published by the aeronautical information services or readily obtainable from other sources.

4.2 Aerodrome operating minima

The pilot-in-command shall not operate to or from an aerodrome using operating minima lower than those which may be established for that aerodrome by the State in which it is located, except with the specific approval of that State.

Note.— It is the practice in some States to declare, for flight planning purposes, higher minima for an aerodrome when nominated as an alternate, than for the same aerodrome when planned as that of intended landing.

4.3 Briefing

4.3.1 The pilot-in-command shall ensure that crew members and passengers are made familiar, by means of an oral briefing or by other means, with the location and the use of:

a) seat belts; and, as appropriate,

b) emergency exits;

c) life jackets;

d) oxygen dispensing equipment; and

e) other emergency equipment provided for individual use, including passenger emergency briefing cards.

4.3.2 The pilot-in-command shall ensure that all persons on board are aware of the location and general manner of use of the principal emergency equipment carried for collective use.

4.4 Aeroplane airworthiness and safety precautions

4.4.1 A flight shall not be commenced until the pilot-in-command is satisfied that:

a) the aeroplane is airworthy, duly registered and that appropriate certificates with respect thereto are aboard the aeroplane;

b) the instruments and equipment installed in the aeroplane are appropriate, taking into account the expected flight conditions;

c) any necessary maintenance has been performed in accordance with Chapter 8;

d) the mass of the aeroplane and centre of gravity location are such that the flight can be conducted safely, taking into account the flight conditions expected;

e) any load carried is properly distributed and safely secured; and

f) the aeroplane operating limitations, contained in the flight manual, or its equivalent, will not be exceeded.

4.4.2 **Recommendation.—** *The pilot-in-command should have sufficient information on climb performance with all engines operating to enable determination of the climb gradient that can be achieved during the departure phase for the existing take-off conditions and intended take-off technique.*

4.5 Weather reports and forecasts

Before commencing a flight the pilot-in-command shall be familiar with all available meteorological information appropriate to the intended flight. Preparation for a flight away from the vicinity of the place of departure, and for every flight under the instrument flight rules, shall include: 1) a study of available current weather reports and forecasts; and 2) the planning of an alternative course of action to provide for the eventuality that the flight cannot be completed as planned, because of weather conditions.

Note.— The requirements for flight plans are contained in Annex 2 — Rules of the Air *and* Procedures for Air Navigation Services — Rules of the Air and Air Traffic Services *(PANS-RAC, Doc 4444).*

4.6 Limitations imposed by weather conditions

4.6.1 Flight in accordance with the visual flight rules

A flight, except one of purely local character in visual meteorological conditions, to be conducted in accordance with the visual flight rules shall not be commenced unless available current meteorological reports, or a combination of current reports and forecasts, indicate that the meteorological conditions along the route, or that part of the route to be flown under the visual flight rules, will, at the appropriate time, be such as to render compliance with these rules possible.

4.6.2 Flight in accordance with the instrument flight rules

4.6.2.1 *When a destination alternate aerodrome is required.* A flight to be conducted in accordance with the instrument flight rules shall not be commenced unless the available information indicates that conditions, at the aerodrome of intended landing and at least one destination alternate will, at the estimated time of arrival, be at or above the aerodrome operating minima.

4.6.2.2 *When no destination alternate aerodrome is required.* A flight to be conducted in accordance with the instrument flight rules to an aerodrome when no alternate aerodrome is required shall not be commenced unless:

a) a standard instrument approach procedure is prescribed for the aerodrome of intended landing; and

b) available current meteorological information indicates that the following meteorological conditions will exist from two hours before to two hours after the estimated time of arrival:

   1) a cloud base of at least 300 m (1 000 ft) above the minimum associated with the instrument approach procedure; and

   2) visibility of at least 5.5 km or of 4 km more than the minimum associated with the procedure.

4.6.3 A flight shall not be continued towards the aerodrome of intended landing unless the latest available meteorological information indicates that conditions at that aerodrome, or at least one destination alternate aerodrome, will, at the estimated time of arrival, be at or above the specified aerodrome operating minima.

4.6.4 Except in the case of emergency, an aeroplane shall not continue its approach-to-land beyond a point at which the limits of the aerodrome operating minima would be infringed.

4.6.5 A flight to be operated in known or expected icing conditions shall not be commenced unless the aeroplane is certificated and equipped to cope with such conditions.

4.7 Destination alternate aerodromes

For a flight to be conducted in accordance with the instrument flight rules, at least one destination alternate aerodrome shall be selected and specified in the flight plan, unless:

a) the duration of the flight and the meteorological conditions prevailing are such that there is reasonable certainty that, at the estimated time of arrival at the aerodrome of intended landing, and for a reasonable period before and after such time, the approach and landing may be made under visual meteorological conditions; or

b) the aerodrome of intended landing is isolated and there is no suitable destination alternate aerodrome.

4.8 Fuel and oil supply

4.8.1 A flight shall not be commenced unless, taking into account both the meteorological conditions and any delays that are expected in flight, the aeroplane carries sufficient fuel and oil to ensure that it can safely complete the flight, and, as applicable, the following special provisions are complied with:

4.8.1.1 *Flight in accordance with the instrument flight rules.* At least sufficient fuel and oil shall be carried to allow the aeroplane:

a) *when, in accordance with the exception contained in 4.6.2.2, a destination alternate aerodrome is not required,* to fly to the aerodrome to which the flight is planned and thereafter for a period of 45 minutes; or

b) *when a destination alternate aerodrome is required,* to fly to the aerodrome to which the flight is planned, thence to an alternate aerodrome, and thereafter for a period of 45 minutes.

Note.— Nothing in 4.8 precludes amendment of a flight plan in flight in order to re-plan the flight to another aerodrome, provided that the requirements of 4.8 can be complied with from the point where the flight is re-planned.

4.9 Oxygen supply

The pilot-in-command shall ensure that breathing oxygen is available to crew members and passengers in sufficient quantities for all flights at such altitudes where a lack of oxygen might result in impairment of the faculties of crew members or harmfully affect passengers.

Note.— Guidance on the carriage and use of oxygen is given in Attachment B.

4.10 Use of oxygen

All flight crew members, when engaged in performing duties essential to the safe operation of an aeroplane in flight, shall use breathing oxygen continuously whenever the circumstances prevail for which its supply has been required in 4.9.

4.11 In-flight emergency instruction

In an emergency during flight, the pilot-in-command shall ensure that all persons on board are instructed in such emergency action as may be appropriate to the circumstances.

4.12 Weather reporting by pilots

Recommendation.— *When weather conditions likely to affect the safety of other aircraft are encountered, they should be reported as soon as possible.*

4.13 Hazardous flight conditions

Recommendation.— *Hazardous flight conditions, other than those associated with meteorological conditions, encountered en route should be reported as soon as possible. The reports so rendered should give such details as may be pertinent to the safety of other aircraft.*

4.14 Fitness of flight crew members

The pilot-in-command shall be responsible for ensuring that a flight:

a) will not be commenced if any flight crew member is incapacitated from performing duties by any cause such as injury, sickness, fatigue, the effects of alcohol or drugs; and

b) will not be continued beyond the nearest suitable aerodrome when flight crew members' capacity to perform functions is significantly reduced by impairment of faculties from causes such as fatigue, sickness, lack of oxygen.

4.15 Flight crew members at duty stations

4.15.1 Take-off and landing

All flight crew members required to be on flight deck duty shall be at their stations.

4.15.2 En route

All flight crew members required to be on flight deck duty shall remain at their stations except when their absence is necessary for the performance of duties in connexion with the operation of the aeroplane, or for physiological needs.

4.15.3 Seat belts

All flight crew members shall keep their seat belts fastened when at their stations.

4.15.4 Safety harness

Recommendation.— *When safety harnesses are provided, any flight crew member occupying a pilot's seat should keep the safety harness fastened during the take-off and landing phases; all other flight crew members should keep their safety harnesses fastened during the take-off and landing phases unless the shoulder straps interfere with the performance of their duties, in which case the shoulder straps may be unfastened but the seat belt must remain fastened.*

Note.— Safety harness includes shoulder strap(s) and a seat belt which may be used independently.

4.16 Instrument flight procedures

4.16.1 One or more instrument approach procedures designed in accordance with the classification of instrument approach and landing operations shall be approved and promulgated by the State in which the aerodrome is located to serve each instrument runway or aerodrome utilized for instrument flight operations.

4.16.2 All aeroplanes operated in accordance with instrument flight rules shall comply with the instrument flight procedures approved by the State in which the aerodrome is located.

Note 1.— Definitions for the classification of instrument approach and landing operations are in Chapter 1.

Note 2.— Operational procedures recommended for the guidance of operations personnel involved in instrument flight operations are described in PANS-OPS (Doc 8168), Volume I.

Note 3.— Criteria for the construction of instrument flight procedures for the guidance of procedure specialists are provided in PANS-OPS (Doc 8168), Volume II.

4.17 Instruction — general

An aeroplane shall not be taxied on the movement area of an aerodrome unless the person at the controls:

a) has been duly authorized by the owner or in the case where it is leased the lessee, or a designated agent;

b) is fully competent to taxi the aeroplane;

c) is qualified to use the radio telephone if radio communications are required; and

d) has received instruction from a competent person in respect of aerodrome layout, and where appropriate, information on routes, signs, marking, lights, ATC signals and instructions, phraseology and procedures, and is able to conform to the operational standards required for safe aeroplane movement at the aerodrome.

4.18 Refuelling with passengers on board

4.18.1 **Recommendation.—** *An aeroplane should not be refuelled when passengers are embarking, on board or disembarking unless it is attended by the pilot-in-command or other qualified personnel ready to initiate and direct an evacuation of the aeroplane by the most practical and expeditious means available.*

4.18.2 **Recommendation.—** *When refuelling with passengers embarking, on board or disembarking, two-way communications should be maintained by aeroplane intercommunications system or other suitable means between the ground crew supervising the refuelling and the pilot-in-command or other qualified personnel required by 4.18.1.*

Note 1.— The provisions of 4.18.1 do not necessarily require the deployment of integral aeroplane stairs or the opening of emergency exits as a prerequisite to refuelling.

Note 2.— Provisions concerning aircraft refuelling are contained in Annex 14 and guidance on safe refuelling practices is contained in the Airport Services Manual, *Parts 1 and 8.*

Note 3.— Additional precautions are required when refuelling with fuels other than aviation kerosene or when refuelling results in a mixture of aviation kerosene with other aviation turbine fuels, or when an open line is used.

CHAPTER 5. AEROPLANE PERFORMANCE OPERATING LIMITATIONS

5.1 An aeroplane shall be operated:

a) in compliance with the terms of its airworthiness certificate or equivalent approved document;

b) within the operating limitations prescribed by the certificating authority of the State of Registry; and

c) within the mass limitations imposed by compliance with the applicable noise certification Standards in Annex 16, Volume I, unless otherwise authorized, in exceptional circumstances for a certain aerodrome or a runway where there is no noise disturbance problem, by the competent authority of the State in which the aerodrome is situated.

5.2 Placards, listings, instrument markings, or combinations thereof, containing those operating limitations prescribed by the certificating authority of the State of Registry for visual presentation, shall be displayed in the aeroplane.

Note.— The Standards of Annex 8 — Airworthiness of Aircraft, *Part III, apply to all aeroplanes of over 5 700 kg maximum certificated take-off mass intended for the carriage of passengers or cargo or mail in international air navigation.*

CHAPTER 6. AEROPLANE INSTRUMENTS AND EQUIPMENT

Note.— Specifications for the provision of aeroplane communication and navigation equipment are contained in Chapter 7.

6.1 All aeroplanes on all flights

6.1.1 General

In addition to the minimum equipment necessary for the issuance of a certificate of airworthiness, the instruments, equipment and flight documents prescribed in the following paragraphs shall be installed or carried, as appropriate, in aeroplanes according to the aeroplane used and to the circumstances under which the flight is to be conducted.

6.1.2 Instruments

An aeroplane shall be equipped with instruments which will enable the flight crew to control the flight path of the aeroplane, carry out any required procedural manoeuvre, and observe the operating limitations of the aeroplane in the expected operating conditions.

6.1.3 Equipment

6.1.3.1 *All aeroplanes on all flights.*

6.1.3.1.1 All aeroplanes on all flights shall be equipped with:

a) an accessible first-aid kit;

b) portable fire extinguishers of a type which, when discharged, will not cause dangerous contamination of the air within the aeroplane. At least one shall be located in:

1) the pilot's compartment; and

2) each passenger compartment that is separate from the pilot's compartment and not readily accessible to the pilot or co-pilot;

c) 1) a seat or berth for each person over an age to be determined by the State of Registry; and

2) a seat belt for each seat and restraining belts for each berth;

d) the following manuals, charts and information:

1) the flight manual or other documents or information concerning any operating limitations prescribed for the aeroplane by the certificating authority of the State of Registry, required for the application of Chapter 5;

2) current and suitable charts for the route of the proposed flight and all routes along which it is reasonable to expect that the flight may be diverted;

3) procedures, as prescribed in Annex 2, for pilots-in-command of intercepted aircraft; and

4) visual signals for use by intercepting and intercepted aircraft, as contained in Annex 2; and

e) spare electrical fuses of appropriate ratings for replacement of those accessible in flight.

6.1.3.1.2 **Recommendation.—** *All aeroplanes on all flights should be equipped with the ground-air signal codes for search and rescue purposes.*

6.1.3.1.3 **Recommendation.—** *All aeroplanes on all flights should be equipped with a safety harness for each flight crew member seat.*

Note.— Safety harness includes shoulder strap(s) and a seat belt which may be used independently.

6.1.4 Marking of break-in points

6.1.4.1 If areas of the fuselage suitable for break-in by rescue crews in an emergency are marked on an aeroplane, such areas shall be marked as shown below (see figure following). The colour of the markings shall be red or yellow, and if necessary they shall be outlined in white to contrast with the background.

6.1.4.2 If the corner markings are more than 2 m apart, intermediate lines 9 cm x 3 cm shall be inserted so that there is no more than 2 m between adjacent markings.

Note.— This Standard does not require any aeroplane to have break-in areas.

6.2 All aeroplanes operated as VFR flights

6.2.1 All aeroplanes when operated as VFR flights shall be equipped with:

a) a magnetic compass;

b) an accurate timepiece indicating the time in hours, minutes and seconds;

c) a sensitive pressure altimeter;

d) an airspeed indicator; and

e) such additional instruments or equipment as may be prescribed by the appropriate authority.

6.2.2 **Recommendation.—** *VFR flights which are operated as controlled flights should be equipped in accordance with 6.6.*

6.3 All aeroplanes on flights over water

6.3.1 Seaplanes

All seaplanes for all flights shall be equipped with:

a) one life jacket, or equivalent individual floatation device, for each person on board, stowed in a position readily accessible from his seat or berth;

b) equipment for making the sound signals prescribed in the International Regulations for Preventing Collisions at Sea, where applicable;

c) one anchor;

d) one sea anchor (drogue), when necessary to assist in manoeuvring.

Note.— "Seaplanes" includes amphibians operated as seaplanes.

6.3.2 Landplanes

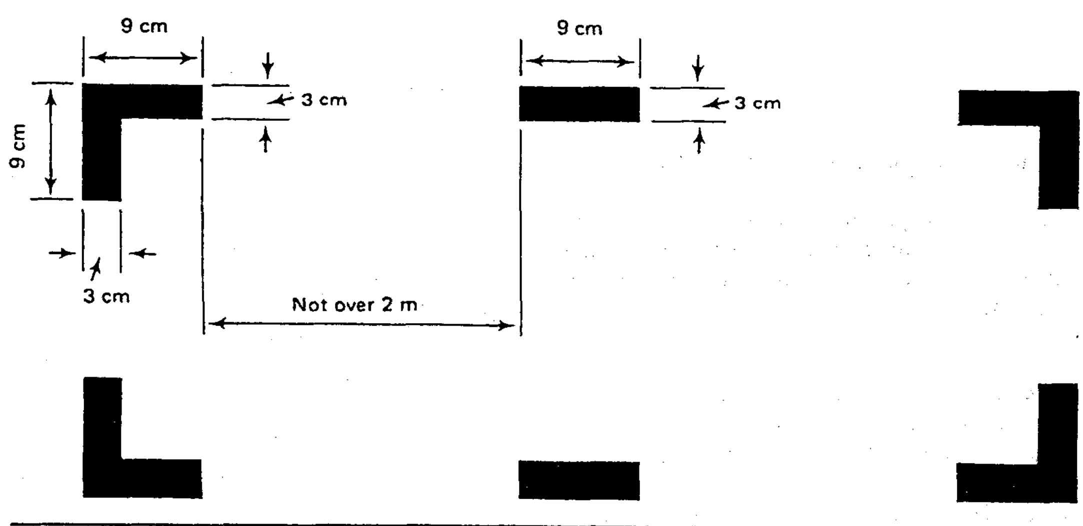
6.3.2.1 Single-Engine Aeroplanes.

Recommendation.— *All single-engine landplanes when flying en route over water beyond gliding distance from the shore should carry one life jacket or equivalent individual floatation device for each person on board, stowed in a position easily accessible from the seat or berth of the person for whose use it is provided.*

Note.— "Landplanes" includes amphibians operated as landplanes.

6.3.3 All aeroplanes on extended flights over water

All aeroplanes when operated on extended flights over water shall be equipped with:



MARKING OF BREAK-IN POINTS (see 6.1.4)

a) when the aeroplane may be over water at a distance of more than 93 km (50 NM) away from land suitable for making an emergency landing:

— one life jacket or equivalent individual floatation device for each person on board, stowed in a position easily accessible from the seat or berth of the person for whose use it is provided;

b) when over water away from land suitable for making an emergency landing at a distance of more than 185 km (100 NM), in the case of single-engine aeroplanes, and more than 370 km (200 NM), in the case of multi-engine aeroplanes capable of continuing flight with one engine inoperative:

1) life-saving rafts in sufficient numbers to carry all persons on board, stowed so as to facilitate their ready use in emergency, provided with such life-saving equipment including means of sustaining life as is appropriate to the flight to be undertaken; and

2) equipment for making the pyrotechnical distress signals described in Annex 2.

6.4 All aeroplanes on flights over designated land areas

Aeroplanes when operated across land areas which have been designated by the State concerned as areas in which search and rescue would be especially difficult, shall be equipped with such signalling devices and life-saving equipment (including means of sustaining life) as may be appropriate to the area overflown.

6.5 All aeroplanes on high altitude flights

6.5.1 All aeroplanes intended to be operated at high altitudes shall be equipped with oxygen storage and dispensing apparatus capable of storing and dispensing the oxygen supplies required in 4.9.

6.5.2 Aeroplanes for which the individual certificate of airworthiness is first issued on or after 1 January 1990

Pressurized aeroplanes intended to be operated at flight altitudes at which the atmospheric pressure is less than 376 hPa shall be equipped with a device to provide positive warning to the flight crew of any dangerous loss of pressurization.

6.5.3 Aeroplanes for which the individual certificate of airworthiness is first issued before 1 January 1990

Recommendation.— *Pressurized aeroplanes intended to be operated at flight altitudes at which the atmospheric pressure is less than 376 Hpa should be equipped with a device to provide positive warning to the flight crew of any dangerous loss of pressurization.*

6.6 All aeroplanes operated in accordance with the instrument flight rules

All aeroplanes when operated in accordance with the instrument flight rules or when the aeroplane cannot be maintained in a desired attitude without reference to one or more flight instruments, shall be equipped with:

a) a magnetic compass;

b) an accurate timepiece indicating the time in hours, minutes and seconds;

c) a sensitive pressure altimeter;

Note.— Due to the long history of misreadings, the use of drum-pointer altimeters is not recommended.

d) an airspeed indicating system with a means of preventing malfunctioning due to either condensation or icing;

e) a turn and slip indicator;

f) an attitude indicator (artificial horizon);

g) a heading indicator (directional gyroscope);

Note.— The requirements of e), f) and g) above, may be met by combinations of instruments or by integrated flight director systems provided that the safeguards against total failure, inherent in the three separate instruments, are retained.

h) means of indicating whether the supply of power to the gyroscopic instruments is adequate;

i) a means of indicating in the flight crew compartment the outside air temperature;

j) a rate-of-climb and descent indicator; and

k) such additional instruments or equipment as may be prescribed by the appropriate authority.

6.7 All aeroplanes when operated at night

All aeroplanes, when operated at night, shall be equipped with:

a) all the equipment specified in 6.6;

b) the lights required by Annex 2 for aircraft in flight or operating on the movement area of an aerodrome;

Note.— Specifications for lights meeting the requirements of Annex 2 for navigation lights are contained in the Appendix. The general characteristics of lights are specified in Annex 8. Detailed specifications for lights meeting the requirements of Annex 2 for aircraft in flight or operating on the movement area of an aerodrome are contained in the Airworthiness Technical Manual *(Doc 9051).*

c) a landing light;

d) illumination for all flight instruments and equipment that are essential for the safe operation of the aeroplane;

e) lights in all passenger compartments; and

f) an electric torch for each crew member station.

6.8 All aeroplanes complying with the noise certification Standards in Annex 16, Volume I

An aeroplane shall carry a document attesting noise certification.

Note.— The attestation may be contained in any document, carried on board, approved by the State of Registry.

6.9 Turbine engine aeroplanes — ground proximity warning system (GPWS)

6.9.1 **Recommendation.**— *All turbine engine aeroplanes of a maximum certificated take-off mass in excess of 15 000 kg or authorized to carry more than 30 passengers should be equipped with a ground proximity warning system.*

6.9.2 All turbine engine aeroplanes of a maximum certificated take-off mass in excess of 5 700 kg or authorized to carry more than nine passengers shall be equipped with a ground proximity warning system on or after 1 January 1999.

6.9.3 A ground proximity warning system shall provide automatically a timely and distinctive warning to the flight crew when the aeroplane is in potentially hazardous proximity to the earth's surface.

6.9.4 On or after 1 January 1999 a ground proximity warning system shall provide, as a minimum, warnings of the following circumstances;

1) excessive descent rate;

2) excessive terrain closure rate;

3) excessive altitude loss after take-off or go-around;

4) unsafe terrain clearance while not in landing configuration;

a) gear not locked down;

b) flaps not in a landing position; and

5) excessive descent below the instrument glide path.

6.10 Flight recorders

Note 1.— Flight recorders comprise two systems, a flight data recorder and a cockpit voice recorder.

Note 2.— Detailed guidance on flight recorders is contained in Attachment A.

6.10.1 Flight data recorders — types

6.10.1.1 A Type I flight data recorder shall record the parameters required to determine accurately the aeroplane flight path, speed, attitude, engine power, configuration and operation.

6.10.1.2 A Type II flight data recorder shall record the parameters required to determine accurately the aeroplane flight path, speed, attitude, engine power and configuration of lift and drag devices.

6.10.1.3 The use of engraving metal foil flight data recorders shall be discontinued by 1 January 1995.

6.10.2 Flight data recorders — duration

Types I and II flight data recorders shall be capable of retaining the information recorded during at least the last 25 hours of their operation.

6.10.3 Flight data recorders — aeroplanes for which the individual certificate of airworthiness is first issued on or after 1 January 1989

6.10.3.1 All aeroplanes of a maximum certificated take-off mass of over 27 000 kg shall be equipped with a Type I flight data recorder.

6.10.3.2 **Recommendation.**— *All aeroplanes of a maximum certificated take-off mass of over 5 700 kg up to and including 27 000 kg should be equipped with a Type II flight data recorder.*

6.10.4 Cockpit voice recorders — aeroplanes for which the individual certificate of airworthiness is first issued on or after 1 January 1987

6.10.4.1 All aeroplanes of a maximum certificated take-off mass of over 27 000 kg shall be equipped with a cockpit voice recorder, the objective of which is the recording of the aural environment on the flight deck during flight time.

6.10.4.2 **Recommendation.—** *All aeroplanes of a maximum certificated take-off mass of over 5 700 kg up to and including 27 000 kg should be equipped with a cockpit voice recorder, the objective of which is the recording of the aural environment on the flight deck during flight time.*

6.10.5 Cockpit voice recorders — duration

6.10.5.1 A cockpit voice recorder shall be capable of retaining the information recorded during at least the last 30 minutes of its operation.

6.10.5.2 **Recommendation.—** *A cockpit voice recorder, installed in aeroplanes of a maximum certificated take-off mass of over 5 700 kg for which the individual certificate of airworthiness is first issued on or after 1 January 1990, should be capable of retaining the information recorded during at least the last two hours of its operation.*

6.10.6 Flight recorders — construction and installation

Flight recorders shall be constructed, located and installed so as to provide maximum practical protection for the recordings in order that the recorded information may be preserved, recovered and transcribed.

6.10.7 Flight recorders — operation

6.10.7.1 Flight recorders shall not be switched off during flight time.

6.10.7.2 **Recommendation.—** *To preserve flight recorder records, flight recorders should be de-activated upon completion of flight time following an accident or incident, and not re-activated prior to removal of these records.*

6.10.8 Flight recorder records

6.10.8.1 The pilot-in-command shall ensure, to the extent possible, in the event the aeroplane becomes involved in an accident, the preservation of all related flight recorder records, and if necessary the associated flight recorders, and their retention in safe custody pending their disposition as determined in accordance with Annex 13.

6.10.8.2 **Recommendation.—** *The pilot-in-command should ensure, to the extent possible, in the event the aeroplane becomes involved in an incident, the preservation of all related flight recorder records, and if necessary the associated flight recorders, and their retention in safe custody pending their disposition as determined in accordance with Annex 13.*

6.11 Mach number indicator

All aeroplanes with speed limitations expressed in terms of Mach number shall be equipped with a Mach number indicator.

Note.— This does not preclude the use of the airspeed indicator to derive Mach number for ATS purposes.

6.12 Emergency locator transmitter (ELT)

6.12.1 All aeroplanes operated on extended flights over water as described in 6.3.3 b) and when operated on flights over designated land areas as described in 6.4 shall be equipped with one ELT.

6.12.2 **Recommendation.—** *All aeroplanes should carry an automatically activated ELT.*

6.12.3 ELT equipment carried to satisfy the requirements of 6.12.1 and 6.12.2 shall operate in accordance with the relevant provisions of Annex 10, Volume I.

CHAPTER 7. AEROPLANE COMMUNICATION AND NAVIGATION EQUIPMENT

7.1 Communication equipment

7.1.1 An aeroplane to be operated in accordance with the instrument flight rules or at night shall be provided with radio communication equipment. Such equipment shall be capable of conducting two-way communication with those aeronautical stations and on those frequencies prescribed by the appropriate authority.

Note.— The requirements of 7.1.1 are considered fulfilled if the ability to conduct the communications specified therein is established during radio propagation conditions which are normal for the route.

7.1.2 When compliance with 7.1.1 requires that more than one communications equipment unit be provided, each shall be independent of the other or others to the extent that a failure in any one will not result in failure of any other.

7.1.3 An aeroplane to be operated in accordance with the visual flight rules, but as a controlled flight, shall, unless exempted by the appropriate authority, be provided with radio communication equipment capable of conducting two-way communication at any time during flight with such aeronautical stations and on such frequencies as may be prescribed by the appropriate authority.

7.1.4 An aeroplane to be operated on a flight to which the provisions of 6.3.3 or 6.4 apply shall, unless exempted by the appropriate authority, be provided with radio communication equipment capable of conducting two-way communication at any time during flight with such aeronautical stations and on such frequencies as may be prescribed by the appropriate authority.

7.1.5 The radio communication equipment required in accordance with 7.1.1 to 7.1.4 shall provide for communication on the aeronautical emergency frequency 121.5 MHz.

7.2 Navigation equipment

7.2.1 An aeroplane shall be provided with navigation equipment which will enable it to proceed:

a) in accordance with the flight plan;

b) in accordance with prescribed RNP types; and

c) in accordance with the requirements of air traffic services;

except when, if not so precluded by the appropriate authority, navigation for flights under the visual flight rules is accomplished by visual reference to landmarks at least every 110 km (60 NM).

Note.— Information on RNP and associated procedures is contained in the Manual on Required Navigation Performance (RNP) *(Doc 9613).*

7.2.2 For flights in defined portions of airspace where, based on Regional Air Navigation Agreement, minimum navigation performance specifications (MNPS) are prescribed, an aeroplane shall be provided with navigation equipment which:

a) continuously provides indications to the flight crew of adherence to or departure from track to the required degree of accuracy at any point along that track; and

b) has been authorized by the State of Registry for MNPS operations concerned.

Note.— The prescribed minimum navigation performance specifications and the procedures governing their application are published in Regional Supplementary Procedures *(Doc 7030).*

7.2.3 For flights in defined portions of airspace where, based on Regional Air Navigation Agreement, a vertical separation minimum (VSM) of 300 m (1 000 ft) is applied above FL 290, an aeroplane:

a) shall be provided with equipment which is capable of:

1) indicating to the flight crew the flight level being flown;

2) automatically maintaining a selected flight level;

3) providing an alert to the flight crew when a deviation occurs from the selected flight level. The threshold for the alert shall not exceed ±90 m (300 ft); and

4) automatically reporting pressure-altitude; and

b) shall be authorized by the State of Registry for operation in the airspace concerned.

7.2.4 The aeroplane shall be sufficiently provided with navigation equipment to ensure that, in the event of the failure of one item of equipment at any stage of the flight, the remaining equipment will enable the aeroplane to proceed in accordance with 7.2.1 and where applicable 7.2.2 and 7.2.3.

Note 1.— This requirement may be met by means other than the duplication of equipment.

Note 2.— Guidance material relating to aircraft equipment necessary for flight in airspace where a 300 m (1 000 ft) VSM is applied above FL 290 is contained in the Manual on Implementation of a 300 m (1 000 ft) Vertical Separation Minimum Between FL 290 and FL 410 Inclusive *(Doc 9574).*

7.2.5 On flights in which it is intended to land in instrument meteorological conditions, an aeroplane shall be provided with radio equipment capable of receiving signals providing guidance to a point from which a visual landing can be effected. This equipment shall be capable of providing such guidance for each aerodrome at which it is intended to land in instrument meteorological conditions and for any designated alternate aerodromes.

CHAPTER 8. AEROPLANE MAINTENANCE

Note on the application of this Chapter.— For the purpose of this Chapter "aeroplane" includes: powerplants, propellers, components, accessories, instruments, equipment and apparatus including emergency equipment.

8.1 Responsibility

8.1.1 The owner of an aeroplane, or in the case where it is leased, the lessee, shall be responsible for its maintenance in an airworthy condition when in use.

8.1.2 The owner of an aeroplane, or in the case where it is leased, the lessee, shall be responsible for ensuring, in so far as practicable, that:

a) all maintenance, overhaul, alterations and repairs which affect airworthiness, are performed as prescribed by the State of Registry;

b) maintenance personnel make appropriate entries in the aeroplane maintenance records certifying that the aeroplane is airworthy;

c) the maintenance release is completed and signed by a person or persons qualified in accordance with the provisions of Annex 1 to certify that the maintenance work has been completed satisfactorily and in accordance with the prescribed methods.

8.2 Qualification to certify as airworthy

Each person charged with the responsibility of certifying as to the airworthiness of an aeroplane shall be qualified in accordance with the provisions of Annex 1.

8.3 Maintenance records

8.3.1 The owner of an aeroplane shall keep a maintenance record of the following:

a) In respect of the entire aeroplane:

1) the current empty mass and the location of the centre of gravity when empty;

2) the addition or removal of equipment;

3) the kind and extent of the maintenance and alteration and the time in service and date when the work was performed;

4) chronological list of compliance with airworthiness directives and the methods of compliance.

b) In respect of the major components:

1) the total time in service;

2) the date of the last overhaul;

3) the time in service since the last overhaul;

4) the date of the last inspection.

c) In respect of those instruments and equipment, the serviceability and operating life of which are determined by their time in service:

1) such records of the time in service as are necessary to determine their serviceability or to compute their operating life;

2) the date of the last inspection.

8.3.2 The records referred to in 8.3.1 shall be kept for a period of 90 days after the end of the operating life of the unit to which they refer.

8.3.3 The lessee of an aeroplane shall comply with the requirements of 8.3.1 and 8.3.2, as applicable, while the aeroplane is leased.

Note.— Maintenance records or related documents, other than a valid certificate of airworthiness, need not be carried in the aeroplane during international flights.

CHAPTER 9. AEROPLANE FLIGHT CREW

9.1 Qualifications

The pilot-in-command shall ensure that the licences of each flight crew member have been issued or rendered valid by the State of Registry, and are properly rated and of current validity, and shall be satisfied that flight crew members have maintained competence.

9.2 Composition of the flight crew

The number and composition of the flight crew shall not be less than that specified in the flight manual or other documents associated with the certificate of airworthiness.

APPENDIX. LIGHTS TO BE DISPLAYED BY AEROPLANES

(Note.— See Chapter 6)

1. Terminology

When the following terms are used in this Appendix, they have the following meanings:

Angles of coverage.

a) Angle of coverage A is formed by two intersecting vertical planes making angles of 70 degrees to the right and 70 degrees to the left respectively, looking aft along the longitudinal axis to a vertical plane passing through the longitudinal axis.

b) Angle of coverage F is formed by two intersecting vertical planes making angles of 110 degrees to the right and 110 degrees to the left respectively, looking forward along the longitudinal axis to a vertical plane passing through the longitudinal axis.

c) Angle of coverage L is formed by two intersecting vertical planes, one parallel to the longitudinal axis of the aeroplane, and the other 110 degrees to the left of the first, when looking forward along the longitudinal axis.

d) Angle of coverage R is formed by two intersecting vertical planes, one parallel to the longitudinal axis of the aeroplane, and the other 110 degrees to the right of the first, when looking forward along the longitudinal axis.

Horizontal plane. The plane containing the longitudinal axis and perpendicular to the plane of symmetry of the aeroplane.

Longitudinal axis of the aeroplane. A selected axis parallel to the direction of flight at a normal cruising speed, and passing through the centre of gravity of the aeroplane.

Making way. An aeroplane on the surface of the water is "making way" when it is under way and has a velocity relative to the water.

Under command. An aeroplane on the surface of the water is "under command" when it is able to execute manoeuvres as required by the International Regulations for Preventing Collisions at Sea for the purpose of avoiding other vessels.

Under way. An aeroplane on the surface of the water is "under way" when it is not aground or moored to the ground or to any fixed object on the land or in the water.

Vertical planes. Planes perpendicular to the horizontal plane.

Visible. Visible on a dark night with a clear atmosphere.

2. Navigation lights to be displayed in the air

Note.— The lights specified herein are intended to meet the requirements of Annex 2 for navigation lights.

As illustrated in Figure 1, the following unobstructed navigation lights shall be displayed:

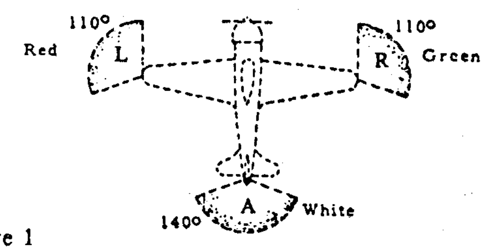


Figure 1

a) a red light projected above and below the horizontal plane through angle of coverage L;

b) a green light projected above and below the horizontal plane through angle of coverage R;

c) a white light projected above and below the horizontal plane rearward through angle of coverage A.

3. Lights to be displayed on the water

3.1 General

Note.— The lights specified herein are intended to meet the requirements of Annex 2 for lights to be displayed by aeroplanes on the water.

The International Regulations for Preventing Collisions at Sea require different lights to be displayed in each of the following circumstances:

a) when under way;

b) when towing another vessel or aeroplane;

c) when being towed;

d) when not under command and not making way;

e) when making way but not under command;

f) when at anchor;

g) when aground.

The lights required by aeroplanes in each case are described below.

3.2 When under way

As illustrated in Figure 2, the following appearing as steady unobstructed lights:

a) a red light projected above and below the horizontal through angle of coverage L;

b) a green light projected above and below the horizontal through angle of coverage R;

c) a white light projected above and below the horizontal through angle of coverage A; and

d) a white light projected through angle of coverage F.

The lights described in a), b) and c) should be visible at a distance of at least 3.7 km (2 NM). The light described in d) should be visible at a distance of 9.3 km (5 NM) when fitted to an aeroplane of 20 m or more in length or visible at a distance of 5.6 km (3 NM) when fitted to an aeroplane of less than 20 m in length.

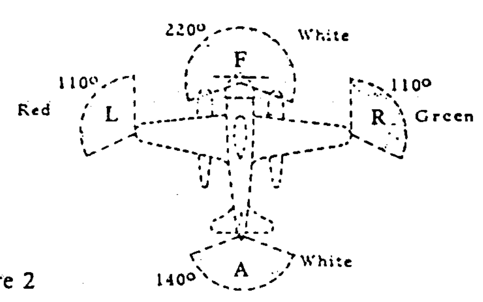

Figure 2

3.3 When towing another vessel or aeroplane

As illustrated in Figure 3, the following appearing as steady, unobstructed lights:

a) the lights described in 3.2 above;

b) a second light having the same characteristics as the light described in 3.2 d) and mounted in a vertical line at least 2 m above or below it; and

c) a yellow light having otherwise the same characteristics as the light described in 3.2 c) and mounted in a vertical line at least 2 m above it.

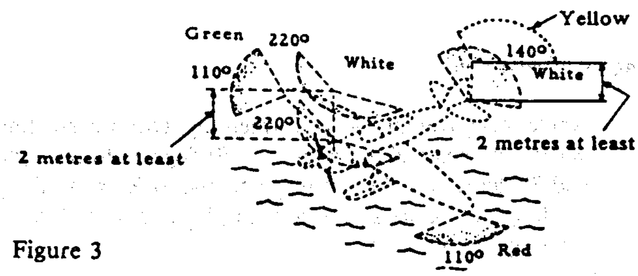

Figure 3

3.4 When being towed

The lights described in 3.2 a), b) and c) appearing as steady, unobstructed lights.

3.5 When not under command and not making way

As illustrated in Figure 4, two steady red lights placed where they can best be seen, one vertically over the other and not less than 1 m apart, and of such a character as to be visible all around the horizon at a distance of at least 3.7 km (2 NM).

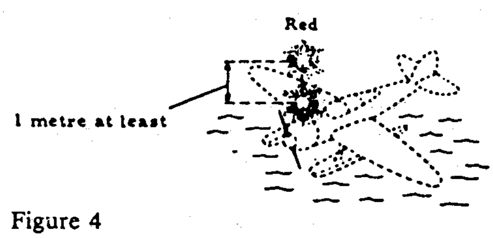

Figure 4

3.6 When making way but not under command

As illustrated in Figure 5, the lights described in 3.5 plus the lights described in 3.2 a), b) and c).

Note.— The display of lights prescribed in 3.5 and 3.6 above is to be taken by other aircraft as signals that the aeroplane showing them is not under command and cannot therefore get out of the way. They are not signals of aeroplanes in distress and requiring assistance.

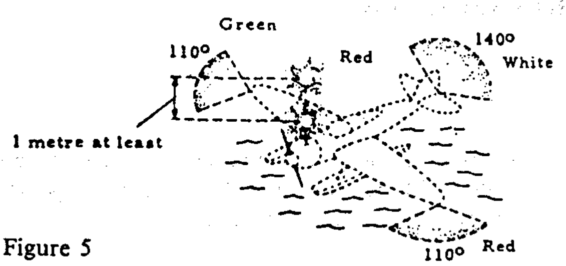

Figure 5

3.7 When at anchor

a) If less than 50 m in length, where it can best be seen, a steady white light (Figure 6), visible all around the horizon at a distance of at least 3.7 km (2 NM).

b) If 50 m or more in length, where they can best be seen, a steady white forward light and a steady white rear light (Figure 7) both visible all around the horizon at a distance of at least 5.6 km (3 NM).

c) If 50 m or more in span a steady white light on each side (Figures 8 and 9) to indicate the maximum span and visible, so far as practicable, all around the horizon at a distance of at least 1.9 km (1 NM).

3.8 When aground

The lights prescribed in 3.7 and in addition two steady red lights in vertical line, at least 1 m apart so placed as to be visible all around the horizon.

ATTACHMENT A. FLIGHT RECORDERS

Supplementary to 6.10

Introduction

The material in this Attachment concerns flight recorders intended for installation in aeroplanes engaged in international air navigation. Flight recorders comprise two systems — a flight data recorder and a cockpit voice recorder. Flight data recorders are classified as Type I and Type II depending upon the number of parameters to be recorded.

1. Flight data recorder (FDR)

1.1 General requirements

1.1.1 The recorder is to record continuously during flight time.

1.1.2 The recorder container is to:

a) be painted a distinctive orange or yellow colour;

b) carry reflective material to facilitate its location; and

c) have securely attached an automatically activated underwater locating device.

1.1.3 The recorder is to be installed so that:

a) the probability of damage to the recording is minimized. To meet this requirement it should be located as far aft as practicable. In the case of pressurized aeroplanes it should be located in the vicinity of the rear pressure bulkhead;

b) it receives its electrical power from a bus that provides the maximum reliability for operation of the recorder without jeopardizing service to essential or emergency loads; and

c) there is an aural or visual means for pre-flight checking that the recorder is operating properly.

1.2 Parameters to be recorded

1.2.1 *Type I flight data recorder.* This recorder will be capable of recording, as appropriate to the aeroplane, at least the 32 parameters in Table A-1. However, other parameters may be substituted with due regard to the aeroplane type and the characteristics of the recording equipment.

1.2.2 *Type II flight data recorder.* This recorder will be capable of recording, as appropriate to the aeroplane, at least the first 15 parameters in Table A-1. However, other parameters may be substituted with due regard to the aeroplane type and the characteristics of the recording equipment.

1.3 Additional information

1.3.1 The measurement range, recording interval and accuracy of parameters on installed equipment is usually verified by methods approved by the appropriate certificating authority.

1.3.2 The manufacturer usually provides the national certificating authority with the following information in respect of the flight data recorder:

a) manufacturer's operating instructions, equipment limitations and installation procedures;

b) parameter origin or source and equations which relate counts to units of measurement; and

c) manufacturer's test reports.

1.3.3 The operator usually supplies position error curves for pitot-static parameters, at various angles of attack and side slip, for the calibration and read-out of the recordings.

2. Cockpit voice recorder (CVR)

2.1 General requirements

2.1.1 The recorder is to be designed so that it will record at least the following:

a) voice communication transmitted from or received in the aeroplane by radio;

b) aural environment on the flight deck;

c) voice communication of flight crew members on the flight deck using the aeroplane's interphone system;

d) voice or audio signals identifying navigation or approach aids introduced in the headset or speaker; and

e) voice communication of flight crew members using the passenger address system, if installed.

2.1.2 The recorder container is to:

a) be painted a distinctive orange or yellow colour;

b) carry reflective material to facilitate its location; and

c) have securely attached an automatically activated underwater locating device.

2.1.3 To aid in voice and sound discrimination, microphones in the cockpit are to be located in the best position for recording voice communications originating at the pilot and co-pilot stations and voice communications of other crew members on the flight deck when directed to those stations. This can best be achieved by wiring suitable boom microphones to record continuously on separate channels.

2.1.4 The recorder is to be installed so that:

a) the probability of damage to the recording is minimized. To meet this requirement it should be located as far aft as practicable. In the case of pressurized aeroplanes it should be located in the vicinity of the rear pressure bulkhead;

b) it receives its electrical power from a bus that provides the maximum reliability for operation of the recorder without jeopardizing service to essential or emergency loads;

c) there is an aural or visual means for pre-flight checking of the recorder for proper operation; and

d) if the recorder has a bulk erasure device, the installation should be designed to prevent operation of the device during flight time or crash impact.

2.2 Performance requirements

2.2.1 The recorder will be capable of recording on at least four tracks simultaneously. To ensure accurate time correlation between tracks, the recorder is to record in an in-line format. If a bi-directional configuration is used, the in-line format and track allocation should be retained in both directions.

2.2.2 The preferred track allocation is as follows:

Track 1 — co-pilot headphones and live boom microphone

Track 2 — pilot headphones and live boom microphone

Track 3 — area microphone

Track 4 — time reference plus the third and fourth crew member's headphone and live microphone, if applicable.

Note.— Track 1 is located closest to the base of the recording head.

2.2.3 The recorder, when tested by methods approved by the appropriate certificating authority, will be demonstrated to be suitable for the environmental extremes over which it is designed to operate.

2.2.4 Means will be provided for an accurate time correlation between the flight data recorder and cockpit voice recorder. One method of achieving this is by superimposing the FDR time signal on Track 4 of the CVR.

2.3 Additional information

2.3.1 The manufacturer usually provides the national certificating authority with the following information in respect of the cockpit voice recorder:

a) manufacturer's operating instructions, equipment limitations and installation procedures; and

b) manufacturer's test reports.

Table A-1
Parameters for Flight Data Recorders

Serial number	Parameter	Measurement range	Recording interval (seconds)	Accuracy limits (sensor input compared to FDR read-out)
1	Time (UTC when available, otherwise elapsed time)	24 hours	4	±0.125% per hour
2	Pressure-altitude	–300 m (–1 000 ft) to maximum certificated altitude of aircraft +1 500 m (+5 000 ft)	1	±30 m to ±200 m (±100 ft to ±700 ft)
3	Indicated airspeed	95 km/h (50 kt) to max V_{S0} *(Note 1)* V_{S0} to 1.2 V_D *(Note 2)*	1	±5% ±3%
4	Heading	360°	1	±2°
5	Normal acceleration	–3 g to +6 g	0.125	±1% of maximum range excluding datum error of ±5%
6	Pitch attitude	±75°	1	±2°
7	Roll attitude	±180°	1	±2°
8	Radio transmission keying	On-off (one discrete)	1	
9	Power on each engine *(Note 3)*	Full range	1 (per engine)	±2%
10	Trailing edge flap or cockpit control selection	Full range or each discrete position	2	±5% or as pilot's indicator
11	Leading edge flap or cockpit control selection	Full range or each discrete position	2	±5% or as pilot's indicator
12	Thrust reverser position	Stowed, in transit, and reverse	1 (per engine)	
13	Ground spoiler/speed brake selection	Full range or each discrete position	1	±2% unless higher accuracy uniquely required
14	Outside air temperature	Sensor range	2	±2°C
15	Autopilot/auto throttle/AFCS mode and engagement status	A suitable combination of discretes	1	
Note.— The preceding 15 parameters satisfy the requirements for a Type II FDR.				
16	Longitudinal acceleration	±1 g	0.25	±1.5% max range excluding datum error of ±5%
17	Lateral acceleration	±1 g	0.25	±1.5% max range excluding datum error of ±5%
18	Pilot input and/or control surface position-primary controls (pitch, roll, yaw) *(Note 4)*	Full range	1	±2° unless higher accuracy uniquely required
19	Pitch trim position	Full range	1	±3% unless higher accuracy uniquely required
20	Radio altitude	–6 m to 750 m (–20 ft to 2 500 ft)	1	±0.6 m (±2 ft) or ±3% whichever is greater below 150 m (500 ft) and ±5% above 150 m (500 ft)

Serial number	Parameter	Measurement range	Recording interval (seconds)	Accuracy limits (sensor input compared to FDR read-out)
21	Glide path deviation	Signal range	1	±3%
22	Localizer deviation	Signal range	1	±3%
23	Marker beacon passage	Discrete	1	
24	Master warning	Discrete	1	
25	NAV 1 and 2 frequency selection *(Note 5)*	Full range	4	As installed
26	DME 1 and 2 distance *(Notes 5 and 6)*	0 – 370 km	4	As installed
27	Landing gear squat switch status	Discrete	1	
28	GPWS (ground proximity warning system)	Discrete	1	
29	Angle of attack	Full range	0.5	As installed
30	Hydraulics, each system (low pressure)	Discrete	2	
31	Navigation data (latitude/longitude, ground speed and drift angle) *(Note 7)*	As installed	1	As installed
32	Landing gear or gear selector position	Discrete	4	As installed

Note.— The preceding 32 parameters satisfy the requirements for a Type I FDR.

Notes.—

1. V_{S0} stalling speed or minimum steady flight speed in the landing configuration.
2. V_D design diving speed.
3. Record sufficient inputs to determine power.
4. For aeroplanes with conventional control systems "or" applies. For aeroplanes with non-mechanical control systems "and" applies. In aeroplanes with split surfaces, a suitable combination of inputs is acceptable in lieu of recording each surface separately.
5. If signal available in digital form.
6. Recording of latitude and longitude from INS or other navigation system is a preferred alternative.
7. If signals readily available.

If further recording capacity is available, recording of the following additional information should be considered:

a) operational information from electronic display systems, such as electronic flight instrument systems (EFIS), electronic centralized aircraft monitor (ECAM) and engine indication and crew alerting system (EICAS). Use the following order of priority:

1) parameters selected by the flight crew relating to the desired flight path, e.g. barometric pressure setting, selected altitude, selected airspeed, decision height, and autoflight system engagement and mode indications if not recorded from another source;

2) display system selection/status, e.g. SECTOR, PLAN, ROSE, NAV, WXR, COMPOSITE, COPY, ETC.;

3) warnings and alerts;

4) the identity of displayed pages for emergency procedures and checklists;

b) retardation information including brake application for use in the investigation of landing overruns and rejected take-offs; and

c) additional engine parameters (EPR, N1, EGT, fuel flow, etc.).

ATTACHMENT B. CARRIAGE AND USE OF OXYGEN

Supplementary to 4.9

Introduction

The performance of crew members and the well-being of passengers during flights at such altitudes where a lack of oxygen might result in impairment of faculties are of major concern. Research conducted in altitude chambers or by exposure to mountain elevations indicates that human tolerance could be related to the altitude concerned and the exposure time. The subject is dealt with in detail in the *Manual of Civil Aviation Medicine* (Doc 8984). In the light of the above and to further assist the pilot-in-command in providing the oxygen supply intended by 4.9, the following guidelines, which take into account the requirements already established in Annex 6, Part I, are considered relevant.

1. Oxygen supply

1.1 A flight to be operated at altitudes at which the atmospheric pressure in personnel compartments will be less than 700 hPa should not be commenced unless sufficient stored breathing oxygen is carried to supply:

a) all crew members and at least 10 per cent of the passengers for any period in excess of 30 minutes that the pressure in compartments occupied by them will be between 700 hPa and 620 hPa; and

b) all crew members and passengers for any period that the atmospheric pressure in compartments occupied by them will be less than 620 hPa.

1.2 A flight to be operated with a pressurized aeroplane should not be commenced unless a sufficient quantity of stored breathing oxygen is carried to supply all crew members and passengers, as is appropriate to the circumstances of the flight being undertaken, in the event of loss of pressurization, for any period that the atmospheric pressure in any compartment occupied by them would be less than 700 hPa. In addition, when an aeroplane is operated at flight altitudes at which the atmospheric pressure is less than 376 hPa, or which, if operated at flight altitudes at which the atmospheric pressure is more than 376 hPa and cannot descend safely within four minutes to a flight altitude at which the atmospheric pressure is equal to 620 hPa, there shall be no less than a 10-minute supply for the occupants of the passenger compartment.

2. Use of oxygen

2.1 All flight crew members, when engaged in performing duties essential to the safe operation of an aeroplane in flight, should use breathing oxygen continuously whenever the circumstances prevail for which its supply has been indicated to be necessary in 1.1 or 1.2.

2.2 All flight crew members of pressurized aeroplanes operating above an altitude where the atmospheric pressure is less than 376 hPa should have available at the flight duty station a quick donning type of mask which will readily supply oxygen upon demand.

Note.— Approximate altitudes in the Standard Atmosphere corresponding to the values of absolute pressure used in the text are as follows:

Absolute pressure	Metres	Feet
700 hPa	*3 000*	*10 000*
620 hPa	*4 000*	*13 000*
376 hPa	*7 600*	*25 000*

— END —

INTERNATIONAL STANDARDS

AIRCRAFT NATIONALITY AND REGISTRATION MARKS

ANNEX 7
TO THE CONVENTION ON INTERNATIONAL CIVIL AVIATION

FOURTH EDITION — JULY 1981

This edition incorporates all amendments adopted by the Council prior to 31 March 1981 and supersedes, on 26 November 1981, all previous editions of Annex 7.

For information regarding the applicability of the Standards, see Foreword.

INTERNATIONAL CIVIL AVIATION ORGANIZATION

AMENDMENTS

The issue of amendments is announced regularly in the *ICAO Bulletin* and in the monthly *Supplement to the Catalogue of ICAO Publications*, which holders of this publication should consult. The space below is provided to keep a record of such amendments.

TABLE OF CONTENTS

FOREWORD

Historical background

Annex 7 contains Standards adopted by the International Civil Aviation Organization as the minimum Standards for the display of marks to indicate appropriate nationality and registration which have been determined to comply with Article 20 of the Convention. Standards for Aircraft Nationality and Registration Marks were first adopted by the Council on 8 February 1949 pursuant to the provisions of Article 37 of the Convention on International Civil Aviation (Chicago 1944) and designated as Annex 7 to the Convention. They became effective on 1 July 1949. The Standards were based on recommendations of the first and second sessions of the Airworthiness Division held respectively in March 1946 and February 1947.

Table A shows the origin of subsequent amendments together with a list of the principal subjects involved and the dates on which the Annex and the amendments were adopted by the Council, when they became effective and when they became applicable.

Action by Contracting States

Notification of differences. The attention of Contracting States is drawn to the obligation imposed by Article 38 of the Convention by which Contracting States are required to notify the Organization of any differences between their national regulations and practices and the International Standards contained in this Annex and any amendments thereto. Further, Contracting States are invited to keep the Organization currently informed of any differences which may subsequently occur, or of the withdrawal of any differences previously notified. A specific request for notification of differences will be sent to Contracting States immediately after the adoption of each amendment to this Annex.

The attention of States is also drawn to the provisions of Annex 15 related to the publication of differences between their national regulations and practices and the related ICAO Standards and Recommended Practices through the Aeronautical Information Service, in addition to the obligation of States under Article 38 of the Convention.

Promulgation of information. The establishment and withdrawal of and changes to facilities, services and procedures affecting aircraft operations provided in accordance with the Standards specified in this Annex should be notified and take effect in accordance with the provisions of Annex 15.

Status of Annex components

An Annex is made up of the following component parts, not all of which, however, are necessarily found in every Annex; they have the status indicated:

1. — *Material comprising the Annex proper:*

a) *Standards* and *Recommended Practices* adopted by the Council under the provisions of the Convention. They are defined as follows:

Standard: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as necessary for the safety or regularity of international air navigation and to which Contracting States will conform in accordance with the Convention; in the event of impossibility of compliance, notification to the Council is compulsory under Article 38.

Recommended Practice: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as desirable in the interest of safety, regularity or efficiency of international air navigation, and to which Contracting States will endeavour to conform in accordance with the Convention.

b) *Appendices* comprising material grouped separately for convenience but forming part of the Standards and Recommended Practices adopted by the Council.

c) *Definitions* of terms used in the Standards and Recommended Practices which are not self-explanatory in that they do not have accepted dictionary meanings. A definition does not have independent status but is an essential part of each Standard and Recommended Practice in which the term is used, since a change in the meaning of the term would affect the specification.

d) *Tables* and *Figures* which add to or illustrate a Standard or Recommended Practice and which are referred to therein, form part of the associated Standard or Recommended Practice and have the same status.

2. — *Material approved by the Council for publication in association with the Standards and Recommended Practices:*

a) *Forewords* comprising historical and explanatory material based on the action of the Council and including an explanation of the obligations of States with regard to the application of the Standards and Recommended Practices ensuing from the Convention and the Resolution of Adoption.

b) *Introductions* comprising explanatory material introduced at the beginning of parts, chapters or sections of the Annex to assist in the understanding of the application of the text.

c) *Notes* included in the text, where appropriate, to give factual information or references bearing on the Standards or Recommended Practices in question, but not constituting part of the Standards or Recommended Practices.

d) *Attachments* comprising material supplementary to the Standards and Recommended Practices, or included as a guide to their application.

Selection of language

This Annex has been adopted in four languages — English, French, Russian and Spanish. Each Contracting State is requested to select one of those texts for the purpose of national implementation and for other effects provided for in the Convention, either through direct use or through translation into its own national language, and to notify the Organization accordingly.

Editorial practices

The following practice has been adhered to in order to indicate at a glance the status of each statement: *Standards* have been printed in light face roman; *Notes* have been printed in light face italics, the status being indicated by the prefix *Note.* There are no *Recommended Practices* in Annex 7.

Any reference to a portion of this document which is identified by a number and/or title includes all subdivisions of that portion.

INTERNATIONAL STANDARDS

1. — DEFINITIONS

When the following terms are used in the Standards for Aircraft Nationality and Registration Marks, they have the following meanings:

Aeroplane. A power-driven heavier-than-air aircraft, deriving its lift in flight chiefly from aerodynamic reactions on surfaces which remain fixed under given conditions of flight.

Aircraft. Any machine that can derive support in the atmosphere from the reactions of the air other than the reactions of the air against the earth's surface. (See Table I. — Classification of Aircraft.)

Airship. A power-driven lighter-than-air aircraft.

Balloon. A non-power-driven lighter-than-air aircraft.

Common mark. A mark assigned by the International Civil Aviation Organization to the common mark registering authority registering aircraft of an international operating agency on other than a national basis.

Note. — All aircraft of an international operating agency which are registered on other than a national basis will bear the same common mark.

Common mark registering authority. The authority maintaining the non-national register or, where appropriate, the part thereof, in which aircraft of an international operating agency are registered.

Fireproof material. A material capable of withstanding heat as well as or better than steel when the dimensions in both cases are appropriate for the specific purpose.

Glider. A non-power-driven heavier-than-air aircraft, deriving its lift in flight chiefly from aerodynamic reactions on surfaces which remain fixed under given conditions of flight.

Gyroplane. A heavier-than-air aircraft supported in flight by the reactions of the air on one or more rotors which rotate freely on substantially vertical axes.

Heavier-than-air aircraft. Any aircraft deriving its lift in flight chiefly from aerodynamic forces.

Helicopter. A heavier-than-air aircraft supported in flight chiefly by the reactions of the air on one or more power-driven rotors on substantially vertical axes.

International operating agency. An agency of the kind contemplated in Article 77 of the Convention.

Lighter-than-air aircraft. Any aircraft supported chiefly by its buoyancy in the air.

Ornithopter. A heavier-than-air aircraft supported in flight chiefly by the reactions of the air on planes to which a flapping motion is imparted.

Rotorcraft. A power-driven heavier-than-air aircraft supported in flight by the reactions of the air on one or more rotors.

State of Registry. The State on whose register the aircraft is entered.

2. — NATIONALITY, COMMON AND REGISTRATION MARKS TO BE USED

2.1 The nationality or common mark and registration mark shall consist of a group of characters.

2.2 The nationality or common mark shall precede the registration mark. When the first character of the registration mark is a letter it shall be preceded by a hyphen.

2.3 The nationality mark shall be selected from the series of nationality symbols included in the radio call signs allocated to the State of Registry by the International Telecommunication Union. The nationality mark shall be notified to the International Civil Aviation Organization.

2.4 The common mark shall be selected from the series of symbols included in the radio call signs allocated to the International Civil Aviation Organization by the International Telecommunication Union.

Note. — Assignment of the common mark to a common mark registering authority will be made by the International Civil Aviation Organization.

2.5 The registration mark shall be letters, numbers, or a combination of letters and numbers, and shall be that assigned by the State of Registry or common mark registering authority.

2.6 When letters are used for the registration mark, combinations shall not be used which might be confused with the five-letter combinations used in the International Code of Signals, Part II, the three-letter combinations beginning with Q used in the Q Code, and with the distress signal SOS, or other similar urgent signals for example XXX, PAN and TTT.

Note. — For reference to these codes see the currently effective International Telecommunications Regulations.

3. — LOCATION OF NATIONALITY, COMMON AND REGISTRATION MARKS

3.1. — General

The nationality or common mark and registration mark shall be painted on the aircraft or shall be affixed by any other means ensuring a similar degree of permanence. The marks shall be kept clean and visible at all times.

3.2. — Lighter-than-air aircraft

3.2.1 *Airships.* The marks on an airship shall appear either on the hull, or on the stabilizer surfaces. Where the marks appear on the hull, they shall be located lengthwise on each side of the hull and also on its upper surface on the line of symmetry. Where the marks appear on the stabilizer surfaces, they shall appear on the horizontal and on the vertical stabilizers; the marks on the horizontal stabilizer shall be located on the right half of the upper surface and on the left half of the lower surface, with the tops of the letters and numbers toward the leading edge; the marks on the vertical stabilizer shall be located on each side of the bottom half stabilizer, with the letters and numbers placed horizontally.

3.2.2 *Spherical balloons (other than unmanned free balloons).* The marks shall appear in two places diametrically opposite. They shall be located near the maximum horizontal circumference of the balloon.

3.2.3 *Non-spherical balloons (other than unmanned free balloons).* The marks shall appear on each side. They shall be located near the maximum cross-section of the balloon immediately above either the rigging band or the points of attachment of the basket suspension cables.

3.2.4 *Lighter-than-air aircraft (other than unmanned free balloons).* The side marks shall be visible both from the sides and from the ground.

3.2.5 *Unmanned free balloons.* The marks shall appear on the identification plate (see Section 8).

3.3. — Heavier-than-air aircraft

3.3.1 *Wings.* On heavier-than-air aircraft the marks shall appear once on the lower surface of the wing structure. They shall be located on the left half of the lower surface of the wing structure unless they extend across the whole of the lower surface of the wing structure. So far as is possible the marks shall be located equidistant from the leading and trailing edges of the wings. The tops of the letters and numbers shall be toward the leading edge of the wing.

3.3.2 *Fuselage (or equivalent structure) and vertical tail surfaces.* On heavier-than-air aircraft the marks shall appear either on each side of the fuselage (or equivalent structure) between the wings and the tail surface, or on the upper halves of the vertical tail surfaces. When located on a single vertical tail surface they shall appear on both sides. When located on multivertical tail surfaces they shall appear on the outboard sides of the outer surfaces.

3.3.3 *Special cases.* If a heavier-than-air aircraft does not possess parts corresponding to those mentioned in 3.3.1 and 3.3.2, the marks shall appear in a manner such that the aircraft can be identified readily.

4. — MEASUREMENTS OF NATIONALITY, COMMON AND REGISTRATION MARKS

The letters and numbers in each separate group of marks shall be of equal height.

4.1. — Lighter-than-air aircraft

4.1.1 The height of the marks on lighter-than-air aircraft other than unmanned free balloons shall be at least 50 centimetres.

4.1.2 The measurements of the marks related to unmanned free balloons shall be determined by the State of Registry, taking into account the size of the payload to which the identification plate is affixed.

4.2. — Heavier-than-air aircraft

4.2.1 *Wings.* The height of the marks on the wings of heavier-than-air aircraft shall be at least 50 centimetres.

4.2.2 *Fuselage (or equivalent structure) and vertical tail surfaces.* The height of the marks on the fuselage (or equivalent structure) and on the vertical tail surfaces of heavier-than-air aircraft shall be at least 30 centimetres.

4.2.3 *Special cases.* If a heavier-than-air aircraft does not possess parts corresponding to those mentioned in 4.2.1 and 4.2.2, the measurements of the marks shall be such that the aircraft can be identified readily.

5. — TYPE OF CHARACTERS FOR NATIONALITY, COMMON AND REGISTRATION MARKS

5.1 The letters shall be capital letters in Roman characters without ornamentation. Numbers shall be Arabic numbers without ornamentation.

5.2 The width of each character (except the letter I and the number 1), and the length of hyphens shall be two-thirds of the height of a character.

5.3 The characters and hyphens shall be formed by solid lines and shall be of a colour contrasting clearly with the background. The thickness of the lines shall be one-sixth of the height of a character.

5.4 Each character shall be separated from that which it immediately precedes or follows, by a space of not less than one-quarter of a character width. A hyphen shall be regarded as a character for this purpose.

6. — REGISTER OF NATIONALITY, COMMON AND REGISTRATION MARKS

Each Contracting State or common mark registering authority shall maintain a current register showing for each aircraft registered by that State or common mark registering authority, the information recorded in the certificate of registration (see Section 7). The register of unmanned free balloons shall contain the date, time and location of release, the type of balloon and the name of the operator.

7. — CERTIFICATE OF REGISTRATION

7.1 The certificate of registration, in wording and arrangement, shall be a replica of the following form (see below).

Note. — The size of the form is at the discretion of the State of Registry or common mark registering authority.

7.2 The certificate of registration shall be carried in the aircraft at all times.

8. — IDENTIFICATION PLATE

An aircraft shall carry an identification plate inscribed with at least its nationality or common mark and registration mark. The plate shall be made of fireproof metal or other fireproof material of suitable physical properties, and shall be secured to the aircraft in a prominent position near the main entrance, or in the case of an unmanned free balloon affixed conspicuously to the exterior of the payload.

9. — GENERAL

The provisions of this Annex shall not apply to meteorological pilot balloons used exclusively for meteorological purposes or to unmanned free balloons without a payload.

END

AMENDMENT NO. 1

TO

SUPPLEMENT NO. 1 TO ANNEX 7 (FOURTH EDITION)

AIRCRAFT NATIONALITY AND REGISTRATION MARKS

To incorporate Amendment No. 1 to Supplement No. 1:

1. Replace the following pages by the corresponding new pages dated 1/8/90:

   1 to 4.

2. Record this amendment on page ii of the Supplement.

1/8/90

SUPPLEMENT NO. 1

TO

ANNEX 7 (FOURTH EDITION)

AIRCRAFT NATIONALITY AND REGISTRATION MARKS

1. The attached Supplement No. 1 supersedes the previous edition of Supplement No. 1 to Annex 7 dated 4 February 1985, and includes information notified by Contracting States up to 1 August 1988.

2. Supplement No. 1 should be inserted at the end of Annex 7, Fourth Edition.

1/8/88

AMENDMENT NO. 2*

TO

SUPPLEMENT NO. 2 TO ANNEX 7 (FOURTH EDITION)

AIRCRAFT NATIONALITY AND REGISTRATION MARKS

To incorporate Amendment No. 2 to the Supplement:

1. Remove existing pages iii, v and vi.
2. Insert the attached pages in the appropriate places.
3. Record this amendment on page ii of Supplement No. 2.

17/12/85

* Amendment No. 1 issued in Russian only.

AMENDMENT NO. 3*

TO

SUPPLEMENT NO. 2 TO ANNEX 7 (FOURTH EDITION)

AIRCRAFT NATIONALITY AND REGISTRATION MARKS

To incorporate Amendment No. 3 to Supplement No. 2:

1. Replace the following pages by the corresponding new pages dated 1/5/88:

iii to vi
Union of Soviet Socialist Republics.

2. Insert the following new pages dated 1/5/88:

Democratic People's Republic of Korea
Morocco
Poland.

3. Record this amendment on page ii of the Supplement.

*Amendment No. 1 was issued in Russian only.

1/5/88

AMENDMENT

TO SUPPLEMENT NO. 1 TO ANNEX 7, FOURTH EDITION

AIRCRAFT NATIONALITY AND REGISTRATION MARKS

Please enter by hand the following amendments to Supplement No. 1 to Annex 7, Fourth Edition, dated 4/1/83.

1. Transmittal Note dated 4/1/83

Amend para 1 to read:

"1. The attached Supplement supersedes all previous editions of Supplement No. 1 to Annex 7."

2. Page 4, Table A

a) Amend the nationality mark for Vanuatu to read "YJ".

b) Insert the following after the entry for Zambia:

"Zimbabwe Z".

3. Page 5, Table B

a) Amend nationality mark for Vanuatu to read "YJ".

b) Insert the following before the entry for New Zealand:

"Z Zimbabwe".

4/8/83

SUPPLEMENT No. 1

TO

ANNEX 7, FOURTH EDITION

AIRCRAFT NATIONALITY AND REGISTRATION MARKS

1. The attached Supplement supersedes all previous Supplements to Annex 7.

2. The Supplement should be inserted at the end of Annex 7, Fourth Edition.

4/1/83

---

1. Contracting States which have notified ICAO of differences

The Contracting States listed below have notified ICAO of differences which exist between their national regulations and practices and the International Standards and Recommended Practices of Annex 7, Fourth Edition, or have commented on their implementation as indicated herein:

State	Date of notification	Pages in Supplement	Date of publication
Bangladesh	11/6/81	1	4/2/85
Canada	28/6/82	1	4/2/85
Democratic People's Republic of Korea	24/11/87	1	1/5/88
Germany, Federal Republic of	22/7/81	1	4/2/85

UNION OF SOVIET SOCIALIST REPUBLICS

2 When an aircraft is entered into the USSR State Register of Civil Aircraft, it is assigned a State registration identification mark which appears on the aircraft. The identification marks for civil aircraft and the rules governing their emplacement are established by the USSR Ministry of Civil Aviation.

3.3.1 The marks must also appear on the upper surface of the wing.

3.3.2 The marks on the tail fin appear mainly in the lower part thereof.

8 Not implemented.

POLAND

6 Registration of unmanned free balloons with payload is not required. Such balloons are not in use in Poland thus far.

8 In the Polish regulations, there is no provision concerning unmanned free balloons because such balloons are not in use in Poland thus far.

MOROCCO

4.2.2 According to Moroccan regulations, the height of the marks on the fuselage must be as large as possible, while being no smaller than 15 cm and no larger than 4/5 of the median height of the fuselage (Article 2 of the Decree of 1963).

8 The identification plate is not mentioned in the Moroccan regulations.

DEMOCRATIC PEOPLE'S REPUBLIC OF KOREA

2.3 P is used for the nationality mark of the Democratic People's Republic of Korea.

NETHERLANDS, KINGDOM OF THE

5.2, 5.3 and 5.4	The enforcement of new regulations in the Netherlands precludes the implementation of these paragraphs. The Netherlands regulations are:
	<u>Article 6 - Height of Hyphen</u>
	The height of the hyphen shall be one-seventh of the height of the nationality and registration marks of the aircraft.
	<u>Article 7 - Type of Characters and Separation</u>
	The type and separation of letters, numbers and hyphens of the marks shall be in accordance with the Decree No. LI/11430 dated 24 March 1966, issued in pursuance of Article 6, paragraph 1 of the Netherlands Aviation Act.
	The letters and numbers shall be placed next to each other in a straight line. If necessary the registration mark may be placed below the nationality mark.
	The letter IJ shall be written as Y.
3.2.5, 6, 8	The marking of unmanned free balloons is not yet applied.

USSR

2	When an aircraft is entered on the State of Registry of Civil Aircraft of the Union of Soviet Socialist Republics, it is assigned a State registration mark which is painted or affixed on the aircraft. Civil aircraft registration marks and the regulations for depicting them on aircraft are established by the Ministry of Civil Aviation of the Union of Soviet Socialist Republics.
3.3.1	The marks must also appear on the upper surface of the wing.
3.3.2	The marks normally appear on the lower half of the vertical tail surface.
8	Not implemented.

INTERNATIONAL STANDARDS

AIRWORTHINESS OF AIRCRAFT

ANNEX 8

TO THE CONVENTION ON INTERNATIONAL CIVIL AVIATION

EIGHTH EDITION — JULY 1988

This edition incorporates all amendments adopted by the Council prior to 23 March 1988 and supersedes on 22 March 1991 all previous editions of Annex 8.

For information regarding the applicability of the Standards, *see* section 2 of Part II and 1.1 of Part III, and the Foreword.

TABLE OF CONTENTS

FOREWORD

Historical Background

Standards and Recommended Practices for the Airworthiness of Aircraft were adopted by the Council on 1 March 1949 pursuant to the provisions of Article 37 of the Convention on International Civil Aviation (Chicago 1944) and designated as Annex 8 to the Convention.

The Annex contained, in Part II, general airworthiness procedures applicable to all aircraft and in Part III, minimum airworthiness characteristics for aeroplanes provided, or to be provided, with certificates of airworthiness classifying them in an established ICAO category. Part I contained definitions.

At its fourth session, the Airworthiness Division collaborating with the Operations Division made recommendations concerning the use of a performance code as an alternative to the one contained in the Annex, in which the climb values had the status of Recommended Practices. Further, the Airworthiness Division made recommendations concerning certain aspects of the certification in ICAO categories. As a result of those recommendations, the Council approved the incorporation of the alternative performance code as Attachment A, but stated its belief that since agreement had not yet been reached upon Standards covering performance, there existed no basis for certification in ICAO Category A. It urged the Contracting States to refrain from such certification pending the becoming effective of Standards on performance or until such time as the Council decides on the basic policy on airworthiness.

The Assembly at its seventh session (June 1953) endorsed the action already taken by the Council and the Air Navigation Commission to initiate a fundamental study of ICAO policy on international airworthiness and directed the Council to complete the study as rapidly as practicable.

In pursuing such study the Air Navigation Commission was helped by an international body of experts designated as the "Airworthiness Panel", which contributed to the preparation of the work of the Third Air Navigation Conference.

As a result of these studies a revised policy on international airworthiness was developed and it was approved by the Council in 1956. According to this policy the principle of certification in an ICAO Category was abandoned. Instead, Annex 8 included broad Standards which defined, for application by the competent national authorities, the complete minimum international basis for the recognition by States of certificates of airworthiness for the purpose of the flight of aircraft of other States into or over their territories, thereby achieving, among other purposes, protection of other aircraft, third persons and property. It was considered that this met the obligation of the Organization under Article 37 of the Convention to adopt International Standards of airworthiness.

It was recognized that the ICAO Standards of airworthiness would not replace national regulations and that national codes of airworthiness containing the full scope and extent of detail considered necessary by individual States would be necessary as the basis for the certification of individual aircraft. Each State would establish its own comprehensive and detailed code of airworthiness, or would select a comprehensive and detailed code established by another Contracting State. The level of airworthiness defined by this code would be indicated by the Standards, supplemented, if necessary, by Acceptable Means of Compliance.

In application of those principles, the Annex was declared as constituting the minimum standards for the purpose of Article 33. It was also recognized that the Annex might, at the time of adoption, not include technical Standards for all classes of aircraft or even for all classes of aeroplanes, if the Council felt that no technical Standards were required at that time to render Article 33 operative. Furthermore, adoption or amendment of the Annex declared to be complete for the purpose of Article 33 did not constitute the end of ICAO's work in the airworthiness field, as there was a need to continue international collaboration in airworthiness matters.

A revised text for Annex 8 consistent with the above principles was prepared on the basis of the recommendations made by the Third Air Navigation Conference (Montreal, September-October 1956). Part III of the Annex was limited to broad Standards stating the objectives rather than the methods of realizing those objectives. However, to indicate by examples the level of airworthiness intended by some of the broad Standards, specifications of a more detailed and quantitative nature were included under the title "Acceptable Means of Compliance". These specifications were intended to assist the Contracting States in the establishment and application of comprehensive and detailed national airworthiness codes.

To adopt a code giving an appreciably lower level of airworthiness than that given in an Acceptable Means of

Compliance was considered to be a violation of the Standard supplemented by that Acceptable Means of Compliance.

The revised text for Annex 8 was included in the Fourth Edition of the Annex, which superseded the First, Second and Third Editions.

Another recommendation of the Third Air Navigation Conference led to the establishment by the Council in 1957 of the Airworthiness Committee, consisting of airworthiness experts with broad experience and selected from those Contracting States and International Organizations willing to contribute.

Present policy on international airworthiness. There had been some concern about the slow progress that had been made over the years with respect to developing supplementary airworthiness specifications in the form of Acceptable means of Compliance. It was noted that the majority of the Acceptable Means of Compliance in Annex 8 had been developed in 1957 and were therefore applicable to only those aeroplane types operating at that time. No effort had been made to update the specifications in these Acceptable Means of Compliance nor had there been any recommendations from the Airworthiness Committee for upgrading of any of the Provisional Acceptable Means of Compliance, which had been developed as potential material for full-fledged Acceptable Means of Compliance. The Air Navigation Commission therefore requested the Airworthiness Committee to review the progress made by it since its inception with a view to determining whether or not desired results had been achieved and to recommend any changes to improve the development of detailed airworthiness specifications.

The Airworthiness Committee at its Ninth Meeting (Montreal, November/December 1970) made a detailed study of the problems and recommended that the concept of developing airworthiness specifications in the form of Acceptable Means of Compliance and Provisional Acceptable Means of Compliance should be abandoned and a provision should be made for an airworthiness technical manual to be prepared and published by ICAO to include guidance material intended to facilitate the development and uniformity of national airworthiness codes by Contracting States.

The Air Navigation Commission reviewed the recommendations of the Airworthiness Committee in the light of the history of the development of the airworthiness policy approved by the Council in 1956. It came to the conclusion that the basic objectives and principles on which the ICAO airworthiness policy had been based were sound and did not require any significant change. It was also concluded that the main reason for the slow progress in the development of airworthiness specifications in the form of Acceptable Means of Compliance and Provisional Acceptable Means of Compliance was the degree of mandatory status to the former implied by the following statement included in the Forewords of the Fourth and Fifth Editions of Annex 8:

> "To adopt a code giving an appreciably lower level of airworthiness than that given in an Acceptable Means of Compliance would be a violation of the Standard supplemented by that Acceptable Means of Compliance."

Several approaches were examined by the Air Navigation Commission to eliminate this difficulty. Finally it came to the conclusion that the idea of developing airworthiness specifications in the form of Acceptable Means of Compliance and Provisional Acceptable Means of Compliance should be abandoned and ICAO should declare that the States' obligations, for the purpose of Article 33 of the Convention, shall be met by their compliance with the broad Standards in Annex 8 supplemented, as necessary, by airworthiness technical guidance material, devoid of all mandatory implications or obligations. Also the requirement that each Contracting State should either establish its own comprehensive and detailed code of airworthiness or select a comprehensive and detailed code established by another Contracting State, should be retained.

The Council on 15 March 1972 approved the above approach to form the basis for the present policy of ICAO in the field of airworthiness. According to this policy:

a) the objective of international airworthiness Standards is to define, for application by the competent national authorities, the minimum level of airworthiness constituting the international basis for the recognition by States under Article 33 of the Convention, of certificates of airworthiness for the purpose of the flight of aircraft of other States into or over their territories thereby achieving, among other things, protection of other aircraft, third parties and property;

b) the Standards developed to meet the objective stated in a) above are considered by the Council as meeting, in the necessary scope and detail, the obligations of the Organization under Article 37 of the Convention to adopt International Standards of airworthiness;

c) international airworthiness Standards adopted by the Council are recognized as being the complete international code necessary to bring into force and effect the rights and obligations which arise under Article 33 of the Convention;

d) the technical airworthiness Standards in Annex 8 shall be presented as broad specifications stating the objectives rather than the means of realizing these objectives; ICAO recognizes that national codes of airworthiness containing the full scope and extent of detail considered necessary by individual States are required as the basis for the certification by individual States of airworthiness of each aircraft;

e) to assist States in applying the Standards of Annex 8 and in developing their own comprehensive national codes in a uniform manner, detailed guidance material shall be developed and published expeditiously in the working languages of the Organization.

The Council also approved the issuance of the airworthiness guidance material under the title of "Airworthiness Technical Manual". It was understood that the guidance material will, before issuance, be examined by the Air Navigation Commission. It will however have no formal status and its main purpose would be to provide guidance to Contracting States in developing the detailed national airworthiness codes mentioned in 2.2 of Part II of the Annex.

A text for Annex 8 consistent with the policy on international airworthiness approved by the Council on 15 March 1972, was developed by the Air Navigation Commission.

Table A shows the origin of amendments together with a list of the principal subjects involved and the dates on which the Annex and the amendments were adopted by the Council, when they became effective and when they became applicable.

Applicability

The applicability of the Standards is indicated in section 2 of Part II and in 1.1 of Part III. The dates were established so as to take account of the provisions of Article 41 of the Convention. However, the Council has recommended that, as far as practicable, earlier dates be applied (see the Note under 1.1.2 of Part III).

Related Standards of Annex 6, Part I. Chapter 5 of Annex 6, Part I dealing with aeroplane performance operating limitations contains Standards that are complementary to the airworthiness Standards of Annex 8. Both state broad objectives. The Standards of Annex 6, Part I, Chapter 5, are supplemented by guidance material in the form of green page attachments which indicate by examples the level of performance intended by the Standards.

The Council has urged Contracting States not to impose on visiting aeroplanes operational requirements other than those established by the State of Registry, provided those requirements are not lower than the Standards of Chapter 5 of Annex 6, Part I, as amended by Amendment 2 and 2.2 of Part III of this edition of Annex 8.

Action by Contracting States

Notification of differences. The attention of Contracting States is drawn to the obligation imposed by Article 38 of the Convention by which Contracting States are required to notify the Organization of any differences between their national regulations and practices and the International Standards contained in this Annex and any amendments thereto. Contracting States are invited to keep the Organization currently informed of any differences which may subsequently occur, or of the withdrawal of any differences previously notified. A specific request for notification of differences will be sent to Contracting States immediately after the adoption of each Amendment to this Annex.

Use of the text of the Annex in national regulations. The Council, on 13 April 1948, adopted a resolution inviting the attention of Contracting States to the desirability of using in their own national regulations, as far as practicable, the precise language of those ICAO Standards that are of a regulatory character and also of indicating departures from the Standards, including any additional regulations that are important for the safety or regularity of air navigation. Wherever possible, the provisions of Part II of this Annex have been written in such a way as would facilitate incorporation, without major textual changes, into national legislation. The provisions of Part III of this Annex, on the other hand, are applicable to aeroplanes through the medium of national codes more comprehensive and detailed than the Standards, so that the Council's Resolution of 13 April 1948 does not apply to Part III.

Information concerning the national codes establishing compliance with the Annex. States are invited to notify the Organization either of the establishment or of the selection of the comprehensive and detailed national codes mentioned in 2.2 of Part II. States that establish such codes are invited to forward a copy of each with its successive amendments, and any appropriate interpretation document concerning them. States that select codes of other Contracting States to comply with 2.2 of Part II are invited to indicate the codes that they intend to use.

Use of the guidance material in the Airworthiness Technical Manual. Contracting States are invited to note that the material in the *Airworthiness Technical Manual* is intended to guide them in the development of their detailed and comprehensive national codes with a view to introducing uniformity in those national codes. The material has no mandatory status and Contracting States are quite free to differ from it either in detail or in methods. States are also not required to notify any differences that may exist between their detailed national regulations and practices and the relevant material in the *Airworthiness Technical Manual.*

General Information

An Annex is made up of the following component parts, not all of which, however, are necessarily found in every Annex; they have the status indicated.

1. — *Material comprising the Annex proper*

a) *Standards and Recommended Practices* adopted by the Council under the provisions of the Convention. They are defined as follows:

Standard: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as necessary for the safety or regularity of international air navigation and to which Contracting States will conform in accordance with the Convention; in the event of impossibility of compliance, notification to the Council is compulsory under Article 38.

Recommended Practice: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as desirable in the interest of safety, regularity or efficiency of international air navigation, and to which Contracting States will endeavour to conform in accordance with the Convention.

b) *Appendices* comprising material grouped separately for convenience but forming part of the Standards and Recommended Practices adopted by the Council.

c) *Provisions* governing the applicability of the Standards and Recommended Practices.

d) *Definitions* of terms used in the Standards and Recommended Practices which are not self-explanatory in that they do not have accepted dictionary meanings. A definition does not have an independent status but is an essential part of each Standard and Recommended Practice in which the term is used, since a change in the meaning of the term would affect the specification.

2. — *Material approved by the Council for publication in association with the Standards and Recommended Practices*

a) *Forewords* comprising historical and explanatory material based on the action of the Council and including an explanation of the obligations of States with regard to the application of the Standards and Recommended Practices ensuing from the Convention and the Resolution of Adoption.

b) *Introductions* comprising explanatory material introduced at the beginning of parts, chapters or sections of the Annex to assist in the understanding of the application of the text.

c) *Notes* included in the text, where appropriate, to give factual information or references bearing on the Standards or Recommended Practices in question, but not constituting part of the Standards or Recommended Practices.

d) *Attachments* comprising material supplementary to the Standards and Recommended Practices, or included as a guide to their application.

Selection of language

This Annex has been adopted in four languages — English, French, Russian and Spanish. Each Contracting State is requested to select one of those texts for the purpose of national implementation and for other effects provided for in the Convention, either through direct use or through translation into its own national language, and to notify the Organization accordingly.

Editorial practice

The following practice has been adhered to in order to indicate at a glance the status of each statement: *Standards* have been printed in light face roman; *Notes* have been printed in light face italics, the status being indicated by the prefix *Note.* There are no *Recommended Practices* in Annex 8.

In accordance with Annex 5, the International System of Units (SI) is used throughout this document.

Any reference to a portion of this document which is identified by a number includes all subdivisions of the portion.

Table A. Amendments to Annex 8

Amendment(s)	*Source(s)*	*Subject(s)*	*Adopted Effective Applicable*

96	Third meeting of the Continuing Airworthiness Panel (CAP/3)	Introduction of responsibilities of State of Design and definition thereof; revision of responsibilities of parties involved in transfer of information relating to continuing airworthiness; addition of new requirements concerning provision of maintenance information.	22 March 1994 25 July 1994 10 November 1994

INTERNATIONAL STANDARDS

PART 1. DEFINITIONS

When the following terms are used in the Standards for the Airworthiness of Aircraft, they have the following meanings:

Aeroplane. A power-driven heavier-than-air aircraft, deriving its lift in flight chiefly from aerodynamic reactions on surfaces which remain fixed under given conditions of flight.

Aircraft. Any machine that can derive support in the atmosphere from the reactions of the air other than the reactions of the air against the earth's surface.

Anticipated operating conditions. Those conditions which are known from experience or which can be reasonably envisaged to occur during the operational life of the aircraft taking into account the operations for which the aircraft is made eligible, the conditions so considered being relative to the meteorological state of the atmosphere, to the configuration of terrain, to the functioning of the aircraft, to the efficiency of personnel and to all the factors affecting safety in flight. Anticipated operating conditions do not include:

a) those extremes which can be effectively avoided by means of operating procedures; and

b) those extremes which occur so infrequently that to require the Standards to be met in such extremes would give a higher level of airworthiness than experience has shown to be necessary and practical.

Appropriate airworthiness requirement. The comprehensive and detailed airworthiness codes established by a Contracting State for the class of aircraft under consideration. (*See* 2.2 of Part II of this Annex.)

Approved. Accepted by a Contracting State as suitable for a particular purpose.

Configuration (as applied to the aeroplane). A particular combination of the positions of the moveable elements, such as wing flaps, landing gear, etc., which affect the aerodynamic characteristics of the aeroplane.

Critical power-unit(s). The power-unit(s) failure of which gives the most adverse effect on the aircraft characteristics relative to the case under consideration.

Design landing mass. The maximum mass of the aircraft at which, for structural design purposes, it is assumed that it will be planned to land.

Design take-off mass. The maximum mass at which the aircraft, for structural design purposes, is assumed to be planned to be at the start of the take-off run.

Design taxiing mass. The maximum mass of the aircraft at which structural provision is made for load liable to occur during use of the aircraft on the ground prior to the start of take-off.

Factor of safety. A design factor used to provide for the possibility of loads greater than those assumed, and for uncertainties in design and fabrication.

Final approach and take-off area (FATO). A defined area over which the final phase of the approach manoeuvre to hover or landing is completed and from which the take-off manoeuvre is commenced. Where the FATO is to be used by performance Class 1 helicopters, the defined area includes the rejected take-off area available.

Helicopter. A heavier-than-air aircraft supported in flight chiefly by the reactions of the air on one or more power-driven rotors on substantially vertical axes.

Landing surface. That part of the surface of an aerodrome which the aerodrome authority has declared available for the normal ground or water run of aircraft landing in a particular direction.

Limit loads. The maximum loads assumed to occur in the anticipated operating conditions.

Load factor. The ratio of a specified load to the weight of the aircraft, the former being expressed in terms of aerodynamic forces, inertia forces, or ground reactions.

Performance Class 1 helicopter. A helicopter with performance such that, in case of engine failure, it is able to land on the rejected take-off area or safely continue the flight to an appropriate landing area.

Performance Class 2 helicopter. A helicopter with performance such that, in case of engine failure, it is able to safely continue the flight, except when the failure occurs prior to a defined point after take-off or after a defined point before landing, in which cases a forced landing may be required.

Performance Class 3 helicopter. A helicopter with performance such that, in case of engine failure at any point in the flight profile, a forced landing must be performed.

Power-unit. A system of one or more engines and ancillary parts which are together necessary to provide thrust, independently of the continued operation of any other power-unit(s), but not including short period thrust-producing devices.

Pressure-altitude. An atmospheric pressure expressed in terms of altitude which corresponds to that pressure in the standard atmosphere.

Rendering (a Certificate of Airworthiness) valid. The action taken by a Contracting State, as an alternative to issuing its own Certificate of Airworthiness, in accepting a Certificate of Airworthiness issued by any other Contracting State as the equivalent of its own Certificate of Airworthiness.

Standard atmosphere. An atmosphere defined as follows:

a) the air is a perfect dry gas;

b) the physical constants are:

— Sea level mean molar mass:
$M_0 = 28.964420 \times 10^{-3}$ kg mol^{-1}
— Sea level atmospheric pressure:
$P_0 = 1013.250$ hPa
— Sea level temperature:
$t_0 = 15°C$
$T_0 = 288.15$ K
— Sea level atmospheric density:
$\rho_0 = 1.2250$ kg m^{-3}
— Temperature of the ice point:
$T_i = 273.15$ K
— Universal gas constant:
$R^* = 8.31432$ JK^{-1}mol^{-1}

c) the temperature gradients are:

Geopotential altitude (km)		*Temperature gradient (Kelvin per standard geopotential kilometre)*
From	*To*	
–5.0	11.0	–6.5
11.0	20.0	0.0
20.0	32.0	+1.0
32.0	47.0	+2.8
47.0	51.0	0.0
51.0	71.0	–2.8
71.0	80.0	–2.0

Note 1.— The standard geopotential metre has the value 9.80665 $m^2 s^{-2}$.

Note 2.— See Doc 7488 for the relationship between the variables and for tables giving the corresponding values of temperature, pressure, density and geopotential.

Note 3.— Doc 7488 also gives the specific weight, dynamic viscosity, kinematic viscosity and speed of sound at various altitudes.

State of Design. The State having jurisdiction over the organization responsible for the type design.

State of Manufacture. The State having jurisdiction over the organization responsible for the final assembly of the aircraft.

State of Registry. The State on whose register the aircraft is entered.

Take-off surface. That part of the surface of an aerodrome which the aerodrome authority has declared available for the normal ground or water run of aircraft taking off in a particular direction.

Ultimate load. The limit load multiplied by the appropriate factor of safety.

PART II. ADMINISTRATION

Note.— Although the Convention on International Civil Aviation allocates to the State of Registry certain functions which that State is entitled to discharge, or obligated to discharge, as the case may be, the Assembly recognized, in Resolution A23-13, that the State of Registry may be unable to fulfil its responsibilities adequately in instances where aircraft are leased, chartered or interchanged — in particular without crew — by an operator of another State and that the Convention may not adequately specify the rights and obligations of the State of an operator in such instances until such time as Article 83 bis *of the Convention enters into force. Accordingly, the Council urged that if, in the above-mentioned instances, the State of Registry finds itself unable to discharge adequately the functions allocated to it by the Convention, it delegate to the State of the operator, subject to acceptance by the latter State, those functions of the State of Registry that can more adequately be discharged by the State of the Operator. It is understood that pending entry into force of Article 83* bis *of the Convention the foregoing action will only be a matter of practical convenience and will not affect either the provisions of the Chicago Convention prescribing the duties of the State of Registry or any third State.*

1. CERTIFICATE OF AIRWORTHINESS

Note.— Certificate of Airworthiness as used in these Standards, is the Certificate of Airworthiness referred to in Article 31 of the Convention.

2. APPLICABILITY

2.1 The Standards of Part II are applicable as follows:

a) sections 4, 5 and 6 in respect of all aircraft, beginning 1 December 1957; and

b) sections 3, 7 and 8 and paragraph 2.2 in respect of all aircraft that are of types of which the prototype is submitted to appropriate national authorities for certification on or after 13 June 1960.

Note.— The applicability of the Standards in other parts of this Annex is stated in those parts.

2.2 A Contracting State shall not issue or render valid a Certificate of Airworthiness for which it intends to claim recognition pursuant to Article 33 of the Convention on International Civil Aviation, unless the aircraft complies with a comprehensive and detailed national airworthiness code established for that class of aircraft by the State of Registry or by any other Contracting State. This national code shall be such that compliance with it will ensure compliance with:

a) the Standards of Part II of this Annex; and

b) where applicable, with the Standards of Part III or Part IV of this Annex.

Where the design features of a particular aircraft render any of the Standards in Part III or Part IV inapplicable or inadequate, variations therefrom that are considered by the State of Registry to give at least an equivalent level of safety may be made.

Note.— An Airworthiness Technical Manual *(Doc 9051) containing guidance material has been published by ICAO. See the Foreword.*

3. PROOF OF COMPLIANCE WITH APPROPRIATE AIRWORTHINESS REQUIREMENTS

3.1 The Certificate of Airworthiness shall be issued by the Contracting State which approves the aircraft or by its authorized representatives on the basis of satisfactory evidence that the aircraft complies with the appropriate airworthiness requirements. Except when Certificates of Airworthiness are issued in accordance with 3.2, that State, or its authorized representatives, shall obtain such evidence in the manner prescribed in 3.1.1, 3.1.2 and 3.1.3.

3.1.1 There shall be an approved design consisting of such drawings, specifications, reports and documentary evidence as are necessary to show that the aircraft complies with the appropriate airworthiness requirements. Records shall be maintained to establish the identification of the aircraft with its approved design.

3.1.2 During the course of construction, the aircraft shall be inspected in accordance with a system of inspection approved by the State, to determine that it conforms in all essential respects with the approved design, and that its construction and assembly are satisfactory.

3.1.3 The aircraft shall be subjected to such flight tests as are deemed necessary by the State to show compliance with the appropriate airworthiness requirements.

3.2 When an aircraft possessing a valid Certificate of Airworthiness issued by a Contracting State is entered on the register of another Contracting State, the new State of Registry, when issuing another Certificate of Airworthiness or rendering the original certificate valid, may consider prior issuance of the Certificate of Airworthiness by a Contracting State as satisfactory evidence, in whole or in part, that the aircraft is airworthy and need not follow the procedure prescribed in 3.1.1, 3.1.2 and 3.1.3.

Note.— This applies both when the aircraft is registered for the first time and when the aircraft changes its nationality.

3.3 Contracting States, in addition to determining compliance with the appropriate airworthiness requirements for an aircraft, shall take whatever other steps they deem necessary to ensure that the Certificate of Airworthiness is withheld if the aircraft is known or suspected to have dangerous features not specifically guarded against by those requirements.

4. CONTINUING AIRWORTHINESS OF AIRCRAFT

4.1 Determination of continuing airworthiness

a) The continuing airworthiness of an aircraft shall be determined by the State of Registry in relation to the appropriate airworthiness requirements in force for that aircraft.

b) The State of Registry shall develop or adopt requirements to ensure the continued airworthiness of the aircraft during its service life.

Note 1.— These requirements will also cover maintenance requirements of Annex 6.

Note 2.— Guidance on continuing airworthiness requirements is contained in the Continuing Airworthiness Manual.

4.2 Information related to continuing airworthiness of aircraft

4.2.1 When a Contracting State first enters on its register an aircraft of a particular type for which it is not the State of Design and issues or validates a Certificate of Airworthiness in accordance with 2.2 of this Part, it shall advise the State of Design that it has entered such an aircraft on its register.

4.2.2 The State of Design of an aircraft shall transmit any generally applicable information which it has found necessary for the continuing airworthiness of the aircraft and for the safe operation of the aircraft (hereinafter called mandatory continuing airworthiness information) as follows:

a) to every Contracting State which has in accordance with 4.2.1 advised the State of Design that it has entered the aircraft on its register; and

b) to any other Contracting State upon request.

Note 1.— In 4.2, the term "mandatory continuing airworthiness information" is intended to include mandatory requirements for modification, replacement of parts or inspection of aircraft and amendment of operating limitations and procedures. Among such information is that issued by Contracting States in the form of airworthiness directives.

Note 2.— ICAO Circular 95 — The Continuing Airworthiness of Aircraft in Service *— provides the necessary information to assist Contracting States in establishing contact with competent authorities of other Contracting States, for the purpose of maintaining continuing airworthiness of aircraft in service.*

4.2.3 The State of Registry shall, upon receipt of mandatory continuing airworthiness information from the State of Design, adopt the mandatory information directly or assess the information received and take appropriate action.

4.2.4 Any Contracting State which has entered on its register an aircraft in respect of which that Contracting State is not the State of Design and for which it has issued or validated a Certificate of Airworthiness in accordance with 2.2 of this Part, shall ensure the transmission to the State of Design of all mandatory continuing airworthiness information originated in respect of that aircraft in the former Contracting State.

4.2.5 The State of Registry shall ensure that in respect of aircraft of over 5 700 kg maximum certificated take-off mass, there exists a system whereby information on faults, malfunctions, defects and other occurrences which cause or might cause adverse effects on the continuing airworthiness of the aircraft is transmitted to the organization responsible for the type design of that aircraft.

Note.— Guidance on interpretation of "the organization responsible for the type design" is contained in the Airworthiness Technical Manual *(Doc 9051).*

4.2.6 The State of Design shall ensure that, in respect of aircraft over 5 700 kg maximum certificated take-off mass, there exists a system for:

a) receiving information submitted in accordance with 4.2.5;

b) deciding if and when airworthiness action is needed;

c) developing the necessary airworthiness actions; and

d) promulgating the information on those actions including that required in 4.2.2.

4.2.7 The State of Design shall ensure that, in respect of aeroplanes over 5 700 kg maximum certificated take-off mass, there exists a continuing structural integrity programme to ensure the airworthiness of the aeroplane. The programme shall include specific information concerning corrosion prevention and control.

4.2.8 Each Contracting State shall establish, in respect of aircraft over 5 700 kg maximum certificated take-off mass, the type of service information that is to be reported to its airworthiness authority by operators, organizations responsible for type design and maintenance organizations. Procedures for reporting this information shall also be established.

4.2.9 Where the State of Manufacture of an aircraft is other than the State of Design there shall be an agreement acceptable to both States to ensure that the manufacturing organization co-operates with the organization responsible for the type design in assessing information received on experience with operating the aircraft.

5. VALIDITY OF CERTIFICATE OF AIRWORTHINESS

5.1 A Certificate of Airworthiness shall be renewed or shall remain valid, subject to the laws of the State of Registry, provided that the State of Registry shall require that the continuing airworthiness of the aircraft shall be determined by a periodical inspection at appropriate intervals having regard to lapse of time and type of service or, alternatively by means of a system of inspection, approved by the State, which will produce at least an equivalent result.

5.2 Method of rendering a Certificate of Airworthiness valid

When a State of Registry renders valid a Certificate of Airworthiness issued by another Contracting State, as an alternative to issuance of its own Certificate of Airworthiness, it shall establish validity by suitable authorization to be carried with the former Certificate of Airworthiness accepting it as the equivalent of the latter. The validity of the authorization shall not extend beyond the period of validity of the Certificate of Airworthiness, but whenever the period of validity of the Certificate of Airworthiness is renewed, the authorization may be renewed or another authorization issued by the State of Registry for a period corresponding to the period of validity of the Certificate of Airworthiness.

6. TEMPORARY LOSS OF AIRWORTHINESS

6.1 General

Any failure to maintain an aircraft in an airworthy condition as defined by the appropriate airworthiness requirements shall render the aircraft ineligible for operation until the aircraft is restored to an airworthy condition.

6.2 Damage to aircraft

When an aircraft has sustained damage, the State of Registry shall judge whether the damage is of a nature such that the aircraft is no longer airworthy as defined by the appropriate airworthiness requirements.

6.2.1 If the damage is sustained or ascertained when the aircraft is on the territory of another Contracting State, the authorities of the other Contracting State shall be entitled to prevent the aircraft from resuming its flight on the condition that they shall advise the State of Registry immediately, communicating to it all details necessary to formulate the judgement referred to in the introductory Standard of 6.2.

6.2.2 When the State of Registry considers that the damage sustained is of a nature such that the aircraft is no longer airworthy, it shall prohibit the aircraft from resuming flight until it is restored to an airworthy condition; the State of Registry may, however, in exceptional circumstances, prescribe particular limiting conditions to permit the aircraft to fly without fare-paying passengers to an aerodrome at which it can be restored to an airworthy condition, and the Contracting State that has originally, in accordance with 6.2.1, prevented the aircraft from resuming flights, shall permit such flight.

6.2.3 When the State of Registry considers that the damage sustained is of a nature such that the aircraft is still airworthy, the aircraft shall be allowed to resume its flight.

7. STANDARD FORM OF CERTIFICATE OF AIRWORTHINESS

The Certificate of Airworthiness shall contain the information indicated in the following form, and shall be generally similar to it (see Figure 1).

8. AIRCRAFT LIMITATIONS AND INFORMATION

Each aircraft shall be provided with a flight manual, placards, or other documents stating the approved limitations within which the aircraft is considered airworthy as defined by the appropriate airworthiness requirements, and additional instructions and information necessary for the safe operation of the aircraft.

PART III. AEROPLANES

CHAPTER 1. GENERAL

1.1 Applicability

1.1.1 The Standards of Part III, except for those specified in 8.4, are applicable in respect of all aeroplanes designated in 1.1.3, that are of types of which the prototype is submitted to the appropriate national authorities for certification on or after 13 June 1960.

1.1.2 The Standards specified in 8.4 of Part III are applicable in respect of all aeroplanes designated in 1.1.3 that are of types of which the prototype is submitted to the appropriate national authorities for certification on or after 22 March 1985.

Note.— The Council recognizes that the amended Standards relating to fire protection, crash survival and provisions for emergency are very important to safety and urges the implementation of the substance of these amended Standards, if feasible and practicable, before their applicability date of 22 March 1991.

1.1.3 The Standards of Part III shall apply to aeroplanes of over 5 700 kg maximum certificated take-off mass intended for the carriage of passengers or cargo or mail in international air navigation.

Note.— The following Standards do not include quantitative specifications comparable to those found in national airworthiness codes. In accordance with 2.2 of Part II, they are to be supplemented by national requirements prepared by Contracting States.

1.1.4 The level of airworthiness defined by the appropriate parts of the comprehensive and detailed national code referred to in 2.2 of Part II for the aeroplanes designated in 1.1.3 shall be at least substantially equivalent to the over-all level intended by the broad Standards of Part III.

1.1.5 Unless otherwise stated, the Standards apply to the complete aeroplane including power-units, systems and equipment.

1.2 Number of power-units

The aeroplane shall have not less than two power-units.

1.3 Limitations

1.3.1 Limiting conditions shall be established for the aeroplane, its power-units and its equipment (see 9.2). Compliance with the Standards of Part III shall be established assuming that the aeroplane is operated within the limitations specified. The limitations shall be sufficiently removed from any condition(s) prejudicial to the safety of the aeroplane to render the likelihood of accidents arising therefrom extremely remote.

1.3.2 Limiting ranges of mass, centre of gravity location, load distribution, speeds, and altitude or pressure-altitude shall be established within which compliance with all the pertinent Standards in Part III is shown, except that combinations of conditions which are fundamentally impossible to achieve need not be considered.

Note 1.— The maximum operating mass and centre of gravity limits may vary, for example, with each altitude and with each practicably separate operating condition, e.g. take-off, en route, landing.

Note 2.— The following items, for instance, may be considered as basic aeroplane limitations:

— *maximum certificated take-off mass*

— *maximum certificated taxiing mass*

— *maximum certificated landing mass*

— *maximum certificated zero fuel mass*

— *most forward and rearward centre of gravity positions in various configurations (take-off, en route, landing).*

Note 3.— Maximum operating mass may be limited by the application of Noise Certification Standards (see Annex 16 and Annex 6, Parts I and II).

1.4 Unsafe features and characteristics

The aeroplane shall not possess any feature or characteristic which renders it unsafe under the anticipated operating conditions.

1.5 Proof of compliance

1.5.1 Compliance with the appropriate airworthiness requirements shall be based on evidence either from tests, from calculations, or from calculations based on tests, provided that in each case the accuracy achieved will ensure a level of airworthiness equal to that which would be achieved were direct tests conducted.

1.5.2 The tests of 1.5.1 shall be such as to provide reasonable assurance that the aeroplane, its components, and equipment are reliable and function correctly under the anticipated operating conditions.

CHAPTER 2. FLIGHT

2.1 General

2.1.1 Compliance with the Standards prescribed in Chapter 2 shall be established by flight or other tests conducted upon an aeroplane or aeroplanes of the type for which a Certificate of Airworthiness is sought, or by calculations based on such tests, provided that the results obtained by calculations are equal in accuracy to, or conservatively represent, the results of direct testing.

2.1.2 Compliance with each Standard shall be established for all applicable combinations of aeroplane mass and centre of gravity position, within the range of loading conditions for which certification is sought.

2.1.3 Where necessary, appropriate aeroplane configurations shall be established for the determination of performance in the various stages of flight and for the investigation of the aeroplane's flying qualities.

2.2 Performance

2.2.1 General

2.2.1.1 Sufficient data on the performance of the aeroplane shall be determined and scheduled in the aeroplane flight manual to provide operators with the necessary information for the purpose of determining the total mass of the aeroplane on the basis of the values, peculiar to the proposed flight, of the relevant operational parameters, in order that the flight may be made with reasonable assurance that a safe minimum performance for that flight will be achieved.

2.2.1.2 The performance scheduled for the aeroplane shall not require exceptional skill or alertness on the part of the pilot.

2.2.1.3 The scheduled performance of the aeroplane shall be consistent with compliance with 1.3.1 and with the operation in logical combinations of those of the aeroplane's systems and equipment the operation of which may affect performance.

2.2.2 Minimum performance

At the maximum mass scheduled (see 2.2.3) for take-off and for landing as functions of the aerodrome elevation or pressure-altitude either in the standard atmosphere or in specified still air atmospheric conditions, and, for seaplanes, in specified conditions of smooth water, the aeroplane shall be capable of accomplishing the minimum performances specified in 2.2.2.1 and 2.2.2.2 respectively, not considering obstacles, or runway or water run length.

Note.— This Standard permits the maximum take-off mass and maximum landing mass to be scheduled in the aeroplane flight manual against, for example:

— aerodrome elevation, or

— pressure-altitude at aerodrome level, or

— pressure-altitude and atmospheric temperature at aerodrome level,

so as to be readily usable when applying the national code on aeroplane performance operating limitations.

2.2.2.1 *Take-off*

a) The aeroplane shall be capable of taking off assuming the critical power-unit to fail (see 2.2.3), the remaining power-units being operated within their take-off power limitations.

b) After the end of the period during which the take-off power may be used, the aeroplane shall be capable of continuing to climb, with the critical power-unit inoperative and the remaining power-units operated within their maximum continuous power limitations, up to a height that it can maintain and at which it can carry out a circuit of the aerodrome.

c) The minimum performance at all stages of take-off and climb shall be sufficient to ensure that under conditions of operation departing slightly from the idealized conditions for which data are scheduled (2.2.3), the departure from the scheduled values is not disproportionate.

2.2.2.2 *Landing*

a) Starting from the approach configuration and with the critical power-unit inoperative, the aeroplane shall be capable, in the event of a missed approach, of continuing the flight to a point from which a fresh approach can be made.

b) Starting from the landing configuration, the aeroplane shall be capable, in the event of a balked landing, of making a climb out, with all power-units operating.

2.2.3 Scheduling of performance

Performance data shall be determined and scheduled in the aeroplane flight manual so that their application by means of the operating rules to which the aeroplane is to be operated in accordance with 5.2 of Annex 6, Part I, will provide a safe relation between the performance of the aeroplane and the aerodromes and routes on which it is capable of being operated. Performance data shall be determined and scheduled for the following stages for the ranges of mass, altitude or pressure-altitude, wind velocity, gradient of the take-off and landing surface for landplanes, water surface conditions, density of water and strength of current for seaplanes, and for any other operational variables for which the aeroplane is to be certificated.

2.2.3.1 *Take-off.* The take-off performance data shall include the accelerate-stop distance and the take-off path.

2.2.3.1.1 *Accelerate-stop distance.* The accelerate-stop distance shall be the distance required to accelerate and stop, or, for a seaplane to accelerate and come to a satisfactorily low speed, assuming the critical power-unit to fail suddenly at a point not nearer to the start of the take-off than that assumed when determining the take-off path (see 2.2.3.1.2).

2.2.3.1.2 *Take-off path.* The take-off path shall comprise the ground or water run, initial climb and climb out, assuming the critical power-unit to fail suddenly during the take-off (see 2.2.3.1.1). The take-off path shall be scheduled up to a height that the aeroplane can maintain and at which it can carry out a circuit of the aerodrome. The climb out shall be made at a speed not less than the take-off safety speed as determined in accordance with 2.3.1.3.

2.2.3.2 *En route.* The en-route climb performance shall be the climb (or descent) performance with the aeroplane in the en-route configuration with:

a) the critical power-unit inoperative; and

b) the critical two power-units inoperative in the case of aeroplanes having three or more power-units.

The operating engines shall not exceed maximum continuous power.

2.2.3.3 *Landing.* The landing distance shall be the horizontal distance traversed by the aeroplane from a point on the approach flight path at a selected height above the landing surface to the point on the landing surface at which the aeroplane comes to a complete stop or, for a seaplane, comes to a satisfactorily low speed. The selected height above the landing surface and the approach speed shall be appropriately related to operating practices. This distance may be supplemented by such distance margin as may be necessary; if so, the selected height above the landing surface, the approach speed and the distance margin shall be appropriately interrelated and shall make provision for both normal operating practices and reasonable variations therefrom.

Note.— If the landing distance includes the distance margin specified in this Standard, it is not necessary to allow for the expected variations in the approach and landing techniques in applying 5.2.7.3 of Annex 6, Part I.

2.3 Flying qualities

The aeroplane shall comply with the Standards of 2.3 at all altitudes up to the maximum anticipated altitude relevant to the particular requirement in all temperature conditions relevant to the altitude in question and for which the aeroplane is approved.

2.3.1 Controllability

The aeroplane shall be controllable and manoeuvrable under all anticipated operating conditions and it shall be possible to make smooth transitions from one flight condition to another (e.g. turns, sideslips, changes of engine power, changes of aeroplane configurations) without requiring exceptional skill, alertness, or strength on the part of the pilot even in the event of failure of any power-unit. A technique for safely controlling the aeroplane shall be established for all stages of flight and aeroplane configurations for which performance is scheduled.

Note.— This Standard is intended, among other things, to relate to operation in conditions of no appreciable atmospheric turbulence and also to ensure that there is not undue deterioration of the flying qualities in turbulent air.

2.3.1.1 *Controllability on the ground (or water).* The aeroplane shall be controllable on the ground (or on the water) during taxiing, take-off, and landing under the anticipated operating conditions.

2.3.1.2 *Controllability during take-off.* The aeroplane shall be controllable in the event of sudden failure of the critical power-unit at any point in the take-off, when the aeroplane is handled in the manner associated with the scheduling of take-off paths and accelerate-stop distances.

2.3.1.3 *Take-off safety speed.* The take-off safety speeds assumed when the performance of the aeroplanes (after leaving the ground or water) during the take-off is determined shall provide an adequate margin above the stall and above the minimum speed at which the aeroplane remains controllable after sudden failure of the critical power-unit.

2.3.2 Trim

The aeroplane shall have such trim, and other characteristics as to ensure that the demands made on the pilot's attention and ability to maintain a desired flight condition are not excessive when account is taken of the stage of flight at which these demands occur and their duration. This shall apply both in normal operation and in the conditions associated with the failure of one or more power-units for which performance characteristics are established.

2.3.3 Stability

The aeroplane shall have such stability in relation to its other flight characteristics, performance, structural strength, and most probable operating conditions (e.g. aeroplane configurations and speed ranges) as to ensure that demands made on the pilot's powers of concentration are not excessive when the stage of the flight at which these demands occur and their duration are taken into account. The stability of the aeroplane shall not, however, be such that excessive demands are made on the pilot's strength or that the safety of the aeroplane is prejudiced by lack of manoeuvrability in emergency conditions.

2.3.4 Stalling

2.3.4.1 *Stall warning.* When the aeroplane is made to approach a stall both in straight and turning flight with all power-units operating and with one power-unit inoperative, clear and distinctive stall warning shall be apparent to the pilot with the aeroplane in all permissible configurations and powers, except those which are not considered to be essential for safe flying. The stall warning and other characteristics of the aeroplane shall be such as to enable the pilot to arrest the development of the stall after the warning begins and, without altering the engine power, to maintain full control of the aeroplane.

2.3.4.2 *Behaviour following a stall.* In any configuration and power in which it is considered that the ability to recover from a stall is essential the behaviour of the aeroplane following a stall shall not be so extreme as to make difficult a prompt recovery without exceeding the airspeed or strength limitations of the aeroplane. It shall be acceptable to throttle back the operating power-units during recovery from the stall.

2.3.4.3 *Stalling speeds.* The stalling speeds or minimum steady flight speeds in configurations appropriate for each stage of flight (e.g. take-off, en route, landing) shall be established. One of the values of the power used in establishing the stalling speeds shall be not more than that necessary to give zero thrust at a speed just above the stall.

2.3.5 Flutter and vibration

It shall be demonstrated by suitable tests that all parts of the aeroplane are free from flutter and excessive vibration in all aeroplane configurations under all speed conditions within the operating limitations of the aeroplane (see 1.3.2). There shall be no buffeting severe enough to interfere with control of the aeroplane, to cause structural damage or to cause excessive fatigue to the flight crew.

Note.— Buffeting as a stall warning is considered desirable and discouragement of this type of buffeting is not intended.

CHAPTER 3. STRUCTURES

3.1 General

The Standards of Chapter 3 apply to the aeroplane structure consisting of all portions of the aeroplane, the failure of which would seriously endanger the aeroplane.

3.1.1 Mass and mass distribution

Unless otherwise stated, all structural Standards shall be complied with when the mass is varied over the applicable range and is distributed in the most adverse manner, within the operating limitations on the basis of which certification is sought.

3.1.2 Limit loads

Except as might be otherwise qualified, the external loads and the corresponding inertia loads, or resisting loads obtained for the various loading conditions prescribed in 3.3, 3.4 and 3.5 shall be considered as limit loads.

3.1.3 Strength and deformation

In the various loading conditions prescribed in 3.3, 3.4 and 3.5 no part of the aeroplane structure shall sustain detrimental deformation at any load up to and including the limit load, and the aeroplane structure shall be capable of supporting the ultimate load.

3.2 Airspeeds

3.2.1 Design airspeeds

Design airspeeds shall be established for which the aeroplane structure is designed to withstand the corresponding manoeuvring and gust loads in accordance with 3.3. In establishing the design airspeeds, consideration shall be given to the following speeds:

a) V_A, the design manoeuvring speed;

b) V_B, the speed at which the maximum vertical gust velocity assumed in accordance with 3.3.2 can be withstood;

c) V_C, a speed not expected to be exceeded in normal cruising flight taking into account possible effects of upsets when flying in turbulent conditions;

d) V_D, maximum dive speed, sufficiently greater than the speed in c), to make it unlikely that such a design speed would be exceeded as a result of inadvertent speed increases in the anticipated operating conditions, taking into account the flying qualities and other characteristics of the aeroplane;

e) V_{E_1} to V_{E_n}, maximum speeds at which flaps and landing gears may be extended or other configuration changes be made.

The speeds V_A, V_B, V_C, and V_E in a), b), c) and e) shall be sufficiently greater than the stalling speed of the aeroplane to safeguard against loss of control in turbulent air.

3.2.2 Limiting airspeeds

Limiting airspeeds, based on the corresponding design airspeeds with safety margins, where appropriate, in accordance with 1.3.1 shall be included in the aeroplane flight manual as part of the operating limitations (see 9.2.2).

3.3 Flight loads

The flight loading conditions of 3.3.1, 3.3.2 and 3.5 shall be considered for the range of mass and mass distributions prescribed in 3.1.1 and at airspeeds established in accordance with 3.2.1. Asymmetrical as well as symmetrical loading shall be taken into account. The air, inertia, and other loads resulting from the specified loading conditions shall be distributed so as to approximate actual conditions closely or to represent them conservatively.

3.3.1 Manoeuvring loads

Manoeuvring loads shall be computed on the basis of manoeuvring load factors appropriate to the manoeuvres permitted by the operating limitations. They shall not be less than values which experience indicates will be adequate for the anticipated operating conditions.

3.3.2 Gust loads

Gust loads shall be computed for vertical and horizontal gust velocities and gradients which statistics or other evidence indicate will be adequate for the anticipated operating conditions.

3.4 Ground and water loads

The structure shall be able to withstand all the loads due to the reactions of the ground and water surface which are likely to arise during taxiing, take-off and landing.

3.4.1 Landing conditions

The landing conditions at the design take-off mass and at the design landing mass shall include such symmetrical and asymmetrical attitudes of the aeroplane at ground or water contact, such velocities of descent and such other factors, affecting the loads imposed upon the structure as might be present in the anticipated operating conditions.

3.5 Miscellaneous loads

In addition to or in conjunction with the manoeuvring and gust loads and with the ground and water loads, consideration shall be given to all other loads (flight control loads, cabin pressures, effects of engine operation, loads due to changes of configuration, etc.) which are likely to occur in the anticipated operating conditions.

10/11/94
No. 96

3.6 Flutter, divergence and vibration

The aeroplane structure shall be designed to be free from flutter, structural divergence (i.e. unstable structural distortion due to aerodynamic loading), and loss of control due to structural deformation, at speeds within and sufficiently beyond the operating limitations to comply with 1.3.1. Adequate strength shall be provided to withstand the vibration and buffeting that might occur in the anticipated operating conditions.

3.7 Fatigue strength

The strength and fabrication of the aeroplane shall be such as to ensure that the probability of disastrous fatigue failure of the aeroplane's structure under repeated loads and vibratory loads in the anticipated operating conditions is extremely remote.

CHAPTER 4. DESIGN AND CONSTRUCTION

4.1 General

Details of design and construction shall be such as to give reasonable assurance that all aeroplane parts will function effectively and reliably in the anticipated operating conditions. They shall be based upon practices which experience has proven to be satisfactory or which are substantiated by special tests or by other appropriate investigations or both.

4.1.1 Substantiating tests

The functioning of all moving parts essential to the safe operation of the aeroplane shall be demonstrated by suitable tests in order to ensure that they will function correctly under all operating conditions for such parts.

4.1.2 Materials

All materials used in parts of the aeroplane essential for its safe operation shall conform to approved specifications. The approved specifications shall be such that materials accepted as complying with the specifications will have the essential properties assumed in the design.

4.1.3 Fabrication methods

The methods of fabrication and assembly shall be such as to produce a consistently sound structure which shall be reliable with respect to maintenance of strength in service.

4.1.4 Protection

The structure shall be protected against deterioration or loss of strength in service due to weathering, corrosion, abrasion, or other causes, which could pass unnoticed, taking into account the maintenance the aeroplane will receive.

4.1.5 Inspection provisions

Adequate provision shall be made to permit any necessary examination, replacement, or reconditioning of parts of the aeroplane which require such attention, either periodically or after unusually severe operations.

4.1.6 Design features

Special consideration shall be given to design features which affect the ability of the flight crew to maintain controlled flight. This shall include at least the following:

a) *Controls and control systems.* The design of the controls and control systems shall be such as to minimize the possibility of jamming, inadvertent operations, and unintentional engagement of control surface locking devices.

b) *Crew environment.* The design of the flight crew compartment shall be such as to minimize the possibility of incorrect or restricted operation of the controls by the crew, due to fatigue, confusion or interference. Consideration shall be given at least to the following: layout and identification of controls and instruments, rapid identification of emergency situations, sense of controls, ventilation, heating and noise.

c) *Pilot vision.* The arrangement of the pilot compartment shall be such as to afford a sufficiently extensive, clear and undistorted field of vision for the safe operation of the aeroplane, and to prevent glare and reflections which would interfere with the pilot's vision. The design features of the pilot windshield shall permit under precipitation conditions sufficient vision for the normal conduct of flight and for the execution of approaches and landing.

d) *Provision for emergencies.* Means shall be provided which shall either automatically prevent or shall enable the flight crew to deal with emergencies resulting from foreseeable failures of equipment and systems the failure of which would endanger the aeroplane. Reasonable provisions shall be made for continuation of essential services following power-unit or system(s) failure(s) to the extent that such failure(s) are catered for in performance and operating limitations Standards in this Annex and in Annex 6, Parts I and II.

e) *Fire precautions.* The design of the aeroplane and the materials used in its manufacture including cabin interior furnishing materials replaced during major refurbishing shall be such as to minimize the possibility of in-flight and ground fires and also to minimize the production of smoke and toxic gases in the event of a fire. Means shall be provided to contain or to detect and extinguish such fires as might occur in such a way that no additional danger to the aeroplane is caused.

f) *Incapacitation of occupants.* Design precautions shall be taken to protect against possible instances of cabin depressurization and against the presence of smoke or other toxic gases which could incapaciate the occupants of the aeroplane.

4.1.7 Emergency landing provisions

4.1.7.1 Provisions shall be made in the design of the aeroplane to protect the occupants, in the event of an emergency landing, from fire and from the direct effects of deceleration forces as well as from injuries arising from the effect of deceleration forces on the aeroplane's interior equipment.

4.1.7.2 Facilities shall be provided for the rapid evacuation of the aeroplane in conditions likely to occur following an emergency landing. Such facilities shall be related to the passenger and crew capacity of the aeroplane.

4.1.7.3 The interior layout of the cabin and the position and number of emergency exits, including the means of locating and illuminating the escape paths and exits, shall be such as to facilitate rapid evacuation of the aeroplane in conditions likely to occur following an emergency landing.

4.1.7.4 On aeroplanes certificated for ditching conditions, provisions shall be made in the design to give maximum practicable assurance that safe evacuation from the aeroplane of passengers and crew can be executed in case of ditching.

4.1.8 Ground handling

Adequate provisions shall be made in the design to minimize the risk that ground handling operations (e.g. towing, jacking) may cause damage, which could pass unnoticed, to the parts of the aeroplane essential for its safe operation. The protection which any limitations and instructions for such operations might provide may be taken into account.

CHAPTER 5. ENGINES

5.1 Scope

The Standards of Chapter 5 shall apply to engines of all types which are used on the aeroplane as primary propulsion units.

5.2 Design, construction and functioning

The engine complete with accessories shall be designed and constructed so as to function reliably within its operating limitations under the anticipated operating conditions when properly installed in the aeroplane in accordance with Chapter 7 and, if applicable, fitted with a suitable propeller.

5.3 Declared ratings, conditions and limitations

The power ratings and the conditions of the atmosphere upon which they are based and all operating conditions and limitations, which are intended to govern the operation of the engine, shall be declared.

5.4 Tests

An engine of the type shall complete satisfactorily such tests as are necessary to verify the validity of the declared ratings conditions and limitations and to ensure that it will operate satisfactorily and reliably. The tests shall include at least the following:

a) *Power calibration*. Tests shall be conducted to establish the power or thrust characteristics of the engine when new and also after the tests in b) and c). There shall be no excessive decrease in power at the conclusion of all the tests specified.

b) *Operation*. Tests shall be conducted to ensure that starting, idling, acceleration, vibration, overspeeding and other characteristics are satisfactory and to demonstrate adequate margins of freedom from detonation, surge, or other detrimental conditions as may be appropriate to the particular type engine.

c) *Endurance*. Tests of sufficient duration shall be conducted at such powers, thrust, speeds and other operating conditions as are necessary to demonstrate reliability and durability of the engine. They shall also include operation under conditions in excess of the declared limits to the extent that such limitations might be exceeded in actual service.

CHAPTER 6. PROPELLERS

6.1 Scope

The Standards of Chapter 6 shall apply to propellers of all types.

6.2 Design, construction and functioning

The propeller assembly complete with accessories shall be designed and constructed so as to function reliably within its operating limitations under the anticipated operating conditions when properly fitted to the engine and installed in the aeroplane in accordance with Chapter 7.

6.3 Declared ratings, conditions and limitations

The power ratings and all operating conditions and limitations, which are intended to govern the operation of the propeller, shall be declared.

6.4 Tests

A propeller of the type shall complete satisfactorily such tests as are necessary to ensure that it will operate satisfactorily and reliably within the declared ratings, conditions and limitations. The texts shall include at least the following:

a) *Operation*. Tests shall be conducted to ensure that strength vibration and overspeeding characteristics are satisfactory and to demonstrate proper and reliable functioning of pitch changing and control mechanisms.

b) *Endurance*. Tests of sufficient duration shall be conducted at such powers, speeds and other operating conditions as are necessary to demonstrate reliability and durability of the propeller.

CHAPTER 7. POWERPLANT INSTALLATION

7.1 General

7.1.1 Applicable Standards

The powerplant installation shall comply with the Standards of Chapter 4 and with the Standards of this Chapter.

7.1.2 Compliance with engine and propeller limitations

The powerplant installation shall be so designed that the engines and propellers (if applicable) are capable of being used in the anticipated operating conditions. In conditions established in the aeroplane flight manual the aeroplane shall be capable of being operated without exceeding the limitations established for the engines and propellers in accordance with Chapters 5, 6 and 7.

7.1.3 Control of engine rotation

In those installations where continued rotation of an engine which had failed would increase the hazard of fire or of a serious structural failure, means shall be provided for the crew to stop the rotation of the engine in flight, or to reduce it to a safe level.

7.1.4 Engine restarting

Means shall be provided for restarting an engine at altitudes up to a declared maximum altitude.

7.2 Arrangement and functioning

7.2.1 Independence of power-units

The powerplant shall be arranged and installed so that each power-unit together with its associated systems is capable of being controlled and operated independently from the others and so that there is at least one arrangement of the powerplant and systems in which any failure, unless the probability of its occurrence is extremely remote, cannot result in a loss of more power than that resulting from complete failure of the critical power-unit.

7.2.2 Propeller vibration

The propeller vibration stresses shall be determined and shall not exceed values which have been found safe for operation within the operating limitations established for the aeroplane.

7.2.3 Cooling

The cooling system shall be capable of maintaining powerplant temperatures within the established limits (see 7.1.2) at ambient air temperatures up to the maximum air temperature appropriate to intended operation of the aeroplane. The maximum and, if necessary, minimum air temperature for which the powerplant has been established to be suitable shall be scheduled in the aeroplane flight manual.

7.2.4 Associated systems

The fuel, oil, air induction, and other systems associated with the powerplant, shall be capable of supplying each engine in accordance with its established requirements, under all conditions affecting the functioning of the systems (e.g. engine power, aeroplane attitudes and accelerations, atmospheric conditions, fluid temperatures) within the anticipated operating conditions.

7.2.5 Fire protection

For regions of the powerplant where the potential fire hazards are particularly serious because of the proximity of ignition sources to combustible materials, the following shall apply in addition to the general Standard of 4.1.6 e).

a) *Isolation.* Such regions shall be isolated by fire resisting material from other regions of the aeroplane where the presence of fire would jeopardize continued flight, taking into account the probable points of origin and paths of propagation of fire.

b) *Flammable fluids.* Flammable fluid system components located in such regions shall be capable of containing the fluid when exposed to fire conditions. Means shall be provided for the crew to shut off the flow of flammable fluids into such regions if a fire occurs.

c) *Fire protection.* There shall be provided a sufficient number of fire detectors so located as to ensure rapid detection of any fire which might occur in such regions.

d) *Fire extinguishment.* Such regions shall be provided with a fire extinguisher system capable of extinguishing any fire likely to occur therein, unless the degree of isolation, quantity of combustibles, fire resistance of the structure, and other factors, is such that any fire likely to occur in the region would not jeopardize the safety of the aeroplane.

CHAPTER 8. INSTRUMENTS AND EQUIPMENT

8.1 Required instruments and equipment

The aeroplane shall be provided with approved instruments and equipment necessary for the safe operation of the aeroplane in the anticipated operating conditions. These shall include the instruments and equipment necessary to enable the crew to operate the aeroplane within its operating limitations.

Note.— Instruments and equipment additional to the minimum necessary for the issuance of a Certificate of Airworthiness are prescribed in Annex 6, Parts I and II, for particular circumstances or on particular kinds of routes.

8.2 Installation

Instrument and equipment installations shall comply with the Standards of Chapter 4.

8.3 Safety and survival equipment

Prescribed safety and survival equipment which the crew or passengers are expected to use or operate at the time of an emergency shall be reliable, readily accessible and easily identified, and its method of operation shall be plainly marked.

*8.4 Navigation lights and anti-collision lights

8.4.1 The lights required by Annex 2 to be displayed by aeroplanes in flight or operating on the movement area of an aerodrome shall have intensities, colours, fields of coverage and other characteristics such that they furnish the pilot of another aircraft or personnel on the ground with as much time as possible for interpretation and for subsequent manoeuvre necessary to avoid a collision. In the design of such lights due account shall be taken of the conditions under which they may reasonably be expected to perform these functions.

Note 1.— It is likely that lights will be viewed against a variety of backgrounds, such as typical city lighting, clear starry sky, moonlit water and daytime conditions of low background luminance. Furthermore, collision risk situations are most likely to arise in terminal control areas in which aircraft are manoeuvring in the intermediate and lower flight levels at closing speeds that are unlikely to exceed 900 km/h (500 kt).

Note 2.— See Part III of the Airworthiness Technical Manual *(Doc 9051) for detailed technical specifications for exterior lights for aeroplanes.*

8.4.2 Lights shall be installed in aeroplanes so as to minimize the possibility that they will:

a) adversely affect the satisfactory performance of the flight crews' duties; or

b) subject an outside observer to harmful dazzle.

Note.— In order to avoid the effects mentioned in 8.4.2, it will be necessary in some cases to provide means whereby the pilot can switch off or reduce the intensity of the flashing lights.

* Please refer to 1.1.2 of this Part.

CHAPTER 9. OPERATING LIMITATIONS AND INFORMATION

9.1 General

The operating limitations within which compliance with the Standards of this Annex is determined, together with any other information necessary to the safe operation of the aeroplane, shall be made available by means of an aeroplane flight manual, markings and placards, and such other means as may effectively accomplish the purpose. The limitations and information shall include at least those prescribed in 9.2, 9.3 and 9.4.

9.2 Operating limitations

Limitations which there is a risk of exceeding in flight and which are defined quantitatively shall be expressed in suitable units and corrected if necessary for errors in measurements so that the flight crew can, by reference to the instruments available to them, readily determine when the limitations are reached.

9.2.1 Loading limitations

The loading limitations shall include all limiting mass, centres of gravity position, mass distributions, and floor loadings (see 1.3.2).

9.2.2 Airspeed limitations

The airspeed limitations shall include all speeds (see 3.2) which are limiting from the standpoint of structural integrity or flying qualities of the aeroplane, or from other considerations. These speeds shall be identified with respect to the appropriate aeroplane configurations and other pertinent factors.

9.2.3 Powerplant limitations

The powerplant limitations shall include all those established for the various powerplant components as installed in the aeroplane (see 7.1.2 and 7.2.3).

9.2.4 Limitations on equipment and systems

The limitations on equipment and systems shall include all those established for the various equipment and systems as installed in the aeroplane.

9.2.5 Miscellaneous limitations

Any necessary limitations with respect to conditions found to be prejudicial to the safety of the aeroplane (see 1.3.1).

9.2.6 Flight crew limitations

The flight crew limitations shall include the minimum number of flight crew personnel necessary to operate the aeroplane, having regard among other things to the accessibility to the appropriate crew members of all necessary controls and instruments and to the execution of the established emergency procedures.

Note.— See Annex 6 — Operation of Aircraft, *Parts I and II, for the circumstances in which the flight crew shall include members in addition to the minimum flight crew defined in this Annex.*

9.2.7 Flying time limitation after system or power-unit failure

The systems limitations shall include the maximum flying time for which system reliability has been established in relation to the approval of operations by aeroplanes with two turbine power-units beyond the threshold time established in accordance with 4.7 of Annex 6, Part I.

Note.— The maximum time established in accordance with 4.7 of Annex 6, Part I for a particular route may be less than that determined in accordance with 9.2.7 because of the operational considerations involved.

9.3 Operating information and procedures

9.3.1 Types of eligible operations

There shall be listed the particular types of operations, as may be defined in Annex 6, Parts I and II, to the Convention or be generally recognized, for which the aeroplane has been shown to be eligible by virtue of compliance with the appropriate airworthiness requirements.

9.3.2 Loading information

The loading information shall include the empty mass of the aeroplane, together with a definition of the condition of the aeroplane at the time of weighing, the corresponding centre of gravity position, and the reference point(s) and datum line(s) to which the centre of gravity limits are related.

Note.— Usually the empty mass excludes the mass of the crew and payload, and the usable fuel supply and the drainable oil; it includes the mass of all fixed ballast, unusable fuel supply, undrainable oil, total quantity of engine coolant and total quantity of hydraulic fluid.

9.3.3 Operating procedures

A description shall be given of normal and emergency operating procedures which are peculiar to the particular aeroplane and necessary for its safe operation. These shall include procedures to be followed in the event of failure of one or more power-units.

9.3.4 Handling information

Sufficient information shall be given on any significant or unusual features of the aeroplane characteristics. Those stalling speeds or minimum steady flight speeds required to be established by 2.3.4.3 shall be scheduled.

9.4 Performance information

The performance of the aeroplane shall be scheduled in accordance with 2.2. There shall be included information regarding the various aeroplane configurations and powers involved and the relevant speeds, together with information which would assist the flight crew in attaining the performance as scheduled.

9.5 Aeroplane flight manual

An aeroplane flight manual shall be made available. It shall identify clearly the specific aeroplane or series of aeroplanes with which it is related. The aeroplane flight manual shall include at least the limitations, information and procedures specified in this chapter.

9.6 Markings and placards

9.6.1 Markings and placards on instruments, equipment, controls, etc., shall include such limitations or information as necessary for the direct attention of the flight crew during flight.

9.6.2 Markings and placards, or instructions, shall be provided to give any information which is essential to the ground crew in order to preclude the possibility of mistakes in ground servicing (e.g. towing, refuelling) which could pass unnoticed and which could jeopardize the safety of the aeroplane in subsequent flights.

22/3/91

CHAPTER 10. CONTINUING AIRWORTHINESS — MAINTENANCE INFORMATION

10.1 General

Information for use in developing procedures for maintaining the aeroplane in an airworthy condition shall be made available. The information shall include that described in 10.2, 10.3 and 10.4

10.2 Maintenance information

Maintenance information shall include a description of the aeroplane and recommended methods for the accomplishment of maintenance tasks. Such information shall include guidance on defect diagnosis.

10.3 Maintenance programme information

Maintenance programme information shall include the maintenance tasks and the recommended intervals at which these tasks are to be performed.

10.4 Maintenance information resulting from the type design approval

Maintenance tasks and frequencies that have been specified as mandatory by the State of Design in approval of the type design shall be identified as such.

PART IV. HELICOPTERS

CHAPTER 1. GENERAL

1.1 Applicability

1.1.1 The Standards of Part IV are applicable in respect of all helicopters designated in 1.1.2, that are of types of which the prototype is submitted to the appropriate national authorities for certification on or after 22 March 1991.

Note.— The Council recognizes that the Standards relating to fire protection, crash survival and provisions for emergency are very important to safety and urges the implementation of the substance of these Standards as soon as it is feasible and practicable before the applicable date.

1.1.2 The Standards of Part IV shall apply to helicopters intended for the carriage of passengers or cargo or mail in international air navigation.

Note.— The following Standards do not include quantitative specifications comparable to those found in national airworthiness codes. In accordance with 2.2 of Part II, they are to be supplemented by national requirements prepared by Contracting States.

1.1.3 The level of airworthiness defined by the appropriate parts of the comprehensive and detailed national code referred to in 2.2 of Part II for the helicopters designated in 1.1.2 shall be at least substantially equivalent to the over-all level intended by the broad Standards of Part IV.

1.1.4 Unless otherwise stated, the Standards apply to the complete helicopter including power-units, systems and equipment.

1.2 Limitations

1.2.1 Limiting conditions shall be established for the helicopter, its power-unit(s) and its equipment (see 9.2). Compliance with the Standards of Part IV shall be established assuming that the helicopter is operated within the limitations specified. The limitations shall be sufficiently removed from any condition(s) prejudicial to the safety of the helicopter to render the likelihood of accidents arising therefrom extremely remote.

1.2.2 Limiting ranges of mass, centre of gravity location, load distribution, speeds and ambient conditions shall be established within which compliance with all the pertinent Standards in Part IV is shown, except that combinations of conditions which are fundamentally impossible to achieve need not be considered.

Note 1.— The maximum operating mass and centre of gravity limits may vary, for example, with each altitude and with each practicably separate operating condition, e.g. take-off, en route, landing.

Note 2.— The following items, for instance, may be considered as basic helicopter limitations:

— maximum certificated take-off (including lift-off) mass

— maximum certificated ground-taxiing mass

— maximum certificated landing mass

— most forward, rearward, and lateral centre of gravity positions in various configurations

— maximum certificated cargo sling mass.

Note 3.— Maximum operating mass may be limited by the application of Noise Certification Standards (see Annex 16 and Annex 6, Part III).

1.3 Unsafe features and characteristics

The helicopter shall not possess any feature or characteristic which renders it unsafe under the anticipated operating conditions.

1.4 Proof of compliance

1.4.1 Compliance with the appropriate airworthiness requirements shall be based on evidence either from tests, calculations, calculations based on tests, or other methods provided that in each case the accuracy achieved will ensure a level of airworthiness equal to that which would be achieved were direct tests conducted.

1.4.2 The tests of 1.4.1 shall be such as to provide reasonable assurance that the helicopter, its components and equipment are reliable and function correctly under the anticipated operating conditions.

CHAPTER 2. FLIGHT

2.1 General

2.1.1 Compliance with the Standards prescribed in Chapter 2 shall be established by flight or other tests conducted upon a helicopter or helicopters of the type for which a Certificate of Airworthiness is sought, or by calculations (or other methods) based on such tests, provided that the results obtained by calculations (or other methods) are equal in accuracy to, or conservatively represent, the results of direct testing.

2.1.2 Compliance with each Standard shall be established for all applicable combinations of helicopter mass and centre of gravity position, within the range of loading conditions for which certification is sought.

2.1.3 Where necessary, appropriate helicopter configurations shall be established for the determination of performance in the various stages of flight and for the investigation of the helicopter's flying qualities.

2.2 Performance

2.2.1 General

2.2.1.1 Sufficient data on the performance of the helicopter shall be determined and scheduled in the helicopter flight manual to provide operators with the necessary information for the purpose of determining the total mass of the helicopter on the basis of the values, peculiar to the proposed flight, of the relevant operational parameters, in order that the flight may be made with reasonable assurance that a safe minimum performance for that flight will be achieved.

2.2.1.2 The performance scheduled for the helicopter shall not require exceptional skill or alertness on the part of the pilot.

2.2.1.3 The scheduled performance of the helicopter shall be consistent with compliance with 1.2.1 and with the operation in logical combinations of those of the helicopter's systems and equipment the operation of which may affect performance.

2.2.2 Minimum performance

At the maximum mass scheduled (see 2.2.3) for take-off and for landing as functions of the take-off or landing site elevation or pressure-altitude either in the standard atmosphere or in specified still air atmospheric conditions, and, for water operations, in specified conditions of smooth water, the helicopter shall be capable of accomplishing the minimum performances specified in 2.2.2.1 and 2.2.2.2 respectively, not considering obstacles, or final approach and take-off area length.

Note.— This Standard permits the maximum take-off mass and maximum landing mass to be scheduled in the helicopter flight manual against, for example at the take-off or landing site:

— elevation, or

— pressure-altitude, or

— pressure-altitude and atmospheric temperature,

so as to be readily usable when applying the national code on helicopter performance operating limitations.

2.2.2.1 *Take-off*

a) In the event of critical power-unit failure, at or after the take-off decision point (for performance Class 1) or the defined point after take-off (for performance Class 2), performance Classes 1 and 2 helicopters shall be capable of continuing safe flight, the remaining power-unit(s) being operated within the approved limitations.

b) The minimum performance at all stages of take-off and climb shall be sufficient to ensure that under conditions of operation departing slightly from the idealized conditions for which data are scheduled (2.2.3), the departure from the scheduled values is not disproportionate.

2.2.2.2 *Landing*

a) Starting from the approach configuration, in the event of critical power-unit failure at or before the landing decision point (performance Class 1) or the defined point before landing (performance Class 2), the helicopter shall be capable of continuing safe flight, the remaining power-unit(s) being operated within the approved limitations.

b) Starting from the landing configuration, the helicopter shall be capable, in the event of a balked landing, of making a climb out, with all power-units operating.

2.2.3 Scheduling of performance

Performance data shall be determined and scheduled in the helicopter flight manual so that their application by means of the operating rules to which the helicopter is to be operated in accordance with 5.1.2 of Annex 6, Part III, will provide a safe relation between the performance of the helicopter and the aerodromes, heliports and routes on which it is capable of being operated. Performance data shall be determined and scheduled for the following stages for the ranges of mass, altitude or pressure-altitude, wind velocity, and other ambient conditions and any other operational variables for which the helicopter is to be certificated, and additionally for amphibians, water surface conditions and strength of current.

2.2.3.1 *Take-off.* The take-off performance data shall include the take-off distance required and the take-off path. For performance Class 1 helicopters, it shall also include the rejected take-off distance required.

2.2.3.1.1 *Take-off decision point.* (For performance Class 1 helicopters only) The take-off decision point shall be the point in the take-off phase used in determining take-off performance and from which either a rejected take-off may be made or a take-off safely continued, with the critical power-unit inoperative.

2.2.3.1.2 *Take-off distance required.* (For performance Class 1 helicopters only) The take-off distance required shall be the horizontal distance required from the start of the take-off to the point at which V_{TOSS}, a selected height above the take-off surface, and a positive climb gradient are achieved, following failure of the critical power-unit at the take-off decision point, the remaining power-unit(s) operating within approved operating limits.

2.2.3.1.3 *Rejected take-off distance required.* (For performance Class 1 helicopters only) The rejected take-off distance required shall be the horizontal distance required from the start of the take-off to the point where the helicopter comes to a complete stop following a power-unit failure and rejection of the take-off at the take-off decision point.

2.2.3.1.4 *Take-off distance required.* (For performance Class 2 and 3 helicopters only) The take-off distance required shall be the horizontal distance required from the start of take-off to the point where the best rate of climb speed (Vy) or the best angle of climb speed (Vx) or a selected intermediate speed (provided this speed does not involve flight within the avoid areas of the height-velocity diagrams) and a selected height above the take-off surface are achieved, all engines operating at approved take-off power.

2.2.3.2 *En route.* The en-route performance shall be the climb, cruise, or descent performance with:

a) the critical power-unit inoperative;

b) the critical two power-units inoperative in the case of helicopters having three or more power-units; and

c) the operating engine(s) not exceeding the power for which they are certificated.

2.2.3.3 *Landing.* The landing performance data shall include the landing distance required and, for performance Class 1 helicopters, the landing decision point.

2.2.3.3.1 *Landing decision point.* (For performance Class 1 helicopters only) The landing decision point shall be the latest point in the approach phase from which either a landing may be made or a rejected landing (go-around) safely initiated, with the critical power-unit inoperative.

2.2.3.3.2 *Landing distance required.* Landing distance required shall be the horizontal distance required to land and come to a complete stop from a point on the approach flight path at a selected height above the landing surface.

2.3 Flying qualities

The helicopter shall comply with the Standards of 2.3 at all altitudes up to the maximum anticipated altitude relevant to the particular requirement in all temperature conditions relevant to the altitude in question and for which the helicopter is approved.

2.3.1 Controllability

The helicopter shall be controllable and manoeuvrable under all anticipated operating conditions and it shall be possible to make smooth transitions from one flight condition to another (e.g. turns, sideslips, changes of engine power, changes of helicopter configurations) without requiring exceptional skill, alertness, or strength on the part of the pilot even in the event of failure of any power-unit. A technique for safely controlling the helicopter shall be established for all stages of flight and helicopter configurations for which performance is scheduled.

Note.— This Standard is intended, among other things, to relate to operation in conditions of no appreciable atmospheric turbulence and also to ensure that there is no undue deterioration of the flying qualities in turbulent air.

2.3.1.1 *Controllability on the ground (or water).* The helicopter shall be controllable on the ground (or on the water) during taxiing, take-off and landing under the anticipated operating conditions.

2.3.1.2 *Controllability during take-off.* The helicopter shall be controllable in the event of sudden failure of the critical power-unit at any point in the take-off, when the helicopter is handled in the manner associated with the scheduling of the take-off data.

2.3.2 Characteristics of flight controls

The helicopter shall have such trim, and handling capabilities as to ensure that the demands made on the pilot's attention and ability to maintain a desired flight condition are not excessive when account is taken of the stage of flight at which these demands occur and their duration. In the event of a malfunction of the systems associated with the flight controls, there must not be any significant deterioration of the handling characteristics.

2.3.3 Stability

The helicopter shall have such stability in relation to its other flight characteristics, performance, structural strength, and most probable operating conditions (e.g. helicopter configurations and speed ranges) as to ensure that demands made on the pilot's powers of concentration are not excessive when the stage of the flight at which these demands occur and their duration are taken into account. The stability of the helicopter shall not, however, be such that excessive demands are made on the pilot's strength or that the safety of the helicopter is prejudiced by lack of manoeuvrability in emergency conditions.

2.3.4 Autorotation

2.3.4.1 *Rotor speed control.* The autorotation characteristics of the helicopter shall be such as to enable the pilot to control the rotor speed to within prescribed limits, and to maintain full control of the helicopter.

2.3.4.2 *Behaviour following a power loss.* The behaviour of the helicopter following a power loss shall not be so extreme as to make difficult a prompt recovery of rotor speed without exceeding the airspeed or strength limitations of the helicopter.

2.3.4.3 *Autorotation airspeeds.* The autorotation airspeeds recommended for maximum range and minimum rate of descent shall be established.

2.3.5 Flutter and vibration

It shall be demonstrated by suitable tests that all parts of the helicopter are free from flutter and excessive vibration in all helicopter configurations under all speed conditions within the operating limitations of the helicopter (see 1.2.2). There shall be no vibration severe enough to interfere with control of the helicopter, to cause structural damage or to cause excessive fatigue to the flight crew.

CHAPTER 3. STRUCTURES

3.1 General

The Standards of Chapter 3 apply to the helicopter structure consisting of all portions of the helicopter, the failure of which would seriously endanger the helicopter.

3.1.1 Mass and mass distribution

Unless otherwise stated, all structural Standards shall be complied with when the mass is varied over the applicable range and is distributed in the most adverse manner, within the operating limitations on the basis of which certification is sought.

3.1.2 Limit loads

Except as might be otherwise qualified, the external loads and the corresponding inertia loads, or resisting loads obtained for the various loading conditions prescribed in 3.4, 3.5 and 3.6 shall be considered as limit loads.

3.1.3 Strength and deformation

In the various loading conditions prescribed in 3.4, 3.5 and 3.6 no part of the helicopter structure shall sustain detrimental deformation at any load up to and including the limit load, and the helicopter structure shall be capable of supporting the ultimate load.

3.2 Airspeeds

3.2.1 Design airspeeds

Design airspeeds shall be established for which the helicopter structure is designed to withstand the corresponding manoeuvring and gust loads in accordance with 3.4.

3.2.2 Limiting airspeeds

Limiting airspeeds, based on the corresponding design airspeeds with safety margins, where appropriate, in accordance with 1.2.1 shall be included in the helicopter flight manual as part of the operating limitations (see 9.2.2). When airspeed limitations are a function of mass, mass distribution, altitude, rotor speed, power or other factors, airspeed limitations based on the critical combination of these factors shall be established.

3.3 Main rotor(s) rotational speed limits

A range of main rotor(s) speeds shall be established that:

a) with power on, provides adequate margin to accommodate the variations in rotor speed occurring in any appropriate manoeuvre, and is consistent with the kind of governor or synchronizer used; and

b) with power off, allows each appropriate autorotative manoeuvre to be performed throughout the ranges of airspeed and mass for which certification is requested.

3.4 Flight loads

The flight loading conditions of 3.4.1, 3.4.2 and 3.6 shall be considered for the range of mass and mass distributions prescribed in 3.1.1 and at airspeeds established in accordance with 3.2.1. Asymmetrical as well as symmetrical loading shall be taken into account. The air, inertia, and other loads resulting from the specified loading conditions shall be distributed so as to approximate actual conditions closely or to represent them conservatively.

3.4.1 Manoeuvring loads

Manoeuvring loads shall be computed on the basis of manoeuvring load factors appropriate to the manoeuvres permitted by the operating limitations. They shall not be less than values which experience indicates will be adequate for the anticipated operating conditions.

3.4.2 Gust loads

Gust loads shall be computed for vertical and horizontal gust velocities which statistics or other evidence indicate will be adequate for the anticipated operating conditions.

3.5 Ground and water loads

The structure shall be able to withstand all the loads due to the reactions of the ground or water surface, as applicable, which are likely to arise during start-up, ground and water taxiing, lift-off, touchdown and rotor braking.

3.5.1 Landing conditions

The landing conditions at the design take-off mass and at the design landing mass shall include such symmetrical and asymmetrical attitudes of the helicopter at ground or water contact, such velocities of descent and such other factors affecting the loads imposed upon the structure as might be present in the anticipated operating conditions.

3.6 Miscellaneous loads

In addition to or in conjunction with the manoeuvring and gust loads and with the ground and water loads, consideration shall be given to all other loads (flight control loads, cabin pressures, effects of engine operation, loads due to changes of configuration, loads due to external mass, etc.) which are likely to occur in the anticipated operating conditions.

3.7 Flutter, divergence and vibration

Each part of the helicopter structure shall be free from excessive vibration or oscillation (ground resonance, flutter, etc.) under each appropriate speed and power condition.

3.8 Fatigue strength

The strength and fabrication of the helicopter shall be such as to ensure that the probability of disastrous fatigue failure of the helicopter's structure under repeated loads and vibratory loads in the anticipated operating conditions is extremely remote.

Note.—This Standard can be complied with by the establishment of "safe lives" or "fail safe" characteristics of the structure, having regard to the reasonable expected load magnitudes and frequencies under the anticipated operating conditions and inspection procedures. For some parts of the structure it might be necessary to establish "fail safe" characteristics as well as "safe lives".

CHAPTER 4. DESIGN AND CONSTRUCTION

4.1 General

Details of design and construction shall be such as to give reasonable assurance that all helicopter parts will function effectively and reliably in the anticipated operating conditions. They shall be based upon practices which experience has proven to be satisfactory or which are substantiated by special tests or by other appropriate investigations or both.

4.1.1 Substantiating tests

The functioning of all moving parts essential to the safe operation of the helicopter shall be demonstrated by suitable tests in order to ensure that they will function correctly under all operating conditions for such parts.

4.1.2 Materials

All materials used in parts of the helicopter essential for its safe operation shall conform to approved specifications. The approved specifications shall be such that materials accepted as complying with the specifications will have the essential properties assumed in the design.

4.1.3 Fabrication methods

The methods of fabrication and assembly shall be such as to produce a consistently sound structure which shall be reliable with respect to maintenance of strength in service.

4.1.4 Protection

The structure shall be protected against deterioration or loss of strength in service due to weathering, corrosion, abrasion, or other causes, which could pass unnoticed, taking into account the maintenance the helicopter will receive.

4.1.5 Inspection provisions

Adequate provision shall be made to permit any necessary examination, replacement, or reconditioning of parts of the helicopter which require such attention, either periodically or after unusually severe operations.

4.1.6 Design features

Special consideration shall be given to design features which affect the ability of the flight crew to maintain controlled flight. This shall include at least the following:

a) *Controls and control systems.* The design of the controls and control systems shall be such as to minimize the possibility of jamming, inadvertent operations, and unintentional engagement of control surface locking devices.

   i) Each control and control system shall operate with the ease, smoothness and positiveness appropriate to its function; and

   ii) each element of each flight control system shall be designed to minimize the probability of any incorrect assembly that could result in the malfunction of the system.

b) *Crew environment.* The design of the flight crew compartment shall be such as to minimize the possibility of incorrect or restricted operation of the controls by the crew, due to fatigue, confusion or interference. Consideration shall be given at least to the following: lay-out and identification of controls and instruments, rapid identification of emergency situations, sense of controls, ventilation, heating and noise.

c) *Pilot vision.* The arrangement of the pilot compartment shall be such as to afford a sufficiently extensive, clear and undistorted field of vision for the safe operation of the helicopter, and to prevent glare and reflections which would interfere with the pilot's vision. The design features of the pilot windshield shall permit under precipitation conditions sufficient vision for the normal conduct of flight and for the execution of approaches and landing.

d) *Provision for emergencies.* Means shall be provided which shall either automatically prevent or shall enable the flight crew to deal with emergencies resulting from foreseeable failures of equipment and systems the failure of which would endanger the helicopter. Reasonable provisions shall be made for continuation of essential services following power-unit or system(s) failure(s) to the extent that such failure(s) are catered for in performance and operating limitations Standards in this Annex and in Annex 6, Part III.

e) *Fire precautions.* The design of the helicopter and the materials used in its manufacture including cabin interior furnishing materials replaced during major refurbishing shall be such as to minimize the possibility of in-flight and ground fires and also to minimize the production of smoke and toxic gases in the event of a fire. Means shall be provided to contain or to detect and extinguish, wherever possible, all accessible fires as might occur in such a way that no additional danger to the helicopter is caused.

f) *Incapacitation of occupants.* Design precautions shall be taken to protect against possible instances of cabin depressurization and against the presence of smoke or other toxic gases which could incapacitate the occupants of the helicopter.

4.1.7 Emergency landing provisions

Provisions shall be made in the design of the helicopter to protect the occupants from fire and effects of deceleration in the event of an emergency landing. Facilities shall be provided for rapid evacuation of the helicopter in conditions likely to occur following an emergency landing and such facilities shall be related to the passenger and crew capacity of the helicopter. On helicopters certificated for ditching conditions, provisions shall also be made in the design to give maximum practicable assurance that safe evacuation from the helicopter of passengers and crew can be executed in case of ditching.

4.1.8 Ground handling

Adequate provisions shall be made in the design to minimize the risk that ground handling operations (e.g. towing, jacking) may cause damage, which could pass unnoticed, to the parts of the helicopter essential for its safe operation. The protection which any limitations and instructions for such operations might provide may be taken into account.

CHAPTER 5. ENGINES

5.1 Scope

The Standards of Chapter 5 shall apply to engines of all types which are used on the helicopter as primary propulsion units.

5.2 Design, construction and functioning

The engine complete with accessories shall be designed and constructed so as to function reliably within its operating limitations under the anticipated operating conditions when properly installed in the helicopter in accordance with Chapter 6 and with the suitable rotor and power transmission installed.

5.3 Declared ratings, conditions and limitations

The power ratings and the conditions of the atmosphere upon which they are based and all operating conditions and limitations, which are intended to govern the operation of the engine, shall be declared.

5.4 Tests

An engine of the type shall complete satisfactorily such tests as are necessary to verify the validity of the declared ratings, conditions and limitations and to ensure that it will operate satisfactorily and reliably. The tests shall include at least the following:

a) *Power calibration.* Tests shall be conducted to establish the power characteristics of the engine when new and also after the tests in b) and c). There shall be no excessive decrease in power at the conclusion of all the tests specified.

b) *Operation.* Tests shall be conducted to ensure that starting, idling, acceleration, vibration, overspeeding and other characteristics are satisfactory and to demonstrate adequate margins of freedom from detonation, surge, or other detrimental conditions as may be appropriate to the particular type engine.

c) *Endurance.* Tests of sufficient duration shall be conducted at such powers, engine and rotor speeds and other operating conditions as are necessary to demonstrate reliability and durability of the engine. They shall also include operation under conditions in excess of the declared limits to the extent that such limitations might be exceeded in actual service.

CHAPTER 6. ROTOR AND POWER TRANSMISSION SYSTEMS AND POWERPLANT INSTALLATION

6.1 General

The powerplant installation, including rotor and power transmission system, shall comply with the Standards of Chapter 4 and with the Standards of this chapter.

6.2 Design, construction and functioning

The rotor and power transmission systems assembly complete with accessories shall be designed and constructed so as to function reliably within its operating limitations under the anticipated operating conditions when properly fitted to the engine and installed in the helicopter in accordance with this chapter.

6.3 Declared ratings, conditions and limitations

The power ratings and all operating conditions and limitations, which are intended to govern the operation of the rotor and power transmission systems, shall be declared.

6.3.1 Maximum and minimum rotor rotational speed limitations

Maximum and minimum speeds for the rotors in both power-on and power-off conditions shall be established. Any operating conditions (e.g. airspeed) which affect such maxima or minima shall be declared.

6.3.2 Rotor underspeed and overspeed warnings

When the helicopter is made to approach a rotor rotational speed limit, with or without power-units inoperative, clear and distinctive warnings shall be apparent to the pilot. The warnings and initial characteristics of the condition shall be such as to enable the pilot to arrest the development of the condition after the warning begins, and to recover the rotor rotational speed to within prescribed normal limits and to maintain full control of the helicopter.

6.4 Tests

Rotor and power transmission systems shall complete satisfactorily such tests as are necessary to ensure that they will operate satisfactorily and reliably within the declared ratings, conditions and limitations. The tests shall include at least the following:

a) *Operation.* Tests shall be conducted to ensure that strength vibration and overspeeding characteristics are satisfactory and to demonstrate proper and reliable functioning of pitch changing and control mechanisms and free wheel mechanisms.

b) *Endurance.* Tests of sufficient duration shall be conducted at such powers, engine and rotor speeds and other operating conditions as are necessary to demonstrate reliability and durability of the rotor and power transmission systems.

6.5 Compliance with engine and rotor and power transmission systems limitations

The powerplant installation shall be so designed that the engines and rotor and power transmission systems are capable of being used in the anticipated operating conditions. In conditions established in the helicopter flight manual the helicopter shall be capable of being operated without exceeding the limitations established for the engines and rotor and power transmission systems in accordance with Chapters 5 and 6.

6.6 Control of engine rotation

In those installations where continued rotation of an engine which had failed would increase the hazard of fire or of a serious structural failure, means shall be provided for the crew to stop the rotation of the engine in flight, or to reduce it to a safe level.

6.7 Engine restarting

Means shall be provided for restarting an engine at altitudes up to a declared maximum altitude.

6.8 Arrangement and functioning

6.8.1 Independence of power-units

For performance Class 1 and 2 helicopters, the powerplant shall be arranged and installed so that each power-unit together with its associated systems is capable of being controlled and operated independently from the others and so that there is at least one arrangement of the powerplant and systems in which any failure, unless the probability of its occurrence is extremely remote, cannot result in a loss of more power than that resulting from complete failure of the critical power-unit.

6.8.2 Rotor and power transmission systems vibration

The vibration stresses for the rotor and power transmission systems shall be determined and shall not exceed values which have been found safe for operation within the operating limitations established for the helicopter.

6.8.3 Cooling

The cooling system shall be capable of maintaining powerplant and power transmission systems temperatures within the established limits (see 6.5) at all ambient temperatures approved for operation of the helicopter. The maximum and minimum air temperatures for which the powerplant and power transmission systems have been established to be suitable shall be scheduled in the helicopter flight manual.

6.8.4 Associated systems

The fuel, oil, air induction, and other systems associated with each power-unit, each power transmission unit and each rotor, shall be capable of supplying the appropriate unit in accordance with its established requirements, under all conditions affecting the functioning of the systems (e.g. engine power setting, helicopter attitudes and accelerations, atmospheric conditions, fluid temperatures) within the anticipated operating conditions.

6.8.5 Fire protection

For designated fire zones where the potential fire hazards are particularly serious because of the proximity of ignition sources to combustible materials, the following shall apply in addition to the general Standard of 4.1.6 e).

a) *Isolation.* Such zones shall be isolated by fire resisting material from other zones of the helicopter where the presence of fire would jeopardize continued flight, taking into account the probable points of origin and paths of propagation of fire.

b) *Flammable fluids.* Flammable fluid system components located in such zones shall be capable of containing the fluid when exposed to fire conditions. Means shall be provided for the crew to shut off the flow of hazardous quantities of flammable fluids into such zones if a fire occurs.

c) *Fire protection.* There shall be provided a sufficient number of fire detectors so located as to ensure rapid detection of any fire which might occur in such zones.

d) *Fire extinguishment.* Such zones shall be provided with a fire extinguisher system capable of extinguishing any fire likely to occur therein, unless the degree of isolation, quantity of combustibles, fire resistance of the structure, and other factors, are such that any fire likely to occur in the zone would not jeopardize the safety of the helicopter.

CHAPTER 7. INSTRUMENTS AND EQUIPMENT

7.1 Required instruments and equipment

The helicopter shall be provided with approved instruments and equipment necessary for the safe operation of the helicopter in the anticipated operating conditions. These shall include the instruments and equipment necessary to enable the crew to operate the helicopter within its operating limitations.

Note.— Instruments and equipment additional to the minimum necessary for the issuance of a Certificate of Airworthiness are prescribed in Annex 6, Part III, for particular circumstances or on particular kinds of routes.

7.2 Installation

Instrument and equipment installations shall comply with the Standards of Chapter 4.

7.3 Safety and survival equipment

Prescribed safety and survival equipment which the crew or passengers are expected to use or operate at the time of an emergency shall be reliable, readily accessible and easily identified, and its method of operation shall be plainly marked.

7.4 Navigation lights and anti-collision lights

7.4.1 The lights required by Annex 2 to be displayed by helicopters in flight or operating on the movement area of an aerodrome or a heliport shall have intensities, colours, fields of coverage and other characteristics such that they furnish the pilot of another aircraft or personnel on the ground with as much time as possible for interpretation and for subsequent manoeuvre necessary to avoid a collision. In the design of such lights due account shall be taken of the conditions under which they may reasonably be expected to perform these functions.

Note 1.— It is likely that lights will be viewed against a variety of backgrounds, such as typical city lighting, clear starry sky, moonlit water and daytime conditions of low background luminance. Furthermore, collision risk situations are most likely to arise in terminal control areas in which aircraft are manoeuvring in the intermediate and lower flight levels at closing speeds that are unlikely to exceed 900 km/h (500 kt).

Note 2.— See Part IV of the Airworthiness Technical Manual *(Doc 9051) for detailed technical specifications for exterior lights for helicopters.*

7.4.2 Lights shall be installed in helicopters so as to minimize the possibility that they will:

a) adversely affect the satisfactory performance of the flight crews' duties; or

b) subject an outside observer to harmful dazzle.

Note.— In order to avoid the effects mentioned in 7.4.2, it will be necessary in some cases to provide means whereby the pilot can switch off or reduce the intensity of the flashing lights.

CHAPTER 8. ELECTRICAL SYSTEMS

The electrical system shall be so designed and installed as to ensure that it will perform its intended function under any forseeable operating conditions.

CHAPTER 9. OPERATING LIMITATIONS AND INFORMATION

9.1 General

The operating limitations within which compliance with the Standards of this Annex is determined, together with any other information necessary to the safe operation of the helicopter, shall be made available by means of a helicopter flight manual, markings and placards, and such other means as may effectively accomplish the purpose. The limitations and information shall include at least those prescribed in 9.2, 9.3 and 9.4.

9.2 Operating limitations

Limitations which there is a risk of exceeding in flight and which are defined quantitatively shall be expressed in suitable units and corrected if necessary for errors in measurements so that the flight crew can, by reference to the instruments available to them, readily determine when the limitations are reached.

9.2.1 Loading limitations

The loading limitations shall include all limiting mass, centres of gravity positions, mass distributions, and floor loadings (see 1.2.2).

9.2.2 Airspeed limitations

The airspeed limitations shall include all speeds (see 3.2) which are limiting from the standpoint of structural integrity or flying qualities of the helicopter, or from other considerations. These speeds shall be identified with respect to the appropriate helicopter configurations and other pertinent factors.

9.2.3 Powerplant and power transmission limitations

The powerplant limitations shall include all those established for the various powerplant and transmission components as installed in the helicopter.

9.2.4 Rotor limitations

Limitations on rotor speeds shall include maximum and minimum rotor speeds for power-off (autorotation) and power-on conditions.

9.2.5 Limitations on equipment and systems

The limitations on equipment and systems shall include all those established for the various equipment and systems as installed in the helicopter.

9.2.6 Miscellaneous limitations

Any necessary limitations with respect to conditions found to be prejudicial to the safety of the helicopter (see 1.2.1).

9.2.7 Flight crew limitations

The flight crew limitations shall include the minimum number of flight crew personnel necessary to operate the helicopter, having regard among other things to the accessibility to the appropriate crew members of all necessary controls and instruments and to the execution of the established emergency procedures.

Note.— See Annex 6 — Operation of Aircraft, *Part III, for the circumstances in which the flight crew shall include members in addition to the minimum flight crew defined in this Annex.*

9.3 Operating information and procedures

9.3.1 Types of eligible operations

There shall be listed the particular types of operations, as may be defined in Annex 6, Part III, to the Convention or be generally recognized, for which the helicopter has been shown to be eligible by virtue of compliance with the appropriate airworthiness requirements.

9.3.2 Loading information

The loading information shall include the empty mass of the helicopter, together with a definition of the condition of the helicopter at the time of weighing, the corresponding centre of gravity position, and the reference point(s) and datum line(s) to which the centre of gravity limits are related.

Note.— Usually the empty mass excludes the mass of the crew and payload, and the usable fuel supply and the *drainable oil; it includes the mass of all fixed ballast, unusable fuel supply, undrainable oil, total quantity of engine coolant and total quantity of hydraulic fluid.*

9.3.3 Operating procedures

A description shall be given of normal and emergency operating procedures which are peculiar to the particular helicopter and necessary for its safe operation. These shall include procedures to be followed in the event of failure of one or more power-units.

9.3.4 Handling information

Sufficient information shall be given on any significant or unusual features of the helicopter characteristics.

9.4 Performance information

The performance of the helicopter shall be scheduled in accordance with 2.2. There shall be included information regarding the various helicopter configurations and powers involved and the relevant speeds, together with information which would assist the flight crew in attaining the performance as scheduled.

9.5 Helicopter flight manual

A helicopter flight manual shall be made available. It shall identify clearly the specific helicopter or series of helicopters with which it is related. The helicopter flight manual shall include at least the limitations, information and procedures specified in this chapter.

9.6 Markings and placards

9.6.1 Markings and placards on instruments, equipment, controls, etc., shall include such limitations or information as necessary for the direct attention of the flight crew during flight.

9.6.2 Markings and placards, or instructions, shall be provided to give any information which is essential to the ground crew in order to preclude the possibility of mistakes in ground servicing (e.g. towing, refuelling, etc.) which could pass unnoticed and which could jeopardize the safety of the helicopter in subsequent flights.

— END —

22/3/91

SUPPLEMENT TO

ANNEX 8 — AIRWORTHINESS OF AIRCRAFT

(Eighth Edition)

1. The attached Supplement supersedes all previous Supplements to Annex 8 and includes differences notified by Contracting States up to 8 April 1994.

2. This Supplement should be inserted at the end of Annex 8, Eighth Edition. Additional differences and revised comments received from Contracting States will be issued at intervals as amendments to this Supplement.

SUPPLEMENT TO ANNEX 8 — EIGHTH EDITION

AIRWORTHINESS OF AIRCRAFT

Differences between the national regulations and practices of States and the corresponding International Standards contained in Annex 8, as notified to ICAO in accordance with Article 38 of the *Convention on International Civil Aviation* and the Council's resolution of 21 November 1950.

APRIL 1994

EGYPT

PART IV

Chapter 1

1.2.2, Note 2 Egypt considers maximum certificated side hoist mass to be a basic limitation because helicopters have side hoists.

Chapter 2

2.2.2 Egypt considers it necessary to schedule minimum performance for hovering with and without ground effect because helicopters can hover with and without ground effect.

JAPAN

PART I

Definitions *Performance Class 1, 2 and 3 helicopters.* Large helicopters (heavier than 2 700 kg) are classified as either Category TA or TB on the basis of weight and performance capabilities. There is no classification scheme for all other helicopters (2 700 kg or less).

Remark: The Japanese airworthiness requirements are basically equivalent to the United States Federal Aviation Regulations.

PART IV

Chapter 2

2.2.1 As stated in the difference with respect to the definitions of classes of helicopters in Part I, classifications in our country are based on weight as well as performance.

Remark: The Japanese airworthiness requirements are basically equivalent to the United States Federal Aviation Regulations.

2.2.2 As stated in the difference with respect to the definitions of classes of helicopters in Part I, classifications in our country are based on weight as well as performance.

Remark: The Japanese airworthiness requirements are basically equivalent to the United States Federal Aviation Regulations.

2.2.3.1 to 2.2.3.1.4 For Category TB helicopters, only take-off distance is required to be included in the performance data while take-off distance, path and rejected take-off distance information is required for Category TA helicopters. There are no comparable requirements for helicopters weighing less than 2 700 kg.

Remark: The Japanese airworthiness requirements are basically equivalent to the United States Federal Aviation Regulations.

2.2.3.2 En-route performance is based solely on climb performance both for all engines operating and one engine inoperative situations (Category TA/TB). There is no comparable requirement for helicopters weighing less than 2 700 kg.

Remark: The Japanese airworthiness requirements are basically equivalent to the United States Federal Aviation Regulations.

2.2.3.3 The landing decision point (LDP) is required for Category TA helicopters only.

Remark: The Japanese airworthiness requirements are basically equivalent to the United States Federal Aviation Regulations.

2.2.3.3.1 The landing decision point (LDP) is required for Category TA helicopters only.

Remark: The Japanese airworthiness requirements are basically equivalent to the United States Federal Aviation Regulations.

Chapter 6

6.3.2 Installation of rotor overspeed warnings is not required with respect to any category of helicopters.

Remark: The Japanese airworthiness requirements are basically equivalent to the United States Federal Aviation Regulations.

6.7 Engine restart capability is not required for Category TB helicopters and helicopters weighing less than 2 700 kg.

Remark: The Japanese airworthiness requirements are basically equivalent to the United States Federal Aviation Regulations.

Chapter 7

7.4.2 Minimum acceptable intensities are prescribed for navigation lights and anti-collision lights, i.e. no reduction below these levels is possible.

Remark: The Japanese airworthiness requirements are basically equivalent to the United States Federal Aviation Regulations.

MARSHALL ISLANDS

PART II

2.1 Standards applicable to all aircraft.

4.2.1 Not issued.

4.2.2 Not issued.

4.2.3 Not issued.

5.2 Not issued.

MEXICO

PART I

Definitions *Performance Class 1, 2 and 3 helicopters.* National regulations do not classify helicopters by performance. Criteria for helicopter performance are based on certification and the manufacturer's manuals.

PART II

4.2.1 National regulations do not envisage the notification of aircraft registration to the State of Manufacture, nor the disclosure of information on the airworthiness of each aircraft. Information regarding aircraft airworthiness is obtained directly from the manufacturer and its compliance is monitored by inspections.

4.2.3 National regulations do not envisage the notification of aircraft registration to the State of Manufacture, nor the disclosure of information on the airworthiness of each aircraft. Information regarding aircraft airworthiness is obtained directly from the manufacturer and its compliance is monitored by inspections.

PART I

Definitions — *Performance Class 1, 2 and 3 helicopters.* Large helicopters (heavier than 6 000 lb) are classified as either Category A or B on the basis of weight, passenger-carrying capacity and auxiliary systems as well as performance capabilities. There is no classification scheme for all other helicopters (6 000 lb or less).

PART III

Chapter 1

1.1.3 — Effective 17 October 1979, the United States certificated certain aeroplanes at weights in excess of 5 700 kg (12 566 lb) that do not fully meet the ICAO Airworthiness Standards of Part III. The Airworthiness Certificate of aeroplanes that do not meet ICAO Standards will be endorsed as follows:

"This aeroplane at weights in excess of 5 700 kg does not meet the airworthiness requirements of ICAO, as prescribed by Annex 8 to the Convention on International Civil Aviation."

PART IV

Chapter 2

2.2.1 — As stated in the difference with respect to the definitions of classes of helicopters in Part I, United States classifications are based on other factors as well as performance.

2.2.2 — As stated in the difference with respect to the definitions of classes of helicopters in Part I, United States classifications are based on other factors as well as performance.

2.2.3.1 to 2.2.3.1.4 — For Category B helicopters, only take-off distance is required to be included in the performance data while take-off distance, path and rejected take-off distance information is required for Category A helicopters. There are no comparable requirements for helicopters weighing less than 6 000 pounds.

2.2.3.2 — En-route performance is based solely on climb performance both for all engines operating and one engine inoperative situations (Categories A and B). There is no comparable requirement for helicopters weighing less than 6 000 pounds.

2.2.3.3.1 — The landing decision point (LDP) is required for Category A helicopters only.

Chapter 7

7.4.2 — Minimum acceptable intensities are prescribed for navigation lights and anti-collision lights, i.e. no reduction below these levels is possible.

AND RECOMMENDED PRACTICES

FACILITATION

ANNEX 9

TO THE CONVENTION ON INTERNATIONAL CIVIL AVIATION

NINTH EDITION — JULY 1990

This edition incorporates all amendments adopted by the Council prior to 5 December 1989 and supersedes, on 15 November 1990, all previous editions of Annex 9.

INTERNATIONAL CIVIL AVIATION ORGANIZATION

AMENDMENTS

The issue of amendments is announced regularly in the *ICAO Bulletin* and in the monthly *Supplement to the Catalogue of ICAO Publications*, which holders of this publication should consult. The space below is provided to keep a record of such amendments.

TABLE OF CONTENTS

15/11/90

FOREWORD

Historical Background

Standards and Recommended Practices on Facilitation were first adopted by the Council on 25 March 1949, pursuant to the provisions of Article 37 of the Convention on International Civil Aviation (Chicago, 1944), and designated as Annex 9 to the Convention with the title "Standards and Recommended Practices — Facilitation". They became effective on 1 September 1949. The Standards and Recommended Practices were based on recommendations of the First and Second Sessions of the Facilitation Division, held at Montreal in February 1946 and at Geneva in June 1948. They were expanded and amended comprehensively as a result of subsequent Sessions of the Division, i.e., the Third Session, held at Buenos Aires in December 1951, the Fourth Session, held at Manila in October 1955, the Fifth Session, held at Rome in December 1959, the Sixth Session, held at Mexico City in March — April 1963, the Seventh Session, held at Montreal in May 1968, the Eighth Session, held at Dubrovnik in March 1973 and the Ninth Session held at Montreal in April — May 1979. As a result of the Division's Recommendations for amendment of Annex 9 and Council's action thereon, the Second Edition of Annex 9 became effective on 1 March 1953, the Third Edition on 1 November 1956, the Fourth Edition on 1 November 1960, the Fifth Edition on 1 April 1964, the Sixth Edition on 1 April 1969, the Seventh Edition on 15 April 1974 and the Eighth Edition on 15 July 1980.

Ninth Edition.— The present edition incorporates, *inter alia,* provisions arising from recommendations of the Tenth Session of the Facilitation Division (Montreal, September 1988) which again resulted in a comprehensive expansion and amendment of Annex 9. This Ninth Edition of Annex 9 became effective on 30 July 1990 and is to become applicable on 15 November 1990.

The Standards and Recommended Practices on Facilitation are the outcome of Article 37 of the Convention, which provides, *inter alia,* that the "International Civil Aviation Organization shall adopt and amend from time to time, as may be necessary, international standards and recommended practices and procedures dealing with . . . customs and immigration procedures . . . and such other matters concerned with the safety, regularity and efficiency of air navigation as may from time to time appear appropriate". The policy with respect to the implementation by States of the Standards and Recommended Practices on Facilitation is strengthened by Article 22 of the Convention, which expresses the obligation accepted by each Contracting State "to adopt all practicable measures, through the issuance of special regulations or otherwise, to facilitate and expedite navigation by aircraft between the territories of Contracting States, and to prevent unnecessary delays to aircraft, crews, passengers, and cargo, especially in the administration of the laws relating to immigration, quarantine, customs and clearance", and by Article 23 of the Convention, which expresses the undertaking of each Contracting State "so far as it may find practicable, to establish customs and immigration procedures affecting international air navigation in accordance with the practices which may be established or recommended from time to time pursuant to this Convention".*

In addition to the Standards and Recommended Practices of Annex 9, the Organization's FAL Programme is based on the FAL Resolutions of the Sixteenth and Twenty-sixth Sessions of the Assembly, Council's Statement of 26 November 1965 on the *Aims of ICAO in the Field of Facilitation* (Doc 7891) and B-type recommendations of FAL Division Sessions which are those recommendations which do not suggest amendments to the Annex provisions. Certain of these B-type recommendations which have the character of guidance material are published in the Attachment to this edition of Annex 9. Other B-type recommendations encouraging States to improve facilitation in general and comply with certain provisions of this Annex will be published in the form of a Circular.

Applicability

As indicated in Chapter 1, Section B, the Standards and Recommended Practices in this document apply to all categories of aircraft operation except where a particular provision specifically refers to one type of operation without mentioning other types of operations.

The Standards and Recommended Practices on Facilitation inevitably take two forms: first a "negative" form, e.g., that States shall not impose more than certain maximum requirements in the way of paperwork, restrictions of freedom of movement, etc., and second a "positive" form, e.g., that States shall provide certain minimum facilities for passenger convenience, for traffic which is merely passing through, etc. Whenever a question arises under a "negative" provision, it is assumed that States will, wherever possible, relax their requirements below the maximum set forth in the Standards and Recommended Practices. Wherever there is a "positive" provision, it is assumed that States will, wherever possible, furnish more than the minimum set forth in the Standards and Recommended Practices.

Action by Contracting States

Notification of differences. The attention of Contracting States is drawn to the obligation imposed by Article 38 of the

* A number of other articles of the Convention have special pertinence to the provision of the FAL Annex and have been taken into account in its preparation. In particular, persons responsible for the implementation of the provisions of this Annex should be familiar with the following articles in addition to Articles 22 and 23:
Article 10, Landing at Customs Airport;
Article 11, Applicability of Air Regulations;
Article 13, Entry and Clearance Regulations;
Article 14, Prevention of Spread of Disease;
Article 16, Search of Aircraft;
Article 24, Customs Duty;
Article 29, Documents carried in Aircraft.

Convention by which Contracting States are required to notify the Organization of any differences between their national regulations and practices and the International Standards contained in this Annex and any amendments thereto. Contracting States are invited to extend such notification to any differences from the Recommended Practices contained in this Annex, and any amendments thereto. Further, Contracting States are invited to keep the Organization currently informed of any differences which may subsequently occur, or of the withdrawal of any differences previously notified. A specific request for notification of differences will be sent to Contracting States immediately after the adoption of each Amendment to this Annex.

Attention of States is also drawn to the provision of Annex 15 related to the publication of significant differences between their national regulations and practices and the related ICAO Standards and Recommended Practices through the Aeronautical Information Service, in addition to the obligation of States under Article 38 of the Convention.

Promulgation of information. The establishment and withdrawal of and changes to facilities, services and procedures affecting aircraft operations provided in accordance with the Standards and Recommended Practices specified in this Annex should be notified and take effect in accordance with the provisions of Annex 15.

Use of the text of the Annex in national regulations. The Council, on 13 April 1948, adopted a resolution inviting the attention of Contracting States to the desirability of using in their own national regulations, as far as practicable, the precise language of those ICAO Standards that are of a regulatory character and also indicating departures from the Standards, including any additional national regulations that were important for the safety or regularity of air navigation. Wherever possible, the provisions of this Annex have been written in such a way as would facilitate incorporation, without major textual changes, into national legislation.

General Information

An Annex is made up of the following component parts, not all of which, however, are necessarily found in every Annex; they have the status indicated:

1.— *Material comprising the Annex proper*

a) *Standards* and *Recommended Practices* adopted by the Council under the provisions of the Convention. They are defined, in the case of this Annex, as follows:

Standard: Any specification, the uniform observance of which has been recognized as practicable and as necessary to facilitate and improve some aspect of international air navigation, which has been adopted by the Council pursuant to Article 54 (*l*) of the Convention, and in respect of which non-compliance must be notified by States to the Council in accordance with Article 38.

Recommended Practice: Any specification, the observance of which has been recognized as generally practicable and as highly desirable to facilitate and improve some aspect of international air navigation, which has been adopted by the Council pursuant to Article 54 (*l*) of the Convention, and to which Contracting States will endeavour to conform in accordance with the Convention.

b) *Appendices* comprising material grouped separately for convenience but forming part of the Standards and Recommended Practices adopted by the Council.

c) *Definitions* of terms used in the Standards and Recommended Practices which are not self-explanatory in that they do not have accepted dictionary meanings. A definition does not have an independent status but it is an essential part of each Standard and Recommended Practice in which the term is used, since a change in the meaning of the term would affect the specification.

2.— *Material approved by the Council for publication in association with the Standards and Recommended Practices*

a) *Forewords* comprising historical and explanatory material based on the action of the Council and including an explanation of the obligations of States with regard to the application of the Standards and Recommended Practices ensuing from the Convention and the Resolution of Adoption.

b) *Introductions* comprising explanatory material introduced at the beginning of parts, chapters or sections of the Annex to assist in the understanding of the application of the text.

c) *Notes* included in the text, where appropriate, to give factual information or references bearing on the Standards or Recommended Practices in question, but not constituting part of the Standards or Recommended Practices.

d) *Attachments* comprising material supplementary to the Standards and Recommended Practices, or included as a guide to their application.

This Annex has been adopted in five languages — English, Arabic, French, Russian and Spanish. Each Contracting State is requested to select one of those texts for the purpose of national implementation and for other effects provided for in the Convention, either through direct use or through translation into its own national language, and to notify the Organization accordingly.

The following practice has been adhered to in order to indicate at a glance the status of each statement: *Standards* have been printed in light face roman; *Recommended Practices* have been printed in light face italics, the status being indicated by the words **Recommended Practice;** *Notes* have been printed in light face italics, the status being indicated by the prefix *Note.*

Any reference to a portion of this document which is identified by a number includes all subdivisions of the portion.

Throughout this Annex, the use of the male gender should be understood to include male and female persons.

INTERNATIONAL STANDARDS AND RECOMMENDED PRACTICES

CHAPTER 1. DEFINITIONS AND APPLICABILITY

A. Definitions

When the following terms are used in the Standards and Recommended Practices on Facilitation, they have the following meanings:

Aircraft equipment. Articles, other than stores and spare parts of a removable nature, for use on board an aircraft during flight, including first-aid and survival equipment.

Airline. As provided in Article 96 of the Convention, any air transport enterprise offering or operating a scheduled international air service.

Airline and operators' documents. Air waybills/consignment notes, passenger tickets and boarding passes, bank and agent settlement plan documents, excess baggage tickets, miscellaneous charges orders (M.C.O.), damage and irregularity reports, baggage and cargo labels, timetables, and weight and balance documents, for use by airlines and operators.

Authorized agent. A responsible person who represents an operator and who is authorized by or on behalf of such operator to act on all formalities connected with the entry and clearance of the operator's aircraft, crew, passengers, cargo, mail, baggage or stores.

Baggage. Personal property of passengers or crew carried on an aircraft by agreement with the operator.

Cargo. Any property carried on an aircraft other than mail, stores and accompanied or mishandled baggage.

Crew member. A person assigned by an operator to duty on an aircraft during flight time.

Direct transit area. A special area established in connexion with an international airport, approved by the public authorities concerned and under their direct supervision, for accommodation of traffic which is pausing briefly in its passage through the Contracting State.

Direct transit arrangements. Special arrangements approved by the public authorities concerned by which traffic which is pausing briefly in its passage through the Contracting State may remain under their direct control.

Disembarkation. The leaving of an aircraft after a landing, except by crew or passengers continuing on the next stage of the same through-flight.

Disinsecting. The operation in which measures are taken to kill the insect vectors of human disease present in aircraft and in containers (International Health Regulations (1969), Third Annotated Edition (1983), Part I, Article 1).

Embarkation. The boarding of an aircraft for the purpose of commencing a flight, except by such crew or passengers as have embarked on a previous stage of the same through-flight.

Flight crew member. A licensed crew member charged with duties essential to the operation of an aircraft during flight time.

Free airport. An international airport at which, provided they remain within a designated area until removal by air to a point outside the territory of the State, crew, passengers, baggage, cargo, mail and stores may be disembarked or unladen, may remain and may be trans-shipped, without being subjected to any customs charges or duties and to any examination, except for aviation security or for appropriate narcotics control measures.

Free zone. An area where merchandise, whether of domestic or foreign origin, may be admitted, deposited, stored, packed, exhibited, sold, processed or manufactured, and from which such merchandise may be removed to a point outside the territory of the State without being subjected to customs duties, internal consumer taxes or to inspection except for aviation security or for appropriate narcotics control measures. Merchandise of domestic origin admitted into a free zone may be deemed to be exported. When removed from a free zone into the territory of the State, the merchandise is subjected to customs and other required entry procedures.

General aviation operation. An aircraft operation other than a commercial air transport operation or an aerial work operation.

Ground equipment. Articles of a specialized nature for use in the maintenance, repair and servicing of an aircraft on the ground, including testing equipment and cargo- and passenger-handling equipment.

Inadmissible person. A person who is or will be refused admission to a State by its authorities.

Infected area. Defined on epidemiological principles by the health administration reporting the disease in its country and need not correspond to administrative boundaries. It is that part of its territory which, because of population characteristics, density and mobility and/or vector and animal reservoir potential, could support transmission of the reported disease (International Health Regulations (1969), Third Annotated Edition (1983), Part I, Article 1).

A list of infected areas notified by health administrations is published in the World Health Organization's Weekly Epidemiological Record.

International airport. Any airport designated by the Contracting State in whose territory it is situated as an airport of entry and departure for international air traffic, where the formalities incident to customs, immigration, public health, animal and plant quarantine and similar procedures are carried out.

Lading. The placing of cargo, mail, baggage or stores on board an aircraft to be carried on a flight, except such cargo, mail, baggage or stores as have been laden on a previous stage of the same through-flight.

Mail. Dispatches of correspondence and other objects tendered by and intended for delivery to postal administrations.

Mishandled baggage. Baggage involuntarily, or inadvertently, separated from passengers or crew.

Narcotics control. Measures to control the illicit movement of narcotics and psychotropic substances by air.

Operator. A person, organization or enterprise engaged in or offering to engage in an aircraft operation.

Pilot-in-command. The pilot responsible for the operation and safety of the aircraft during flight time.

Public authorities. The agencies or officials of a Contracting State responsible for the application and enforcement of the particular laws and regulations of that State which relate to any aspect of these Standards and Recommended Practices.

Security equipment. Devices of a specialized nature for use, individually or as part of a system, in the prevention or detection of acts of unlawful interference with civil aviation and its facilities.

Spare parts. Articles of a repair or replacement nature for incorporation in an aircraft, including engines and propellers.

State of Registry. A Contracting State on whose register the aircraft is entered.

Stores. Articles of a readily consumable nature for use or sale on board an aircraft during flight, including commissary supplies.

Temporary visitor (visitor). Any person, who disembarks and enters the territory of a Contracting State other than that in which that person normally resides; remains there lawfully as prescribed by that Contracting State for legitimate non-immigrant purposes, such as touring, recreation, sports, health, family reasons, study, religious pilgrimages, or business; and does not take up any gainful occupation during his stay in the territory visited.

Through-flight. A particular operation of aircraft, identified by the operator by the use throughout of the same symbol, from point of origin via any intermediate points to point of destination.

Unaccompanied baggage. Baggage which is transported as cargo and may or may not be carried on the same aircraft with the person to whom it belongs.

Unclaimed baggage. Baggage which arrives at an airport and is not picked up or claimed by a passenger.

Unidentified baggage. Baggage at an airport with or without a baggage tag which is not picked up by or identified with a passenger.

Unlading. The removal of cargo, mail, baggage or stores from an aircraft after a landing, except cargo, mail, baggage or stores continuing on the next stage of the same through-flight.

Visitor. (See *temporary visitor.)*

B. Applicability

The provision of these Standards and Recommended Practices apply to all categories of aircraft operation except where a particular provision specifically refers to one type of operation without mentioning other types of operations.

CHAPTER 2. ENTRY AND DEPARTURE OF AIRCRAFT

A. General

2.1 Governmental regulations and procedures applicable to the clearance of aircraft shall be no less favourable than those applied to other forms of transportation.

2.2 Contracting States shall make provision whereby procedures for the clearance of aircraft, including those normally applied for aviation security purposes, as well as those appropriate for narcotics control, will be applied and carried out in such a manner as to retain the advantage of speed inherent in air transport.

Note 1.— With respect to application of aviation security measures, attention is drawn to Annex 17 and to the ICAO Security Manual.

Note 2.— With respect to application of appropriate narcotics control measures, attention is drawn to the relevant ICAO publication (currently in preparation).

2.3 No documents, other than those provided for in this Chapter, shall be required by the public authorities from operators for the entry and departure of aircraft.

Note.— It is part of the intention of this provision that standard forms shall not be varied by the inclusion of national markings thereon.

B. Description, Purpose and Use of Aircraft Documents

2.4 Contracting States shall not require the presentation of the General Declaration when this information can be readily obtained in an alternative and acceptable manner.

2.4.1 A Contracting State which continues to require the presentation of a General Declaration shall limit its requirements to the items and shall follow the format set forth in Appendix 1 — General Declaration.

2.4.2 When a Contracting State has eliminated the Passenger Manifest and no longer requires the General Declaration (except for purposes of attestation) it shall accept, at the option of the operator, either a General Declaration or an appropriate attestation, signed by the authorized agent or pilot-in-command, on one page only of the Cargo Manifest. The attestation on the Cargo Manifest can be provided by means of a rubber stamp.

2.4.3 A Contracting State which continues to require the presentation of the General Declaration shall accept it when signed by either the authorized agent or the pilot-in-command, but may, when necessary, require the health section thereof to be signed by a crew member when the General Declaration itself has been signed by a non-crew member.

2.4.4 Contracting States shall not require the General Declaration, where it continues to be in use, to be signed or stamped by clearance control authorities for the purpose of outbound or inbound clearance.

2.5 Where Contracting States require the presentation on entry and departure of aircraft of information relating to crew members, such information shall be limited to the number of crew on board. Where the General Declaration continues to be required, this information shall be provided in the column headed "Total number of crew".

2.6 Contracting States shall not normally require the presentation of a Passenger Manifest, but when this type of information is required it may also be provided in an alternative and acceptable manner.

Note.— If the type of information referred to in 2.6 above is required it should be limited to the items shown in the format of a Passenger Manifest set forth in Appendix 2.

2.6.1 **Recommended Practice.—** *In Contracting States where the presentation of a list of passenger names is not required, public authorities should not require more information than the number of passengers embarking or disembarking, as the case may be, and the number going through the airport on the same flight. Where the General Declaration continues to be required, this information should be provided in the column headed "Number of Passengers on this Stage".*

Note.— It is the aim to eliminate from the General Declaration, as soon as possible, any notation in respect of passengers.

2.7 **Recommended Practice.—** *Contracting States should not require the presentation of the Cargo Manifest, when this information can be readily obtained in an alternative and acceptable manner.*

2.8 A Contracting State which continues to require the presentation of a Cargo Manifest shall, apart from the information indicated in the heading of the format of the Cargo Manifest set forth in Appendix 3, not require more than the following three items:

a) the air waybill number;

b) the number of packages related to each air waybill number; and

c) the nature of the goods.

The Cargo Manifest shall be accepted either when it follows the above-mentioned format, or a clear and understandable format adapted to electronic data-processing techniques.

Note.— It is part of the intention of this provision that, for the purpose of reporting air cargo on arrival to the authorities, operators be given the following options subject to the agreement of the governments concerned:

a) submission of the Cargo Manifest as per Appendix 3 when prepared by the station of loading abroad, or

b) preparation and submission of the Cargo Manifest on arrival on the basis of shipments actually landed, or

c) submission of the information required in the Cargo Manifest in a different way, such as direct transmission into a computer, teletype listings, or one copy of the air waybill per shipment.

2.8.1 **Recommended Practice.—** *Contracting States should dispense with the requirement for information concerning the nature of goods in the Cargo Manifest. A Contracting State should require the information listed on the Manifest only once.*

2.8.2 **Recommended Practice.—** *Contracting States which continue to require information about the nature of goods in the Cargo Manifest should use a plain language description of the goods. When Cargo Manifest data are transmitted by electronic data interchange, the description of goods should conform to internationally recognized standards.*

2.9 Contracting States shall not require the presentation of a written declaration of the mail other than the form AV 7 prescribed in the Acts in force of the Universal Postal Union. Operators carrying mail shall, upon the request of the customs authorities, present to them for inspection and return a copy of the aforementioned AV 7 mail form in cases where it has not otherwise been made available for customs clearance purposes by the postal authorities.

2.10 Contracting States shall not require the presentation of a written declaration of stores remaining on board aircraft. In respect of stores laden on or unladen from an aircraft, Contracting States which continue to require the presentation of a written declaration of such stores shall limit the information required to an absolute minimum, and simplify their clearance to the greatest possible extent.

2.11 Contracting States shall not require the presentation of a list of the number of pieces of accompanied baggage. Operators carrying baggage shall, upon request from the authorities, provide them with any available information where it has not otherwise been provided for customs clearance purposes by the passenger.

C. Outbound Procedures

2.12 Contracting States shall not require the authorized agent or pilot-in-command to deliver to the public authorities concerned, before departure of the aircraft, more than:

a) two copies of the General Declaration, when used;

b) two copies of the Cargo Manifest, when used, listing cargo, including unaccompanied baggage, laden according to points of unlading;

c) two copies of a simple stores list, when used, listing stores laden.

2.13 If the aircraft is not embarking passengers or lading cargo, mail, stores or baggage, no aircraft document shall be required except the General Declaration (which shall so state) or, if the provisions of 2.4.2 apply, the Cargo Manifest.

Note.— If the General Declaration is not required, this information can be supplied in the alternative manner referred to in 2.4.

2.14 When it will facilitate aircraft departure, Contracting States shall permit those operators that have provided a sufficiently conclusive statistical basis for obtaining such permission the use of standard baggage weights for each piece of baggage or for the aggregate of baggage for each passenger on given services.

D. Inbound Procedures

2.15 Contracting States shall not require the authorized agent or pilot-in-command to deliver to the public authorities concerned, on arrival of the aircraft, more than:

a) three copies of the General Declaration, when used;

b) three copies of the Cargo Manifest, when used, listing cargo, including unaccompanied baggage, unladen according to points of lading;

c) two copies of a simple stores list, when used, listing stores unladen.

2.16 If the aircraft is not disembarking passengers or unlading cargo, mail, stores or baggage, no aircraft document shall be required except the General Declaration (which shall so state) or, if the provisions of 2.4.2 apply, the Cargo Manifest.

Note.— If the General Declaration is not required, this information can be supplied in the alternative manner referred to in 2.4.

E. Consecutive Stops at Two or More International Airports in the Same Contracting State

2.17 Contracting States shall not require documents or procedures for entry or departure of aircraft which are different from or in excess of those prescribed in this Chapter in the case where aircraft stop at two or more international airports within their territories without intermediate landing in the territory of another State.

Note.— During the interval (which may be of some duration in the case of many private flights) between the time when all inbound procedures have been completed and outbound procedures are begun, it is assumed that Contracting States normally will allow aircraft to land at other than international airports in their territories and will require no further documentation or procedures of the nature referred to in this Chapter.

F. Completion of Aircraft Documents

2.18 **Recommended Practice.—** *Documents for entry and departure of aircraft should be accepted if furnished in either English, French, Russian or Spanish. Any Contracting State may require an oral or written translation into its own language.*

2.19 Typewriting shall not be required in filling out the documents referred to in this Chapter 2. Handwritten block lettering in ink or indelible pencil, or documents produced by electronic data-processing techniques, in legible and understandable form shall be accepted in all cases.

2.20 No visa shall be required, nor shall any visa or other fee be collected, in connexion with the use of any documentation required for the entry or departure of aircraft.

2.21 At the time the documents are being checked, the public authorities concerned shall either accord the authorized agent or pilot-in-command, where this can be done without undue delay, an opportunity to correct, or shall themselves correct, any errors which they are satisfied are of a purely clerical nature and were not made with intent to violate the laws of the Contracting State.

2.22 In the event of errors being found in documents, the operator or authorized agent shall not be subjected to penalties if he satisfies the public authorities concerned that the error was inadvertent and not of a serious nature.

G. Disinsecting of Aircraft

2.23 When disinsecting is required by a Contracting State as a public health measure, that requirement shall be deemed to have been met by discharging into those portions of the aircraft which may carry insects from one area to another, an insecticide of a strength, formula and method of dispersal recommended by the World Health Organization and acceptable to that State, such insecticide to be effectively discharged from dispensers conforming to WHO specifications as follows:

a) into the flight deck and into those portions of the aircraft which cannot be reached when the aircraft is moving, as near as possible to the time of the aircraft's last departure before entering the State and in sufficient time to avoid delaying such departure; and

b) into those portions of the aircraft which can be reached when the aircraft is moving, after the time of the aircraft's last departure before entering the State, either:

   1) by means of an aerosol spray, or any equivalent system, while the aircraft is taxiing from the ramp to the runway for take-off, or

   2) if the aircraft is suitably equipped, by means of an automatic dispersal of vapour while the aircraft is flying, but as far in advance as possible and at least thirty minutes prior to first landing, or

   3) by other equally effective means;

c) or, by means of a residual treatment with permethrin of the interior surfaces of an aircraft, in accordance with the recommendations of the World Health Organization (WHO).

Note.— When the carriage by air of filled aerosol dispensers is required, for instance on multi-sector flights, the aerosol dispensers should be packed in accordance with ICAO's Technical Instructions for the Safe Transport of Dangerous Goods by Air *(Doc 9284).*

2.24 **Recommended Practice.—** *When disinsecting as a public health measure has been properly performed pursuant to 2.23 and has been recorded on the General Declaration or in the Certificate of Residual Disinsection set forth in Appendix 4, if the disinsecting procedure indicated in c) of 2.23 above has been followed, it should be accepted by all Contracting States as evidence that effective disinsecting has* *been carried out for preventing the spread of all insect vectors of human diseases for whose destruction the insecticide is effective.*

Note 1.— If the General Declaration is not required, this information can be supplied in the alternative manner referred to in 2.4.

Note 2.— When disinsecting is carried out by residual treatment of permethrin, the appropriate government authority should issue a "Certificate of Residual Disinsection" conforming to the form shown in Appendix 4, which should be part of the aircraft documentation for the period of effectiveness of the certificate, and should be shown to health authorities on request.

2.25 When disinsecting as a public health measure has been properly performed pursuant to 2.23, passengers and crew on arrival shall, except in special circumstances, be allowed to disembark immediately from the aircraft.

2.26 **Recommended Practice.**— *Contracting States should ensure that all personnel in charge of disinsecting receive appropriate information concerning the way in which to perform such disinsecting effectively.*

2.27 **Recommended Practice.**— *Disinsecting of an aircraft on a through-flight should not be required to be repeated on behalf of any insect vectors of human disease, against which the insecticide used is effective, except when live insect vectors of human disease have been found on board the aircraft, or when the aircraft is proceeding directly from an infected area of an insect-borne disease to a receptive area.*

2.28 **Recommended Practice.**— *When a Contracting State requires treatment of the aircraft with an insecticide in the interest of agriculture or food conservation, a single treatment should be employed that also meets the requirements of public health.*

2.29 **Recommended Practice.**— *When disinsecting or other remedial measures are required by a Contracting State for animal and plant quarantine purposes, such State should devise means to integrate its procedures in this field with other clearance procedures whenever this will expedite the clearance of aircraft and the loads that they carry, in so far as this does not detract from the safety of the aircraft and the effectiveness of the measures.*

2.30 Contracting States shall ensure that their procedures for disinsecting or any other remedial measure are not injurious to the health of passengers and crew and cause the minimum of discomfort to them.

2.31 Contracting States shall ensure that any insecticide or any other substance used to meet the requirements of public health, agriculture or food conservation is not inflammable and does not have a deleterious effect on the structure of the aircraft or its operating equipment.

15/11/90

H. Disinfection of Aircraft

2.32 Contracting States shall define the types of animals and animal products which, when imported by air, require that the aircraft be disinfected and shall normally exempt aircraft from disinfection when such animals or animal products are carried in approved containers. When aircraft disinfection is required, the following provision shall apply:

a) the application shall be limited solely to the container or to the compartment of the aircraft in which the traffic was carried;

b) the disinfection shall be carried out expeditiously;

c) inflammable chemical compounds or solutions likely to damage aircraft structure, by corrosion or other effects, shall not be employed.

I. Arrangements Concerning International General Aviation and Other Non-scheduled Flights

I. General

2.33 Contracting States shall publish their regulations concerning the advance notices and applications for permission referred to in 2.34 and 2.39, and communicate them to ICAO.

II. Advance Notification of Arrival

2.34 In the case of aircraft registered in other Contracting States, which are not engaged in scheduled international air services and which are making flights either in transit non-stop across the territory of a Contracting State or stopping in the territory of a Contracting State for non-traffic purposes, such Contracting State shall not require more advance notice of such flights than is necessary to meet the requirements of air traffic control and of the public authorities concerned.

Note.— This provision is not intended to prevent the application of appropriate narcotics control measures.

2.35 Contracting States shall accept from the appropriate authority of any other Contracting State the information contained in a flight plan as adequate advance notification of the arrival of in-coming aircraft referred to in 2.34 above, provided that such information is received at least two hours in advance of arrival and that the landing occurs at a previously designated international airport. Responsibility for notification to authorized inspection officials, in the case of both arrivals and departures of registered aircraft of other Contracting States, shall rest with the appropriate authority of the State concerned.

Note.— Specifications for flight plans are set forth in Annex 2 — Rules of the Air.

2.36 Contracting States requiring advance notice of the intended landing of aircraft in their territory shall designate a single agency through which such notices may be routed.

2.37 **Recommended Practice.—** *Contracting States requiring advance notice as referred to in 2.34 and 2.36 or special permission as referred to in 2.38 should indicate the address and, where available, the telex number or cable address of the agency to which application for special permission or advance notice shall be routed.*

III. Special Permission for Operations

2.38 Any Contracting State which, for reasons of safety of flight, requires special permission in respect of flights referred to in 2.34 above, shall not require any other information than that contained in a flight plan when application for such permission is made. Such application shall not be required to be filed more than three working days in advance of the intended arrival of the aircraft in the territory of said Contracting State, or the intended non-stop transit flight across the territory of said State.

2.39 In the case of aircraft engaged in the carriage of passengers, cargo or mail for remuneration or hire on other than scheduled international air services, if a Contracting State requires its special permission for the operation of taking on or discharging passengers, cargo or mail, it shall not require that such special permission be applied for through diplomatic channels, and shall:

a) establish procedures whereby such application will be dealt with promptly;

b) make such permission effective for a specific length of time or number of flights wherever possible; and

c) impose no fees, dues or charges for the issue of such permission.

2.40 **Recommended Practice.—** *Contracting States should not require more than the following details in the applications referred to in 2.39:*

a) name of operator;

b) type of aircraft and registration marks;

c) date and time of arrival at, and departure from, the airport concerned;

d) place or places of embarkation or disembarkation abroad, as the case may be, of passengers and/or freight;

e) purpose of flight and number of passengers and/or nature and amount of freight;

f) name, address and business of charterer, if any.

Note.— It is the intent of this provision that applications in advance for special permission should be acted upon expeditiously on the basis of the above standard information. As an example to illustrate the intent of this provision, a State which requires applications in advance could provide that whenever applications contain all of the above standard information they need not reach the appropriate agency more than two full business days in advance of the intended landing of the aircraft in the territory of that State.

IV. Clearance and Sojourn of Aircraft

2.41 **Recommended Practice.—** *Where there are international general aviation operations at an international airport, Contracting States should arrange for an adequate level of inspection and clearance for those services.*

2.42 **Recommended Practice.—** *In cases where the number of border-crossing general aviation flights so warrant, Contracting States should make arrangements whereby one governmental agency is authorized to undertake, on behalf of all other government departments concerned, clearance of smaller aircraft and their loads at airports used only by occasional international flights.*

Note.— Some Contracting States have already authorized local police or other authorities at or near certain of their airfields to carry out all clearance aspects, thus enabling the State concerned to permit many of the smaller aircraft, coming directly from abroad, to land and depart from airports where normal clearance facilities do not exist, provided that no dutiable articles are unladen upon arrival or intended to be laden on departure.

2.43 An aircraft which is not engaged in scheduled international air services and which is making a flight to or through any designated international airport of a Contracting State and is admitted temporarily free of duty in accordance with Article 24 of the Convention shall be allowed to remain within that State, for a period to be established by that State, without security for customs duty on the aircraft being required.

CHAPTER 3. ENTRY AND DEPARTURE OF PERSONS AND THEIR BAGGAGE

A. General

3.1 Regulations and procedures applied to persons travelling by air shall be no less favourable than those applied to persons travelling by other means of transport.

3.2 Contracting States shall make provision whereby the procedures for clearance of persons travelling by air, including those normally applied for aviation security purposes, as well as those appropriate for narcotics control, will be applied and carried out in such a manner as to retain the advantage of speed inherent in air transport.

Note 1.— With respect to application of aviation security measures, attention is drawn to Annex 17 and to the ICAO Security Manual.

Note 2.— With respect to application of appropriate narcotics control measures, attention is drawn to the relevant ICAO publication (currently in preparation).

3.3 No documents other than those provided for in this Chapter shall be required by Contracting States for the entry into and departure from their territories of visitors.

B. Entry Requirements and Procedures

I. Passenger Identity Documents

3.4 Contracting States shall not require from visitors travelling by air any other document of identity than a valid passport.

Note.— It is not the intent of the above provision to discourage Contracting States, who wish to be more liberal, from accepting official documents of identity such as expired passports, national registration cards, seafarers' identity documents, alien resident permits and crew member certificates in lieu of a valid passport.

3.4.1 **Recommended Practice.—** *Contracting States should endeavour, where practicable, to standardize the personal identification data included in their national passports (whether machine readable or not) to conform with the items and presentation recommended in ICAO Doc 9303* — A Passport with Machine Readable Capability.

3.5 Contracting States shall take all practicable measures to ensure that passports are issued as quickly as possible after receipt of the application.

3.5.1 **Recommended Practice.—** *Contracting States should issue machine readable passports in the layout set forth in ICAO Doc 9303.*

3.5.2 **Recommended Practice.—** *As a means of giving effect to 3.5 above, Contracting States should, if necessary, decentralize their facilities for the issue of passports and should waive any requirements to produce certificates of good conduct, documentary evidence of financial status and similar supporting documents, except in special circumstances.*

3.5.3 **Recommended Practice.—** *Contracting States should issue passports with an initial period of validity of at least five years, valid for an unlimited number of journeys and for all countries, except in special circumstances.*

3.5.4 **Recommended Practice.—** *Contracting States should institute simple procedures for the renewal or replacement of passports and grant the same period of validity for the new or renewed passport as for the initial issue.*

3.5.5 **Recommended Practice.—** *If any fee is charged for the issue or renewal of a passport, the amount of such fee should not exceed the cost of the operation.*

3.5.6 **Recommended Practice.—** *A Contracting State should not require separate passports for children under 16 years of age entering its territory when accompanied by a parent or legal guardian, provided that particulars of the child are recorded in the passport of the accompanying adult.*

3.5.7 **Recommended Practice.—** *Contracting States should refrain from issuing a joint passport to two spouses.*

3.5.8 **Recommended Practice.—** *Contracting States should endeavour within a reasonable period of time to issue a separate passport to children under the age of 16 years.*

3.6 In cases where a visitor holds a valid passport and no visa is required of him (*cf.* 3.7 below), Contracting States shall not require him to obtain any other identity document from their consulates or from operators prior to the commencement of his flight.

Note.— It is the intention of this provision that the visitors referred to should be admitted upon arrival without having to furnish any other document except, if required, a

Disembarkation Card (cf. 3.10 and 3.10.1 below) and, if required, a Certificate of Vaccination or Revaccination (cf. 3.11 below).

II. Visas

3.7 **Recommended Practice.—** *Contracting States should extend to the maximum number of countries the practice of abolishing, through bilateral or multilateral arrangements or through unilateral action, entrance visas for visitors.*

3.8 In cases where a Contracting State continues to require entrance visas from visitors, it shall adopt the practice of issuing such visas without charge through reciprocal or other acceptable arrangements.

3.8.1 **Recommended Practice.—** *In cases where Contracting States continue to require entry clearances or visas, these should be issued in machine readable form compatible with the layout specified in ICAO Doc 9303 even if the travel document in which they are placed is not established in machine readable format.*

3.8.2 Contracting States shall simplify the documentary requirements and other formalities for the issue of entrance visas for visitors and shall ensure that such visas are issued as quickly as possible after receipt of the application and shall not normally require the applicant to make a personal appearance at a consulate.

3.8.3 Entrance visas for visitors shall normally be made valid for at least twelve months from the date of issue regardless of the number of entries into the State concerned and with the understanding that the duration of each stay may be limited. However, the State concerned may require that the length of validity of the visa does not exceed the length of validity of the passport or other identity document in which such visa is inserted.

3.8.4 **Recommended Practice.—** *In exceptional circumstances, when a visitor, for reasons of* force majeure, *does not possess the required entry visa, Contracting States should authorize entry and enable the visitor to regularize his position.*

3.8.5 Contracting States shall not require visas for re-entry from their own nationals.

3.8.6 **Recommended Practice.—** *Contracting States should not require visas for re-entry from their resident aliens.*

3.8.7 **Recommended Practice.—** *Visas should in all cases include the following information given in the order shown:*

a) number of visa;

b) type of visa;

c) date of issue, showing day, month and year in that order;

d) date of expiry, showing day, month and year in that order;

e) number of entries permitted;

f) authorized duration of each stay.

3.8.8 **Recommended Practice.—** *Numerals 1, 2, 3, 4, 5, 6, 7, 8, 9, 0 and the Gregorian calendar (with months being spelled out in full) should be used in furnishing the information listed in 3.8.7.*

3.8.9 **Recommended Practice.—** *When the text of the visa is in a national language other than English, French or Spanish, one of these three languages should also be used.*

III. Additional Documentation

3.9 **Recommended Practice.—** *Contracting States should not require either from visitors travelling by air, or from operators on their behalf, any information in writing supplementary to or repeating that already presented in their identity documents.*

3.10 A Contracting State which continues to require written supplementary information from visitors travelling by air, shall limit its requirements to the items and shall follow the format set forth in Appendix 5 — Embarkation/Disembarkation Card.

3.10.1 Contracting States, when requiring Embarkation/Disembarkation Cards, shall accept their completion by visitors and shall not require them to be completed or checked by the operator. Legible handwritten script shall be accepted on the cards, except where the form specifies block lettering.

3.10.2 Contracting States which require the presentation of Embarkation/Disembarkation Cards shall provide them to airline operators at no charge for distribution to passengers prior to embarkation or during the flight.

IV. Public Health Requirements

3.11 In cases where evidence of protection against yellow fever is required from persons travelling by air, Contracting States shall accept the International Certificate of Vaccination or Revaccination in the form set out by the World Health Organization in Appendix 2 of the International Health Regulations (1969).

3.12 **Recommended Practice.—** *Medical examination of persons arriving by air should normally be limited to those disembarking and coming within the incubation period of the* *disease concerned, as stated in the International Health Regulations (1969), from an area infected with one of the three quarantinable diseases (plague, cholera and yellow fever).*

V. Clearance Procedures

3.13 Except in special circumstances, Contracting States shall not require that identity documents be collected from passengers or crew before they arrive at the passport control points.

3.13.1 After individual presentation by passengers and crew of the identity documents, the public officials concerned shall, except in special individual cases, hand back such documents immediately after examination, rather than withholding them for purposes of obtaining additional control.

3.14 In giving effect to 3.2, Contracting States shall ensure that examination by clearance control officials is performed as expeditiously as possible.

3.14.1 **Recommended Practice.**— *Contracting States should adopt a multi-channel immigration inspection system at international airports where passenger traffic justifies its installation and where this may expedite clearance procedures.*

3.15 Each Contracting State shall make arrangements whereby the identity document of a visitor need be inspected by only one official at times of entry and departure.

Note.— This provision is intended to ensure inspection of the identity document of a visitor by only one official on behalf of both the Immigration and Police authorities. It is not intended to discourage Health and Customs officials from examining the identity document whenever this may facilitate health and customs clearance of the visitor.

3.16 Contracting States shall accept an oral declaration of baggage from passengers and crew.

3.17 Contracting States shall normally accomplish inbound passenger baggage inspection on a sampling or selective basis.

3.17.1 Contracting States shall adopt the dual-channel baggage clearance system at international airports where the volume of passenger traffic justifies its installation.

Note.— See Appendix 6 — Dual-Channel Clearance System as recommended by the Customs Co-operation Council.

3.18 **Recommended Practice.**— *Contracting States should make arrangements whereby a passenger and his baggage, on an international flight making two or more stops within the territory of the same State, should not be required to be cleared through governmental formalities at more than one airport of the State concerned. Similarly, the State concerned should, in so far as is possible, make arrangements whereby these formalities are effected at the passenger's airport of destination on that flight, except in special circumstances determined by the authorities concerned.*

3.19 Contracting States shall facilitate the return of mishandled baggage to passengers or crew concerned or to the operator's central tracing office and shall not hold operators liable for penalties, fines, customs duties and taxes, on the basis that the baggage was mishandled. Under the conditions laid down by the competent authorities, operators may be permitted to open such baggage to determine ownership.

Note.— The application of this provision should be subject to the relevant customs laws and regulations. The provision of storage facilities for unclaimed, unidentified and mishandled baggage is covered in 6.37.2.

3.20 Contracting States shall permit operators to clear mishandled baggage at an appropriate destination on behalf of passengers and crew, subject to completion of the appropriate documentation.

Note 1.— Appropriate documentation may include:

a) a list of contents and a written customs declaration, in lieu of clearance in person by the passenger or crew concerned; and

b) where required, a written authorization for the operator to act as representative of the passenger or crew in clearing such baggage.

Note 2.— Appropriate destination may refer to:

a) the final destination which has clearance facilities; or

b) where necessary, the first port of entry.

In each case it is the intent of this provision that the operator shall retain the responsibility for delivering the baggage to its final destination.

3.21 Subject to appropriate security measures, Contracting States shall facilitate the clearance of unidentified and unclaimed baggage and its return to the operator. Under the conditions laid down by the competent authorities, operators may be permitted to open such baggage so as to ascertain its owner.

VI. Crew and Other Operators' Personnel

3.22 Contracting States shall ensure that when inspection of crew members and their baggage is required on arrival or departure, such inspection shall be carried out as expeditiously as possible.

3.23 Contracting States shall provide facilities which will enable crew members of their airlines who are not required to be licensed to obtain without delay and without charge crew members' certificates containing the material set forth in Appendix 7 and valid for the crew member's term of employment.

3.24 In the case of an airline flight crew member who retains his licence in his possession when embarking and disembarking, remains at the airport where the aircraft has stopped or within the confines of cities adjacent thereto, and departs on the same aircraft or on his next regularly scheduled flight, each Contracting State shall accept such licence for temporary admission to the State and shall not require a passport or visa provided the licence contains the specifications set forth in 5.1.1 of Annex 1, plus: a) a certification that the holder may at all times re-enter the State of issuance of the licence upon production of the licence; b) a photograph of the holder; and c) place and date of birth of the holder.

Note.— It is the intent of this provision that a licence shall be recognized as a satisfactory identity document under the specific circumstances when it contains the above certification and the other items specified, even if the holder is not a national of the State of Registry of the aircraft on which he serves. It is not desired to discourage Contracting States from issuing such licences to resident alien flight crew members if they are willing to do so.

Specifications for licences are set forth in Chapter 5 of Annex 1 — Personnel Licensing.

3.24.1 Each Contracting State shall extend privileges of temporary admission similar to those provided under 3.24, and on the same conditions, to a flight crew member of an aircraft operated for remuneration or hire but not engaged in scheduled international air services, subject to the requirement that such flight crew member must depart on the aircraft on its first flight out of the territory of the State.

3.25 In the case of either an airline flight crew member whose licence does not meet the specifications of 3.24 or an airline crew member who is not required to be licensed, each Contracting State shall extend privileges of temporary admission similar to those provided under 3.24 and on the same conditions, provided the crew member concerned is in possession of a valid Crew Member Certificate (Appendix 7).

Note.— The implementation of 3.24 and 3.25 permits rapid and efficient disposition of flight personnel by airlines. The full benefit cannot be derived from these provisions while some States withhold acceptance of them.

3.25.1 **Recommended Practice.—** *Each Contracting State should extend privileges of temporary admission similar to those provided under 3.25 and on the same conditions, to a flight crew member of an aircraft operated for remuneration or hire but not engaged in scheduled international air services, when such flight crew member's licence does not meet the specifications of 3.24 and to a crew member who is not required to be licensed of an aircraft operated for remuneration or hire but not engaged in scheduled international air services, subject to the requirements that:*

a) the crew member concerned is in possession of a valid Crew Member Certificate (Appendix 7); and

b) the crew member concerned must depart on the aircraft on its first flight out of the territory of the State.

3.25.2 When it is necessary for an airline crew member, in the exercise of his duties, to travel to another State as a passenger by any means of transportation in order to join an aircraft, each State shall accept from that crew member, in lieu of a passport and visa for temporary admission and for the necessary freedom of movement within its territory to join such aircraft, a licence as specified in 3.24 or a Crew Member Certificate as specified in Appendix 7, together, where required, with a document from the crew member's employer certifying the purpose of the journey.

3.25.3 **Recommended Practice.—** *Each Contracting State should extend privileges of temporary admission similar to those provided under 3.25.2 and on the same conditions, to a crew member of an aircraft operated for remuneration or hire but not engaged in scheduled international air services.*

3.26 **Recommended Practice.—** *Contracting States should make arrangements to expedite the admission, for residence in their territories, of ground and flight personnel of foreign airlines operating to or through such territories, to the extent that such personnel are necessary to perform supervisory and technical duties directly connected with the operation of the international air services being performed by such airlines.*

3.27 Contracting States shall make arrangements to ensure entry without delay into their territories on a temporary basis of technical personnel of foreign airlines operating to or through such territories who are urgently required for the purpose of converting to an airworthy condition any aircraft which is, for technical reasons, unable to continue its journey. In the event of States requiring a guarantee of, for instance, the subsistence in, and return from, such State, this shall be negotiated without delaying the immediate admission of such personnel.

C. Departure Requirements and Procedures

3.28 Contracting States shall not require exit visas from their own nationals or residents wishing to tour abroad nor from visitors at the end of their stay.

3.29 **Recommended Practice.—** *Contracting States should, in conformity with their respective regulations, endeavour to reduce the documentation required to be* *produced by passengers departing from their territories to a valid passport or other acceptable form of identity document.*

Note.— It is not the intent of the above provision to discourage Contracting States, who wish to be more liberal, from accepting official documents of identity such as expired passports, national registration cards, seafarers' identity documents, alien resident permits, crew member certificates, etc. in lieu of a valid passport.

3.30 **Recommended Practice.—** *Contracting States should not require presentation of baggage of passengers departing from their territory except for aviation security measures, or in special circumstances.*

Note.— This provision is not intended to prevent the application of appropriate narcotics control measures.

3.31 Contracting States shall not require inspection of baggage of passengers departing from their territory, except for aviation security measures, or in special circumstances.

Note.— This provision is not intended to prevent the application of appropriate narcotics control measures.

3.32 Contracting States shall not require tax clearance certificates from visitors.

3.33 Contracting States shall not hold the operator responsible for any payment arising from the non-payment of taxes by any passenger.

D. Completion of Passenger and Crew Documents

3.34 **Recommended Practice.—** *The practice of entering names on passenger and crew documents should be to put the surname or surnames first. Where both paternal and maternal surnames are used, the paternal surname should be placed first. Where for married females both the husband's and the wife's paternal surnames are used, the husband's paternal surname should be placed first.*

E. Custody and Care of Passengers and Crew and Their Baggage

I. Passengers and Crew

A. General Provisions

3.35 The public authorities concerned shall, without unreasonable delay, accept passengers and crew for examination as to their admissibility into the State.

3.35.1 The operator shall be responsible for the custody and care of passengers and crew until they are accepted for such examination. The responsibility of the operator shall include the custody of passengers and crew between the aircraft and the terminal building and within the terminal building transit area, it being understood that the Contracting State may, if it so wishes, relieve the operator from all, or part of this responsibility.

3.35.2 **Recommended Practice.—** *After such acceptance, whether conditional or unconditional, the public authorities concerned should be responsible for the custody and care of passengers and crew until they are admitted for entry or found to be inadmissible and transferred back to the custody of the operator for transport away from the territory of the State.*

B. Particular Provisions

Inadmissible Persons

3.36 Each Contracting State shall ensure that a person found inadmissible is transferred back into the custody of the operator(s) who shall be responsible for prompt removal to:

— the point where the person commenced his journey; or

— to any other place where the person is admissible.

Note.— The public authorities shall without delay inform the operator(s) when a person is found inadmissible and consult the operator(s) regarding the possibilities of departure.

3.36.1 Contracting States shall accept for examination a person being returned from his point of disembarkation after having been found inadmissible if this person previously stayed in their territory before embarkation, other than in direct transit. Contracting States shall not return such a person to the country where he was earlier found to be inadmissible.

Note 1.— This provision is not intended to prevent public authorities from further examining a returned inadmissible person to determine his eventual acceptability in the State or make arrangements for his transfer, removal or deportation to a State of which he is a national or where he is otherwise acceptable. Where a person who has been found to be inadmissible has lost or destroyed his travel document, a Contracting State will accept instead a document attesting to the circumstances of embarkation and arrival issued by the public authorities of the Contracting State where the person was found to be inadmissible.

Note 2.— Nothing in this provision or in Note 1 is to be construed so as to allow the return of a person seeking asylum in the territory of a Contracting State, to a country where his life or freedom would be threatened on account of his race, religion, nationality, membership of a particular social group or political opinion.

3.36.2 The obligation of a carrier to transport any person away from the territory of a Contracting State shall terminate from the moment such person has been definitely admitted into that State.

3.36.3 When a person is found inadmissible and is returned to the operator for transport away from the territory of the State, the operator shall not be precluded from recovering from such person any transportation costs arising from his inadmissibility.

3.37 Operators shall take precautions at the point of embarkation to the end that passengers are in possession of any control documents prescribed by Contracting States.

3.37.1 Contracting States shall not fine operators in the event that passengers are found inadmissible unless there is evidence to suggest that the carrier was negligent in taking precautions to the end that the passengers complied with the documentary requirements for entry into the receiving State.

3.37.2 Contracting States and operators shall co-operate, where practicable, in establishing the validity and authenticity of passports and visas.

3.38 Each Contracting State shall ensure that the public authorities seize fraudulent, falsified or counterfeit travel documents of inadmissible persons. Such documents shall be removed from circulation and returned to the appropriate authorities when practicable. In place of a seized document, a covering letter shall be issued by the removing State and attached to it will be a photocopy of the forged travel documents (if available) as well as any important information. The covering letter and its attachments shall be handed over to the operator responsible for the removal of the inadmissible person. It will serve to give information to the authorities at the transit and/or the original point of embarkation.

Note.— A suggested format for the covering letter is set forth in Appendix 8.

Deportees

3.39 Each Contracting State shall ensure that operator(s) are informed when persons are obliged to travel because they have been formally ordered by the public authorities to be removed from that State.

Note.— Information to be provided as far as practicable by the public authorities at the time of reservation is:

— Name of person to be identified as deportee;

— Reason for deportation;

— Names of escorts/guards.

3.40 **Recommended Practice.—** *Each Contracting State should, whenever practicable, ensure that the public authorities ordering the deportation inform the public authorities of transit and destination countries of the planned transport.*

II. Baggage

3.41 In Contracting States where the operator has the obligation to the customs authorities for safeguarding baggage until it is cleared by customs, he shall be freed from this obligation and from liability for customs duties and taxes chargeable on such baggage when it is taken into charge by the customs authorities and is under their sole control.

CHAPTER 4. ENTRY AND DEPARTURE OF CARGO AND OTHER ARTICLES

A. General

4.1 Regulations and procedures applicable to goods carried by aircraft shall be no less favourable than those which would be applicable if the goods were carried by other means.

4.2 Contracting States shall make provisions whereby procedures for the clearance of goods carried by air and for the interchange of air cargo with surface transport, including those normally applied for aviation security purposes as well as those appropriate for narcotics control, will be applied and carried out in such a manner as to retain the advantage of speed inherent in air transport and to avoid delay.

Note 1.— With respect to application of aviation security measures, attention is drawn to Annex 17 and to the ICAO Security Manual.

Note 2.— With respect to application of appropriate narcotics control measures, attention is drawn to the relevant ICAO publication (currently in preparation).

4.3 Contracting States shall examine with operators and organizations concerned with international trade all possible means of simplifying the clearance of goods carried inbound and outbound by air and shall introduce such means as soon as possible.

B. Electronic Data-processing Techniques

4.4 **Recommended Practice.—** *When introducing electronic data-processing techniques for air cargo facilitation, Contracting States should encourage international airline operators, handling companies, airports, customs and other authorities and/or cargo agents, to exchange data electronically to facilitate cargo processing in conformity with international message standards.*

4.5 Contracting States shall accept commercial documents required for the clearance of air cargo, when produced by electronic data-processing techniques, provided they are in legible and understandable form and that they contain the required information.

4.6 Contracting States shall examine, in close collaboration with international operators and others concerned with air cargo, the facilitation implications which may result from the introduction of electronic data-processing techniques.

4.6.1 **Recommended Practice.—** *When introducing electronic data-processing techniques for air cargo, Contracting States should limit the information required from operators to that relating to the latter's particular function concerned (e.g. operator, clearing agent, importer), as provided for in the pertinent provisions of this Annex.*

4.7 **Recommended Practice.—** *When the introduction, or modification, of electronic data-processing techniques for air cargo is planned Contracting States should endeavour to apply the following principles:*

a) affording all interested parties, from the outset, the opportunity for consultation;

b) evaluating existing procedures and eliminating those which are unnecessary;

c) determining those procedures which are to be computerized;

d) using United Nations (UN) standards to the maximum extent practicable. These include, but are not limited to, the UN Trade Data Elements Directory (TDED), Electronic Data Interchange for Administration, Commerce and Transport (EDIFACT syntax rules) and UN Standard Messages (UNSMs); and

e) ensuring compatibility with the various electronic data-processing systems in existence.

4.8 When introducing electronic data-processing techniques for air cargo, Contracting States shall consider the principle of optionality regarding participation by operators and other interested parties.

4.8.1 **Recommended Practice.—** *Electronic data-processing systems for the clearance and facilitation of air cargo should cover its intermodal transfer.*

C. Clearance of Export Cargo

4.9 **Recommended Practice.—** *Contracting States should waive, as far as possible, presentation of individual documents pertaining to shipments of cargo including unaccompanied baggage to be exported by air.*

4.9.1 **Recommended Practice.—** *Contracting States, in giving effect to 4.9, should encourage, to the maximum extent* *practicable, alignment of documents required for the clearance of export cargo with the United Nations Layout Key for Trade Documents, to follow the format set forth in Appendix 9 — United Nations Layout Key for Trade Documents.*

4.10 A Contracting State which continues to require such documents for export clearance shall, for as many types of goods as possible, limit its requirements to a simple export declaration.

4.11 Contracting States shall make arrangements consistent with aviation security, as well as those appropriate for narcotics control, which permit operators to select and load cargo, including unaccompanied baggage, and stores on outbound aircraft up to the time of departure.

4.12 A Contracting State which continues to require export licences or permits for certain types of goods shall establish simple procedures whereby such licences or permits can be obtained or renewed rapidly.

4.13 Except for reasons of aviation security Contracting States shall not normally require physical examination of cargo, including unaccompanied baggage, to be exported by air.

Note.— This provision is not intended to prevent authorities from examining goods exported under certain conditions, e.g. under bond, licence or drawback, nor is it intended to preclude other essential examinations including any appropriate narcotics control measures.

4.14 In Contracting States where physical examination of export cargo cannot be waived completely, such examination shall be accomplished by applying the sampling or selective technique in a most liberal manner. The appropriate public authorities of the State concerned shall also, in consultation with, *inter alia*, operators and airport administrations, devise physical means for carrying out the inspection rapidly and without necessitating a separate ground handling of the bulk of the goods for purposes of examination.

4.15 Contracting States shall permit cargo, including unaccompanied baggage which is to be exported by air, to be presented for clearance purposes at any approved customs office. Transfer from the first office to the air customs office of the airport where the cargo, including unaccompanied baggage, is to be laden on the aircraft, shall be effected in accordance with the procedure laid down in the laws and regulations of the State concerned. Such procedure shall be as simple as possible, making due allowance for aviation security requirements, and any appropriate narcotics control measures.

4.16 Where goods are exported from a Contracting State, free of taxes or duties which would be payable in the absence of exportation, and that State requires evidence of the arrival abroad of such goods, it shall accept as such evidence a statement supplied by the shipper or consignee and certified by the customs authorities in the State of destination. In any event, the Contracting State shall not require a certified cargo manifest as such evidence of arrival at destination.

D. Clearance of Import Cargo

4.17 Contracting States shall endeavour to simplify documentary requirements for the clearance of import cargo and reduce to a minimum the variety of forms and the information to be shown thereon.

4.17.1 **Recommended Practice.—** *Contracting States, in giving effect to 4.17, should encourage to the maximum extent practicable, alignment of documents required for the clearance of import cargo with the United Nations Layout Key for Trade Documents, to follow the format set forth in Appendix 9 — United Nations Layout Key for Trade Documents.*

4.18 The commercial invoice, which includes the information required by the importing country for the clearance of goods, shall constitute the basic document for the accomplishment of customs or other governmental formalities.

4.19 **Recommended Practice.—** *Where a Contracting State requires two or more of the following documents :*

— *commercial invoice,*

— *certificate of origin,*

— *certificate of value.*

it should accept either separate documents or a combined form incorporating the information contained on the separate documents, at the trader's option.

4.20 Contracting States which continue to require the air waybill to be presented for inspection in connexion with the clearance of cargo shall not require the consignor and/or operator to place special information for customs or other governmental purposes on the air waybill.

Note.— It is the intention of this provision, inter alia, *that the provisions of 4.9.1 and 4.17.1 should also apply to the air waybill.*

4.21 Contracting States shall not require consular formalities or consular charges or fees in connexion with documents for the clearance of air cargo.

4.22 A Contracting State which continues to require import licences or permits for certain types of goods shall establish simple procedures whereby such licences or permits can be obtained and renewed rapidly.

4.23 **Recommended Practice.—** *Each Contracting State should make arrangements whereby imported air cargo, including private gift packages and trade samples, not exceeding a certain value or weight specified by that State, will be exempt, as far as possible, from governmental clearance documents and facilitate their prompt clearance and release to the consignee or his agent. Such value or weight limitation should be set at a level as high as possible.*

4.23.1 **Recommended Practice.—** *Contracting States should exempt those shipments referred to in 4.23, as far as possible, from import duties and other taxes and charges.*

4.24 Contracting States shall make arrangements for the use of a simplified form of customs documentation and facilitate prompt clearance and release in respect of that imported cargo, including private gift packages and trade samples, which exceeds the limits set in accordance with 4.23 and shall establish higher limits of value or weight up to which such simplified documentation will apply.

4.25 **Recommended Practice.—** *Contracting States should make arrangements whereby the maximum number of consignments not falling under 4.23 and 4.24 above can be released promptly after arrival upon presentation of a provisional entry document and an adequate guarantee for payment of duties and other taxes and charges, subject to complete fulfilment of customs and other requirements within a time limit specified by that State.*

4.26 **Recommended Practice.—** *Procedures should be developed for the submission of pre-import information to customs prior to arrival of cargo in order to facilitate the processing of entries.*

4.27 Contracting States shall, subject to compliance with any national prohibitions or restrictions and any required aviation security or appropriate narcotics control measures, make arrangements whereby special air cargo consignments, e.g. disaster relief shipments, perishable goods (livestock, plants, foodstuffs, etc.) can be released and/or cleared immediately upon arrival.

4.28 **Recommended Practice.—** *Where the nature of a consignment calls for different clearance agencies, e.g. customs and veterinary or phytosanitary controls, Contracting States should endeavour to delegate authority for clearance to one of the agencies or, where not feasible, take all necessary steps to ensure that clearance is carried out simultaneously and with a minimum of delay.*

4.29 Contracting States, in co-operation with operators, airport authorities and other agencies concerned with the handling, clearance and forwarding of goods, shall take the necessary steps to reduce to a minimum the dwell-time of air cargo in airport cargo terminals.

4.30 Contracting States shall accomplish their physical examination of cargo imported by air on a sampling or selective basis. The appropriate public authorities of the State concerned shall also, in consultation with, *inter alia*, operators and airport administrations, devise physical means for carrying out such examination rapidly.

4.31 Each Contracting State shall allow cargo, including unaccompanied baggage, which has been unladen from an aircraft at an international airport to be transferred to any authorized customs office within the State for customs entry and clearance. The customs regulations of the State concerned relating to such transfer shall be as simple as possible.

E. Containers, Pallets and their Loads

4.32 Contracting States shall, subject to compliance with their respective regulations, permit the temporary importation of containers, pallets and associated equipment — whether owned by airlines, consignors/consignees, or third parties — without payment of customs duties and other taxes and charges and shall facilitate the use of this equipment in air traffic.

Note.— A Contracting State may reserve the right not to grant these concessions in the case of containers, pallets and associated equipment which have been the subject of purchase, hire-purchase, lease or a contract of a similar nature, concluded by a person (natural or legal) resident or established in its territory.

4.32.1 **Recommended Practice.—** *Contracting States should provide in their regulations, referred to in 4.32, for the acceptance of a simple declaration from the operator to the effect that the containers, pallets and associated equipment temporarily imported will be re-exported within the time limit set by the State concerned.*

4.33 Containers, pallets and associated equipment entering the territory of a Contracting State under the provisions of 4.32 shall be permitted to leave the limits of an international airport for import clearance of their loads and/or for export lading under simplified control procedures and with a minimum of documentation as specified by the State concerned.

4.34 **Recommended Practice.—** *Contracting States should, where practicable and desirable, make suitable arrangements for the clearance and/or examination of containers/pallets and their loads at off-airport locations.*

4.35 Contracting States shall permit containers, pallets and associated equipment temporarily imported, to be re-exported to any other State and through any of its approved customs offices.

4.36 Contracting States shall permit the temporary importation of component parts of containers and pallets without payment of customs duties and other taxes and charges when these parts are needed for the repair of containers and pallets already admitted under the terms of 4.32.

4.37 **Recommended Practice.**— *Contracting States should permit the loan between airlines of temporarily imported containers, pallets, and associated equipment, without payment of customs duties and other taxes and charges, when these are used only on international routes.*

F. Limitation of Operators' Responsibilities

4.38 Where a Contracting State has requirements for documents such as the commercial invoice, declaration forms, import licence and the like, it shall not make it the obligation of the operator to ensure that these documentary requirements are met, nor shall the operator be held responsible, fined or penalized for inaccuracies or omissions of facts shown on such documents, unless he is, or is acting for, the importer or exporter.

4.39 In Contracting States where the operator has the obligation to the customs authorities for safeguarding cargo, unaccompanied baggage, mail and stores until they are cleared by customs, he shall be freed from this obligation and from liability for customs duties and taxes chargeable on such items when they are taken into charge by the customs authorities and are under their sole control.

4.40 Contracting States shall absolve operators from liability for customs duties, taxes and other charges at such time as goods are transferred, with the approval of the authorities, into the possession of a third party, having on file with the customs authorities adequate security or guarantee.

4.41 Contracting States shall not impede the movement of air cargo solely in order to collect statistics. Any necessary documents shall be provided by the declarant as required by the authorities.

G. Aircraft Equipment, Stores and Parts

4.42 Stores imported into the territory of a Contracting State by an airline of another Contracting State for use in connexion with the establishment or maintenance of an international service operated by that airline shall be admitted free of customs duties and other taxes or charges subject to compliance with the regulations of the Contracting State concerned. Such regulations shall not unreasonably interfere with the necessary use by the airline concerned of such stores.

4.43 **Recommended Practice.**— *In the case where aircraft engaged in international flights stop at two or more international airports within the territory of a Contracting State without intermediate landing in the territory of another State and without embarking and disembarking any domestic passengers, Contracting States should permit the sale and use of commissary supplies on board aircraft without payment of customs duties or other taxes.*

4.44 **Recommended Practice.**— *Ground equipment and security equipment imported into the territory of a Contracting State by an airline of another Contracting State for use within the limits of an international airport in connexion with the establishment or maintenance of an international service operated by that airline should be admitted free of customs duties and, as far as possible, other taxes and charges, subject to compliance with the regulations of the Contracting State concerned. Such regulations should not unreasonably interfere with the necessary use by the airline concerned of such ground equipment and security equipment.*

Note.— It is the intent of this provision that items such as the following should be admissible under the above provision, and it is not desired to discourage a Contracting State from allowing once-admitted items to be used by another foreign airline or at a location other than an international airport:

a) Repair, maintenance and servicing equipment:

- *all repair and maintenance material for airframes, engines and instruments;*
- *specialized aircraft repair kits;*
- *starter batteries and carts;*
- *maintenance platforms and steps;*
- *test equipment for aircraft, aircraft engines, and aircraft instruments;*
- *aircraft engine heaters and coolers;*
- *ground radio equipment.*

b) Passenger-handling equipment:

- *passenger-loading steps;*
- *specialized passenger-weighing devices;*
- *specialized catering equipment.*

c) Cargo-loading equipment:

- *vehicles for moving or loading of baggage, cargo, equipment or supplies;*
- *specialized cargo-loading devices;*
- *specialized cargo-weighing devices.*

d) Component parts for incorporation into ground equipment including the items listed above.

e) Security equipment:

— weapon-detecting devices;

— explosives-detecting devices;

— intrusion-detecting devices.

f) Component parts for incorporation into security equipment.

4.45 **Recommended Practice.—** *Instructional material and training aids imported by an airline of another Contracting State into the territory of a Contracting State for use in connexion with the technical training of ground and flight personnel required to establish and maintain an international service operated by that airline should be admitted free of customs duties and other taxes and charges, subject to compliance with the regulations of the Contracting State concerned.*

Note.— It is the intent of this provision that items solely identified with aviation and aeronautical education and training such as the following should be admissible under the above provisions:

— flight simulators;

— link-trainers;

— mock-ups;

— cutaway engines and parts;

— charts showing the functioning of various technical systems.

4.46 **Recommended Practice.—** *Contracting States should, wherever possible, arrange for duty-free admittance of airline and operators' documents and should arrange for their expeditious clearance.*

4.47 Contracting States shall establish procedures for airlines and/or operators of other Contracting States allowing the prompt entry into or departure from their territories of aircraft equipment, spare parts, ground, training and security equipment, whether or not they are free of customs duties and other taxes and charges, under the provisions of this Annex or any other arrangements. Contracting States shall grant prompt clearance for the importation and exportation of such goods upon completion of simplified documentary procedures by the airlines or operators concerned. These arrangements shall not extend to goods intended for general sale, food, beverages and tobacco.

4.47.1 **Recommended Practice.—** *A Contracting State should whenever possible permit an airline or operator of another Contracting State to present on a separate page of the Cargo Manifest a list of the aircraft equipment, spare parts, ground, training and security equipment being imported or exported. This should be endorsed as follows:*

Note.— We certify that the goods listed on this page of the Manifest are not for sale and are for the sole use of (insert name of airline or operator) in connexion with the establishment or maintenance of an international air service.

4.48 Contracting States shall dispense with the requirements for advance production of documents such as entry or exit permits, and the like, when aircraft equipment, spare parts, stores, ground, training and security equipment are urgently required by an airline or operator of another Contracting State in order to maintain service, provided the airline accepts full responsibility in writing to produce these documents within a reasonable time after the items have been admitted or exported, and provided that the Contracting State concerned is satisfied that the documents will in fact be produced.

4.49 Contracting States shall allow the loan of aircraft equipment and spare parts and security equipment and spare parts between airlines, when these are used in connexion with the establishment or maintenance of scheduled international air services, without payment of customs duties or other taxes or charges subject only to control measures which may provide that repayment of the loan is normally to be accomplished by means of the return of articles that are qualitatively and technically similar and of the same origin, and in any event that no profit-making transaction is involved.

H. Cargo and Other Articles Not Entering the Country of Intended Destination

4.50 When cargo, unaccompanied baggage or stores are not unladen at their intended destination, due to error, emergency or inaccessible stowage, the public authorities at the place of intended unlading shall, subject to the operator proving to them that there has been no gross negligence or carelessness on his part, accept a declaration from him that the articles in question have not been unladen and the reasons therefor, and shall not require the operator to prepare new documentation, nor impose penalties, fines, customs duties and taxes on the operator.

4.51 When goods are consigned to a destination within a Contracting State and have not yet been released for home consumption in that State but subsequently are required to be returned to the point of origin or to be redirected to another destination, the Contracting State shall allow reforwarding without requiring import, export or transit licences if no contravention of the laws and regulations in force is involved.

Note.— This provision is not intended to prevent Contracting States from requiring import, export or transit licences in case of particular consignments which are subject to special restrictions.

4.52 When, because of error or emergency, or being stowed so as to be inaccessible upon arrival, cargo, unaccompanied baggage or stores are not unladen at their intended destination but are unladen at another international airport, the Contracting State where the unlading takes place shall facilitate their being reforwarded to their intended destination and, if satisfied that there has been no gross negligence or carelessness by the operator, shall not impose penalties, fines, customs duties and taxes on the operator nor any requirements in connexion with such reforwarding other than the following:

a) that they be reported to the public authorities concerned;

b) that until reforwarded, they remain under the supervision of the public authorities concerned at the point of unlading or at any other place prescribed by the State;

c) that a notation that they were carried to the wrong destination be made either on the manifest or General Declaration (see also 2.4) delivered in connexion with the unlading;

d) that they be reforwarded without delay;

e) that they be subject to the laws and regulations of the State relating to public health and animal and plant quarantine;

f) that, if reforwarded by air, they be entered either on the appropriate manifest or General Declaration (see also 2.4) upon reforwarding;

g) that, if reforwarded by air, a declaration of transshipment and/or verification be made in respect of them at the airport from which they leave the State.

I. Unaccompanied Baggage

4.53 Unaccompanied baggage carried by air shall be cleared under the procedure applicable to accompanied baggage or under another simplified customs procedure distinct from that normally applicable to other cargo.

Note.— It is the intent of this provision, inter alia, *that:*

a) unaccompanied baggage, to the extent possible, be as free from declaration forms as accompanied baggage; however, clearance documents provided by airlines shall be completed by the passenger prior to shipment;

b) the same customs concessions be granted as for accompanied baggage, subject to compliance with the regulations of the Contracting State concerned; and

c) arrangements be made for the clearance of unaccompanied baggage in the passenger customs hall where selected accompanied baggage is cleared when necessary.

4.53.1 Contracting States shall make provision so that unaccompanied baggage may be cleared upon request of a person acting as an authorized representative for the owner.

J. Animal and Plant Shipments

4.54 Contracting States which in certain circumstances require sanitary certificates or related documents in respect of particular animal and plant shipments shall publish the details of their requirements in this connexion.

K. Mail Documents and Procedures

4.55 Contracting States shall carry out the handling, forwarding and clearance of mail and shall comply with the documentary procedures as prescribed in the Acts in force of the Universal Postal Union.

CHAPTER 5. TRAFFIC PASSING THROUGH THE TERRITORY OF A CONTRACTING STATE

A. Traffic Arriving and Departing on the Same Through-flight

5.1 Each Contracting State shall make provision by means of direct transit areas, direct transit arrangements, or otherwise, whereby crew, passengers, baggage, cargo, stores and mail continuing their journey on the same through-flight may remain temporarily within the State without undergoing any examination except for reasons of aviation security, narcotics control or in special circumstances.

Note 1.— With respect to application of aviation security measures, attention is drawn to Annex 17 and the ICAO Security Manual.

Note 2.— With respect to application of appropriate narcotics control measures, attention is drawn to the relevant ICAO publication (currently in preparation).

5.2 Contracting States shall not require any documents or visas in respect of traffic continuing its journey on the same through-flight, except in special circumstances determined by the public authorities concerned.

Note.— It is the intent of this provision, inter alia, *that Contracting States shall neither a) temporarily deprive passengers of their passports nor b) require the operator to do so.*

B. Traffic Being Transferred to Another Flight at the Same Airport

5.3 Each Contracting State shall make arrangements so that disembarking passengers and their baggage being transferred from one flight or operator to another at the same airport will be treated in a manner similar to that set forth in Section A above. Operators shall undertake to sort out transferring passengers and their baggage in order that such passengers and baggage may be allowed to proceed as rapidly as possible to their connecting flights.

5.4 Contracting States shall not require any documents or visas in respect of traffic being transferred to another flight at the same airport, except in special circumstances determined by the public authorities concerned.

5.4.1 With respect to passengers passing through the territory of a Contracting State who are to leave that State within two days from the day of their arrival and who cannot stay at the international airport of arrival until their next flight for lack of facilities or on account of other circumstances, each Contracting State shall permit them to remain within its territory without requiring them to obtain visas prior to their arrival, except in special circumstances determined by the public authorities concerned.

Note.— It is the intent of this provision that each Contracting State may:

a) issue to such passengers, upon arrival, some form indicating they have permission to enter, such as a laissez-passer *or a stopover visa;*

b) designate some specific area or place in the city where the international airport is located, or a neighbouring city, as the sphere of activities of such passengers;

c) take any other necessary administrative measures relating to the stay of such passengers in its territory; and

it is also understood that any Contracting State may, if it wishes to do so, extend to passengers passing through its territory more facilities than are provided in the above provision and in a), b) and c) of this Note.

5.5 Each Contracting State shall make arrangements for the direct trans-shipment of mishandled baggage, unaccompanied baggage, unladen cargo and stores, from one flight or operator to another at the same airport, without examination, except for reasons of aviation security or in special circumstances. In cases when direct trans-shipment cannot be effected, Contracting States shall ensure that arrangements are made for the temporary custody of such goods under secure supervision at an appropriate location. Operators shall undertake to process mishandled baggage, unaccompanied baggage, trans-shipment cargo and stores as rapidly as possible.

Note.— This provision is not intended to prevent the application of appropriate narcotics control measures.

5.6 Each Contracting State shall make arrangements to allow operators, under supervision of the public authorities concerned, to disassemble trans-shipment cargo, including shipments in containers and pallets, so that they may sort and reassemble shipments for onward carriage without examination, except for reasons of aviation security or in special circumstances, and subject only to simple documentation where required.

Note.— This provision is not intended to prevent the application of appropriate narcotics control measures.

5.7 Unladen airmail being trans-shipped from one flight or operator to another at the same airport shall be effected in accordance with the Acts in force of the Universal Postal Union.

C. Traffic Being Transferred to Another Airport

5.8 **Recommended Practice.—** *Each Contracting State should make provision, by means of direct transit arrangements or otherwise, whereby traffic which passes directly through the State and, in the course of such passage, transfers from one international airport to another international airport, may proceed without undergoing examination, except for aviation security measures or in special circumstances.*

Note.— This provision is not intended to prevent the application of appropriate narcotics control measures.

5.9 **Recommended Practice.—** *With respect to the traffic referred to in 5.8, Contracting States should not require any documents or visas for passengers and their baggage, and if documents are required for cargo, unaccompanied baggage and stores, documents as simplified as possible should be used.*

D. Cargo Traffic Being Transferred Between Air and Surface Transport

5.10 Contracting States shall make arrangements whereby formalities for the interchange of air cargo with surface transport are applied in such a manner as to retain the speed advantage of air transport and to avoid delay.

E. Free Airports and Free Zones

5.11 **Recommended Practice.—** *Contracting States should establish free airports.*

5.12 **Recommended Practice.—** *In connexion with international airports, Contracting States should establish and either develop and operate themselves, or permit other parties to develop and operate, free zones and/or warehousing facilities and should publish detailed regulations as to the types of operations which may or may not be performed therein.*

5.13 In all cases where free zone facilities and/or warehousing facilities are not provided in connexion with an international airport but have been provided elsewhere in the same general vicinity, Contracting States shall make arrangements so that air transport can utilize these facilities on the same basis as other means of transport.

5.14 Contracting States shall ensure that the provision of free airports, free zones and/or warehousing facilities presents no additional risks as regards aviation security and narcotics control.

CHAPTER 6. INTERNATIONAL AIRPORTS — FACILITIES AND SERVICES FOR TRAFFIC

A. General

6.1 Contracting States shall take all necessary steps to secure the co-operation of operators and airport administrations in ensuring that satisfactory facilities and services are provided for rapid handling and clearance of passengers, crew, baggage, cargo and mail at their international airports. Such facilities and services shall be flexible and capable of expansion to meet anticipated growth in traffic volume, or increased security measures during higher threat situations, while permitting appropriate narcotics control measures.

*Note 1.— With respect to the application of aviation security measures, attention is drawn to the relevant specification in Annex 17, Chapter 2.**

Note 2.— With respect to the application of appropriate narcotics control measures, attention is drawn to the relevant ICAO publication (currently in preparation).

6.1.1 Contracting States shall take the necessary steps to ensure that facilities and services are adapted to the needs of elderly and disabled persons.

6.2 Contracting States shall take all necessary steps to encourage consultations between the airport administration on the one hand and operators, control authorities and appropriate bodies representing other airport users on the other at the earliest stage in the planning of new or substantially modified terminal buildings at their international airports.

6.3 Contracting States shall take all necessary steps to secure the co-operation of operators and airport administrations in ensuring that the facilities and services at their international airports are designed in such a way as to provide the best possible airport traffic flow arrangements.

6.3.1 **Recommended Practice.—** *Contracting States whose international airports experience traffic peaking problems should, in accordance with appropriate procedures for co-ordination of schedules at airports, indicate to the appropriate airlines operating scheduled and non-scheduled flights, well in advance of the recognized traffic seasons, any restrictions that may apply in order to match the traffic and the airport capacity.*

6.4 **Recommended Practice.—** *Where a passenger service charge is levied at an international airport and its collection from passengers gives rise to facilitation problems, this charge should be levied on the airlines where practicable, following consultations and advance notice.*

6.5 **Recommended Practice.—** *Whenever possible, the use of credit cards should be acceptable as a means of payment for services rendered at international airports.*

6.6 **Recommended Practice.—** *It is recommended that the airlines, in agreement with, and subject to reasonable limitations which may be imposed by the airport authorities, be offered the choice of providing their own services for ground handling operations, or the option of having such operations performed entirely, or in part, by an organization controlled by another airline authorized by the airport authority, or by the airport operator, or by a servicing agent approved by the airport authority.*

B. Airport Traffic Flow Arrangements

I. Common Provisions

6.7 Contracting States shall ensure that particular attention is given to the need for adequate facilities to be available at all times at international airports and that appropriate measures are adopted to permit embarkation and disembarkation of passengers without delay.

6.8 **Recommended Practice.—** *The arrangements in 6.3 should be by the most direct route with no crossing between passenger and baggage lines nor between different circuits. To the extent that the route is not self-evident, appropriate sign-posting should be used.*

6.9 **Recommended Practice.—** *International signs to facilitate passengers using airports, reproduced in the document developed for that purpose by ICAO, should be introduced at the earliest practicable opportunity.*

6.9.1 **Recommended Practice.—** *Notices and leaflets should be prominently displayed at international airports, warning travellers of the serious consequences of illegal*

---

* The specification reads as follows:

2.2.1 Recommendation.— Each Contracting State should whenever possible arrange for the security measures and procedures to cause a minimum of interference with, or delay to the activities of, international civil aviation.

narcotics trafficking and of the penal measures to which persons convicted of narcotics law offences may be liable.

6.10 **Recommended Practice.**— *Arrangements should be made so that, when necessary, passengers and crew can proceed under shelter between the air terminal buildings and the aircraft, and vice versa.*

6.11 **Recommended Practice.**— *Contracting States should ensure that lifting systems or any other appropriate device are made available in order to facilitate the movement of elderly and disabled passengers between the aircraft and the terminal on both arrival and departure as required where telescopic passageways are not used.*

6.12 **Recommended Practice.**— *Particular attention should be given to passenger routes involving long distances to be covered on foot and the possibility should be studied of facilitating travel over these routes by mechanical systems.*

6.13 **Recommended Practice.**— *Flight information boards, or displays, supplemented, where necessary, by a clearly audible public address system should be provided so that passengers and the public can be fully informed of arrivals, departures and cancellations of flights, and particularly of any last minute changes in arrival or departure times or changes in gate numbers.*

6.13.1 **Recommended Practice.**— *In giving effect to 6.13, flight information boards or displays should, as far as possible, be in the standard layout recommended in ICAO Doc 9249* — Dynamic Flight-related Public Information Displays.

6.13.2 **Recommended Practice.**— *Measures should be taken to ensure that the hearing and vision impaired are able to obtain flight information.*

II. Parking and Servicing Arrangements

6.14 **Recommended Practice.**— *Adequate measures should be taken to ensure convenient parking and servicing of aircraft of all types and categories — regular, non-scheduled and general aviation aircraft — in order to expedite clearance and operations on the apron and to reduce aircraft ground stop time. It is desirable in particular:*

a) to make arrangements for optimum allocation of aircraft parking spaces as close as possible to the terminal building for rapid loading and unloading;

b) to provide adequate parking spaces for aircraft when neither loading nor unloading, away from the terminal building so as to avoid obstruction to the flow of traffic on the apron, and make adequate arrangements for their optimum use;

c) to equip the parking spaces with the necessary means for rapid performance of all aircraft servicing operations;

d) to give particular importance to measures for assistance to aircraft during embarkation and disembarkation operations;

e) to provide facilities for fuelling of aircraft during hours established by the public authorities;

f) to provide transportation between remote parking positions and the terminal building when distance and safety so require as a result of optimum use of the parking area available;

g) to provide, when necessary, parking space for international flights where inspection of aircraft, passengers, crew and baggage can be performed.

III. Outbound Passengers, Crew and Baggage

6.15 **Recommended Practice.**— *Easy and speedy access to the terminal should be provided for passengers, crew and their baggage arriving at the airport by surface transport.*

6.15.1 **Recommended Practice.**— *For elderly and disabled persons being set down or picked up at a terminal building, reserved points should be located as close as possible to main entrances. These should be clearly marked with appropriate signs. Access routes to the check-in desk area should be barrier-free.*

6.16 **Recommended Practice.**— *Contracting States should ensure that rapid and reliable city/airport ground transportation is available.*

6.16.1 **Recommended Practice.**— *Where access to public services is limited, every effort should be made to provide accessible and reasonably priced ground transportation services, by adapting current and planned public transit systems, or by providing special transport services for the mobility impaired.*

6.17 **Recommended Practice.**— *Easy and frequent transportation should be available between airport terminal buildings as well as between designated remote parking facilities and airport terminal buildings.*

6.18 **Recommended Practice.**— *International airports should have available appropriate automobile parking facilities for short- and long-term parking.*

6.18.1 **Recommended Practice.**— *Adequate parking facilities should be provided for wheelchair users and appropriate measures taken to facilitate their movement between parking areas and the terminal buildings.*

6.19 **Recommended Practice.**— *Consideration should be given to the provision of baggage check-in facilities as close as possible to arrival points of surface transport.*

6.20 **Recommended Practice.**— *Contracting States should study the possibility of allowing the provision of off-airport check-in facilities, with due regard to the necessary security precautions.*

6.21 **Recommended Practice.**— *In order to facilitate aircraft departure, Contracting States, in examining passengers as a security measure, or for purposes of narcotics control as appropriate, should, to the extent feasible, utilize specialized equipment in conducting such examinations so as to reduce materially the number of persons to be searched by other means.*

Note 1.— The use of radiological techniques for screening passengers should be avoided.

Note 2.— Privacy should be assured when a thorough physical search is to be carried out. If special rooms are not available, portable screens may be used for this purpose.

6.22 **Recommended Practice.**— *In order to facilitate aircraft departure, Contracting States, in examining baggage of passengers departing from their territory as a security measure, or for narcotics control purposes as appropriate, should, to the extent feasible, utilize specialized equipment in conducting such examinations so as to reduce materially the amount of baggage to be searched by other means.*

6.23 **Recommended Practice.**— *An individual and continuous "trickle" method of processing and loading of passengers, crew and baggage should be adopted — in lieu of the group ("package") system — whenever this will speed up their clearance.*

6.24 **Recommended Practice.**— *Particular attention should be paid to the use of sorting, conveyance and loading devices for baggage. Provision should be made as far as possible for:*

a) mechanized systems capable of transferring and loading large quantities of baggage within a minimum amount of time, consistent with the volume of traffic;

b) an area where it would be possible to hold baggage containers and to rearrange their contents;

c) mechanical means of handling and storing empty baggage containers, consistent with the volume of traffic.

6.25 **Recommended Practice.**— *The premises where crew members have to report for operational purposes should be readily accessible and, if possible, next to one another.*

IV. Inbound Passengers, Crew and Baggage

6.26 Contracting States shall make arrangements for a sufficient number of control channels so that clearance of inbound passengers and crew may be obtained with the least possible delay. Additional channel(s) shall be available if possible to which complicated cases may be directed without delaying the main flow of passengers.

6.27 **Recommended Practice.**— *Particular attention should be given to points where passenger delays are frequently found to occur.*

6.28 **Recommended Practice.**— *Contracting States should establish as a goal, as far as is practicable, the clearance within forty-five (45) minutes of disembarkation from the aircraft of all passengers requiring not more than the normal inspection at major international airports, regardless of aircraft size and scheduled arrival time.*

6.29 To obviate any delay to passengers, the necessary steps shall be taken to ensure that baggage arrives on time in the baggage claim area.

6.29.1 **Recommended Practice.**— *Arrangements should be made for rapid unloading of baggage, including containerized baggage, from the aircraft and its swift movement to the baggage claim area. To this end, mechanical unloading and conveyance systems should be used where the volume of traffic warrants and a sufficient number of handling staff should be available at all times.*

6.30 **Recommended Practice.**— *Adequate space should be provided in the baggage claim area permitting ready identification and speedy withdrawal by each passenger of his checked baggage.*

6.31 **Recommended Practice.**— *Where the volume of baggage so warrants, mechanized baggage dispensing systems should be provided in baggage-claim areas so as to move the baggage towards passengers, thus facilitating pick-up of baggage.*

6.31.1 The authorities responsible for international airports shall ensure that passengers can obtain assistance in the carriage of baggage to enable them to transfer baggage from baggage claim areas to points as close as possible to areas where surface transportation from the airport or between airport terminals is provided.

V. Transit and Transfer of Passengers and Crew

6.32 **Recommended Practice.**— *Contracting States should, whenever possible, permit passengers to remain on board the aircraft and authorize embarkation and disembarkation during refuelling, subject to the necessary safety measures.*

6.32.1 **Recommended Practice.**— *It is recommended in particular, that technical and regulatory provisions should be adopted to ensure that telescopic passageways to and from aircraft can be kept in use during refuelling of aircraft.*

6.33 **Recommended Practice.**— *Contracting States should ensure that physical facilities at airports are provided, where the volume and nature of the traffic so require, whereby crew and passengers in direct transit on the same aircraft, or transferring to other flights, may remain temporarily without being subject to inspection formalities, except for aviation security measures, or in special circumstances.*

Note.— This provision is not intended to prevent the application of appropriate narcotics control measures.

6.34 **Recommended Practice.**— *Provisions should be made for airline handling counters in the transit area for the purpose of processing passengers transferring from one aircraft to another and not going through clearance controls.*

6.35 **Recommended Practice.**— *Direct transfer from one aircraft to another of passengers, particularly elderly and disabled passengers, should be authorized, where necessary and possible, whenever this is warranted by deadlines in making connecting flights or by other circumstances.*

6.36 **Recommended Practice.**— *Arrangements should be made whereby crew members in brief transit can communicate from a point near the aircraft's loading position, located either on the apron or in a locale near the apron, via television, telautograph or telephone with the various governmental agencies (e.g. air traffic control, MET Office) without the need to report to them in person.*

VI. Miscellaneous Facilities and Services in Passenger Terminal Buildings

6.37 **Recommended Practice.**— *Facilities provided for the use of transit passengers should contain all necessary arrangements for their convenience.*

6.37.1 **Recommended Practice.**— *Storage facilities should be provided for baggage left by their owners at international airports for later pick-up.*

6.37.2 International airports shall be equipped with functional storage facilities where unclaimed, unidentified and mishandled baggage will be kept available for clearance for a minimum of five days. Airline personnel shall have access to the baggage at least throughout the hours of airport operation.

6.38 **Recommended Practice.**— *To the extent that the non-travelling public are admitted to terminal buildings, appropriate arrangements should be made so that they do not interfere with the flow of inbound and outbound traffic.*

6.38.1 **Recommended Practice.**— *Provisions should be made to locate facilities for group/tour operators in public or uncontrolled areas in the arrival and/or departure areas in order to minimize congestion in the terminal buildings.*

6.39 **Recommended Practice.**— *When duty-free goods are offered for sale in terminal buildings, whether to outbound passengers only or to both outbound and inbound passengers, provisions should be made for convenient locations of the stores and adequate customer space so as to avoid congestion and interference with the main streams of outbound and inbound passenger traffic.*

VII. Cargo and Mail Handling and Clearance Facilities

6.40 **Recommended Practice.**— *Contracting States should make arrangements whereby all-cargo aircraft and their loads can be entered and cleared at the cargo terminal area.*

6.41 **Recommended Practice.**— *Easy and speedy access should be provided to airport cargo terminals, taking into account the space requirements of extra-large trucks on access roads and in front of terminals for manoeuvring into position.*

6.42 **Recommended Practice.**— *Each cargo terminal should be provided with delivery/receiving positions adaptable to truck-bed heights.*

6.43 **Recommended Practice.**— *Use should be made, where justified, of mechanized and automated facilities for loading and unloading, conveyance and storage of cargo.*

6.44 **Recommended Practice.**— *Adequate space should be available in cargo terminals for storage and handling of air cargo, including building up and breaking down of pallet and container loads, located next to the customs area and easily accessible to authorized persons and vehicles from both the apron and the landside road. Such arrangements should take into account aviation security and appropriate narcotics control measures.*

6.45 **Recommended Practice.**— *Adequate space and facilities should be provided at international airports, or at convenient off-airport locations, for the temporary storage of empty containers.*

6.46 **Recommended Practice.**— *Cargo terminals should be equipped with storage facilities as appropriate for special cargo (e.g. valuable goods, perishable shipments, human remains, radioactive and other dangerous goods, as well as live animals). Those areas of cargo terminals in which cargo and mail are stored overnight or for extended periods prior to shipment by air should be protected against access by unauthorized persons.*

6.47 **Recommended Practice.**— *Parking spaces should be available at cargo terminals for handling equipment when not in use, located so as to avoid interference with the flow of inbound and outbound cargo.*

6.48 **Recommended Practice.**— *Where high-capacity aircraft with mixed passenger and cargo loads are positioned next to the passenger terminal, all necessary facilities should be provided for swift loading/unloading and conveyance between the aircraft and the cargo terminal(s) of large volumes of air cargo. To this end flow routes should be designed so as to avoid interference with those for passengers and baggage.*

6.49 **Recommended Practice.**— *Facilities should be provided, where necessary, for the direct removal of bulky or heavy consignments by approved transport, from the airport to the premises of the importer, agent or freight forwarder, such removal being subject to customs approval and any conditions attached to that approval.*

6.50 **Recommended Practice.**— *Sufficiently large and convenient areas should be provided at international airports, where, under customs supervision, trans-shipment cargo can be broken down, sorted and reassembled for immediate or later onward transmission. Such arrangements should take into account aviation security and appropriate narcotics control measures.*

6.51 **Recommended Practice.**— *At airports whose cargo handling capacity is insufficient and whose expansion is limited or unfeasible, off-airport bonded warehouses should be allowed, and the procedures for moving cargo between them and the airport should be minimal in order to accelerate clearance and reduce congestion in airport warehouses.*

6.52 **Recommended Practice.**— *Where the volume of air mail so warrants and where it will expedite the onward transmission of the mail, in the opinion of the postal authorities, adequate space and facilities should be provided at international airports for the reworking, sorting and onward transmission of air mail. Such arrangements should take into account aviation security and appropriate narcotics control measures.*

C. Facilities Required for Implementation of Public Health, Emergency Medical Relief, and Animal and Plant Quarantine Measures

6.53 Contracting States, in co-operation with airport authorities, shall ensure the maintenance of public health, including human, animal and plant quarantine at international airports.

6.54 **Recommended Practice.**— *Contracting States should provide, at or near all their major international airports, facilities and services for vaccination or revaccination, and for the delivery of the corresponding certificates.*

6.55 **Recommended Practice.**— *International airports should have available adequate facilities for administration of public health and animal and plant quarantine measures applicable to aircraft, crew, passengers, baggage, cargo, mail and stores.*

6.56 **Recommended Practice.**— *Contracting States should provide arrangements whereby passengers and crew in transit can remain in premises free from any danger of infection and insect vectors of diseases and, when necessary, facilities should be provided for the transfer of passengers and crew to another terminal or airport nearby without exposure to any health hazard. Similar arrangements and facilities should also be made available in respect of animals.*

6.57 **Recommended Practice.**— *Contracting States, in co-operation with airport authorities and aircraft operators, should take all steps to ensure that the procurement, preparation, handling, storage and service of food and water supplies intended for consumption both at airports and on board aircraft are hygienically carried out in accordance with the pertinent regulations, recommendations and standards of the World Health Organization and the pertinent recommendations of the Food and Agriculture Organization of the United Nations.*

6.58 **Recommended Practice.**— *Contracting States, in co-operation with airport authorities and aircraft operators, should ensure that an effective system is instituted for the safe removal and safe disposal of excrement, refuse, waste water, waste, unused and condemned food and other matter dangerous to the health of persons, animals or plants in accordance with the pertinent regulations and recommendations of the World Health Organization and the recommendations of the Food and Agriculture Organization of the United Nations.*

6.59 **Recommended Practice.**— *There should be maintained at international airports an organized, immediately responsive staff with facilities for first aid attendance on site and appropriate arrangements should be available for expeditious referral of the occasional more serious case to pre-arranged competent medical attention.*

D. Facilities Required for Clearance Controls and Operation of Control Services

6.60 **Recommended Practice.**— *Space and facilities for the authorities in charge of clearance controls should, as far as possible, be provided at public expense.*

6.61 If the space and facilities referred to in 6.60 are not provided at public expense, Contracting States shall ensure that such space and facilities are provided on terms not less favourable than those which apply to the operators of other means of transportation entering the State and requiring space and facilities on a comparable scale.

6.62 Contracting States shall provide sufficient services of the public authorities concerned without charge to operators during working hours established by those authorities.

Note.— Where traffic, volume and available space and facilities warrant, Contracting States may wish to provide clearance controls for passengers and their baggage at more than one location.

6.62.1 Contracting States shall provide sufficient services of the public authorities concerned in such a way as to respond to real needs and thus to the flow of traffic during working hours established by those authorities.

Note 1.— Paragraphs 6.62 and 6.62.1 should be applied in accordance with Article 82 of the International Health Regulations (1969), Third Annotated Edition (1983) which provides that no charge shall be made by a health authority for any medical examination provided for in the International Health Regulations (IHR) or for any vaccination of a person on arrival and any certificate thereof. The IHR specify that it is not permissible to exact or receive payment for medical examination carried out at any time of the day or night. Article 24 provides that health measures shall be initiated forthwith and completed without delay.

Note 2.— Under Annex 15 — Aeronautical Information Services, *States are obligated to publish the types and hours of clearance services (customs, immigration, health) at their international airports.*

6.63 Outside of the working hours established to cover any periods of substantial workload at international airports referred to in 6.62 and 6.62.1 Contracting States shall provide services of such authorities on terms not less favourable to operators of aircraft than those which apply to operators of other means of transportation entering the State.

6.64 **Recommended Practice.—** *Contracting States should make arrangements whereby one State will permit another State to station representatives of the public authorities concerned in its territory to examine aircraft, passengers, crew, baggage, cargo and documentation for customs, immigration, public health and animal and plant quarantine purposes, prior to departure for the other State concerned, when such action will facilitate clearance upon arrival in that State.*

E. Monetary Exchange Facilities

6.65 Contracting States shall make arrangements to display at their international airports their regulations governing the exchange of funds of other States against national funds.

6.66 Contracting States which maintain exchange controls with respect to funds of other States shall make arrangements:

a) to publish the current legal rates of exchange for such funds;

b) to display or otherwise make available at their international airports such rates as may be of principal interest at the respective airports.

6.67 Contracting States which do not maintain exchange controls with respect to some or all funds of other States shall make arrangements to display information to that effect at their international airports.

6.68 **Recommended Practice.—** *With respect to those funds of other States for which no controlled exchange rates have been established by the Contracting State concerned, it should make such arrangements as may be feasible to make information available at its international airports as to the prevailing open market rates.*

6.69 Contracting States shall provide, at such times as to meet the needs of the travelling public, adequate facilities at international airports for the legal exchange of funds of other States through governmental agencies or shall authorize private agencies to do so. These facilities shall be available to arriving and departing passengers.

Note.— In giving effect to this provision, the use of vending machines at international airports, enabling a departing passenger to obtain foreign currency, at any time of the day or night, has proved to be of valuable assistance and should be considered as a possibility by Contracting States.

6.70 **Recommended Practice.—** *Contracting States restricting the import or export of funds of other States should provide for the issuance to travellers of certificates showing the amounts of such funds in their possession upon entering the State and should permit such travellers, upon surrender of such certificates prior to leaving the State, to take such funds with them. Inscription on the passport or other official document for travel may serve the same purpose.*

6.71 **Recommended Practice.—** *Contracting States which prohibit or limit the amount of importation of their own currency should provide reasonable facilities for travellers from abroad, who declare an amount of such currency in excess of that permitted by the current regulations, to deposit such amount at the international airport of entry and, upon departure, to reclaim it at the same point or at any other point designated by the public authorities concerned.*

CHAPTER 7. LANDING ELSEWHERE THAN AT INTERNATIONAL AIRPORTS

A. General

7.1 Each Contracting State shall take steps to ensure that all possible assistance is rendered by its public authorities to an aircraft which, for reasons beyond the control of the pilot-in-command, has landed elsewhere than at one of its international airports and, to this end, shall keep control formalities and procedures, in such cases, to a minimum.

7.2 The pilot-in-command or the next senior crew member available shall cause the landing to be reported as soon as practicable to the public authorities concerned.

B. Short Stopover

7.3 If it is apparent that the aircraft can resume its flight within a relatively short time of arrival, the following procedure shall apply:

7.3.1 Control measures shall be limited to those that ensure that the aircraft departs with the same load that was on board at the time of arrival. In case the load or part thereof cannot, for operational or other reasons, continue on that flight, the public authorities shall expedite clearance formalities and co-operate in speedy onward transportation for that load to its destination.

7.3.2 The public authorities shall designate, if necessary, an adequate area under their general supervision where passengers and crew can move about during their stopover.

7.3.3 The pilot-in-command shall not be required to apply to more than one government agency for take-off permission (other than for any necessary air traffic control clearance).

C. No Resumption of Flight

7.4 If it is apparent that the aircraft will be substantially delayed or is unable to continue its flight, the following provisions shall apply:

7.4.1 The pilot-in-command, while awaiting the instructions of the public authorities concerned or if he or his crew is unable to get in touch with them, shall be entitled to take such emergency measures as he deems necessary for the health and safety of passengers and crew and for avoiding or minimizing loss or destruction to the aircraft itself and its load.

7.4.2 Passengers and crew shall be permitted to secure suitable accommodation pending completion of the necessary formalities if such formalities cannot be promptly carried out.

7.4.3 Cargo, stores and unaccompanied baggage, if required to be removed from the aircraft for safety reasons, shall be deposited in a nearby area and remain there pending completion of the necessary formalities.

7.4.4 Mail shall be disposed of as is required pursuant to the Acts in force of the Universal Postal Union.

CHAPTER 8. OTHER FACILITATION PROVISIONS

A. Bonds and Exemption from Requisition or Seizure

8.1 **Recommended Practice.**— *If a Contracting State requires bonds of an operator to cover his liabilities under the customs, immigration, public health, animal and plant quarantine, or similar laws of the State, it should permit the use of a single comprehensive bond whenever possible.*

8.2 **Recommended Practice.**— *The aircraft, ground equipment, security equipment, spare parts and technical supplies of an airline located in a Contracting State (other than the Contracting State in which such airline is established) for use in the operation of an international air service serving such Contracting State, should be exempt from the laws of such Contracting State authorizing the requisition or seizure of aircraft, equipment, parts or supplies for public use, without prejudice to the right of seizure for breaches of the laws of the Contracting State concerned.*

B. Facilitation of Search, Rescue, Accident Investigation and Salvage

8.3 Subject to any conditions imposed by Annex 12 — *Search and Rescue* and Annex 13 — *Aircraft Accident Investigation*, Contracting States shall make arrangements to ensure entry without delay into their territories on a temporary basis of qualified personnel required for search, rescue, accident investigation, repair or salvage in connexion with a lost or damaged aircraft.

8.4 Each Contracting State shall facilitate the temporary entry into its territory of all aircraft, tools, spare parts and equipment required in the search, rescue, accident investigation, repair or salvage of the damaged aircraft of another State. These items shall be temporarily admitted free from customs duties and other taxes or charges and the application of regulations of any nature restricting the importation of goods.

Nqte.— It is understood that this provision does not preclude the application of public health and animal and plant quarantine measures, if required.

8.5 Each Contracting State shall facilitate the removal from its territory of both the damaged and any assisting aircraft, together with tools, spare parts and equipment which may have been brought in for search, rescue, accident investigation, repair or salvage purposes.

8.6 Damaged aircraft or parts thereof, and any stores or cargo contained therein, together with any aircraft, tools, spare parts or equipment brought in for temporary use in search, rescue, accident investigation, repair or salvage, which are not removed from the territory of the Contracting State within a length of time to be specified by that State, shall be subject to the requirements of the applicable laws of the State concerned.

8.7 If, in connexion with an aircraft accident investigation, it becomes necessary to send a part, or parts, of a damaged aircraft to another Contracting State for technical examination or testing, each Contracting State concerned shall ensure that the movement of such part, or parts, is effected without delay. The Contracting States concerned shall likewise facilitate the return of such part, or parts, to the State instituting the accident investigation should the latter State require them in order to complete the investigation.

C. Relief Flights Following Natural and Man-made Disasters Which Seriously Endanger Human Health or the Environment, and Similar Emergency Situations Where United Nations (UN) Assistance is Required

8.8 Contracting States shall facilitate the entry into, departure from and transit through their territories of aircraft engaged in relief flights performed by or on behalf of international organizations recognized by the UN or by or on behalf of States themselves and shall take all possible measures to ensure their safe operation. Such relief flights are those undertaken in response to natural and man-made disasters which seriously endanger human health or the environment, as well as similar emergency situations where UN assistance is required. Such flights shall be commenced after obtaining agreement with the recipient State as quickly as possible.

8.9 Contracting States shall ensure that personnel and articles arriving on relief flights referred to in 8.8 are cleared without delay.

Note.— With respect to the application of measures to ensure the safe operation of relief flights attention is drawn to Annex 11 — Air Traffic Services *(paragraphs 2.15 and 2.16), the* Manual concerning Safety Measures Relating to Military Activities Potentially Hazardous to Civil Aircraft Operations *(Doc 9554) and the* Manual concerning Interception of Civil Aircraft *(Doc 9433).*

D. Marine Pollution and Safety Emergency Operations

8.10 In cases of emergency, Contracting States shall facilitate the entry, transit and departure of aircraft engaged in the combatting or prevention of marine pollution, or other operations necessary to ensure maritime safety, safety of the population or protection of the marine environment.

8.11 In cases of emergency, Contracting States shall, to the greatest extent possible, facilitate the entry, transit and departure of persons, cargo, material and equipment required to deal with the marine pollution and safety operations described in 8.10.

E. Implementation of International Health Regulations and Related Provisions

8.12 Contracting States shall comply with the pertinent provisions of the current edition of the International Health Regulations (1969) of the World Health Organization and any amendments thereto.

8.13 **Recommended Practice.**— *In cases where epidemiological conditions permit and it will result in reducing or eliminating the number of sanitary measures required, Contracting States should, pursuant to Article 85, paragraphs 1 and 1 d) of the International Health Regulations, Third Annotated Edition (1983), combine their territories or make agreements for the purpose of sanitary control.*

8.14 Contracting States shall take all possible measures to have vaccinators use the International Certificates of Vaccination or Revaccination form, in order to assure uniform acceptance.

8.15 **Recommended Practice.**— *Each Contracting State should make arrangements to enable all airlines and agencies concerned to make available to passengers, sufficiently in advance of departure, information concerning the vaccination requirements of the countries of destination, as well as vaccination or revaccination certificate forms conforming to the International Health Regulations (1969).*

8.16 Operators shall ensure compliance with any requirement of a Contracting State whereby illness, other than suspected airsickness, on an aircraft is to be reported promptly by radio to health authorities in the Contracting State for which the aircraft is destined, in order to facilitate provision for the presence of any special medical personnel and equipment necessary for medical assistance and health procedures on arrival.

F. Establishment of National Facilitation Programmes

8.17 Each Contracting State shall establish a national air transport facilitation programme based on the facilitation requirements of the Chicago Convention and Annex 9.

8.18 Each Contracting State shall ensure that the objective of its national air transport facilitation programme shall be to adopt all practicable measures to facilitate the movement of aircraft, crews, passengers, cargo, mail and stores, by removing unnecessary obstacles and delays.

8.19 **Recommended Practice.**— *Each Contracting State should establish a National Air Transport Facilitation Committee, and Airport Facilitation Committees as required, or similar co-ordinating bodies, for the purpose of co-ordinating facilitation activities between departments, agencies, and other organizations of the State concerned with, or responsible for, various aspects of international civil aviation as well as with airport and aircraft operators.*

8.20 **Recommended Practice.**— *In establishing and operating National and Airport Facilitation Committees, States should use the guidance material outlined in Appendix 10.*

2. Date of birth. . . . .
(Day) (Month) (Year)

3. Place of birth . . . .

4. Nationality. . . . .

5. Passport Number . . . .

6. Occupation . . . .

7. Permanent address . . . .

8. For arriving passengers: port of embarkation / For passengers leaving: port of disembarkation . . . .

(FOR OFFICIAL USE ONLY)

148 mm (or 5 7/8 inches)

105 mm (or 4 1/8 inches)

* *Layout:* Card to be printed vertically with its layout and print size, as illustrated above, back of the card to be left blank.

Colour: White.

Languages: Text to be printed in one or more of the four working languages of ICAO (English, French, Russian, Spanish) and possibly in the language of the operator.

Completion: Card to be completed: a) on board aircraft when required from arriving passengers; b) prior to clearing with public authorities concerned at airport, when required from departing passengers.

Carbon copies: Carbon-copy version of card to be furnished when it is required in duplicate by the State concerned.

APPENDIX 6. RECOMMENDATION OF THE CUSTOMS CO-OPERATION COUNCIL

For a Simplified Customs Control, Based on the Dual-Channel System, of Passengers Arriving by Air (8 June 1971)

"THE CUSTOMS CO-OPERATION COUNCIL,

Having Regard to Recommendation No. B-3 of the Seventh Session of the Facilitation Division of the International Civil Aviation Organization, as adopted by the Council of that Organization in December 1968, relating to the establishment at international airports of dual-channel systems for speedy clearance of inbound baggage;

Having Regard to Recommendation No. 11 adopted by the Second Intermediate Session of the European Civil Aviation Conference in July 1969 on the dual-channel or red/green system;

Desiring to contribute to the efforts to improve the flow of passenger traffic at international airports;

Considering that this aim can be achieved by introducing a simplified procedure, based on the dual-channel system, for the Customs control of passengers and their baggage;

Considering that such a system can be adopted without reducing the effectiveness of the control and that it enables Customs authorities to deal efficiently with an increasing number of passengers without a corresponding increase in the number of Customs staff;

Considering that harmonization of the features of this system, as between the various countries, is essential to its smooth operation;

Recommends that Members introduce, at their major international airports, in close co-operation with the airport operators and other agencies concerned, the dual-channel system outlined below for the clearance inwards of passengers and their baggage:

1) The system shall allow the passengers to choose between two types of channels:

   a) one (green channel) for passengers having with them no goods or only goods which can be admitted free of import duties and taxes and which are not subject to import prohibitions or restrictions; and

   b) the other (red channel) for other passengers.

2) Each channel shall be clearly and distinctively marked so that the choice between them can easily be understood by passengers. The basic distinctive marking shall be:

   a) for the channel referred to under 1) a), green, in the shape of a regular octagon, and the words "NOTHING TO DECLARE" ("RIEN À DÉCLARER");

   b) for the channel referred to under 1) b), red, in the shape of a square, and the words "GOODS TO DECLARE" ("MARCHANDISES À DÉCLARER").

   In addition, the channels should be identified by an inscription including the words "CUSTOMS" ("DOUANE").

3) The texts referred to in paragraph 2) shall be in English and/or French and in any other language or languages deemed useful for the airport concerned.

4) Passengers must be sufficiently well informed to choose between the channels. For this purpose it is important:

   a) that passengers be informed about the functioning of the system and about the descriptions and quantities of goods they may have with them when using the green channel. This may be done by means of posters or panels at the airport or by means of leaflets available to the public at the airport or distributed through tourist agencies, airlines and other interested bodies.

   b) that the route to the channels be clearly signposted.

5) The channels shall be located beyond the baggage delivery area so that passengers have all their baggage with them when choosing their channel. Moreover, the channels shall be so arranged that the passenger flow from that area to the exits from the airport is as direct as possible.

6) The distance between the baggage delivery area and the entrances to the channels shall be sufficient to allow passengers to decide which channel to choose and to move into that channel without causing congestion.

7) In the green channel passengers shall not be subject to any Customs formalities but the Customs may make spot checks; in the red channel passengers shall accomplish the formalities required by the Customs;

Points out that the dual-channel system is not necessarily incompatible with the application of other controls, for example, exchange control, unless the relevant regulations require full control of the passengers and their baggage;

Requests Members who accept this Recommendation to notify to the Secretary General:

a) their acceptance and the date from which they will apply the Recommendation;

b) the names of the airports where the dual-channel system is applied.

The Secretary General will transmit this information to the Customs Administrations of Members, to the Secretary General of the International Civil Aviation Organization (ICAO) and to the Director General of the International Air Transport Association (IATA)."

ANNEX 9

15/11/90

APPENDIX 10. GUIDELINES FOR THE ESTABLISHMENT AND OPERATION OF NATIONAL AIR TRANSPORT AND AIRPORT FACILITATION COMMITTEES

The following guidelines outline suggested terms of reference, membership and methods of operation of National Air Transport and Airport Facilitation Committees. States may find it useful to have both a National Air Transport Facilitation Committee and one or more Airport Facilitation Committees, bearing in mind the need to solve local problems in the simplest possible manner at the local level with more complex, legislative, policy and interdepartmental problems being considered by the higher body. However, in cases where there is only one international airport, the National Air Transport Facilitation Committee may serve as an Airport Facilitation Committee or vice versa.

I. National Air Transport Facilitation Committees

Terms of Reference

Where a National Air Transport Facilitation Committee (or a similar co-ordinating body) is formed, its functions should broadly be as follows:

a) to implement the National Facilitation Programme;

b) to review questions of policy in relation to clearance formalities applied to international air transport services;

c) to consider recommendations made by Airport Facilitation Committees established at international airports; and, in turn, refer matters to Airport Facilitation Committees for attention;

d) to make recommendations to the departments, competent authorities and other organizations concerned with the National Facilitation Programme;

e) to keep the departments, competent authorities, and other organizations concerned, informed of significant developments in the field of international civil aviation in so far as they affect operations into and out of the Contracting State.

Membership

National Air Transport Facilitation Committees should be composed of senior officials representing the main interests concerned with facilitation, including the following, as required: civil aviation authorities; government clearance agencies (immigration, customs, consular, passport and visa, public health, agriculture, security and narcotics control); other government agencies concerned with facilitation (such as postal services, tourism and trade departments); airport authorities; and operators, including forwarders and express carriers.

Operation

a) As a general rule, National Air Transport Facilitation Committees should meet at least twice a year. It is desirable that the site of meetings be rotated among the premises of the different government agencies concerned.

b) Whenever possible, periodic inspection tours of international airports within the national territories and abroad should be arranged for members of the Committee.

c) Representatives of the board(s) of airline representatives should be encouraged to attend meetings and to submit their co-ordinated approach to current facilitation problems, together with proposed solutions.

d) Whenever appropriate, National Air Transport Facilitation Committees should consider the establishment of sub-committees to study particular facilitation problems (e.g. cargo or baggage). Such sub-committees should have a balanced representation similar to that of the Committee.

e) Whenever possible, on the occasion of visits to States by facilitation experts of the ICAO Secretariat, arrangements should be made for them to participate in meetings of the National Air Transport Facilitation Committees.

f) States should inform ICAO of the work of their Facilitation Committees, so that this information can be distributed to other States.

II. Airport Facilitation Committees

Terms of Reference

Where Airport Facilitation Committees are formed for particular international airports, their functions should be broadly as follows:

a) to implement the National Facilitation Programme at the airport level;

b) to examine problems arising in connexion with the clearance of aircraft, passengers, baggage, cargo, mail and stores and to effect, if possible, immediate solutions to the problems which may arise at the international airport concerned;

c) to make recommendations, as appropriate, to the Regional Office of the department, ministry, or authority concerned, or to the National Facilitation Committee for the implementation of proposals which cannot be effected by the Airport Committee;

d) to inform the National Facilitation Committee of action taken and recommendations made by forwarding copies of the minutes of all Committee meetings.

Membership

Airport Facilitation Committees should be composed of representatives of the main interests concerned with facilitation at the airport(s), including the following, as required: civil aviation authorities; the authority responsible for the airport; government clearance agencies (immigration, customs, consular, passport and visa, public health, agriculture, security and narcotics control); other government agencies concerned with facilitation at the airport (such as postal services, tourism and trade departments); and operators using the airport(s), including representatives of forwarders and express carriers.

Operation

Airport Facilitation Committees should meet regularly and whenever necessary for the purpose of reviewing the FAL situation and finding solutions to local problems.

ATTACHMENT. GUIDANCE MATERIAL

Note.— This guidance material does not form part of the Annex proper but provides supplementary information concerning methods and procedures for implementing its provisions and facilitation in general.

Guidance Material relating to Chapter 3 — Entry and Departure of Persons and Their Baggage

Airline operators, airport administrations and public services of Contracting States should maintain, and expand where possible, continuing programmes to inform passengers on a timely basis of entry requirements and procedures, particularly with respect to public health and immigration requirements, customs exemptions, prohibitions and restrictions on imports, agricultural quarantine regulations and rates of duty on articles most commonly purchased abroad by tourists and other returning travellers.

Note.— Source: Recommendation B-3 of FAL/8.

Contracting States should encourage their immigration authorities to exchange information through the appropriate channels on practices relating to document abuse by passengers and/or travel agents. For that purpose they should direct their airlines to supply the said information to their immigration authorities.

Whenever a travel agent's right to sell air transportation on behalf of an airline is withdrawn by that airline for abuses in the observance of immigration requirements, the airline taking such action should inform the public authorities concerned, as well as all other airlines that may be affected by similar abuses by that agent, so that they may take appropriate action.

Note.— Source: Recommendation B-7 of FAL/10.

Carriers should systematically publish the last check-in time in timetables for use by the public, at least for each international flight;

this last check-in time should be confirmed in writing to the passenger at the time he makes his reservations or purchases his ticket; and

the operators and airport administrations should endeavour to determine, for one and the same airport, a single time for each flight category, for the time intervening between the last check-in time and the time of departure.

Note.— Source: Recommendation B-15 of FAL/6.

Operators should make every effort to inform their passengers of any delays in departure times, prior to check-in.

Note.— Source: Recommendation B-8 of FAL/9.

Considering that great importance should be attached to research by airlines into rapid operational procedures in their ground services in general;

considering that time can be saved by reducing to the minimum the amount of baggage to be checked in and placed in the hold; and

considering the progress made by certain airlines in simplifying and accelerating ground operations on high-frequency short-range flights;

airlines should endeavour to enlarge the maximum dimensions now imposed on hand baggage and consequently investigate new designs for aeroplane cabins; and

on high-frequency short-range flights, the arrangements indicated above should be made in such a way that the majority of passengers need not check any of their baggage, and measures should also be adopted to accelerate the pertinent procedures for those passengers that continue to check their baggage.

Note.— Source: Recommendation B-14 of FAL/6.

Contracting States should make arrangements for passengers, arriving at an international airport of entry and continuing their voyage on a connecting flight of the domestic network, to allow the checked baggage of such transferring passengers to be cleared at the customs airport of final destination, whenever such clearance may be carried out by the competent authorities at the time of arrival of the passengers.

Note 1.— Source: Recommendation B-4 of FAL/7.

Note 2.— See also 3.18 of the Annex.

States which are prepared to accept the arrangements for checked baggage to be cleared through customs at the airport of final destination should arrange for the insertion into the FAL Section of Aeronautical Information Publications of the list of airports in their territories at which this measure can be implemented.

Note 1.— Source: Recommendation B-4 of FAL/8.

Note 2.— See also 3.18 of the Annex.

Airline operators and their agents, together with airport handling organizations and airport operators, should take all necessary steps to reduce substantially the incidence of baggage mishandling through training of, and supervision over, all personnel involved, better co-ordination between personnel processing passengers and those handling their baggage and improvements in the labelling of baggage.

Wherever existing procedures delay the reforwarding of mishandled baggage to its owner, Contracting States should establish an Airport Committee comprising representatives of the public authorities, airport operator and the airlines with a view to adopting procedures which will lead to the speedy disposal of mishandled baggage, if such terms of reference are not already given to the existing Airport Facilitation Committees.

Note 1.— Source: Recommendation B-2 of FAL/9.

Note 2.— In the light of Council action subsequent to FAL/9 (i.e. with respect to Recommendation B-12 of FAL/10 as noted below), any procedures adopted for handling such baggage must be fully consistent with security requirements.

Note 3.— The Council, in approving this recommendation, noted that additional airport consultative committees need not be established where adequate machinery is available.

To assist in dealing with congestion problems caused by high volumes of courier traffic at certain airports, States, airport authorities, airline operators and courier companies should, where required and possible, make special arrangements for processing courier baggage.

Such arrangements must be fully consistent with security requirements and could include:

a) advance notification by couriers when they will be presenting a large number of bags;

b) a more advanced deadline for check-in by such couriers;

c) a distinctive baggage tag for courier baggage to facilitate handling at destination and transfer points; and

d) identification of check-in facilities to be used by couriers.

Note.— Source: Recommendation B-12 of FAL/10 as amended by Council to include a reference to security requirements.

Guidance Material relating to Chapter 4 — Entry and Departure of Cargo and Other Articles

Contracting States, air carriers and shippers' organizations should encourage the development and use of containers for transport of agricultural products by air that are designed to assure the maximum degree of facilitation in the conduct of necessary animal and plant quarantine inspections.

Note.— Source: Recommendation B-12 of FAL/7.

Contracting States, in order to realize the benefits of uniform customs treatment of containerized cargo, should give careful consideration to adoption of the Customs Convention on the International Transit of Goods (ITI Convention), adopted by the Customs Co-operation Council on 7 June 1971.

Note.— Source: Recommendation B-6 of FAL/8.

Contracting States should take all practical measures to impress upon shippers, forwarding agents and international operators the need for ensuring that the processing and movement of documents relating to the contents of containers and pallets are closely co-ordinated with the movement of the respective containers and pallets. To this end, steps should be taken to ascertain that documents relating to the contents are completed by the time of packing the container or pallet and that these documents are readily available at the point of clearance of all or part of the contents.

Note.— Source: Recommendation B-14 of FAL/7.

Guidance Material relating to Chapter 6 — International Airports — Facilities and Services for Traffic

Contracting States should undertake, on a priority basis, comprehensive planning for expansion of international airport facilities;

they should recognize fully the need to experiment with new passenger- and cargo-handling techniques to reduce ground time for the aircraft and time spent in the terminal area by passengers and cargo and that, where possible, the results of such experiments should be communicated to ICAO for circulation to other Contracting States;

they should give particular attention to the design and layout of international air terminal buildings to assure sufficient space for the handling and clearance of passengers and baggage. In the planning process, consideration must be given to traffic levels at average busy hours;

they should emphasize in their planning swift passenger, baggage and cargo flow through the terminal area by careful interrelationship of access roads, parking facilities, passenger ticketing and service areas, arrival and departure lounges, and aircraft aprons and gate positions; and

they should plan expanded air cargo facilities, using automated systems as widely as possible, capable of handling substantial increases in cargo.

Note 1.— Source: Recommendation B-20 of FAL/7.

Note 2.— In the light of Council action subsequent to FAL/7, States should also take into account the aspect of security and appropriate narcotics control measures — see also 6.1 of the Annex.

Contracting States should make adequate provision in planning expansion of airport facilities for the smooth and efficient handling of intermodal van containers;

the objective of this planning should be to reduce to a minimum the time spent by such containers within the airport area;

to this end Contracting States should encourage the development and use of facilities for the loading, unloading and storing of containers and for the conduct of necessary inspections away from the airport; and

Contracting States should seek to provide effective procedures for removal of containers from the apron area and transfer to rail or highway carriers.

Note 1.— Source: Recommendation B-11 of FAL/7.

Note 2.— In the light of Council action subsequent to FAL/7, States should also take into account the aspect of security and appropriate narcotics control measures — see also 6.1 of the Annex.

Airport administrations, in co-operation with operators, should provide, at international airports where the volume of traffic warrants, facilities for the proper care and handling of elderly and disabled passengers and of small children; such facilities might include, for example, wheelchairs, baby trolleys, a special room where these passengers can rest, etc.

Note 1.— Source: Recommendation B-17 of FAL/7.

Note 2.— See also 6.1.1 of the Annex.

States, in co-operation with airport authorities and other bodies as necessary, should make every effort to provide accessible airport ground transportation services to facilitate, to the extent possible, the use of taxi services and private transport and to ensure that parking areas and access routes to terminal buildings are suitably designed and identified;

new airport buildings should be designed to ensure obstacle-free movement for disabled persons and the removal of physical barriers in existing buildings should be undertaken when any general improvements are made;

the provision of services and facilities at airports should be evaluated to ensure that they are both accessible and adapted to disabled users including the sensory-impaired;

airport authorities, in co-operation with airlines, should make it possible, where practical, for wheelchair users to use their own wheelchairs to move to and from the aircraft door; and

airport authorities, in co-operation with airlines, should establish and co-ordinate training programmes to ensure the availability of personnel sensitive to the needs of the elderly and disabled and familiar with means of communicating with the sensory-impaired.

Note 1.— Source: Recommendation B-6 of FAL/10.

Note 2.— See also 6.1.1 of the Annex.

Contracting States, in giving effect to 6.2 of Annex 9 in their respective territories, should ensure that postal authorities are included amongst those to be consulted at the earliest stage in the planning of new or substantially modified terminal facilities at their international airports.

Note.— Source: Recommendation B-6 of FAL/9.

Whereas charges are collected in various States for facilities provided for passengers at airports and this practice is becoming more general and the method of collecting these charges should involve as little inconvenience as possible for the passenger and not cause any delay in the traffic flow;

save in exceptional circumstances the charge should normally be collected only from departing passengers;

the system adopted for collection should not impose any extra formality on the passenger at the time of his departure but should enable him to pay the amount of the charge when he completes one of the formalities required for his journey (i.e. at the time he purchases his ticket, makes his reservation or checks in);

the charge should be payable in reasonably acceptable foreign currency as well as in the national currency and by all the usual means of payment (e.g. travellers' cheques, banknotes or coins);

the passenger should be given a receipt as proof that he has paid the charge;

all suitable measures should be taken to inform the passenger in advance of the existence of this charge (e.g. mention in the airline's timetables, when the ticket is purchased, when the reservation is made, etc.); and

representatives of the airport authority and elected representatives of the appropriate operator's committee at each airport where the charge is being imposed should engage in consultation with a view to developing the simplest possible method of collection within the terms of this recommendation.

Note 1.— Source: Recommendation B-8 of FAL/6.

Note 2.— These guidelines are for use where service charges are levied on the passengers and not the airlines. See also 6.4 of the Annex.

With regard to existing procedures, Contracting States, airport authorities and airlines should co-operate in introducing better methods of informing passengers of the existence of passenger service charges; and

also with regard to existing procedures, Contracting States, airport authorities and airlines should co-operate in developing methods whereby passengers may pay the charge while purchasing tickets or visiting airline offices for reconfirmation. Where this cannot be achieved, co-operation should be directed towards developing simplified procedures for payment of these charges at every check-in point.

Note 1.— Source: Recommendation B-7 of FAL/7.

Note 2.— These guidelines are for use where service charges are levied on the passengers and not the airlines. See also 6.4 of the Annex.

As a means of relieving congestion at international airports, Contracting States should encourage the authorities concerned to:

a) expedite check-in procedures through simplification;

b) provide adequate staff and facilities, etc.; and

c) consider the advisability of using city terminals, including check-in facilities where possible.

Note 1.— Source: Recommendation B-5 of FAL/7.

Note 2.— See also 6.28 of the Annex.

Facilities should be made available to provide incoming passengers with information of interest to tourists and on room reservations at as many hotels as possible;

States and airport administrations should devote the closest attention to the provision of these services with a view to supplementing the efforts already made by air carriers and travel agencies; and

arrangements should be made, to the maximum extent possible, to enable passengers on departure to book a room in the country of their destination.

Note.— Source: Recommendation B-16 of FAL/7.

With regard to departures on high-frequency short- and medium-range flights, operators and airport authorities at busy air terminals should give consideration to:

a) the elimination of routine baggage weighing;

b) the establishment of a simple baggage reception system in lieu of the present system.

Note.— Source: Recommendation B-6 of FAL/7.

Guidance Material relating to Chapter 8 — Other Facilitation Provisions

In order to ensure that security measures deemed essential to prevent unlawful interference with civil aviation are carried out as expeditiously as possible and in such a manner as to cause the minimum inconvenience or delay to international civil aviation, there should be close co-ordination, adapted to circumstances, between facilitation and security programmes and, to this end, certain members of Facilitation Committees should also be members of Security Committees.

Note 1.— Source: Recommendation B-12 of FAL/8.

Note 2.— See also 8.20 and Appendix 10.

INDEX

D

— END —

SUPPLEMENT TO

ANNEX 9 — FACILITATION

(Ninth Edition)

1. This revised and enlarged version of the Supplement to Annex 9 includes differences notified by Contracting States up to 28 February 1994 and replaces the edition dated July 1991.

2. The Supplement should be inserted at the end of Annex 9, Ninth Edition. Additional differences and revised comments received from Contracting States will be issued at intervals as amendments.

28/2/94

SUPPLEMENT TO ANNEX 9 — NINTH EDITION

(revised and enlarged version)

FACILITATION

Differences between the national regulations and practices of Contracting States and the corresponding International Standards and Recommended Practices contained in Annex 9, as notified to ICAO in accordance with Article 38 of the *Convention on International Civil Aviation* and the Council's resolution of 21 November 1950.

CHAPTER 2

2.7* The Cargo Manifest is required in accordance with the format set forth in Appendix 3.

2.8.1* The nature of the goods must be indicated in the cargo manifest.

2.38 As a general rule, special permission is required in addition to the flight plan for the flights mentioned in 2.34.

2.40* In the case of non-scheduled transport flights with commercial stops, unless there are reciprocal arrangements, a request for permission must be addressed to the Directorate General of Civil Aviation and Meteorology fifteen days before the commencement of the planned flight or flights. This application must contain, in addition to the information in 2.40, the name of the aircraft owner (where applicable).

CHAPTER 3

3.8 As a general rule, a tax is levied when an entrance visa is issued.

3.8.2 The visa applicant must appear in person.

3.8.3 Aside from nationals of States with which Algeria has signed an agreement for the mutual elimination of visas, entrance visas for temporary visitors are valid for one or more entries and for a period of three months from the date of use.

3.8.6* As a general rule, an "exit and re-entry" visa is required from resident aliens.

3.20 Customs clearance of unaccompanied baggage may be effected by the operator if he is empowered to effect forwarding operations (see also 4.53.1 below).

3.23 The Crew Members' Certificates presented in Appendix 7 are not issued.

3.24.1 The flight crew members of an aircraft operated for remuneration or hire but not engaged in scheduled international air services do not have the same privileges as those outlined in 3.24.

3.25.1* The flight crew members of an aircraft operated for remuneration or hire but not engaged in scheduled international air services do not have the same privileges as those outlined in 3.24.

3.25.3* This provision not applied as a general rule. Such crew members as are given temporary permission must possess a valid passsport and, where applicable, a visa.

3.29* Applied as a general rule.

3.30* Passenger baggage is inspected by customs service on a random sample basis.

3.39 The Algerian Public Authorities will ensure, whenever it is deemed possible, that operators are informed when passengers are obliged to travel due to a deportation order.

3.40* The Algerian Public Authorities ordering the deportation order will, whenever it is deemed feasible, inform the public authorities of destination countries of the planned transport.

* Recommended Practice

CHAPTER 4

4.9*	A cargo report declaration is required.
4.13	Inspection is carried out by the customs on a random sample basis.
4.15	Cargo, including unaccompanied baggage which is to be exported by air, is presented for clearance purposes at the customs office of the embarkation airport.
4.34*	Parts and elements of containers must be intended for domestic use. They must be cleared through customs on payment of the fees and taxes prescribed in the customs tariffs.
4.37*	The customs administration cannot allow the loan between airlines operating in Algeria of containers and other associated equipment. This is due to the fact that an open account manages and covers the equipment (containers) specific to each airline.
4.38	From the point of view of customs legislation, the operator is responsible for omissions or inaccuracies of fact on documents.
4.44*	Customs legislation provides that goods intended for use in the manufacture, modification or repair of aircraft are admitted free of duties and taxes. Other equipment is admitted under the temporary admission system.
4.53	Baggage, whether accompanied or unaccompanied, shall be grouped together when presented for clearance to enable the customs service to determine the tolerance (freedom from duties and taxes) and taxation thresholds under a simplified procedure.
4.53.1	Customs clearance of unaccompanied baggage may be effected by: the owner, a forwarding agent or customs broker, or the operator empowered to effect forwarding operations.

---

* Recommended Practice

CHAPTER 2

2.12 One of the copies of the General Declaration shall be delivered by the operator to each DNAC, ENANA and DNEFA for departure clearance from every stop in Angolan Territory.

2.15 One of the copies of the General Declaration shall be delivered by the operator to each DNAC, ENANA and DNEFA for arrival clearance at every stop in Angolan Territory.

2.38 The authority of the international airport where the aircraft will land, as first stop when entering Angolan Territory, must be notified at least 72 hours before the arrival of the aircraft.

CHAPTER 3

3.8.3 The tourist visa is valid for one entry for 120 days from the date of issue.

3.8.6* Exit visas are required for national and permanent resident aliens in Angola as well as for temporary visitors, such as technical personnel, teachers and other classes of professionals who work under a labour agreement or in the service of the Angolan Government. The exit visa is not required for tourists if they leave the country within the period of stay allotted to them.

3.9* The passport number is required on the Embarkation/Disembarkation Card to be filled out by the passenger before embarking or disembarking.

3.10 The passport number is required on the Embarkation/Disembarkation Card to be filled out by the passenger before embarking or disembarking.

3.37 Operators are liable to be fined if they carry alien passengers whose documents are not in order and aliens who enter Angolan Territory illegally.

---

* Recommended Practice

CHAPTER 1

Definitions

Pilot-in-command. The Argentine Administration will continue to use the term "comandante de la aeronave".

Unaccompanied baggage. Baggage may be personally conveyed by the passenger or handed over by him before or after the passenger's exit or entrance.

Cargo. Any property carried on an aircraft other than mail and stores.

Free zone. An area that may exceptionally be subject to control measures.

CHAPTER 2

2.4 Presentation of the General Declaration is required.

2.4.1 Presentation of the General Declaration is required on arrival and at departure.

2.8.1* Information on the nature of the goods is required in the cargo manifest.

CHAPTER 3

3.5.1* It is not feasible at present to issue machine readable passports (MRPs).

3.10.2 Airline operators, and not Contracting States, are charged with the responsibility for the provision of Embarkation/Disembarkation cards.

CHAPTER 4

4.9* Unaccompanied baggage is not considered the same as cargo.

4.11 Unaccompanied baggage is not considered the same as cargo.

4.12 Unaccompanied baggage is not considered the same as cargo.

4.15 Unaccompanied baggage is not considered the same as cargo.

---

* Recommended Practice

CHAPTER 2

2.1 Except when permitted under special authority, Australian quarantine requirements prohibit the bringing into Australia by air, not only of animals and certain animal products intended for importation, but also of animals on aircraft transiting Australia for some other destination.

2.4 General Declarations are required (see also 2.4.3).

2.4.3 The General Declaration is not required by the Australian Quarantine and Inspection Service. The aircraft is required to make the health declaration by radio message before arrival.

2.4.4 Customs in Australia use the Declaration as a reporting and clearance document. As such it is required to be signed. Stamping merely identifies the authority.

2.6 Unacceptable. Australia considers that the current wording (as per 8th Edition) is more appropriate, i.e. "Contracting States shall not require the presentation of a passenger manifest."

2.10 Aircraft arriving at and departing from the same airport without proceeding to another airport in Australia, and aircraft of countries in respect of which bilateral agreements between those countries and Australia provide for duty-free consumption of stores on flights within Australia, are not required to present a written declaration of stores remaining on board. All other aircraft are required to present such a declaration.

2.18* Documents are required to be furnished in English.

2.23 Aircraft cabins should be treated by disinsecting at top-of-descent, or residually disinsected in accordance with a Compliance Agreement between the airline and the Australian Quarantine and Inspection Service.

2.24* Aircraft cabins should be treated by disinsecting at top-of-descent, or residually disinsected in accordance with a Compliance Agreement between the airline and the Australian Quarantine and Inspection Service.

2.32 If considered necessary by the health authorities, all or any part of the aircraft and the contents may be treated by disinfection after the aircraft lands at its first airport of call in Australia.

2.40* Operators of high-capacity aircraft (more than 38 passenger seats or 4 200 kg payload) who wish to conduct programmes of charters involving more than two flights in a calendar year are required to submit copies of company operations (or instructors) manual, route manual, flight manual and aircraft operations manual.

2.41* Under Australian law, all aircraft arriving in or departing from Australian territory must use a designated airport as their first point of arrival or last point of departure, as the case may be.

CHAPTER 3

3.8.4* Unacceptable.

a) Clarification of the intention of the proposed clause and the use of the term "force majeure" is required for further consideration.

b) The Australian Migration Act and Regulations provide for certain categories of persons, in certain circumstances, to apply for a border visa.

3.8.5 While Australia conforms to this Standard, it should be noted that in circumstances where Australian nationals hold another citizenship and elect to travel on other than their Australian passport, they will be required to provide proof of Australian citizenship on arrival, so as to establish their right of re-entry. Travellers in these circumstances may choose to have a re-entry visa issued in their non-Australian passport to simplify clearance formalities on arrival in Australia and to ensure uplift by carriers for travel to Australia.

* Recommended Practice

3.8.6* Australia requires non-citizen residents to be in possession of a valid re-entry visa.

3.8.8* Australian visas do not indicate the month in full.

3.9* Australia requires Embarkation and Disembarkation Cards.

3.10 The content and format of Australian Embarkation/Disembarkation Cards differ from Appendix 5 of Annex 9.

3.12* Australian health authorities reserve the right to examine medically any person arriving by air who is subject to the Australian Quarantine Act 1908.

3.16 A questionnaire is to be completed by passengers. A written declaration on Australian Customs Form 5 (Aircraft) is required in respect of goods in the possession of crew members.

3.17.1 The general principle and purpose of the dual-channel baggage clearance system are incorporated in Australia's modified one-stop system. The basic difference is that in checking all passengers for immigration purposes at a single point, the opportunity is taken to re-direct a small proportion of those passengers who, by their baggage statement, have been identified as "free-run" (or green) channel.

3.23 Unacceptable. Australia is unable to issue crew member certificates to other than Australian citizens.

3.25 Flight crew travelling to Australia as passengers aboard aircraft and not listed as crew members are required to be in possession on arrival, in addition to a pilot's licence as specified in 3.23 of Annex 9, or crew member certificate, a visa or a letter from their employers providing certification of the purpose of their journey (in lieu of visa).

3.25.1* Flight crew travelling to Australia as passengers aboard aircraft and not listed as crew members are required to be in possession on arrival, in addition to a pilot's licence as specified in 3.23 of Annex 9, or crew member certificate, a visa or a letter from their employers providing certification of the purpose of their journey (in lieu of visa).

3.29* Australia requires Embarkation and Disembarkation Cards.

3.37.1 Proof of negligence is not an element of defence in Australian Immigration law when a carrier brings an undocumented person to Australia. In practice, however, prosecution or service of an infringement notice is not initiated if the carrier was not negligent.

CHAPTER 4

4.8.1* Customs is wherever possible aligning its import and export document requirements with the United Nations Layout Key for Trade Documents. In some instances, circumstances at this time do not permit the adoption of the United Nations format.

4.17 The Australian customs authorities accept the commercial invoice together with the air waybill as basic documents for customs formalities. In certain circumstances a customs entry may also be required.

4.17.1* Customs is wherever possible aligning its import and export document requirements with the United Nations Layout Key for Trade Documents. In some instances, circumstances at this time do not permit the adoption of the United Nations format.

4.19* The inclusion of a "Value for Customs Purposes" on the air waybill will greatly assist the clearance of goods falling within 4.22 and 4.23 of Annex 9.

4.23.1* Australian law does not provide for complete exemption of goods in these categories from customs duties and sales tax.

4.38 In the case of the importation of any animal into Australia by air, it will be the operator's responsibility to be in possession of the appropriate import permit or a copy of it.

* Recommended Practice

4.39 The Australian authorities are unable to relieve airlines of their responsibilities in respect of goods brought to Australia on their aircraft, that being a matter between the airlines and the owner of the goods. However, these authorities would accept liability for any loss or damage sustained by any goods subject to the control of the customs where such loss or damage was due to the neglect or wilful act of a customs officer.

In regard to customs duty payable on the goods, an airline would be released from all liability to pay such duty while the goods were in the custody of the customs authorities or after receipt into the custody, possession or control of another person in pursuance of a permission given by the customs authorities.

4.42 Acceptable, subject to the following conditions:

1) The stores are consumed on the aircraft in the operation of an international air service. Stores, if landed for use in Australia, would lose their identity as stores and be treated as goods imported.

2) The country in which the aircraft is registered grants reciprocal concessions on stores to Australian aircraft operating in that country.

4.43* Countries which implement this paragraph of Annex 9 will receive reciprocal concessions on stores consumed in Australia.

4.44* Certain items in this category are subject to sales tax. In so far as customs duties are concerned, Australia will implement this paragraph, whenever possible, subject only to its international trade agreements and other obligations arising out of the Australian Government's policy to protect existing Australian industries.

4.45* Australian law does not provide for complete exemption from customs duties and sales tax on instructional material and training aids.

4.46* Australia is not able to comply fully with the provisions of this paragraph in respect of the duty-free admission of airline documents.

4.53 Unaccompanied baggage arriving by air is treated as cargo for purposes of inward report of aircraft, but may be cleared under procedures other than formal entry. Personal and household effects which qualify for concessions when accompanied may not necessarily enjoy the same treatment when unaccompanied. Other goods are liable to normal customs duties.

CHAPTER 5

5.4 Transfer traffic is treated as incoming and outgoing traffic; as such, normal documentation is required except in the case of transfer and through-flight passengers when they remain in transit areas.

5.11* No free airports or free zones have been established in Australia. Warehousing facilities are available elsewhere in the same general vicinity.

5.12* No free airports or free zones have been established in Australia. Warehousing facilities are available elsewhere in the same general vicinity.

CHAPTER 6

6.50* Warehousing facilities are provided in the same general vicinity as the international airports.

6.51* Warehousing facilities are provided in the same general vicinity as the international airports.

6.55* Australia is not bound by International Health Regulations.

CHAPTER 8

8.12 Australia is not bound by International Health Regulations.

8.13* Australia is not bound by International Health Regulations.

* Recommended Practice

AUSTRIA

CHAPTER 2

2.40* Detailed provisions concerning contents of applications and advance filing periods are published in AIP Austria, Section FAL.

CHAPTER 3

3.8 Charges are imposed for the issuance of entrance visas.

3.8.3 The issuance of visas at entry clearance points is limited to exceptional cases, the validity of such visas being restricted in the light of the reason of travel.

3.35.2* The public authorities concerned are not responsible for the custody of persons found inadmissible. The public authorities will bear the cost of custody only if a valid application requesting asylum has been submitted and the applicant has not found other means of protection.

3.36 The public authorities concerned are not responsible for the custody of persons found inadmissible. The public authorities will bear the cost of custody only if a valid application requesting asylum has been submitted and the applicant has not found other means of protection.

3.37.1 In the case of passengers who do not possess the required entry documents, the operator concerned must furnish evidence that the required documentary controls have been complied with.

CHAPTER 5

5.4.1 Permission to enter Austrian territory can only be issued if the passenger referred to in this paragraph holds a passport complying with the relevant regulations.

BELGIUM

CHAPTER 2

2.8 The interpretation given in the Note to paragraph 2.8 cannot be accepted at present. The customs and excise administration cannot offer operators a choice of the various options suggested.

2.8.1* This Recommended Practice cannot be accepted. Whether or not the cargo manifest is used, Community customs legislation requires an indication of the gross weight and the nature of the goods on the documents presented at customs.

CHAPTER 3

3.5.1* The production of machine readable passports is not envisaged in the foreseeable future.

3.40* Recommended Practice 3.40 will not always be applied in so far as it stipulates that public authorities in the destination country be informed in cases of deportation (repatriation). This is a Recommended Practice which will be applied only in very exceptional cases.

* Recommended Practice

CHAPTER 4

4.9* This Recommended Practice cannot be accepted by Member States of the EEC, as unaccompanied baggage is shipped as cargo and, as such, is covered by an air waybill.

4.19* This Recommended Practice is not applicable. The commercial invoice and the certificate of origin are required to be separate documents.

4.44* Not all the equipment referred to in this Recommended Practice is admitted duty-free.

4.45* Not all the equipment referred to in this Recommended Practice is admitted duty-free.

4.53 Notes (b) and (c) cannot be accepted. In fact, unaccompanied baggage, treated like cargo, is physically transferred to the areas provided for goods, which are different from those reserved for passengers' baggage.

CHAPTER 5

5.4 A document showing first, the identity of the packages and of the aircraft and second, the nature, gross weight and place of lading of the goods may be required by customs as a concise declaration of the goods.

5.5 The proposed change is unacceptable. Community customs legislation provides that goods introduced into customs territory are subject to customs surveillance and may be checked by customs authorities.

CHAPTER 6

6.5* This Recommended Practice is not acceptable. Community customs legislation provides that payment of duties and taxes may be made either in cash or by guaranteed and certified bank cheque. The use of credit cards as a means of payment is not provided for.

6.28* This Recommended Practice is not acceptable. While, in practice, customs clearance is carried out as rapidly as possible and, in most cases, within the limit provided by this measure, it is not possible for customs administrations to accept such a constraint.

6.37.2 The customs administration is not in a position to apply this Standard fully.

6.39* This Recommended Practice cannot be accepted. The activities of duty-free shops are tolerated because they are based on the notion that the goods offered for sale are for export. The new definition is incompatible with this principle.

CHAPTER 8

8.19* Belgium no longer has a facilitation committee. However, ongoing co-ordination of facilitation matters is established among the various ministries, institutions and other bodies as well as with operators and airport and aircraft users.

---

* Recommended Practice

CHAPTER 2

2.4 A General Declaration is required (simplified format).

2.20 The fees are payable at the Consulate which has jurisdiction over the last point of departure before entering the national territory.

2.34 Advance notification by the aeronautical authorities of the country of origin of the aircraft is required for issuance of the particular authorization.

2.35 Notification of the arrival of the aircraft must be at least 48 hours in advance.

CHAPTER 3

3.5.3* The initial period of validity of passports is one year.

3.5.4* Passports may be renewed at the end of the first year of issue and in each case the period of renewed validity is one year.

3.8.3 Entry visas for temporary visitors are valid initially for 30 days and may be renewed twice (total 90 days).

3.9* A simple Embarkation/Disembarkation Card is required in original form only for the Immigration authorities.

3.17 All baggage is inspected.

3.17.1 There is no dual channel system.

3.28 Visas are required except for holders of official passports. Bolivian nationals and foreign residents leaving the territory of Bolivia are required to obtain a permit from the Ministry of the Interior (Immigration), and all minors whether foreign residents or nationals, must submit an exit certificate, issued by the National Directorate of Minors (DIRME).

3.29* Visas are required except for holders of official passports. Bolivian nationals and foreign residents leaving the territory of Bolivia are required to obtain a permit from the Ministry of the Interior (Immigration), and all minors whether foreign residents or nationals, must submit an exit certificate, issued by the National Directorate of Minors (DIRME).

3.32 Tax clearance certificates are required of temporary visitors who stay in Bolivia for gainful purposes.

CHAPTER 4

4.13 Examination of goods and unaccompanied baggage is not required but such shipments are inspected by the trained dogs of the narcotics law enforcement authorities.

4.15 Goods and unaccompanied baggage which are being exported are only cleared in the local customs office. At present, the clearing of merchandise and unaccompanied baggage not exceeding U.S.$300.00 in value is being done at the customs offices of La Paz and Santa Cruz Airports.

* Recommended Practice

4.17 For duty-free imports, a Certificate of Value of the goods is required to be attached to the original purchase bills.

4.19* For duty-free imports, a Certificate of Value of the goods is required to be attached to the original purchase bills.

4.22 Import licences or permits are still required for certain articles.

4.23* Goods of a value not exceeding U.S.$300.00 only require the air waybill and the commercial invoice as clearance documents. The customs will make out an official import certificate for clearing the goods.

4.23.1* Only goods of small value under U.S.$300.00 are exempt from payment of import duties.

4.24 Goods of a value not exceeding U.S.$300.00 only require the air waybill and the commercial invoice as clearance documents. The customs will make out an official import certificate for clearing the goods.

4.25* Applicable in exceptional cases only.

4.28* Veterinary and phytosanitary controls are only required in the absence of the relevant health documents.

4.30 All imported goods are required to be examined, but this can be done by sampling if the goods are identical.

CHAPTER 6

6.6* When an airline wishes to provide its own services for ground handling operations or to have such operations performed entirely, or in part, by another airline, it must have the express approval of the airport administration (AASÁNA).

6.37.1* There is not sufficient space available at the passenger terminal for storage of baggage.

6.40* to 6.52* These Recommended Practices will be taken into account in the plans for new cargo terminals and/or extension of existing cargo terminals.

6.64* Not justified at the present time.

---

* Recommended Practice

CHAPTER 2

2.4 A General Declaration is required.

2.4.2 A Passenger Manifest is required in respect of inbound and outbound passengers.

2.4.4 The General Declaration must be presented to both Immigration and Customs authorities.

2.5 The names of the crew members must be given under the heading "Total Number of Crew" or by annex.

2.6 A list of names of inbound and outbound passengers is required. This list can be in the form of an annex to the General Declaration.

2.6.1* A list of names of inbound and outbound passengers is required. This list can be in the form of an annex to the General Declaration.

2.7* A cargo manifest is required.

2.22 Contravention of any of the regulations may lead to prosecution.

CHAPTER 3

3.8.6* Re-entry visas are not required from resident aliens provided they are in possession of a valid residents permit.

3.9* Arrival/Departure Forms differing from Appendix 5 and including passport particulars must be completed by passengers.

3.10 Arrival/Departure Forms differing from Appendix 5 and including passport particulars must be completed by passengers. The Arrival Form requires the following information:

1) Name
2) Other Names
3) Date of Birth
4) Country of Issue
5) Passport Number
6) Flight Number
7) Amount of money brought into Botswana
8) Country of Birth
9) Nationality of Passport Holder
10) Address in Botswana
11) Purpose of Entry
12) Permanent Home Address
13) Length of Intended Stay in Botswana
14) Whether the passport holder has ever been refused entry to Botswana
15) Declaration and Signature

The Departure Form also has 15 requirements. Requirements 1-7 (inclusive) are the same as in the Arrival Form. The others are as follows:

* Recommended Practice

8) Are you leaving Botswana for
   a) less than 6 months
   b) between 6 months to 1 year
   c) more than one year
9) Country of Birth
10) Nationality of Passport Holder
11) Address in Botswana
12) Permanent Home Address
13) Length of Stay in Botswana
14) Approximate amount of money spent in Botswana
15) Declaration and Signature

3.15 Documents of passengers may, under certain circumstances, be inspected by more than one official.

3.16 The customs authorities would determine the manner in which the declaration of goods by passengers and crew should be made.

3.37.1 Certain penalties may be imposed for failure to remove a prohibited person.

CHAPTER 4

4.23* All goods must be declared for customs purposes on the prescribed form except those goods which, in the opinion of the Director of Customs, are of no commercial value.

4.23.1* All goods must be declared for customs purposes on the prescribed form except those goods which, in the opinion of the Director of Customs, are of no commercial value.

4.24 All goods must be declared for customs purposes on the prescribed form except those goods which, in the opinion of the Director of Customs, are of no commercial value.

4.53 Unaccompanied baggage is not allowed the same concessions as accompanied baggage.

CHAPTER 5

5.2 The Arrival/Departure Form is required from all inbound and outbound passengers except Botswana passport holders.

5.4 The Arrival/Departure Form is required from all inbound and outbound passengers except Botswana passport holders.

5.8* The Arrival/Departure Form is required from all inbound and outbound passengers except Botswana passport holders.

5.9* The Arrival/Departure Form is required from all inbound and outbound passengers except Botswana passport holders.

---

* Recommended Practice

28/2/94

CHAPTER 2

2.4 Although there is no requirement for the presentation of the General Declaration, the operator has to provide the number of crew members and passengers disembarking and in transit (on arrival) and the route of the onward journey, the number of crew members and passengers embarking and in transit (on departure). This information has to be submitted to the Federal Police and Sanitary Inspection Unit. In addition the pilot-in-command has to report any sickness observed during flight and details of procedure followed concerning the sickness, conditions on board as affected by the sickness in question and the process of disinfection the aircraft has undergone when travelling through States affected by infectious/contagious disease.

2.12 At the outbound dispatch the operator shall provide the Federal Police and the Sanitary Inspection Unit, in writing, at intermediate stop airports, in addition to the name of the airline, the flight number or registration of aircraft, also the route, number of crew members and passengers embarking and in transit.

2.15 Upon arrival of aircraft at international airports, the operator has to provide, in writing to the Federal Police and Sanitary Inspection Unit, the name of the airline, flight number or registration number of the aircraft, details of inbound route, number of crew members and passengers disembarking and in transit. Also, the pilot-in-command has to inform the Sanitary Inspection Unit of all details of medical/sanitary events of concern that occur on board the aircraft.

2.35 The arrival of the aircraft shall be notified at least 24 hours in advance to the administration of the international airport at which it will land upon entering Brazilian airspace.

2.42* The participation of more than one government department is required for clearance of small aircraft and their loads.

CHAPTER 3

3.8.3 The validity of any visa is 90 days as of the date of issuance, subject to one renewal by the Consular authorities on payment of the appropriate fee. Foreign holders of tourist visas who leave Brazilian territory may return without a new visa provided the return falls within the period of validity of their stay in Brazil as prescribed in the visa.

3.9* The control of embarkation and disembarkation will be performed through an entry and departure form which will be completed and delivered, in duplicate copies, to the Federal Police by the passengers and crew members.

3.10 The authorities require full completion of entry and departure forms, which differ from the model contained in Appendix 5 of Annex 9.

3.37.1 Operators may be fined if they transport into Brazil any foreigners whose documents are not in order.

CHAPTER 4

4.23* Customs clearance of imported goods are processed by declaration regardless of the established value or weight. The air waybill corresponds in all respects to a commercial invoice and the carrier must provide to the Federal Revenue Authorities at the unloading point, within 48 hours following the arrival of the aircraft, a cargo bill of lading which must follow the format approved by the Secretary of Federal Revenue.

CHAPTER 8

8.16 The pilot-in-command has to report any sickness observed during flight and details of procedure followed concerning sickness, conditions on board as affected by the sickness in question and the process of disinfection the aircraft has undergone when travelling through States affected by infectious/contagious disease.

* Recommended Practice

CHAPTER 2

2.6 The Passenger Manifest is required.

2.8.1* The nature of the goods must be indicated.

2.18* The documents must be in French.

2.42* The undertaking of the owner to export his/her aircraft at the end of the time period is required.

CHAPTER 3

3.5.3* The period of validity of the passport is 3 years.

3.8.1* Machine Readable Passports are not issued.

3.8.3 Visas are valid for 3 months.

3.8.6* Foreigners obliged to have visas must be in possession of a visa for re-entry.

3.10 The Embarkation/Disembarkation Card contains the following additional information:

— address in the country of disembarkation;
— reason for the journey;
— duration of the journey;
— number, date and place of issue of the passport;
— duration of the period of validity of the visa; and
— passenger's signature.

3.30* Presentation of baggage may be required.

CHAPTER 4

4.9* Presentation of individual documents is required.

4.42 Payment of taxes for services rendered may be required.

4.43* Payment of taxes for services rendered may be required.

4.44* Payment of taxes for services rendered may be required.

---

* Recommended Practice

CHAPTER 2

2.6 A list of passengers' names including their place of boarding and place of destination is required for an aircraft which is admitted to air traffic in Burundi.

2.8 A manifest of detailed bills of lading is required for a cargo aircraft which is admitted to air traffic in Burundi.

2.34 The minimum periods required for advance notification of arrival are established as 2 days for transit non-stop flights, 8 days for flights stopping for non-traffic purposes, and 15 days for flights stopping for traffic purposes.

2.35 The minimum periods required for advance notification of arrival are established as 2 days for transit non-stop flights, 8 days for flights stopping for non-traffic purposes, and 15 days for flights stopping for traffic purposes.

CHAPTER 3

3.3 A foreign currency declaration is required on arrival.

3.5.1* Burundi does not issue machine readable passports.

3.5.3* Burundi issues regular passports with a period of validity of four years, and one year for service passports.

3.8 There is no charge for the issue of diplomatic or courtesy visas. The issue of an entrance visa is subject to a charge of US$20 or its equivalent in Burundi francs.

3.8.3 Entrance visas for visitors have a period of validity of not more than three months.

3.17 Inbound passengers' baggage is inspected on a systematic basis.

3.31 Outbound passengers' baggage is inspected by the airport security and customs departments.

CHAPTER 4

4.10 An export licence is required for customs clearance of export cargo.

4.30 Goods imported by air are inspected on a systematic basis when they are cleared through customs.

CHAPTER 6

6.10* Passengers and crew are not under shelter when proceeding between the air terminal and the aircraft.

6.54* Vaccinations, revaccinations and the delivery of the corresponding certificates are carried out at the health service in the city.

---

* Recommended Practice

28/2/94

CHAPTER 2

2.8 Canadian customs' regulations require that all air carriers report cargo either on an IATA standard format air waybill or on the official national customs cargo control deocument.

2.8.1* This Recommended Practice suggests that States not require the completion of information concerning the nature of goods listed on the Cargo Manifest. The description of the nature of goods provided on this document is essential information which cannot be dispensed with.

2.40*, Note In order to arrange for the clearance of charters involving the arrival of a large number of passengers at small airports or at remote locations in Canada, customs officials require more than two days notice. (The notification period varies between 48 hours and 15 days depending on the country of origin for reporting to the National Transportation Agency. In addition, the requirements pertaining to advance notice for a Canadian originating flight vary between two working days and 45 calendar days.)

CHAPTER 3

3.8 Fees are normally payable by nationals of all countries, except those countries where no visitor visa is required, for processing the issuance of approved Canadian visitor's visas. No charge is levied for refused visas as no further processing is required.

3.8.2 Canada reserves the right to require visitor visa applicants to appear at a Canadian consulate before a visitor's visa will be issued.

3.8.3 Some travellers may be issued single entry visas valid for less than one year.

3.17.1 The system of optional channels which may be established in Canada will be different in certain respects from the one recommended in Appendix 6 to Annex 9. Nevertheless, the general principle and the ultimate purpose are the same.

3.19 If mishandled baggage includes baggage which was delivered to the owner and not reported to customs by the air carrier, national legislation in Canada provides for the assessment of penalties in such cases.

3.36 In Canada, the responsibility of carriers goes further than is implied in the Standards and Note. Section 88(1) of the Immigration Act requires, *inter alia*, that the airline shall have the custody and care of the person in question until such time as it is possible to place him on board the aircraft on which he is deemed to travel.

3.36.1 Section 52(2) of the Immigration Act requires, *inter alia*, that where a person is ordered removed from Canada, the person shall be removed to:

(a) the country from which that person came to Canada;
(b) the country in which that person last permanently resided before he came to Canada;
(c) the country of which that person is a national or citizen; or
(d) the country of that person's birth.

In some cases, it may be necessary to return a person found inadmissible to Canada to a country where the person was earlier found inadmissible.

* Recommended Practice

3.36.2 In Canada, the responsibility of carriers goes further than is implied in the Standards. Section 85(1) of the Immigration Act requires, *inter alia*, that where a person is ordered removed from Canada after his admission, the carrier which brought that person to Canada shall convey him or cause him to be conveyed from Canada, at the expense of the Canadian government when required to do so.

3.36.3 Unless there is an agreement respecting return fares between the operator and the person being conveyed, Section 88(2) of the Immigration Act prohibits the operator from recovering transportation costs from any person who is ordered removed from Canada, rejected from Canada or is allowed or required to leave Canada.

3.37 The obligation of the carrier goes further than is implied in the Standards. Section 89(1) of the Immigration Act requires transportation companies, *inter alia*, to ensure that passengers requiring travel documents are presented to an immigration officer at the Canadian port of entry in possession of required documents.

3.37.1 A fine can only be levied where a transportation company has been convicted of an offence in court. However, no person (company) can be found guilty of an offence if the person can establish that they exercised due diligence to prevent its commission.

Subject to the terms of any Memorandum of Understanding between a transportation company and the Immigration Department, a transportation company may be assessed an administration fee for bringing improperly documented passengers to Canada. The fee is assessed in order to recover a small portion of the costs required to process inadmissible passengers with no documents or improper documents. The fee can be reduced to zero if the transportation company meets certain performance standards to reduce the arrival of improperly documented passengers.

CHAPTER 4

4.9* When goods are being exported from Canada, the exporting carrier is required to present to customs a single copy of the air waybill for each shipment laden on board the aircraft. This document is to be supported by individual export declarations, export permits, etc. as required by national legislation. In the case of goods exported temporarily, there is a need in some instances for additional documentation other than a simple export declaration.

4.10 When goods are being exported from Canada, the exporting carrier is required to present to customs a single copy of the air waybill for each shipment laden on board the aircraft. This document is to be supported by individual export declarations, export permits, etc. as required by national legislation. In the case of goods exported temporarily, there is a need in some instances for additional documentation other than a simple export declaration.

4.14 The physical examination of goods referred to in this section cannot normally be carried out on a selective technique basis. Goods exported temporarily or those which are exported after having been temporarily imported must normally be examined on an individual basis.

4.18 When the value of commercial shipments does not exceed $500.00 a commercial invoice is acceptable. In all other instances properly completed customs invoices are required.

4.23* Gifts, not being advertising matter, tobacco or alcoholic beverages, may be admitted duty free and tax exempt under the provisions of the Customs Tariff and Excise Tax Act provided they are sent by persons abroad to residents of Canada when the value does not exceed twenty-five dollars in any one case. Travellers' samples of negligible value may be admitted without payment of customs charges when imported by residents or non-residents to solicit orders for similar goods to be supplied from abroad. Commercial samples may be temporarily imported free of duties and taxes provided they meet the requirements of national legislation. However, such samples must be documented on an ATA Carnet or on the appropriate national customs document.

* Recommended Practice

4.23.1* Imports of commercial samples referred to in 4.23, while exempt from customs duties and excise taxes, may be subject to the filing of security when imported on a temporary basis. Commercial samples remaining in Canada on a permanent basis are subject to the regular provisions of the Customs Tariff Act and the Excise Tax Act. However, samples of negligible value are, under national legislation, free of duties and taxes and other charges.

4.44* Machinery and equipment imported into Canada for use exclusively in servicing aircraft registered in a foreign country while at international airports in Canada are duty free provided the foreign country in which the aircraft is registered grants a similar privilege to aircraft registered in Canada. Sales tax is payable on the value of the equipment.

4.46* National legislation provides for the duty and tax free importation of airline documents referred to in this section provided that reciprocal privileges are extended to Canada.

4.47 National legislation does not allow urgently required goods to be imported or exported from Canada completely free of all documentation. However, Canadian Customs entry and release procedures do provide in the case of goods imported systems whereby goods can be entered with a minimum of documentation so long as fully completed entry documents are provided and any duties and taxes payable are paid within a prescribed period of time.

CHAPTER 5

5.4.1 Under Canadian Immigration Legislation, every person who intends to come to Canada or to transit through Canada shall be in possession of a valid visa, unless exempted by the Immigration Act or regulations.

5.8* The Canadian Immigration Act requires that any person requesting admission to Canada shall first appear before an immigration officer at a port of entry for examination as to whether he may be allowed to enter Canada. Passengers in transit from an international airport to another international airport must satisfy these requirements.

5.12* Canadian legislation does not provide for the establishment of free airports or free zones, but a warehouse procedure may be utilized as an alternative system. Under this procedure, imported goods may be stored in a customs bonded warehouse for subsequent re-exportation without payment of duties and taxes.

CHAPTER 6

6.69 Wherever possible, the Canadian Department of Transport will make accommodation available for authorized private agencies to provide monetary exchange facilities, but the Department will not itself provide such services.

CHAPTER 8

8.1* It was concluded after careful study that it is not practical to have a single bond cover an operator's liabilities for all government requirements.

8.4 There is provision in national legislation for the temporary importation of goods for a search or rescue operation. However, there is no provision which would allow duty or tax free entry of the articles mentioned for the accident investigation, repair or salvage aspects. The goods in this case would be subject to the provisions of the Customs Tariff and Excise Tax Acts.

8.7 The outward movement of the parts would pose no problem. However, on re-importation the parts would be subject to the regular provisions of the Customs Tariff and Excise Tax Acts if they are foreign goods.

* Recommended Practice

CHAPTER 2

2.4	The presentation of a General Declaration containing a list of crew members is required.
2.4.4	An international police stamp is required for the purpose of outbound or inbound clearance.
2.7*	The presentation of a cargo manifest following the ICAO format is required.
2.35	The information contained in the flight plan alone is not accepted. The pilot-in-command or the owner of the aircraft (or his legal agent) must report their entry into the country to the Directorate General of Civil Aviation at least 24 hours beforehand.

CHAPTER 3

3.5.1*	The implementation of this provision in the near future is being studied.
3.5.3*	This provision is complied with. Passports are now valid for 10 years.
3.7*	This Recommended Practice is complied with on a reciprocal basis.
3.8.3	As a general rule, tourists do not require a visa to enter the country. They may continue in that capacity for 90 days from the date of issue of their visas after which their visas may be renewed for another 90 days. This system operates on a basis of reciprocity.
3.8.4*	In special cases of force majeure, international police can even permit the entry of transit passengers who do not possess suitable documentation.
3.8.6*	Resident aliens, with the exception of officials or diplomats and those who have permanent resident status, are required to have a re-entry visa granted by the administrative authorities so that they do not lose their resident status. On their return, they should enter as holders of the permit that they held before.
3.9*	An Embarkation/Disembarkation Card, as well as a tourist card, are required.

CHAPTER 4

4.6	Not yet applicable to Chile.
4.8.1*	This provision is not applied.
4.9.1*	The United Nations Layout Key is not used.
4.17.1*	The United Nations Layout Key is not used. Very similar forms, however, are used depending on customs requirements.
4.23.1*	Trade samples are not subject to customs duties in Chile, provided that a certificate of non-use has been previously issued. Gifts are subject to full duties, but their clearance is expedited.

* Recommended Practice

CHAPTER 5

5.4.1 This Standard is complied with. The International Police Authorities stamp the tourist cards of transit passengers with a 24-hour permit. This period may be extended by the competent authorities.

5.11* In Chile there are no free airports as such, but the purposes of such airports are served in specially designated areas.

CHAPTER 6

6.4* The airline simply functions as collector of the boarding fee for the Directorate General of Civil Aviation, using stamps of a particular value.

6.5* The credit card system is not yet implemented.

6.37.1* Such facilities are not available in Chile.

6.46* There are no cargo terminals with storage facilities for special cargo.

CHAPTER 8

8.19* There is an Air Transport National Facilitation Commission in Chile which meets ICAO requirements. There are also Airport Committees governed by Basic and Operational Regulations established by the Directorate General of Civil Aviation.

* Recommended Practice

CHAPTER 1

Infected area. The Ministry of Public Health complies with the requirements relating to international notification (PAHO/WHO) concerning the existence on national territory of areas infected by transmissible diseases. Currently, our country has no etiological agents, vectors or hosts of the diseases referred to in the International Health Regulations, or of others which are the subject of epidemiological surveillance by WHO such as malaria, dengue fever, filariasis, trypanosomiasis, leishmaniasis, hemorrhagic fevers, etc.

Disinsecting. In this respect the Ministry of Public Health has regulations similar to those contained in the Annex (operation in which measures are taken to kill the insect vectors of human diseases in aircraft and containers, International Health Regulations).

Direct transit area. This area, in addition to affording accommodation to passengers, should serve to prevent the propagation of transmissible diseases, through epidemiological monitoring and the adoption of immediate health measures while passengers remain therein.

CHAPTER 2

2.4 The health authorities of the Ministry of Public Health of the Republic of Cuba shall continue to require the presentation of the General Declaration at airports serving international traffic, but not that of the Passenger Manifest.

2.4.1 The Ministry of Public Health of the Republic of Cuba shall continue to require that the General Declaration be signed in the health section by the purser or other crew member designated by the pilot-in-command.

2.4.3 The final part of this provision is not clear where it reads: "When the General Declaration itself has been signed by a non-crew member."

2.6 The Minister of Public Health of the Republic of Cuba shall not normally require the presentation of a Passenger Manifest. This document shall be required only in situations of epidemiological emergency in the countries of origin in order to carry out personal monitoring of the passengers.

2.23 Disinsection as a public health measure shall continue to be required of all aircraft whether of Cuban or non-Cuban registry. The technical regulations laid down by WHO for the application of insecticides shall be complied with, in conformity with the specifications in subparagraphs a), b) and c).

2.24* The public health authorities of the Ministry of Public Health of the Republic of Cuba shall accept, as proof that disinsection has been carried out, the procedure mentioned above in respect of the General Declaration. The foregoing does not preclude the health authorities from checking for the presence on board of manual equipment or other technical means of disinsection, which they shall do in epidemiological situations or for random checking of disinsecting procedures. In Note 2 to this paragraph concerning the "Certificate of Residual Disinsection", in our country this procedure is followed only on aircraft operated by Cubana de Aviación. No airline owning or leasing foreign aircraft has requested this type of antivectorial processing on aircraft arriving in Cuba.

2.27* Detection on board of live insects which are vectors of human disease after it has been declared that the aircraft has been disinsected entails immediate antivectorial processing by the national health authorities and the imposition of fines, in accordance with the health legislation in force.

2.28* In the usual practice of national airports serving international traffic, aircraft disinsection procedures are integrated and co-ordinated in such a way as to satisfy the requirements of the veterinary, phytosanitary and public health authorities, thus avoiding the separate and repeated performance of disinsection.

2.29* In the usual practice of national airports serving international traffic, aircraft disinsection procedures are integrated and co-ordinated in such a way as to satisfy the requirements of the veterinary, phytosanitary and public health authorities, thus avoiding the separate and repeated performance of disinsection.

* Recommended Practice

CHAPTER 3

3.4 This provision is complied with. It is not required in the case of special tourism, sailors having seafarers' identity documents, or aircrew having crew members' certificates.

3.4.1* It is not yet possible for our passports to be machine readable. They are guaranteed to contain those data which are necessary strictly to identify the bearer and attest to Cuban nationality.

3.5 Current passports are issued at the time of application, i.e. immediately.

3.5.2* Passports are applied for and obtained in territorial offices, at which the applicants present themselves in accordance with their domicile. These offices are located throughout the national territory.

3.5.3* Passports are valid for two years, renewable for an additional two-year period on two consecutive occasions, for a total of six years. Cuba is not in agreement with granting an initial validity of five years renewable once for a total of ten years, since this would necessitate changing the legislation in force.

3.5.4* Passport renewal is carried out immediately.

3.5.7* In practice joint passports are not issued to both spouses, but to one spouse and his/her minor children.

3.5.8* The passport is issued immediately irrespective of bearer's age.

3.6 This provision is complied with only when the passport is accompanied by the Embarkation/Disembarkation Card.

3.8.1* There are no provisions for the machine reading of visas.

3.8.2 This is complied with. Such visas are obtainable in not more than 7 working days, unless this time limit is shortened or extended by reciprocal agreement.

3.8.3 The issuance of entrance visas for visitors is authorized in Cuba at the request of a competent senior official. In other cases, visas are issued for one entry and if the bearer does not enter the country within the next 90 days, the visa requested loses its validity.

3.8.4* The immigration legislation in force, like all legislation, subordinates its requirements to reasons of *force majeure*, which would necessarily have to be exceptional.

This possibility should not be confused with indiscriminate practices and deliberate failure to comply with the above-mentioned legislation.

3.8.5 For the time being the entry of Cubans who have emigrated remains, for obvious reasons, subject to a permit from Immigration to enter Cuba. Those whose migration took place before 1.1.59, as well as those who reside abroad with a foreign residence permit (PRE), may enter whenever they desire and do not require a permit from Immigration.

3.8.7* Our current visa system includes the items shown.

3.9* Only the General Declaration is required. It contains the number of passengers in transit. The passengers must fill in the Embarkation/Disembarkation Card, unless they have visas or permits on a separate piece of paper or a tourist card.

3.10.1 Current legislation establishes the obligation of airlines to provide each passenger with an Embarkation/Disembarkation Card, in accordance with such instructions as may be made with regard to its contents.

3.11 The Ministry of Public Health does not require the Certificate of Vaccination or Revaccination against yellow fever and informs all countries of the world of this annually, through WHO.

3.12* Medical examination of persons arriving by air shall normally be limited to those coming from an area infected with one of the quarantinable diseases (plague, cholera and yellow fever) and having symptoms or clinical signs of these diseases. The remaining passengers having no clinical indications of these diseases and disembarking within the incubation period shall be subject to epidemiological monitoring until the end of that period, depending on the disease suspected.

* Recommended Practice

3.13 In Cuba the identity documents of passengers or crew are not collected, unless infractions are committed which are aimed at flouting clearance procedures and policies governing entry to the country.

3.23 All crew members are licence holders. Crew members' certificates are issued free of charge.

3.24 Flight crew members may identify themselves with their licences in lieu of passports, and with crew members' certificates in lieu of visas.

At the present time visas are not required of crew members from countries extending the same treatment to Cuban crew members.

3.26* There are no immigration limitations on the length of time ground and flight personnel may remain in Cuba to the extent that such personnel are necessary to perform supervisory and technical duties directly connected with the operation of the international air services being performed by such airlines.

3.27 The same as above (3.26) applies to 3.27, to technical personnel of foreign airlines, in the case of forced landings or damage which must be remedied before the flight can be continued.

3.28 Also, for obvious reasons, Cubans are required to have exit permits when travelling with a regular passport but not when carrying a diplomatic, service, official or seaman's passport.

Foreigners remaining more than 90 days in Cuba, other than guests of the Government, are required to have exit permits and therefore, when they remain less than 90 days like visitors, the entrance visa itself can be used for their departure.

CHAPTER 6

6.6* There is participation in ground handling operations, basically on the departure of aircraft. This function takes the form of a control procedure to prevent unauthorized persons from boarding.

It is agreed that there should be no participation in ground handling operations at disembarkation, although personnel should make sure that all passengers proceed to the locations established for immigration control.

6.27* We check on this constantly.

6.28* The immigration averages are less than one minute per passenger at all airports.

6.32* This is applied at the request of the airline.

6.33* Passengers in transit and crew members not entering the country are not cleared. Passengers are given a boarding pass which is taken from them when they board the aircraft. Crew members remain on the ground during the operations. They are only checked against the title page of the flight log and they are authorized to enter the terminal building to carry out work duties and even to make purchases in the shops.

6.35* Authorization is granted at the request of the airline.

6.53 The Ministry of Public Health of the Republic of Cuba, in co-ordination with the airport authorities, guarantees and will in future guarantee at Cuban airports serving international traffic, public health, personnel quarantine, vaccination and revaccination, adequate premises for the administration of public health measures, premises and exterior areas free from any danger of infection and insect vectors of diseases.

6.54* The Ministry of Public Health of the Republic of Cuba, in co-ordination with the airport authorities, guarantees and will in future guarantee at Cuban airports serving international traffic, public health, personnel quarantine, vaccination and revaccination, adequate premises for the administration of public health measures, premises and exterior areas free from any danger of infection and insect vectors of diseases.

6.55* The Ministry of Public Health of the Republic of Cuba, in co-ordination with the airport authorities, guarantees and will in future guarantee at Cuban airports serving international traffic, public health, personnel quarantine, vaccination and revaccination, adequate premises for the administration of public health measures, premises and exterior areas free from any danger of infection and insect vectors of diseases.

* Recommended Practice

28/2/94

6.56* The Ministry of Public Health of the Republic of Cuba, in co-ordination with the airport authorities, guarantees and will in future guarantee at Cuban airports serving international traffic, public health, personnel quarantine, vaccination and revaccination, adequate premises for the administration of public health measures, premises and exterior areas free from any danger of infection and insect vectors of diseases.

6.57* The Ministry of Public Health of the Republic of Cuba and other airport authorities have adopted the necessary measures to ensure that the procurement, preparation, handling, storage and service of food and water intended for human consumption both at airports and on aircraft are hygienically carried out and do not constitute a health hazard, in accordance with the recommendations and standards of the World Health Organization.

6.58* The Ministry of Public Health of the Republic of Cuba, in co-operation with airport authorities, will adopt the necessary measures to ensure that the disposal of excrement, refuse, waste water, food waste, unused food and other dangerous matter, produced on aircraft engaged in international traffic and in airport facilities, are hygienically carried out without constituting an epidemiological hazard, in accordance with WHO recommendations and standards.

6.59* The Ministry of Public Health of the Republic of Cuba maintains a qualified, organized and responsive staff at all times along with facilities for first aid attendance at the airport, and co-ordination procedures with selected hospitals for competent medical attention of the highest order have been established and tested.

6.62 The Ministry of Public Health of the Republic of Cuba provides immediate medical services free of charge to international passengers at every airport in the country and on a 24-hour basis.

6.62.1 The Ministry of Public Health of the Republic of Cuba provides immediate medical services free of charge to international passengers at every airport in the country and on a 24-hour basis.

Cuba does not require International Certificates of Vaccination and vaccinations are only administered to those passengers who expressly request them to satisfy a requirement to visit a third country. In such cases the vaccination is administered free of charge.

6.64* It is not the usual practice for States to station medical personnel at the airports of other countries to examine aircraft, passengers, crew, etc., prior to their departure for those States or countries. In fact, this has never been done. Taking into account public health development and experience in our country, the Ministry of Public Health of the Republic of Cuba, with regard both to medical assistance and to epidemiological control and with respect to public health in the Republic of Cuba, disapproves and is not in agreement with this recommendation.

CHAPTER 8

8.12 The Ministry of Public Health of the Republic of Cuba, as a representative of the Cuban State and an active member of WHO, complies with the provision of the International Health Regulations.

8.13* The Ministry of Public Health of the Republic of Cuba is in agreement that in cases where epidemiological conditions permit and it will result in reducing or eliminating the number of sanitary measures required, agreements be established with the health authorities of other States in conformity with the provisions of the International Health Regulations.

8.14 The Ministry of Public Health of the Republic of Cuba has established that International Certificate of Vaccination forms in compliance with the International Health Regulations be used officially at all International Vaccination Centres in the country.

8.15* Respecting the provision of health regulation notices to foreign international passengers bound for Cuba, the requirements referred to have been specified in this document.

8.16 Compliance with this Recommendation is incumbent upon the pilot-in-command or other authorized crew member to inform the health authorities of the State for which the aircraft is bound of the presence of illness, other than suspected airsickness, in order to facilitate provision for the presence of any special medical personnel and equipment necessary for medical assistance and health procedures on arrival.

* Recommended Practice

CHAPTER 2

2.4 The presentation of General Declaration is required by statute. The ICAO standard form is used.

2.4.4 Customs in Cyprus need the General Declaration as a reporting and clearance document and as such it is required to be stamped and signed for both inbound and outbound traffic.

2.7* The presentation of Cargo Manifest is required.

2.8.1* Information concerning the nature of goods is required in the Cargo Manifest.

CHAPTER 3

3.8.2 Applicants are required to make a personal appearance at the Cyprus Consulate.

3.8.3 Entry visas for visitors are normally made valid for a period of three months from the date of issue, regardless of the number of entries, on the understanding that the duration of each stay may be limited.

3.10 The format of the Embarkation/Disembarkation Card differs from the format set forth in Appendix 5 to Annex 9 in data and colour. The Arrival Card is white and the Departure Card is green.

3.25.2 Crew members arriving as passengers in order to join an aircraft are required to present their national passports.

CHAPTER 4

4.23.1* Unacceptable in principle, but certain articles are exempted.

4.44* The duty-free importation of airline tickets, shipping documents and luggage labels by airlines is provided for under the Customs and Excise Duties Law No. 18 of 1978. Aircraft stores, spare parts, lubricants and fuel are exempted from the payment of duty under the provisions of bilateral air services agreements between the Republic of Cyprus and the governments of various countries whose national airlines use the international airports of the Republic of Cyprus. Certain items may be subject to import duty.

4.46* The duty-free importation of airline tickets, shipping documents and luggage labels by airlines is provided for under the Customs and Excise Duties Law No. 18 of 1978. Aircraft stores, spare parts, lubricants and fuel are exempted from the payment of duty under the provisions of bilateral air services agreements between the Republic of Cyprus and the governments of various countries whose national airlines use the international airports of the Republic of Cyprus. Certain items may be subject to import duty.

4.53 As to the items covered in the note under this paragraph:

(i) acceptable only when the baggage is not shown on the aircraft Cargo Manifest;

(ii) acceptable only when the Customs Authorities are satisfied that these concessions were not granted to the passenger on arrival.

---

* Recommended Practice

28/2/94

CHAPTER 2

2.38 An application for landing in the Republic is required to be filed at least 14 days in advance of the intended arrival of the aircraft.

2.40* The charter price is required in addition to the details required in this Recommended Practice. In instances where the charter is an inclusive fare charter, more details may be required.

2.42* Not applicable.

CHAPTER 3

3.5.6* Children over the age of fifteen years require a separate passport.

3.8.3 Entrance visas for visitors are usually issued to be valid for up to a period of three months from the date of issue. Visas are usually issued on a trip-by-trip basis and not on a multiple-entry basis.

3.8.6* Re-entry visas are required from resident aliens.

3.24 Implementation on the condition of reciprocity.

3.24.1 Implementation on the condition of reciprocity.

3.25 Implementation on the condition of reciprocity.

3.25.1* Implementation on the condition of reciprocity.

3.25.2 Implementation on the condition of reciprocity.

3.25.3* Implementation on the condition of reciprocity.

3.30* Presentation of baggage of passengers is required when they leave the Republic.

CHAPTER 4

4.23* Trade samples over the value of US$1 have to be accompanied by a commercial invoice (certificate of value).

4.23.1* Private consignments over the value of Czech CZK 3.000 (retail price) are subject to the levy of import duties.

4.28* Veterinary and plant consignments fall within the purview of the customs authorities.

CHAPTER 5

5.11* Neither free airports nor free zones have been established in the Czech Republic.

5.12* Neither free airports nor free zones have been established in the Czech Republic.

5.13 Warehousing facilities are provided only at international airports.

CHAPTER 6

6.64* Pre-clearance facilities are not provided in the Czech Republic to authorities of the other Contracting States.

6.71* Non-Czech citizens may import up to CZK 100 without a foreign exchange permit unless otherwise specified in a bilateral finance agreement between the Czech Republic and a Contracting State.

* Recommended Practice

CHAPTER 2

2.8 European Community legislation requires that the gross weight and nature of goods be declared.

2.8.1* European Community legislation requires that the gross weight and nature of goods be declared.

2.10 A written Customs Declaration which is a combination of the general declaration and a stores list is required. The declaration covers the stores remaining on board the aircraft.

CHAPTER 3

3.5.6* Children over the age of fifteen years require a separate passport.

3.8.1* Visas to Denmark are not issued in machine readable form.

3.8.2 Normally, applicants for entrance visas must make a personal appearance at a consulate.

3.8.3 Entry visas are normally issued for not more than three months on a trip-by-trip basis.

3.8.6* Re-entry visas are necessary for residents who do not possess a document proving their residence entitlement in Denmark (residence permit).

3.9* The Inter-Nordic passport control area comprising Denmark, Finland, Iceland, Norway and Sweden, requires visitors who hold entry visas to complete a special disembarkation card, which differs from the ICAO format. Others who do not require entry visas are not required to fill out disembarkation cards.

3.25.2 Visas are required from crew members who are nationals of States who otherwise are obliged to obtain visas.

3.25.3* Visas are required from crew members who are nationals of States who otherwise are obliged to obtain visas.

3.37.1 Any person who brings a foreign national into Denmark would be liable to pay a fine if the foreigner in question has no proof of identity and visa to enter Denmark. The negligence or absence thereof of the person who brings in the foreign national has no relevance (Danish Aliens Act).

3.39 Such information will definitely be provided in cases only where the authorities foresee any security problems during transportation.

CHAPTER 4

4.9* European Community recognizes unaccompanied baggage as freight which requires a transport letter.

4.19* European Community member States require separate documents.

4.44* Not all the equipment referred to is admitted under the exemption from customs duties and taxes.

4.45* Not all the equipment referred to is admitted under the exemption from customs duties and taxes.

* Recommended Practice

28/2/94

4.53 b) and c) Unaccompanied baggage is classified and regarded as freight and is physically handled in goods areas, which are different from those areas reserved for passenger baggage.

CHAPTER 5

5.2 Transit visas may be required from nationals of certain countries.

5.4 While transit visas may be required from nationals of certain countries, transfer cargo may require a document specifying in particular the identity of the packages, the aircraft and nature, gross weight and place of loading of the goods.

5.4.1 A transit visa is required prior to the arrival in the country from transit passengers obliged to possess a visa.

5.5 European Community customs law requires that goods brought into a customs territory of the Community shall be subject to customs supervision and may also be subject to checking by the customs authority concerned.

5.8* Passengers who transfer from one international airport to another cannot always be exempt from control.

CHAPTER 6

6.5* European Community customs laws state that duties and other taxes may be paid either in cash or by a guaranteed and certified bank cheque.

6.28* Although customs clearance is expedited and accomplished as soon as possible, there is no guarantee that clearance could be accomplished in the specified time.

6.39* Duty-free goods are sold for export and therefore duty-free shops have to be established at specified places.

6.51* Off-airport bonded warehouses (transit sheds) are allowed only where customs resources are available.

CHAPTER 8

8.19* There is no national air transport facilitation committee in Denmark. The co-ordination of facilitation activities between relevant departments, agencies, organizations, airports and airport operators is done by the Civil Aviation Administration.

---

* Recommended Practice

CHAPTER 4

4.9* For the exportation of species or agriculture and livestock products, the International Conventions and the sanitary laws applicable to plants, animals, forests, natural areas and wildlife are observed.

4.9.1* The Ministry of Agriculture does not use the United Nations form for the clearance of cargo of the kind described in the foregoing paragraph.

4.17.1* The Ministry of Agriculture (MAG) requires presentation of the following documents:

— Central Bank import form — Commercial invoice.

— Import authorization from the Ministry of Agriculture and Livestock (MAG)

— Phytosanitary permit granted by the Ministry of Agriculture and Livestock (MAG).

— Phytosanitary certificate from the country of origin of the cargo.

— Air waybill.

— Certificate of payment of customs duties.

4.54 The Ministry of Agriculture and Livestock (MAG) requires the respective phytosanitary and veterinary certificates, prior to shipment of animals and plants.

* Recommended Practice

CHAPTER 2

2.4 The Arab Republic of Egypt requires the presentation of the General Declaration.

2.4.1 The Arab Republic of Egypt requires the presentation of the flight crew names, in addition to those items required in Appendix 1.

2.5 The Arab Republic of Egypt requires the presentation of the flight crew names.

2.6 The Arab Republic of Egypt requires the presentation of the passenger manifest which includes points and dates of embarkation and disembarkation.

2.8.1* The Arab Republic of Egypt requires the nature of goods and the States in which the goods were loaded to be indicated on the cargo manifest.

2.12 The Arab Republic of Egypt requires the authorized agent or pilot-in-command to deliver the following documents to the public authority concerned, before departure or on arrival, as the case may be:

5 copies of the General Declaration;
5 copies of the Passenger Manifest;
3 copies of a simple stores list; and
2 copies of the Cargo Manifest.

2.15 The Arab Republic of Egypt requires the authorized agent or pilot-in-command to deliver the following documents to the public authority concerned, before departure or on arrival, as the case may be:

5 copies of the General Declaration;
5 copies of the Passenger Manifest;
3 copies of a simple stores list; and
2 copies of the Cargo Manifest.

2.19 Handwritten block lettering must not be with indelible pencil.

2.34 Advance notice is required according to rules published in the A.I.P. of the Arab Republic of Egypt.

2.35 Advance notice is required according to rules published in the A.I.P. of the Arab Republic of Egypt.

2.36 Advance notice is required according to rules published in the A.I.P. of the Arab Republic of Egypt.

CHAPTER 3

3.12* If a person coming from a country that is infected with yellow fever does not hold the international certificate mentioned in 3.11, such person will be subject to a medical examination.

CHAPTER 6

6.5* This item is pending as it is being further scrutinized.

6.62 The Arab Republic of Egypt will charge vaccination fees as mentioned in the Egyptian Law NBR. 45/1955 as amended by Decree NBR. 103

---

* Recommended Practice

CHAPTER 2

2.6 The Passenger Manifest remains as a requirement for immigration purposes.

2.38 Prior permission for such flights is required 15 days before the intended date of operation in case mail service is used and 7 days when telegram or telex is used.

CHAPTER 3

3.5.3* The initial period of validity of a passport is not more than one year.

3.8 Temporary visitors are required to pay for the issuance of an entry visa.

3.8.3 A temporary visa is valid for a month and upon request can be extended up to a period of two months.

3.10 The Embarkation/Disembarkation Card is a requirement for immigration purposes. Contents of the Embarkation/Disembarkation Card vary from the Annex format.

3.17 Baggage of passengers is subject to customs inspection.

3.17.1 No dual-channel baggage clearance system is installed.

3.25.2 No foreigner shall enter Ethiopia unless he/she is in possession of:

a) a valid passport;
b) a valid entry visa; and
c) an international health certificate.

3.28 Exit visas are required for nationals as well as for temporary visitors at the end of their stay.

3.31 Baggage of outgoing passengers is subject to inspection.

CHAPTER 4

4.13 Cargo and unaccompanied baggage are not exempted from physical examination.

4.24 Imported private gift package and trade samples not exceeding the value of Birr 75 are exempted from duty and other clearance formalities.

4.30 As long as each and every package of the cargo imported by air has uniformity, then their physical examination shall be accomplished on a sampling basis.

4.53 Unaccompanied baggage is treated as cargo. However, declaration formalities shall not be required for unaccompanied baggage not exceeding the weight of 60 kg.

---

* Recommended Practice

28/2/94

CHAPTER 2

2.5	A full crew declaration is required in respect of crew who are not in transit on the same aircraft.
2.8	Additionally, weight of cargo in kilograms and details of point of unlading are required.
2.10	A written declaration of stores to be laden is required if the aircraft stops over for more than three hours.
2.13	A separate "NIL" manifest is required in addition to the General Declaration.
2.16	A separate "NIL" manifest is required in addition to the General Declaration.
2.23	Disinsecting of aircraft is carried out by national health authorities. Other methods are not acceptable. Direct entry into certain airports may be denied in respect of aircraft from notified areas.
2.35	More than 2 hours' notice may be required at certain airports.
2.39	On other than scheduled services or a technical refuelling stop, at least 14 days' notice of a commercial flight is required.

CHAPTER 3

3.8.3	Visas are only valid for use within 30 days of issue.
3.10	Items additional to that detailed in Appendix 5 are required.
3.16	A written declaration is required in respect of the crew.
3.24	A flight crew licence is accepted provided the crew concerned arrive/depart on the same aircraft as crew. Crew arriving as passengers and departing as crew or **vice versa** require a valid passport.
3.25	Crew not in possession of a valid licence require a passport.
3.25.2	Crew not in possession of a valid licence require a passport.

CHAPTER 4

4.5	No data-processing facilities are available at present. Requirements will be evaluated when such a system is introduced.
4.6	No data-processing facilities are available at present. Requirements will be evaluated when such a system is introduced.
4.8	No data-processing facilities are available at present. Requirements will be evaluated when such a system is introduced.
4.10	All cargo exported by air must be supported by a Customs Export Entry if over the following value: Commercial $50 Private $100 Unaccompanied Baggage $1 000
4.20	Inclusion of "Value of Customs Purposes" on the air waybill will facilitate clearance.
4.53	Unaccompanied baggage is treated as cargo and a written declaration is required for its clearance.

CHAPTER 3

3.9* Upon entering the Inter-Nordic passport control area (comprising Denmark, Finland, Iceland, Norway and Sweden) visitors holding entry visas are required to complete a special Disembarkation Card (control card) which differs slightly from the ICAO format.

3.10 Upon entering the Inter-Nordic passport control area (comprising Denmark, Finland, Iceland, Norway and Sweden) visitors holding entry visas are required to complete a special Disembarkation Card (control card) which differs slightly from the ICAO format.

CHAPTER 4

4.9* Export declaration is generally required in the case of cargo and unaccompanied baggage.

4.19* The choice between submitting separate documents and a combined document is not always given.

4.23* Documentary requirements do not depend on the value or weight of the consignment but rather on its nature.

4.23.1* The exemption from paying import duties does not depend on the value or weight of the consignment but rather on its nature. Relief from import duties is thus granted in respect of certain samples and certain gifts.

4.24 Customs declaration is not required only in respect of goods imported by private persons for non-commercial purposes.

CHAPTER 5

5.4.1 A transit visa is required to be obtained prior to arrival in Finland for passengers who are obliged to obtain such visa and who intend to leave the international airport area.

---

* Recommended Practice

28/2/94

CHAPTER 2

2.8.1* European Community customs legislation requires an indication of the gross weight and nature of the goods on the documents submitted to the customs authorities of France.

CHAPTER 3

3.4 A visa is required as a form of identification in some instances.

3.5.8* Children under 16 years of age do not have to be issued with a separate passport.

3.8 Where a visa is required for purposes of identification of the passenger (as in 3.4 above) such a visa is not issued without charge.

CHAPTER 4

4.9* Unaccompanied baggage is shipped as cargo and as such, is required to be accompanied by an air waybill.

4.44* Not all equipment referred to in this Recommended Practice is admitted duty free.

4.45* Not all equipment referred to in this Recommended Practice is admitted duty free.

4.53 b) and c) Unaccompanied baggage is regarded as cargo and is physically directed to the areas provided for cargo.

CHAPTER 5

5.2 The French authorities, noting that the purpose of certain provisions of Chapter 5 of Annex 9 is being distorted by certain international air transport passengers, are compelled to require that nationals of certain States be in possession of a transit visa prior to their arrival in France. This measure is of a strictly conservatory nature.

The States, whose nationals are referred to in the previous paragraph, are at present Albania, Angola, Bangladesh, Ethiopia, Ghana, Haiti, Nigeria, Pakistan, Somalia, Sri Lanka and Zaire.

5.4 The French authorities, noting that the purpose of certain provisions of Chapter 5 of Annex 9 is being distorted by certain international air transport passengers, are compelled to require that nationals of certain States be in possession of a transit visa prior to their arrival in France. This measure is of a strictly conservatory nature.

The States, whose nationals are referred to in the previous paragraph, are at present Albania, Angola, Bangladesh, Ethiopia, Ghana, Haiti, Nigeria, Pakistan, Somalia, Sri Lanka and Zaire.

5.4.1 The French authorities, noting that the purpose of certain provisions of Chapter 5 of Annex 9 is being distorted by certain international air transport passengers, are compelled to require that nationals of certain States be in possession of a transit visa prior to their arrival in France. This measure is of a strictly conservatory nature.

The States, whose nationals are referred to in the previous paragraph, are at present Albania, Angola, Bangladesh, Ethiopia, Ghana, Haiti, Nigeria, Pakistan, Somalia, Sri Lanka and Zaire.

5.5 European Community customs legislation provides that goods introduced into a customs territory in the Community are subject to customs surveillance and may be checked by customs authorities.

5.8* It is not always possible for passengers transferring from one international airport or terminal to another international airport or terminal to be exempt from examination.

CHAPTER 6

6.5* Payment of duties and taxes has to be made either in cash or by guaranteed or certified bank cheque.

6.28* It is not possible for customs administration to undertake to clear all disembarking passengers from a flight within 45 minutes although customs clearance is carried out as expeditiously as possible.

6.39* Duty-free sales are conducted on the notion of exportation of goods and such duty-free shops have to be located at specific points.

6.51* Where airport capacity is limited, off-airport bonded warehouses are allowed only when customs resources are available.

* Recommended Practice

CHAPTER 2

2.8 European Community customs legislation requires that the weight (gross mass) and nature of goods must be indicated in the document presented.

2.8.1* European Community customs legislation requires that the weight (gross mass) and nature of goods must be indicated in the document presented.

2.35 All flight times relating to arrival and departure of all commercial flights at international airports of Germany as well as those that overfly German territory have to be notified, normally four to five months in advance. Non-commercial flights to Frankfurt airport have to abide by the same conditions.

CHAPTER 3

3.8 In principle, all visas for Germany are granted on the payment of a fee. This requirement may be waived or the fee reduced in special circumstances or in instances where Germany has entered into an agreement with other Contracting States.

3.8.3 The validity period of a visa for Germany is not fixed and may vary (for periods of more or less than 12 months) depending on the exigency.

3.8.7* Visas for Germany do not include the number of entries permitted.

3.10 There is no longer a requirement for an Embarkation/Disembarkation Card. However, stateless persons and persons who are citizens of countries that do not have diplomatic ties with Germany have to fill out a "registration form" upon entry and departure.

3.10.1 There is no longer a requirement for an Embarkation/Disembarkation card. However, stateless persons and persons who are citizens of countries that do not have diplomatic ties with Germany have to fill out a "registration form" upon entry and departure.

3.10.2 There is no longer a requirement for an Embarkation/Disembarkation card. However, stateless persons and persons who are citizens of countries that do not have diplomatic ties with Germany have to fill out a "registration form" upon entry and departure.

3.24.1 Flight crew members of scheduled air services may have their crew member licences and crew member certificates recognized in lieu of passports.

3.25.1* Flight crew members of scheduled air services may have their crew member licences and crew member certificates recognized in lieu of passports.

3.25.2 Crew member licences and crew member certificates are accepted as travel documents only on scheduled air services. They are not accepted in relation to surface transportation or for any other form of travel in Germany.

3.25.3* Crew member licences and crew member certificates are accepted as travel documents only on scheduled air services. They are not accepted in relation to surface transportation or for any other form of travel in Germany.

3.37 German authorities reserve the right to impose punitive sanctions on operators (usually by fine) if German regulations in relation to this Standard are violated.

3.37.1 German authorities reserve the right to impose punitive sanctions on operators (usually by fine) if German regulations in relation to this Standard are violated.

3.37.2 German authorities reserve the right to impose puniutive sanctions on operators (usually by fine) if German regulations in relation to these Standard are violated.

* Recommended Practice

CHAPTER 4

4.9* Unaccompanied baggage is regarded as freight and requires the accompaniment of a transport letter.

4.19* The commercial invoice and any certificate of origin are required to be produced separately.

4.44* Not all equipment referred to in this Recommended Practice is admitted free of customs duties.

4.45* Not all equipment referred to in this Recommended Practice is admitted free of customs duties.

4.53 b) and c) Unaccompanied baggage, regarded as freight, is physically handled in areas which are different from those areas reserved for accompanied baggage.

CHAPTER 5

5.1 Only passengers and flight crew members who make more than one intermediate stop in the territory of Germany or leave the transit area of the airport or in the course of their transit journey are transferred to a neighbouring airport would undergo examination.

5.2 Only passengers and flight crew members who make more than one intermediate stop in the territory of Germany or leave the transit area of the airport or in the course of their transit journey are transferred to a neighbouring airport would undergo examination.

5.4 Customs may require a document including the identity of a package in transit, identity of the aircraft which brought it, the nature, gross mass (weight) and place of loading of the cargo.

5.4.1 Only passengers and flight crew members who make more than one intermediate stop in the territory of Germany or leave the transit area of the airport or in the course of their transit journey are transferred to a neighbouring airport would undergo examination.

5.5 European Community customs legislation requires that goods brought into the customs territory of the Community shall be subject to checking by the customs authority.

5.8* Only passengers and flight crew members who make more than one intermediate stop in the territory of Germany or leave the transit area of the airport or in the course of their transit journey are transferred to a neighbouring airport would undergo examination.

5.9* Only passengers and flight crew members who make more than one intermediate stop in the territory of Germany or leave the transit area of the airport or in the course of their transit journey are transferred to a neighbouring airport would undergo examination.

CHAPTER 6

6.5* European Community customs law states that duties and other taxes may be paid either in cash or by a guaranteed and certified bank cheque. There is no provision for payment by credit card.

6.28* While, in practice, customs clearance is given as soon as possible and in most cases within the time allowed by this measure, the customs administrations cannot accept the constraint stipulated in 6.28.

6.31.1 The German airport authorities may be unable to provide assistance during peak operational hours to passengers in order that they transfer their baggage on arrival to other modes of transport. The costs involved in ensuring this process would be unconscionable.

6.39* Duty-free goods are sold for export only and therefore duty-free shops have to be established at specified places.

6.51* When airport capacity is limited, off-airport bonded warehouses (transit sheds) are allowed only when the resources to carry out customs clearance procedures are available.

CHAPTER 8

8.19* Germany does not intend to establish any national or airport facilitation committees.

* Recommended Practice

GHANA

CHAPTER 3

3.16 Written baggage declarations are required of returning residents.

3.31 All baggage of departing passengers is subject to search.

GREECE

CHAPTER 2

2.4 General Declaration is required to be presented, although the withdrawal of this requirement is being considered. In order to facilitate the operator's task, the General Declaration for scheduled and charter flights may be presented to the authorities after the arrival or departure of the flight, provided this is done on the same day.

2.4.1 The pilot-in-command's full name must be inserted in the appropriate section of the General Declaration.

2.5 The pilot-in-command's full name must be inserted in the appropriate section of the General Declaration.

2.6 A passenger manifest is not required for scheduled flights.

2.7* Cargo manifest is required.

2.8.1* Information concerning the nature of goods must be provided in the cargo manifest.

2.22 Penalties are imposed very seldom and only in special cases.

2.42* In special instances, commercial international flights are operated direct to domestic airports. Generally, Greek law requires that all aircraft that enter or depart from Greece do so at designated international airports.

CHAPTER 3

3.8.3 The validity of the entrance visas for visitors depends on the specific case for which such a visa is required.

3.8.4* Visas for re-entry are required only from resident aliens who are nationals of countries subject to the requirement of entrance visa, unless such persons have a permanent permit in their possession.

3.9* Embarkation/Disembarkation Card is required. However, the format of the card includes only four questions (i.e. name, date of birth, nationality and country of destination or permanent residence).

3.10 Embarkation/Disembarkation Card is required. However, the format of the card includes only four questions (i.e. name, date of birth, nationality and country of destination or permanent residence).

3.13.1 Only passengers who are subject to entrance visa requirements and who wish to make a stopover of up to 48 hours in Greece would have their passports withheld. Such passengers are provided with a special document (town visit card) which is exchanged for the passport on their departure.

3.15 Implemented, but an additional control (customs, health, currency, etc.) may be applied in some instances.

* Recommended Practice

28/2/94

3.24	This Standard is applied only to nationals of countries who reciprocate the courtesy to Greek nationals.
3.25.2	Crew members entering Greece by any means other than air transporation should hold a valid passport.
3.33	An airport tax is levied on all departing passengers and the carrier is responsible for the payment. Also, the carrier is authorized to collect this charge from the passengers.

CHAPTER 4

4.13	This Standard is implemented in practice, although such implementation is not provided for by legislation.
4.14	This Standard is implemented in practice, although such implementation is not provided for by legislation.
4.18	The commercial invoice is not considered the basic document for the accomplishment of customs formalities.
4.19*	Commercial invoice and certificate of origin are required in two separate forms.
4.23*	A simplified form is required.
4.30	This Standard is practically implemented although there is no covering legislation.
4.45*	Only some items specified are admitted duty free.

CHAPTER 5

5.11*	This Recommended Practice has not yet been implemented.
5.12*	This Recommended Practice has not yet been implemented.

CHAPTER 6

6.64*	There are no facilities in Greece.

CHAPTER 8

8.4	This Standard is implemented, although its implementation is not provided for by legislation.
8.5	This Standard is implemented, although its implementation is not provided for by legislation.
8.6	This Standard is implemented, although its implementation is not provided for by legislation.

CHAPTER 2

2.4 The presentation of the General Declaration is required.

2.4.2 The presentation of the General Declaration is required.

2.4.4 The General Declaration is required to be stamped by the immigration authorities for the purpose of clearance of outbound flights.

2.5 The names of the crew members in full with their nationality are required on the General Declaration.

2.6 The presentation of a passenger manifest is required. The format of a passenger manifest is different from that of Appendix 2.

2.6.1* See remarks in 2.4 and 2.6.

2.8.1* Information concerning the nature of goods in the cargo manifest is required.

2.23 Only the "blocks away" method of disinsection is acceptable.

2.34 Due to reasons of flight safety, permission of the Director General of Civil Aviation is required for such flights and for that purpose an application should be submitted at least 72 hours in advance.

2.35 Due to reasons of flight safety, permission of the Director General of Civil Aviation is required for such flights and for that purpose an application should be submitted at least 72 hours in advance.

2.38 A few more particulars are required to be given in the application, details of which can be seen in the facilitation component of the AIP-India.

CHAPTER 3

3.3 Passengers who have visited Yellow Fever Zone within the last 6 days may be required to produce a certificate of vaccination/revaccination.

3.8 Generally, a fee is charged for the grant of a visa.

3.8.3 Visas and transit visas are normally valid for single journeys unless otherwise specified. Tourists are granted visas, however, for three journeys valid for stays of 3 to 6 months duration in India.

3.8.6* Resident aliens require visas for re-entry.

3.10 Separate Embarkation/Disembarkation Cards are required. The formats of these cards differ from that of Appendix 5.

3.12* Persons arriving within 6 days of leaving a yellow fever infected area may be subjected to a medical examination.

3.16 The right to demand a written declaration under certain circumstances is reserved.

3.24.1 The privileges of temporary admission are extended to a flight crew member of an aircraft operated for remuneration or hire but which is not engaged in the operation of scheduled international air services, provided that the airline is also operating scheduled international air services to India.

* Recommended Practice

28/2/94

3.25.1* See remarks in 3.24.1.

3.25.3* See remarks in 3.24.1.

3.30* The presentation of baggage of departing passengers may be required for inspection by the customs authorities on a sampling and selective basis.

3.31 The presentation of baggage of departing passengers may be required for inspection by the customs authorities on a sampling and selective basis.

3.33 Operators are liable to be held responsible under Indian law.

CHAPTER 4

4.9* The waiver reflected in this provision cannot be agreed to.

4.13 Physical examination is carried out on a sampling and selective basis.

4.23* All imported air cargo is required to have governmental clearance documents.

4.23.1* Bona fide gifts up to Rs. 750/- sent by post and bona fide gifts sent by airfreight that are valued up to Rs. 200/- and trade samples which are valued up to Rs. 1 300/- are allowed to be imported free of duty. In other cases, customs duty will always be payable unless otherwise exempted.

4.25* Provisional clearance is permitted in limited cases only as per Section 18 of the Customs Act, 1962.

4.27 Besides appropriate narcotics control measures, there are also anti-smuggling measures applied.

4.44* The duty-free entry of ground equipment and security equipment is not permitted.

4.45* The material listed in the Note to this provision is liable to be subject to the payment of import duty except in the case of charts.

4.46* There is no duty-free admittance of airlines' documentation. Printed matter in book form, charts, maps, topographical plans and technical drawings, however, is exempted from being subject to the payment of duty.

4.51 Re-forwarding will be subject to examination on the merits of the case.

CHAPTER 5

5.2 Passengers would have to remain either in the aircraft or inside the direct transit area. The operator concerned would have to file the passenger manifest and the cargo manifest indicating all details of passengers and cargo in direct transit in a manner similar to the filing of details relating to disembarking passengers and unloaded cargo.

5.4 When traffic is transferred from one flight to another, the documents required by the customs authorities are to be furnished and such transfer is carried out under customs supervision.

CHAPTER 8

8.12 The provisions of International Health Regulations (1969) of the World Health Organization are complied with except to the extent of the reservations filed.

---

* Recommended Practice

CHAPTER 2

2.4 General Declaration is required.

2.4.2 Passenger Manifest and General Declaration signed by the pilot-in-command, or authorized agent on behalf of the pilot-in-command, are required.

2.5 In addition to total number of crew, names and position of the crew are required.

2.6 Passenger Manifest is required.

2.8 Data-processing technique format is not acceptable yet. Cargo Manifest is required.

2.12 The following are required: five copies of the General Declaration; six copies of the Passenger Manifest; four copies of the Cargo Manifest; and two copies of a simple stores list.

2.14 Not acceptable.

2.15 The following are required: five copies of the General Declaration; six copies of the Passenger Manifest; and four copies of the Cargo Manifest.

2.19 Documents produced by electronic data-processing techniques are not acceptable.

2.34 Approval should be obtained 14 days in advance.

2.36 The designated agency is the Directorate General of Air Communications.

CHAPTER 3

3.4 Temporary visitors arriving in Indonesia are required to have a valid passport and visa. Visas are issued by the Indonesian Embassies or Consulates abroad. Separate passports are required for children under 16 years of age, unless accompanied by their parents. No document or visa is required for passengers arriving and departing in the same through-flight or transferring to another flight at the same airport.

3.8.2 Entrance visas for temporary visitors are valid for three months from the date of issuance with the understanding that the duration of each stay is subjected to the following conditions:

a) tourist visas may be extended at the local Immigration office for up to 45 days from the date of arrival;

b) visitor-visas (visas for business or social visits) may be extended at the local Immigration office for up to 6 months from the date of arrival;

c) citizens of the following countries holding national passports valid for at least three months are allowed to enter Indonesia without a tourist visa for a maximum stay of two months, provided that they enter and leave through: Polonia (Medan), Hang Nadim (Batam), Simpang Tiga (Pakanbaru), Tabing (Padang), Soekarno-Hatta (Jakarta), Ngurah Rai (Bali), Sam Ratulangi (Manado), Pattimura (Ambon), Frans Kaisiepo (Biak), Supadio (Pontianak), El tari (Kupang), Jayapura (Sentani), Tanjung Pinang (Kijang), Tarakan (Tarakan), Solo (Adi Sumarmo) and Merauke (Mopah).

Argentina, Australia, Austria, Belgium, Brazil, Brunei Darussalam, Canada, Chile, Denmark, Finland, France, Greece, Iceland, Ireland, Italy, Japan, Liechtenstein, Luxembourg, Malaysia, Malta, Morocco, Mexico, Netherlands, New Zealand, Norway, Philippines, Singapore, Republic of Korea, Spain, Sweden, Switzerland, Taiwan, Thailand, United Kingdom, United States of America, Venezuela, Germany and Yugoslavia.

This facility may also apply to business visitors who are citizens of the countries mentioned above as long as their visits are for limited business purposes and not for employment, with or without remuneration.

d) foreign visitors attending a convention in Indonesia will be granted the same facilities as above, provided the convention has been approved by the Indonesian Government.

e) Entrance visas for Taiwanese citizens issued on the above basis are valid if their passports have been issued by the Taiwanese Ministry of Foreign Affairs and they enter Indonesia in Soekarno-Hatta, Ngurah Rai, Polonia or Sekupang (seaport).

3.10 Written supplementary information from temporary visitors shall be required according to the format set out by the Indonesian Government.

3.16 Written Customs Declaration is required.

3.22 Embarking or disembarking crew members who remain at the airport where the aircraft has stopped or within the confines of the cities adjacent thereto, and depart on the same aircraft or on the next regularly scheduled flight from Indonesia may use their crew member licence or certificate in lieu of a passport as long as the names and positions of such crew members are listed in the General Declaration. In all other instances, a valid passport and visa are required.

3.28 Only temporary visitors and Indonesian nationals residing abroad are exempted from obtaining exit permits if their stay does not exceed six months from the date of arrival.

CHAPTER 4

4.4* Not applicable.

4.7* Not applicable.

4.9* Customs Declaration is required.

CHAPTER 5

5.13 Not applicable.

---

* Recommended Practice

CHAPTER 2

2.6	The Passenger Manifest is required (one copy only).
2.20	Documents shall be accepted with required fees.
2.31	Not practicable at present.
2.34	Twenty-four hours advance notice and reference to our NOTAM for availability of the airports is required.
2.36	"No objection certificate" is required from the concerned national carrier.

CHAPTER 3

3.5.3*	Iranian passports are valid for 5 years but exit clearance is required.
3.5.4*	Not acceptable.
3.5.5*	Not acceptable.
3.5.6*	Acceptable except when an Iranian child is accompanied by legal guardian.
3.7*	Not acceptable.
3.8.3	Not acceptable.
3.11	Certificate of cholera, yellow fever or smallpox is required.
3.16	Not acceptable.
3.24	Not acceptable.
3.30*	Presentation of departing passengers' baggage is required.
3.31	Not acceptable.
3.33	Acceptable except in special cases.

CHAPTER 4

4.9*	Presentation of documents for unaccompanied baggage is not necessary. In the case of commercial goods, however, their presentation is required.
4.13	Physical examination of air cargo as well as unaccompanied baggage is necessary.
4.15	Customs formalities are to be performed 24 hours before departure of aircraft.
4.21	Documents relating to the clearance of air cargo require charges and fees.
4.23*	Trade samples are not exempt from governmental clearance documents. Private gift packages, however, are exempt from governmental clearance formalities to that extent not considered as to gain benefit.
4.24	Acceptable only for simplification of customs documents and clearance of goods.
4.25*	Not acceptable.
4.26*	Not acceptable.
4.42	Except for the charges, other aspects of the Standard are accepted.
4.44*	Except for the maintenance platforms, steps and cargo weighing devices, the other items are acceptable on the basis of temporary admission.
4.49	Not acceptable at present.
4.50	Operator's declaration must include reasons as to why the cargo was not unladen. If these articles arrive afterwards in the same conditions under a separate air waybill or are unladen by mistake at another airport, they must be separated from the rest and the operator must present a certificate.

* Recommended Practice

CHAPTER 2

2.8 More information is needed on the cargo manifest as per European Community law.

2.8.1* Whether or not the freight manifest is used, European Community customs legislation requires the gross weight and the nature of goods to be stated on the documents presented to the customs.

CHAPTER 4

4.9* Unaccompanied baggage is consigned as freight and in that case under cover of a transport letter.

4.19* The documents specified have to be submitted separately.

4.44* Not all the equipment referred to in this Recommended Practice is admitted under exemption.

4.45* Not all the equipment referred to in this Recommended Practice is admitted under exemption.

4.53 b) and c) Unaccompanied baggage, regarded as freight, is physically handled in goods areas which are different from those areas reserved for passenger baggage.

CHAPTER 5

5.4 Visas may be required from transferring traffic.

5.5 Community customs law states that goods brought into the customs territory of the Community shall be subject to customs supervision and may also be subject to checking by the customs authority.

5.8* Passengers who transfer from one airport or terminal to another cannot always be exempted from control.

CHAPTER 6

6.5* Community customs law states that duties and other taxes may be paid either in cash or by a guaranteed or certified bank cheque.

6.28* While in practice customs clearance is conducted as soon as possible and in most cases within the time specified in this Recommended Practice, customs administration cannot accept such a constraint.

6.39* Duty-free sales are regarded as a fictitious exportation and as such the locations of duty-free shops have to be in specific places.

6.51* When airport capacity is limited, off-airport bonded warehouses are allowed only when customs resources are available.

---

* Recommended Practice

CHAPTER 2

2.4	Presentation of a General Declaration is required.
2.5	Specification of the names of crew members is required.
2.7*	A detailed cargo manifest is required.

CHAPTER 3

3.7*	Entrance visas for temporary visitors are required except when such requirement is waived.
3.8	Visas are issued without charge on a reciprocal basis only.
3.8.3	The period of validity of a visa is determined solely by the appropriate authorities.
3.9*	In accordance with Article 26A of the International Sanitary Regulations, a temporary visitor could be required to provide the authorities with a destination address in writing.
3.10	In accordance with Article 26A of the International Sanitary Regulations, a temporary visitor could be required to provide the authorities with a destination address in writing.
3.29*	A crew member certificate is accepted only when the crew member is carried as such on the General Declaration.

CHAPTER 4

4.40	If imported stores are liable to be charged import duties, they remain the liability of the operator until taken out of Israel.
4.53	Unaccompanied baggage cannot receive the same treatment as accompanied baggage, if it is not collected by the passenger and cleared in the passenger customs hall at the international terminal building.

---

* Recommended Practice

28/2/94

CHAPTER 2

2.4 The presentation of a General Declaration is required.

2.4.1 In the column in the General Declaration concerning crew, surname with initials and nationality should be entered.

2.4.4 As permission system exists for the departure of foreign trading aircraft, the customs authorities' permission stamp is affixed on the General Declaration which is required to be submitted on departure. In addition, the General Declaration should be signed or stamped by the pilot-in-command or by the authorized agent, since it should be one of the most reliable documents.

2.5 In the column in the General Declaration concerning crew, surname with initials and nationality should be entered.

2.6 The presentation of a Passenger Manifest is required for arriving aircraft.

2.7* Presentation of the Cargo Manifest is required at entry in order that the customs authorities can get necessary information on the cargo promptly and ensure its proper clearance.

2.8 Information with respect to loading and unloading is required to be included in the Cargo Manifest.

2.8.1* Completion of the column concerning the nature of goods in a Cargo Manifest is required for customs purposes.

2.8.2* Details of goods included in the Cargo Manifest are required to be as detailed and descriptive as possible.

2.12 Three copies of the General Declaration are required.

2.15 Presentation of the Passenger Manifest is required for the conduct of customs procedures such as inspection of baggage.

2.34 Written application for permission is required at least 10 days prior to the intended date of such flight, except when the flight follows only air routes.

2.38 Written application for permission is required at least 10 days prior to the intended date of such flight, except when the flight follows only air routes.

2.42* Not applicable.

CHAPTER 3

3.3 The authorities reserve the right to require any documents other than those provided for in Chapter 3 of Annex 9 in instances when a visitor to Japan applies for a stay of more than 90 days duration.

3.4 Expired passports, National Registration Cards, alien resident permits, etc., are not accepted in lieu of a valid passport. However, seafarers' identity documents are accepted in cases when the holders are to join ships in Japan.

* Recommended Practice

3.5.3* Two kinds of passports exist in Japan: one is for a single journey and the other for multiple journeys. In the passport for a single journey, necessary destinations are listed. It continues to be valid indefinitely as long as its bearer remains abroad and ceases to be valid upon the bearer's return to Japan.

The passport for multiple journeys is valid to all States except "Specific Areas" and the period of validity is five years from the date of its issuance.

3.5.4* Although no system for renewal of an expired passport exists, systems for replacement exist in Japan. The period of validity of a renewed passport is five years from the date of the issuance of the original passport.

3.8.3 A visa for a temporary visitor to Japan is normally valid for a single journey within six months.

3.8.4* Where a visitor is found not to possess a valid entry visa for Japan under any circumstances his case would be examined first and decided on merit.

3.8.6* In the case that resident aliens are granted permission for re-entry before departing from Japan, visas are not required.

3.8.7* i) In the Japanese visa, items are listed in a different order.

ii) The duration of validity of visa is normally shown in months or in days.

iii) The duration of the stay is not always included.

3.10 The Embarkation/Disembarkation Card in use in Japan differs in items and format from the Embarkation/Disembarkation Card as set out in Appendix 5.

3.10.2 There is a charge levied on airlines for the provision of the Embarkation/Disembarkation Cards.

3.17.1 Having not yet accepted the Recommendation of the Customs Co-operation Council of 1971, the Japanese administration is unable to adopt this Recommended Practice. However, the dual channel system has been tentatively implemented for Japanese passengers and resident aliens at the Tokyo and the Osaka International Airports since 1970.

3.25.2 A foreign crew member seeking entry into Japan as a transit passenger in order to join an aircraft located at an airport in any other State is required to possess a valid passport and visa, except in the case where permission for port-of-call landing is granted.

3.25.3* A foreign crew member seeking entry into Japan as a transit passenger in order to join an aircraft located at an airport in any other State is required to possess a valid passport and visa, except in the case where permission for port-of-call landing is granted.

3.35.2* The operator is responsible for the custody and care of passengers and crew until they are finally admitted for entry or found to be inadmissible.

3.36 An inadmissible person is transferred to a point outside Japan at the expense of the operator who brought him in.

3.36.1 Japan would not undertake to examine a deportee returned to Japan if he does not possess a valid passport even if he/she is alleged to have stayed in Japan prior to leaving for the country that deported him.

3.36.2 There may be cases where a carrier is obliged to transport an alien away, even after he has been admitted into Japan. Such cases may arise when the carrier is recognized to have brought him to Japan with full knowledge of the fact which constitutes grounds for his (or her) deportation.

3.38 The Japanese authorities are not empowered to seize fraudulent, falsified or counterfeit travel documents unless such documents are abandoned.

* Recommended Practice

3.40* It is practically impossible to inform authorities of other countries of deported persons owing to the large numbers of deportees Japan faces, unless such information is needed to be transmitted for security or other special reasons.

CHAPTER 4

4.13 Permission is required to export cargo and the customs authorities make inspection as necessary.

4.44* Not all the items listed in the Note are exempted from import duties and taxes. However, duty-free importation has been granted on and after 1 April 1974 for those types of equipment specially manufactured to prevent unlawful seizure of aircraft, such as detectors of firearms.

4.45* Except flight simulators and charts, the items listed in the Note are not exempt from customs duties.

4.46* Import duties and taxes are imposed on any document imported by airlines. Printed matter is, however, free of import duties and taxes.

4.47 There are no simplified customs clearance procedures which are applicable specially for the items specified in this Standard.

4.47.1* Customs clearance of aircraft equipment, spare parts, ground, training and security equipment requires the presentation of a regular importation/exportation declaration.

4.48 All normal customs clerarance procedures are required to be complied with in this instance.

4.51 No import or export licences are required for the temporary landing of goods. But in other cases, even where the goods stored in bonded areas (including those stored elsewhere) are exported in their original condition, the reshipment permit has to be acquired.

4.53 With respect to unaccompanied baggage, the presentation of a declaration as documentary evidence for duty-free admittance is required.

CHAPTER 5

5.8* When a passenger transfers from one international airport to another by means of a domestic flight or other domestic transportation, a passport, visa and Embarkation/Disembarkation Card are required.

5.9* When a passenger transfers from one international airport to another by means of a domestic flight or other domestic transportation, a passport, visa and Embarkation/Disembarkation Card are required.

CHAPTER 6

6.51* No imported plant is allowed to be transferred to a bonded warehouse away from the airport.

---

* Recommended Practice

KUWAIT

CHAPTER 3

3.5.1* This Practice is not implemented in Kuwait.

3.40* This Practice is not implemented in Kuwait.

* Recommended Practice
28/2/94

MALAWI

CHAPTER 2

2.4 A General Declaration, a sample of which is in Annex 9, is still required. Due to customs regulations the General Declaration must be signed and stamped for both inbound and outbound traffic.

2.6.1* The Passenger Manifest is not needed. Instead, a teletype disembarkation list should be received before the aircraft arrives.

2.7* A cargo manifest is still required.

2.8.1* Information concerning the nature of goods on the cargo manifest is also a requirement.

2.34 Six days advance notification of the arrival of non-scheduled aircraft is required.

2.38 Six days advance notification of the arrival of non-scheduled aircraft is required.

2.39 Fees (Temporary Air Services Permit) may be imposed for such operation.

2.40* In addition, crew and passenger names are required. In the case of an overflight, the time of entry and exit and the routing should be included.

CHAPTER 3

3.17.1 The volume of passengers does not justify the adoption of a dual-channel baggage system.

CHAPTER 6

6.53 Neither animal nor plant quarantine services are available outside airport premises.

* Recommended Practice

28/2/94

MAURITIUS

CHAPTER 2

2.5 Names of crew members are required if they stay overnight.

2.8.1* Information on nature of goods required.

2.34 Seven working days prior notice is required for non-scheduled and private flights.

2.35 Seven working days prior notice is required for non-scheduled and private flights.

2.38 Seven working days prior notice is required for non-scheduled and private flights.

CHAPTER 3

3.8.3 Visas are made valid for twelve months on application.

3.8.6* Resident aliens require re-entry visas.

3.8.9* Requirement is for French or English only.

3.9* Embarkation/Disembarkation Card required.

3.10 Special Embarkation/Disembarkation Card is being introduced.

CHAPTER 4

4.23.1* Duty is payable on dutiable samples that are not re-exported.

CHAPTER 6

6.37.1* Storage facilities are not available.

6.54* Vaccination centre is available off-airport.

6.71* Passengers are allowed to import 700 Mauritian Rupees and export 350 Mauritian Rupees.

---

* Recommended Practice

28/2/94

MEXICO

CHAPTER 2

2.6 Presentation of the passenger manifest is required since Mexico wishes to implement Recommended Practice 6.4 which recommends that when a passenger service charge is levied at an international airport in order to avoid facilitation problems such charge should be levied on airlines and not be collected directly from the passenger.

28/2/94

CHAPTER 2

2.8.1* The gross weight and the nature of the goods must be indicated on the document that is submitted to the customs authorities.

CHAPTER 3

3.4 A visa is required as a form of identification in some instances.

3.5.8* Children under 16 years of age do not have to be issued with a separate passport.

3.8 Where a visa is required for purposes of identification of the passenger (as in 3.4 above), such a visa is not issued without charge.

CHAPTER 4

4.9* Unaccompanied baggage is shipped as cargo and, as such, is required to be accompanied by an air waybill.

4.44* Not all equipment referred to in this Recommended Practice is admitted duty-free.

4.45* Not all equipment referred to in this Recommended Practice is admitted duty-free.

4.53 b) & c) Unaccompanied baggage is regarded as cargo and is physically directed to the areas provided for cargo.

CHAPTER 5

5.5 Goods introduced into the customs territory of the Community are subject to customs surveillance and may be checked by customs authorities.

CHAPTER 6

6.5* Payment of duties and taxes has to be made either in cash or by guaranteed and certified bank cheque.

6.28* It is not possible for the customs administration to undertake to clear all disembarking passengers from a flight within 45 minutes, although customs clearance is carried out as expeditiously as possible.

---

* Recommended Practice

28/2/94

CHAPTER 2

2.7* For the time being not acceptable. At the moment the Cargo Manifest is the basic document for customs and operator on the basis of which the clearance formalities are completed.

2.8 The gross weight of the goods has to be included in the documents presented to the customs authorities.

2.8.1* Under the present circumstances not yet acceptable. Completion of the "Nature of goods" column in the Cargo Manifest is essential for customs purposes.

CHAPTER 3

3.8 Issuing visas without a charge is not an obligatory practice in the Kingdom of the Netherlands.

3.8.2 The applicant for a visa may be called upon to appear personally before the issuing authorities.

3.8.3 The principle of making visas valid for more than one journey regardless of the number of entries is acceptable only on condition that it can be waived for reasons of public order, national security or the Kingdom of the Netherlands policy with regard to aliens.

3.18* The manner in which the passenger is cleared in future should take into account the implementation of international conventions.

3.24 Implementation on the condition of reciprocity.

3.24.1 Implementation on the condition of reciprocity.

3.25 Implementation on the condition of reciprocity.

3.25.1* Implementation on the condition of reciprocity.

3.25.2 Implementation on the condition of reciprocity.

3.25.3* Implementation on the condition of reciprocity.

3.40* The Kingdom of the Netherlands considers that informing the public authorities of transit and destination countries of a deportee from the Kingdom would be tantamount to extradition. As such, information of deportation is not transmitted to transit and destination countries.

CHAPTER 4

4.9* Unaccompanied baggage is consigned as freight and should be under cover of a transport document.

4.19* This Recommended Practice cannot be applied. The commercial invoice and the certificate of origin, in case the latter is required, have to be produced separately.

4.44* Duty-free admission cannot be granted for all the equipment concerned.

* Recommended Practice

4.45* Duty-free admission cannot be granted for all the equipment concerned.

4.53 b) and c) Unaccompanied baggage, which is regarded as freight, is physically handled in areas allocated for freight-handling.

CHAPTER 5

5.4 The customs authorities can, by means of a brief declaration, demand the production of a document in which, on the one hand, the identification of the goods and the aircraft, and on the other hand, the nature, the gross weight and the place of loading of the goods are mentioned.

5.5 Customs legislation requires that goods brought into the customs territory of the Kingdom of the Netherlands be subject to customs supervision and may be subject to checking by customs authorities.

5.8* Passengers who transfer from one international airport or terminal to another international airport or terminal would not always be exempt from control.

5.11* The Kingdom of the Netherlands is in favour of this Recommended Practice, but does not intend to establish "free airports", as the national customs legislation provides for extensive facilities for storage and handling of goods on and in the vicinity of airports.

This legislation offers more opportunities than a system of "free airports" would do whilst the supervision by the customs can more easily be carried out.

CHAPTER 6

6.5* Customs legislation requires that duties and other taxes be paid either in cash or by guaranteed and certified bank cheque.

6.28* While customs clearance is expedited as far as possible, customs administrators cannot undertake to clear all disembarking passengers of a flight within 45 minutes.

6.39* Duty-free sales are considered to be sales accomplishing the fictitious exportation of goods and as such, duty-free shops have to be established at specified points.

6.51* Off-airport bonded warehouses are allowed when airport capacity is limited and only where customs resources are available.

---

* Recommended Practice

28/2/94

CHAPTER 2

2.23 Disinsection is required to encompass animal, plant and public health concerns.

CHAPTER 3

3.8.6* Visas for re-entry are required for resident aliens.

3.9* New Zealand requires entry and departure cards for all passengers entering and leaving New Zealand.

3.16 A written baggage declaration is required from passengers and crew.

3.25.2 Crew members travelling as passengers require passports.

3.25.3* Crew members travelling as passengers require passports.

3.37.1 Operators can be fined.

CHAPTER 4

4.31 Some cargo of interest to the Ministry of Agriculture and Fisheries requires quarantine clearance at the airport of arrival.

4.40 Not acceptable. Under New Zealand customs law, ownership of the goods may not be clearly established and may be subject to dispute between two or more parties concerned. In these circumstances a claim may then be made on the original importer.

4.44* Not acceptable. A number of concessions exist and there is provision for individual goods or types of goods to be given concessionary entry, each case being judged on its merits. No over-all concessions exist or are envisaged to cover broad groupings of items.

4.45* Not acceptable. A number of concessions exist and there is provision for individual goods or types of goods to be given concessionary entry, each case being judged on its merits. No over-all concessions exist or are envisaged to cover broad groupings of items.

4.49 Unacceptable to New Zealand. Duty and taxes will be levied on appropriate items.

4.53 Not acceptable. Unaccompanied baggage is treated as cargo and is not subject to any customs concessions.

CHAPTER 5

5.4.1 Those who do not otherwise qualify for visa-free entry are required to obtain visas (Immigration Act 1987).

---

* Recommended Practice

CHAPTER 3

3.8 There is a fee charged for the issuance of a visa for Norway.

3.8.3 Entrance visas for temporary visitors are normally issued for one trip only and each stay limited to three months.

3.9* Upon entering the Inter-Nordic passport control area, comprising Denmark, Finland, Iceland, Norway and Sweden, temporary visitors holding entrance visas are, irrespective of means of transportation, required to complete a special Embarkation/Disembarkation Card which differs slightly from the ICAO format. (For the vast majority of travellers, visas and consequently Embarkation/Disembarkation Cards are not required.)

3.10 Upon entering the Inter-Nordic passport control area, comprising Denmark, Finland, Iceland, Norway and Sweden, temporary visitors holding entrance visas are, irrespective of means of transportation, required to complete a special Embarkation/Disembarkation Card which differs slightly from the ICAO format. (For the vast majority of travellers, visas and consequently Embarkation/Disembarkation Cards are not required.)

3.10.1 Upon entering the Inter-Nordic passport control area, comprising Denmark, Finland, Iceland, Norway and Sweden, temporary visitors holding entrance visas are, irrespective of means of transportation, required to complete a special Embarkation/Disembarkation Card which differs slightly from the ICAO format. (For the vast majority of travellers, visas and consequently Embarkation/Disembarkation Cards are not required.)

3.24 Visa is required from crew members being nationals of States who otherwise are obliged to obtain visa.

CHAPTER 4

4.9* Export declaration is generally required.

4.19* The choice between separate documents and a combined document is not left to the trader's option.

4.23* The requirement to submit documents does not depend upon the value or weight of a consignment but upon its nature. No customs declaration is thus required in respect of goods imported by private persons for non-commercial purposes.

4.23.1* The exemption from import duties does not depend on the value or weight of the consignments, but on their nature. Relief from import duty payment is thus granted in respect of certain samples and gifts.

4.24 The requirement to submit documents does not depend upon the value or weight of a consignment but upon its nature. No customs declaration is thus required in respect of goods imported by private persons for non-commercial purposes.

CHAPTER 5

5.4.1 Passengers who are obliged to hold an entry visa for Norway would obtain permission to stay in transit without a visa only if they continue their journey on the same day and remain in the transit area of the airport until they leave Norway.

---

* Recommended Practice

28/2/94

CHAPTER 2

2.4 The General Declaration is required on arrival and departure.

2.6 A Passenger Manifest is required on the arrival and departure of aircraft.

2.12 The authorized agent or pilot-in-command is required to deliver to the public authorities concerned:

a) Three copies of the General Declaration.

b) Three copies of the Cargo Manifest, listing and describing the cargo according to points of unlading.

2.34 Notice must be given at least 24 hours in advance of the arrival or the intended overflight of the aircraft.

2.38 Special permission may be given, provided application for such permission is filed at least 72 hours before the intended arrival of the aircraft.

CHAPTER 3

3.5.2* Presentation of a certificate of good conduct is desirable.

3.6 This Standard is implemented in the case of nationals of those countries with which Panama has concluded special agreements. Nationals of other countries are required to present a tourist or transit card or to have obtained a visa.

3.8 In cases where a visa is required, the visa charge is payable except where there are agreements providing for exemption from such payment.

3.8.3 The length of validity of the visa is 90 days from the date of issue. A visitor who has not entered Panamanian territory before expiry of that period must obtain a new visa.

3.8.6* Foreign residents must obtain a return permit which must be countersigned at a Panamanian consulate. Residents who are United States nationals and holders of multiple re-entry visas are exempt from this requirement.

3.9* The Embarkation/Disembarkation Card is required of all passengers without exception.

3.10 The passport number, place of issue of the passport, purpose of visit and length of stay in Panama are also required.

3.17 All baggage is subject to inspection.

3.36 Operators are penalized whenever they are shown to have neglected taking precautions with regard to control documentation. In some cases, passengers are sent back to their place of origin; depending on their economic solvency, they are permitted to enter.

* Recommended Practice

CHAPTER 4

4.12 Export Licences are only required for silver, gold, platinum and bananas. Licences are also required for the export of other goods when, in the opinion of the Executive Body, they are necessary in order to implement any prohibition to export or re-export specific goods.

4.18 The commercial invoice, the consular invoice, the bill of lading, the special permit in cases of restricted importation and, in some cases, the certificate of origin are required for imported goods.

4.19* Where appropriate, separate documents are required.

4.21 Consular formalities (duly attested commercial invoice) and consular fees are required except for goods dispatched by mail.

4.22 Licences are required and the procedures are those laid down in national legislation.

4.23* It is recommended that goods of this kind be sent into the country by mail, and consequently they are exempt from consular formalities and export permits.

4.24 All goods require customs clearance formalities, with the exception of those sent by mail.

4.28* In these cases, inspection by all control services is required.

4.30 All imported goods are subject to inspection.

4.33 It will be subject to inspection if so required by customs and the documentation governing this type of operation will be required.

4.34* Goods in transit are inspected in the airport cargo area. Large pallets and containers are examined at the place of final destination.

4.46* Some airline documents (forms) are subject to formalities and payment of customs duties.

CHAPTER 5

5.4.1 These passengers must obtain a "passenger-in-transit card" which is issued at the airport.

5.12* A free zone has been established at Tocumen International Airport.

CHAPTER 6

6.22* Electronic devices are used to inspect passengers' baggage.

6.59* The medical service at Tocumen Airport is open twenty-four (24) hours a day.

---

* Recommended Practice

28/2/94

CHAPTER 2

2.4 The use of a document entitled Traffic Form (Formulario de Trafego) has made it possible to eliminate the following documents: General Declaration, Passenger Manifest and Customs Clearance for entry and exit of goods, permit to load and unload cargo and customs entry declaration.

2.7* Presentation of the Cargo Manifest is required.

2.8 The gross weight of the consignment has also be be indicated.

CHAPTER 3

3.5.1* Machine readable passports are not being used in Portugal, although there are plans to introduce them in the near future.

3.8 There is a charge imposed on all visas except on courtesy visas.

3.9* Embarkation/Disembarkation Card is required except for EEC citizens.

3.10 The Embarkation/Disembarkation Card of Portugal does not have the items "Place of Birth", "Occupation" and "Permanent address" as are found in Appendix 5 of Annex 9. Also, there is provision for obtaining the signature of the passenger in the card of Portugal which has not been made in Appendix 5 to Annex 9.

CHAPTER 4

4.9* Unaccompanied baggage is shipped as cargo and as such is accompanied by an air waybill.

4.19* The commercial invoice and the certificate of origin are required separately.

4.53 b) and c) Unaccompanied baggage is regarded as cargo and is physicially directed to areas provided for cargo.

CHAPTER 5

5.4 The identity of the aircraft involved, the nature and identity of the consignment (packages), the gross weight and the place of lading of the goods may be required to be included in a document to be presented as a summary declaration of goods to the customs authorities.

5.5 Goods introduced into a Portuguese custom territory are subject to customs surveillance and may be checked by customs authorities.

CHAPTER 6

6.5* Payment of duties and taxes may be made either in cash or by guaranteed and certified bank cheque. The use of credit cards as a means of payment is not provided for.

6.28* While customs clearance is carried out as expeditiously as possible, it is not possible to undertake to impose a time limit on the clearance of passengers.

6.39* Duty-free sales are carried out on the basis that such are exports. Therefore, duty-free sales shops have to be located at specific spots.

6.51* When airport capacity is limited, off-airport bonded warehouses are allowed only when customs resources are available.

* Recommended Practice

CHAPTER 2

2.4 The requirement is for presenting a General Declaration.

2.5 The General Declaration shall state the surnames of the crew members.

2.7* A Cargo Manifest is required.

2.8.1* The Cargo Manifest shall specify the kind of cargo.

2.34 A preliminary permit is required for operating such flights in accordance with the procedures set forth in AIP Russian Federation.

2.35 A preliminary permit is required for operating such flights in accordance with the procedures set forth in AIP Russian Federation.

2.36 A preliminary permit is required for operating such flights in accordance with the procedures set forth in AIP Russian Federation.

2.38 A preliminary permit is required for operating such flights in accordance with the procedures set forth in AIP Russian Federation.

2.39 A preliminary permit is required for operating such flights in accordance with the procedures set forth in AIP Russian Federation.

2.40* A preliminary permit is required for operating such flights in accordance with the procedures set forth in AIP Russian Federation.

2.42* Not applicable.

CHAPTER 3

3.7* The requirement is for delivering a valid document providing evidence of the right to arrive in or depart from the Russian Federation.

3.16 Passengers crossing the Russian Federation State border whose cabin-carried articles and baggage are subject to customs clearance shall fill in a customs declaration. All crew members may be cleared on the basis of oral declaration.

3.24 The crew members of foreign airlines arriving in the Russian Federation shall be in possession of valid national passports with Russian visas, unless bilateral agreements stipulate otherwise.

3.24.1 The crew members of foreign airlines arriving in the Russian Federation shall be in possession of valid national passports with Russian visas, unless bilateral agreements stipulate otherwise.

3.25 The crew members of foreign airlines arriving in the Russian Federation shall be in possession of valid national passports with Russian visas, unless bilateral agreements stipulate otherwise.

* Recommended Practice

3.25.1* The crew members of foreign airlines arriving in the Russian Federation shall be in possession of valid national passports with Russian visas, unless bilateral agreements stipulate otherwise.

3.25.2 The crew members of foreign airlines arriving in the Russian Federation shall be in possession of valid national passports with Russian visas, unless bilateral agreements stipulate otherwise.

3.25.3* The crew members of foreign airlines arriving in the Russian Federation shall be in possession of valid national passports with Russian visas, unless bilateral agreements stipulate otherwise.

3.28 Not applicable.

CHAPTER 5

5.4.1 Transit passengers without a transit visa may stay in the airport transit area or in a hotel for foreign transit passengers for a period of 24 hours.

5.11* There are no free airports, zones or storages in the Russian Federation.

5.12* There are no free airports, zones or storages in the Russian Federation.

5.13 There are no free airports, zones or storages in the Russian Federation.

CHAPTER 6

6.64* Activity in the territory of the Russian Federation by representatives of appropriate bodies of other States is not provided for.

---

* Recommended Practice

CHAPTER 2

2.4 The General Declaration is required.

2.6 The Passenger Manifest, with an indication of origin and destination, is required.

2.7* The Cargo Manifest and a detailed statement of the goods carried are required.

2.8 The Cargo Manifest and a detailed statement of the goods carried are required.

2.12 More than two copies of the General Declaration, the Cargo Manifest and the List of Stores are required.

2.15 More than two copies of the General Declaration, the Cargo Manifest and the List of Stores are required.

2.40* In addition to the information listed in 2.40, the following information is required:

— call sign of the aircraft
— name of the aircraft commander
— other crew members (names and/or number)
— coordinates of the Rwandan border-crossing points

CHAPTER 3

3.8 There are five types of visas:

— transit visa
— travel visa (8 days to 6 months)
— temporary visa (6 months to 2 years)
— residence visa (indefinite duration)
— diplomatic visa (free of charge)

3.9* Two cards are used:

— Embarkation Card (pink)
— Disembarkation Card (blue)

3.30* Baggage is regularly inspected upon departure.

CHAPTER 4

4.17 An air waybill is required.

CHAPTER 5

5.12* Kigali/Gregoire Kayibanda International Airport has no free zone.

---

* Recommended Practice

28/2/94

CHAPTER 2

2.6 The passenger manifest is required.

2.11 A list of the number of pieces of accompanied baggage is required.

2.17 No extra documentation is required only when the aircraft is cleared at one of the airports.

2.23 Disinsecting of an aircraft on a through flight is not required. Aircraft leaving an area infected with yellow fever or Aedes Aegypti for an area receptive to these diseases or where these diseases have been eradicated require disinsection.

2.34 All non-scheduled flights must apply for and obtain permission to land in or overfly Saudi Arabia before departure from the point preceding the port of entry into Saudi Arabian territory.

2.35 Reasons for non-scheduled flights must be given in the application.

2.41* All aircraft, when entering or departing from Saudi Arabia, have to do so at international airports.

CHAPTER 3

3.6 Tourist cards and visas are not given at airports of entry. Both must be obtained before arrival in Saudi Arabia.

3.7* Entry visas are required for all visitors to the Kingdom.

3.9* Supplementary information such as proof of religion is required in addition to the information given in the passenger's identity documents.

3.10 Saudi Arabian Embarkation/Disembarkation Cards do not conform to the format in Appendix 5 of Annex 9.

3.24 Crew licences are not acceptable in lieu of passports and visas.

3.37.1 Operators are liable to pay a fine if documents of passengers they bring into the Kingdom are inadequate or unacceptable or if passengers are inadmissible on other grounds.

CHAPTER 4

4.9* A cargo manifest or certified copy of the manifest is required for the clearance of export cargo.

4.21 Consular charges are levied in connexion with documents for the clearance of air cargo.

4.32 Customs duties and other taxes are waived on containers, pallets and associated equipment brought into the Kingdom on a reciprocal basis.

4.44* There is duty payable on the items included in this Recommended Practice.

* Recommended Practice

CHAPTER 5

5.8* Passengers who transfer from one international airport to another are not exempt from control and all landing and embarkation documents are required to be presented at the transfer.

5.11* Free airports and free zones to not exist in Saudi Arabia.

5.12* Free airports and free zones to not exist in Saudi Arabia.

CHAPTER 6

6.10* The contents of this Recommended Practice have not been implemented.

6.64* There is no pre-clearance facility accorded to other Contracting States in Saudi Arabia in keeping with its immigration requirements.

CHAPTER 7

7.3.3 It must be ensured that all required and relevant documentation has been cleared before take-off.

CHAPTER 8

8.12 Special sanitary regulations are in force in Saudi Arabia.

8.15* No advance information regarding vaccination requirements or the availability of documentation in relation to vaccination is available prior to departure and it is the responsibility of the handling agencies concerned to inform passengers prior to departure.

---

* Recommended Practice

28/2/94

CHAPTER 2

2.4 The presentation of a stamped General Declaration is required.

2.7* The presentation of a cargo manifest is required.

2.8.1* Information concerning the nature of goods is required.

2.23 All aircraft arriving at Seychelles International Airport are required to have been disinsected on chocks at the last point of departure. Failure to satisfy the Health Authorities that disinsection has been "properly performed" will require the aircraft to be disinsected prior to disembarkation of passengers.

2.24* All aircraft arriving at Seychelles International Airport are required to have been disinsected on chocks at the last point of departure. Failure to satisfy the Health Authorities that disinsection has been "properly performed" will require the aircraft to be disinsected prior to disembarkation of passengers.

2.25 All aircraft arriving at Seychelles International Airport are required to have been disinsected on chocks at the last point of departure. Failure to satisfy the Health Authorities that disinsection has been "properly performed" will require the aircraft to be disinsected prior to disembarkation of passengers.

2.26* All aircraft arriving at Seychelles International Airport are required to have been disinsected on chocks at the last point of departure. Failure to satisfy the Health Authorities that disinsection has been "properly performed" will require the aircraft to be disinsected prior to disembarkation of passengers.

2.27* All aircraft arriving at Seychelles International Airport are required to have been disinsected on chocks at the last point of departure. Failure to satisfy the Health Authorities that disinsection has been "properly performed" will require the aircraft to be disinsected prior to disembarkation of passengers.

2.28* All aircraft arriving at Seychelles International Airport are required to have been disinsected on chocks at the last point of departure. Failure to satisfy the Health Authorities that disinsection has been "properly performed" will require the aircraft to be disinsected prior to disembarkation of passengers.

2.29* All aircraft arriving at Seychelles International Airport are required to have been disinsected on chocks at the last point of departure. Failure to satisfy the Health Authorities that disinsection has been "properly performed" will require the aircraft to be disinsected prior to disembarkation of passengers.

2.30 All aircraft arriving at Seychelles International Airport are required to have been disinsected on chocks at the last point of departure. Failure to satisfy the Health Authorities that disinsection has been "properly performed" will require the aircraft to be disinsected prior to disembarkation of passengers.

2.31 All aircraft arriving at Seychelles International Airport are required to have been disinsected on chocks at the last point of departure. Failure to satisfy the Health Authorities that disinsection has been "properly performed" will require the aircraft to be disinsected prior to disembarkation of passengers.

2.32 All aircraft arriving at Seychelles International Airport are required to have been disinsected on chocks at the last point of departure. Failure to satisfy the Health Authorities that disinsection has been "properly performed" will require the aircraft to be disinsected prior to disembarkation of passengers.

2.33 Permission for non-traffic stops for non-scheduled flights must be obtained from the Director General of Civil Aviation at least 3 working days in advance of the planned flight. (See AIP FAL 0-1/1-2.)

* Recommended Practice

2.34 Permission for non-traffic stops for non-scheduled flights must be obtained from the Director General of Civil Aviation at least 3 working days in advance of the planned flight. (See AIP FAL 0-1/1-2.)

2.35 Permission for non-traffic stops for non-scheduled flights must be obtained from the Director General of Civil Aviation at least 3 working days in advance of the planned flight. (See AIP FAL 0-1/1-2.)

2.36 Permission for non-traffic stops for non-scheduled flights must be obtained from the Director General of Civil Aviation at least 3 working days in advance of the planned flight. (See AIP FAL 0-1/1-2.)

2.37* Permission for non-traffic stops for non-scheduled flights must be obtained from the Director General of Civil Aviation at least 3 working days in advance of the planned flight. (See AIP FAL 0-1/1-2.)

2.38 Permission for non-traffic stops for non-scheduled flights must be obtained from the Director General of Civil Aviation at least 3 working days in advance of the planned flight. (See AIP FAL 0-1/1-2.)

2.39 Permission for non-traffic stops for non-scheduled flights must be obtained from the Director General of Civil Aviation at least 3 working days in advance of the planned flight. (See AIP FAL 0-1/1-2.)

2.40* Permission for non-traffic stops for non-scheduled flights must be obtained from the Director General of Civil Aviation at least 3 working days in advance of the planned flight. (See AIP FAL 0-1/1-2.)

CHAPTER 3

3.9* Embarkation/Disembarkation cards are required to be completed. E/D cards do not conform to that laid out in Appendix 5 of Annex 9. Certain additional information is required to be provided by passengers. It is the responsibility of the carrier to issue disembarkation cards to the passengers.

3.10 Embarkation/Disembarkation cards are required to be completed. E/D cards do not conform to that laid out in Appendix 5 of Annex 9. Certain additional information is required to be provided by passengers. It is the responsibility of the carrier to issue disembarkation cards to the passengers.

3.10.1 Embarkation/Disembarkation cards are required to be completed. E/D cards do not conform to that laid out in Appendix 5 of Annex 9. Certain additional information is required to be provided by passengers. It is the responsibility of the carrier to issue disembarkation cards to the passengers.

3.10.2 Embarkation/Disembarkation cards are required to be completed. E/D cards do not conform to that laid out in Appendix 5 of Annex 9. Certain additional information is required to be provided by passengers. It is the responsibility of the carrier to issue disembarkation cards to the passengers.

3.16 A written declaration is required if crew leaves the airport.

3.17 Although Red and Green channels exist, the Government reserves the right to search all arriving passengers' baggage.

3.17.1 Although Red and Green channels exist, the Government reserves the right to search all arriving passengers' baggage.

* Recommended Practice

CHAPTER 4

4.9* An export entry is required for the exportation of cargo.

4.9.1* An export entry is required for the exportation of cargo.

4.53 Unaccompanied baggage is treated as cargo for the purpose of clearance through customs controls.

CHAPTER 5

5.4 Disembarking passengers, being transferred from one international flight to another at Seychelles International Airport, must pass through immigration controls, except in special circumstances.

5.11* Free Zones are not considered necessary or feasible at present.

5.12* Free Zones are not considered necessary or feasible at present.

5.13 Free Zones are not considered necessary or feasible at present.

CHAPTER 6

6.10* At present, passengers and crew have to proceed across the open apron between the terminal building and the aircraft and vice versa.

6.33* No facilities are provided for passengers not connecting immediately with another aircraft. Passengers are therefore required to pass through Immigration and Customs Controls.

6.35* Transit passengers await connections in the departure lounge.

6.59* No nursing or paramedical staff are available at the airport. First aid is provided until medical help arrives. Ambulance and nursing/medical personnel are made available when prior notice of a requirement is given.

---

* Recommended Practice 28/2/94

SINGAPORE

CHAPTER 3

3.10 Supplementary information and information required in Embarkation/ Disembarkation Cards are not all similar to those required in Appendix 5 of Annex 9.

CHAPTER 6

6.62 A fee for yellow fever vaccination is levied since this service is provided by a private clinic at Changi Airport.

28/2/94

CHAPTER 2

2.6 Presentation of a Passenger Manifest is not required. The operator is obliged to disclose passenger information to the Customs Authorities.

2.8.1* Recommended Practice 2.8.2 is applied in the Slovak Republic.

2.40* The price of the charter flight is required. If the flight is organized in conjunction with an "inclusive Tour", more details are required (See FAL 1. paragraph 1.3.2.3 in A.I.P).

2.42* Not applied.

CHAPTER 3

3.8.3 Entry visas for aliens, if required, usually only entitle one entry during the three months from the date of issue, except in special circumstances.

3.8.6* New entry visas for re-entry from resident aliens are required.

3.8.9* At present the text of the Slovak visa is in the national language only.

3.24 In accordance with Regulations valid in the Slovak Republic, flight members' licences and crew members' certificates are not accepted as travel documents or an entrance visa.

3.24.1 In accordance with Regulations valid in the Slovak Republic, flight members' licences and crew members' certificates are not accepted as travel documents or an entrance visa.

3.25 In accordance with Regulations valid in the Slovak Republic, flight members' licences and crew members' certificates are not accepted as travel documents or an entrance visa.

3.25.1* In accordance with Regulations valid in the Slovak Republic, flight members' licences and crew members' certificates are not accepted as travel documents or an entrance visa.

3.25.2 In accordance with Regulations valid in the Slovak Republic, flight members' licences and crew members' certificates are not accepted as travel documents or an entrance visa.

3.25.3* In accordance with Regulations valid in the Slovak Republic, flight members' licences and crew members' certificates are not accepted as travel documents or an entrance visa.

3.29* Presentation of baggage of passengers departing from the Slovak Republic is required.

3.30* Presentation of baggage of passengers departing from the Slovak Republic is required.

CHAPTER 4

4.23* A commercial invoice (certificate of value) is required for high value trade samples; for trade samples up to an equivalent value of US$1, the declaration of the consignor in the air waybill is sufficient.

* Recommended Practice

28/2/94

4.23.1* Private consignments up to the value of the Slovak retail price of 500 Sk and trade samples of modest value are free from import duties.

4.28* The Customs Authorities decide about consignments of veterinary and plant origin.

4.32.1* The Customs Authorities will accept a declaration from the operator if it is not in contradiction with the declaration of the consignor or consignee.

CHAPTER 5

5.11* No free aerodromes or free zones have been established at Slovak international aerodromes. Warehousing facilities are provided.

5.12* No free aerodromes or free zones have been established at Slovak international aerodromes. Warehousing facilities are provided.

5.13 No free aerodromes or free zones have been established at Slovak international aerodromes. Warehousing facilities are provided.

CHAPTER 6

6.71* Aliens can import without foreign exchange permission 100 Sk unless otherwise specified in respective bilateral financial agreements.

---

* Recommended Practice

CHAPTER 2

2.8 European Community customs legislation requires that documents relating to cargo indicate the gross weight of each consignment of cargo.

2.8.1* European Community customs legislation requires that the gross weight and the nature of goods be shown on the documents presented at customs.

2.17 Special interior traffic manifests must be presented before departure from Spain, relating to cargo loaded at an intermediate stop within Spain.

CHAPTER 4

4.9* Unaccompanied baggage is shipped as cargo and as such is covered by a traffic document.

4.13 The customs authorities reserve the right to inspect exported goods and this inspection is carried out on a selective basis.

4.19* The commercial invoice and the certificate of origin are required separately as required by European Community legislation.

4.32.1* Spain follows provisions of international conventions relating to containers and pallets which are usually included in European Community customs legislation.

4.44* Not all items referred to in this Recommended Practice are admitted duty free.

4.45* Not all items referred to in this Recommended Practice are admitted duty free.

4.53 b) and c) European Community customs legislation regards unaccompanied baggage as cargo and as such it is cleared in areas allocated to cargo.

CHAPTER 5

5.4 European Community customs legislation requires that the identity of the aircraft as well as the identity and nature of cargo and baggage, the gross weight and place of lading of the goods may be required by customs as a summary declaration of goods.

5.5 European Community customs legislation requires that any goods introduced into a customs territory shall be subject to customs surveillance and may be checked by customs authorities.

5.8* Passengers who transfer from one international airport or terminal to another airport or terminal cannot always be exempted from control.

CHAPTER 6

6.5* European Community customs legislation requires that payment of duties and taxes may be made either in cash or by certified and guaranteed cheque.

6.28* Clearance of all disembarking passengers of a flight within 45 minutes cannot be guaranteed by the customs authorities although all measures are being taken to expedite clearance.

6.39* Duty-free sales are conducted on the basis that such are exports. Therefore, duty-free shops have to be located at specific points (European Community regulations).

6.51* European Community regulations require that where airport capacity is limited, off-airport bonded warehouses (transit sheds) are allowed only where customs resources are available.

* Recommended Practice

CHAPTER 2

2.4 The General Declaration is still required by Customs and Immigration for statistical purposes.

2.6 The Passenger Manifest is still required by Customs and Immigration for statistical purposes.

2.39 Aircraft engaged in the carriage of passengers, cargo or mail for hire or reward on non-scheduled air services, or a series thereof, are required to obtain a permit from the Director of Civil Aviation and a fee is payable for the issue of such permit.

CHAPTER 3

3.5 Passports are normally issued at least two weeks after receipt of the application except in special cases.

3.5.2* Passports are only issued by the Central Immigration Department.

3.5.3* Period of validity of passports varies between two and five years depending on the immediate requirement of the applicant.

3.7* Visas are required from temporary visitors except visitors from the following countries:

All Commonwealth countries, European Economic Community, Finland, Iceland, Norway, Denmark, Sweden, Israel, San Marino, Uruguay, South Africa and Liechtenstein.

Other nationals may be granted entrance visas on arrival for a period of 2 to 3 days provided there is in existence a valid passport to enable the visitor to regularize his position.

3.8.3 Visas are made valid depending on the visit of the applicant but not more than 90 days from the date of issue. See also 3.7 above.

3.16 A baggage declaration form is required by Customs.

3.17 Although a Baggage Declaration Form is required, some inspection is done on a selective basis for selective flights.

3.17.1 The dual-channel baggage clearance system is not employed but some sampling inspection is done for selected flights.

CHAPTER 4

4.4* Automation has not been considered by the aviation authorities for the foreseeable future and any developments shall be notified accordingly.

4.5 Automation has not been considered by the aviation authorities for the foreseeable future and any developments shall be notified accordingly.

4.6 Automation has not been considered by the aviation authorities for the foreseeable future and any developments shall be notified accordingly.

* Recommended Practice

4.6.1*	Automation has not been considered by the aviation authorities for the foreseeable future and any developments shall be notified accordingly.
4.7*	Automation has not been considered by the aviation authorities for the foreseeable future and any developments shall be notified accordingly.
4.8	Automation has not been considered by the aviation authorities for the foreseeable future and any developments shall be notified accordingly.
4.8.1*	Automation has not been considered by the aviation authorities for the foreseeable future and any developments shall be notified accordingly.
4.9*	The following documents are required by Customs:
	Air Waybill; Invoices; Bill of Entry; Baggage Declaration for unaccompanied baggage; Bank form.
4.9.1*	The following documents are required by Customs:
	Air Waybill; Invoices; Bill of Entry; Baggage Declaration for unaccompanied baggage; Bank form.
4.10	The following documents are required by Customs:
	Air Waybill; Invoices; Bill of Entry; Baggage Declaration for unaccompanied baggage; Bank form.
4.13	Random checks are done for import cargo.

---

* Recommended Practice

28/2/94

CHAPTER 3

3.9* Upon entering the Inter-Nordic passport control area, comprising Denmark, Finland, Iceland, Norway and Sweden, temporary visitors holding entry visas are, irrespective of means of transportation, required to complete a special Disembarkation Card which differs from the ICAO format. (For the vast majority of travellers, visas and consequently Disembarkation Cards are not required.)

3.10 Upon entering the Inter-Nordic passport control area, comprising Denmark, Finland, Iceland, Norway and Sweden, temporary visitors holding entry visas are, irrespective of means of transportation, required to complete a special Disembarkation Card which differs from the ICAO format. (For the vast majority of travellers, visas and consequently Disembarkation Cards are not required.)

CHAPTER 4

4.9* Export declaration is generally required.

4.19* The choice between separate documents and a combined form is not always left at the trader's option.

4.23* The required documents do not as a rule depend on the value or weight of the consignments but on their nature. No customs declaration is thus required in respect of goods imported by private persons for non-commercial purposes.

4.23.1* The exemption of import duties does not as a rule depend on the value or weight of the consignments but on their nature. Relief from import duties is thus granted in respect of certain gifts and samples.

4.24 The required documents do not as a rule depend on the value or weight of the consignments but on their nature. No customs declaration is thus required in respect of goods imported by private persons for non-commercial purposes.

CHAPTER 5

5.4.1 Transit stay without a visa is granted only to persons continuing their journey on the same day without leaving the airport.

---

* Recommended Practice

CHAPTER 2

2.17 Domestic flights by aircraft which have not cleared customs are in principle not permitted.

CHAPTER 3

3.8 Switzerland cannot undertake to conclude reciprocal or other arrangements to issue entrance visas to temporary visitors without charge.

3.8.3 In cases where the visa is granted the Swiss authorities reserve the right to fix the duration of validity of the visa as well as the number of entries into the State.

3.41 The operator is liable for as long as the legal requirements have not been fulfilled, whether by himself or by a third person.

CHAPTER 4

4.9* In most cases, all that is required for the shipment of cargo by freight traffic is an ordinary export declaration. For certain consignments, the export declaration is replaced by a duplicate waybill, to which a special stamp is affixed.

CHAPTER 5

5.2 Exemption from the requirement for a transit passenger in Switzerland to hold a transit visa is made only in instances where:

a) the passenger is in possession of a valid passport of a country whose nationals are exempted from obtaining a transit visa to Switzerland;

b) the passenger is scheduled to leave the airport within 48 hours;

c) the passenger has necessary identity papers and visa for the country of destination;

d) the passenger has valid reservations and a passenger ticket for the onward journey.

5.4 Exemption from the requirement for a transit passenger in Switzerland to hold a transit visa is made only in instances where:

a) the passenger is in possession of a valid passport of a country whose nationals are exempted from obtaining a transit visa to Switzerland;

b) the passenger is scheduled to leave the airport within 48 hours;

c) the passenger has necessary identity papers and visa for the country of destination;

d) the passenger has valid reservations and a passenger ticket for the onward journey.

CHAPTER 2

2.4	Presentation of the General Declaration is required.
2.4.2	Not applicable, since Passenger Manifest and General Declaration are required.
2.5	First names, surnames and nationalities of crew members are required.
2.6	Presentation of a Passenger Manifest is required.
2.6.1*	List of passenger names is required to be submitted.
2.7*	Cargo Manifest is required to be submitted.
2.8.1*	Information concerning the nature of goods in the Cargo Manifest is required.
2.12	Four copies of the General Declaration, five copies of the Passenger Manifest, three copies of the Cargo Manifest and one copy of the stores list in respect of stores laden are required before departure of the aircraft.
2.13	Three copies of the General Declaration, three copies of the Passenger Manifest and one copy of the Cargo Manifest are required.
2.14	The use of standard baggage weights for each piece of baggage is not permitted for safety reasons.
2.15	Five copies of the General Declaration, six copies of the Passenger Manifest, four copies of the Cargo Manifest are required to be submitted on arrival of the aircraft.
2.16	Three copies of the General Declaration, three copies of the Passenger Manifest and one copy of the Cargo Manifest are still required.
2.18*	Only English language is required.
2.19	Documents written in pencil are not acceptable.
2.34	Prior permission is required. Detailed requirements are published in AIP — Thailand.
2.35	Prior permission is required. Detailed requirements are published in AIP — Thailand.
2.38	Private aircraft with maximum take-off weight not exceeding 5 700 kg must request permission at least 15 days in advance; seven days in advance for aircraft with maximum take-off weight exceeding 5 700 kg.
2.39 a)	It would take at least seven days to process such an application owing to security considerations. Therefore an application has to be made at least seven days in advance.

CHAPTER 3

3.8.1*	Visas are not issued in machine readable form.
3.8.3	A visitor's visa is usually valid for a period of three months from the date of issue but it may be extended on a case-by-case basis.
3.8.6*	Resident aliens are required to obtain a non-quota immigrant visa before their departure from Thailand.

* Recommended Practice

3.8.7* The authorized duration of stay will be stamped on the visa only on arrival in Thailand.

3.9* Embarkation/Disembarkation Card is required.

3.16 Inbound passengers are required to complete Passenger Declaration Form No. 211.

3.24 Flight crew member licences are accepted for a stay of up to 30 days.

3.24.1 Flight crew member licences are accepted for a stay of up to 30 days.

3.25 Flight crew member licences are accepted for a stay of up to 30 days.

3.25.1* Flight crew member licences are accepted for a stay of up to 30 days.

3.25.2 Passport and an airline's letter stating the departure as crew member are required but visa is required only in case the stay exceeds 15 days.

3.25.3* Passport and an airline's letter stating the departure as crew member are required but visa is required only in case the stay exceeds 15 days.

3.28 Residents must, in addition to the requirements of 3.8.6, have their residence certificates endorsed by the Immigration Authorities before departure.

3.31 Authorities reserve the right to inspect baggage of departing passengers.

3.32 Tax clearance certificates are required from passengers whose stay in Thailand exceeds 30 days' duration in one year or whose income during their stay (of whatever duration) reaches taxable levels.

CHAPTER 4

4.13 Physical examination of cargo and unaccompanied baggage to be exported by air is normally required.

4.15 All cargo must be presented for clearance at the air customs office of the airport.

4.44* The Customs Act of Thailand requires customs duties and other charges or taxes to be paid on the items specified in this Recommended Practice.

4.45* The Customs Act of Thailand requires customs duties and other charges or taxes to be paid on the items specified in this Recommended Practice.

4.46* The Customs Act of Thailand requires customs duties and other charges or taxes to be paid on the items specified in this Recommended Practice.

CHAPTER 5

5.4.1 A transit visa is required from a national of a country which is not included in the list of visa-exempted countries.

CHAPTER 6

6.62.1. Note 1 An amount of 350 Baht shall be charged for a vaccination against yellow fever.

---

* Recommended Practice

28/2/94

CHAPTER 2

2.4 A General Declaration is required by the customs authorities when aircraft arrive at the airport.

2.4.4 The General Declaration must be signed and stamped by a proper officer for the purpose of outbound and inbound clearance.

2.5 A Crew Declaration Form must be signed by each member of the crew who must state therein the quantity of dutiable articles that are in their possession.

2.6 The presentation of a Passenger Manifest is required by the Departments of Customs and Immigration.

2.7* The presentation of a Cargo Manifest is required by the Department of Customs.

2.8 Description of cargo should reveal:

a) Marks and number on packages;
b) Number and type/s of packages;
c) Nature of goods;
d) Gross weight of the goods.

CHAPTER 3

3.7* Visa requirements are on a reciprocal basis. Entry visas are not required for Preferential Trade Area (P.T.A). A charge for the issuance of a visa is levied.

3.8.3 Entrance visas are valid for 3 months. A visitor, however, may stay for 12 months provided a visa extension application is made every 3 months.

3.10 On the Embarkation/Disembarkation Card, the Department of Immigration requires the following additional information from non-residents:
a) duration of stay in Uganda;
b) purpose of visit.

3.17.1 At present, no dual-channel baggage clearance system exists, but consideration is being given for the establishment of one during the on-going rehabilitation programme.

CHAPTER 4

4.9* Customs authorities require that individual documents be presented to account for shipments of cargo including unaccompanied baggage.

4.13 Physical verification/examination is required to ascertain the nature and quantity of goods.

4.19* Simplified documents are accepted as long as the following information is given:

a) Exporter's name and address;
b) Consignee's name and address;
c) Number of package/s;
d) Gross weight of the package/s;
e) Nature and quantity of the goods.

4.53 Unaccompanied baggage weighing not more than 100 kg is cleared as personal effects. Unaccompanied baggage whose gross weight is above 100 kg is cleared as cargo.

CHAPTER 5

5.4.1 A transit visa valid for 7 days is granted on arrival.

* Recommended Practice

CHAPTER 2

2.4 A General Declaration is required in certain circumstances, e.g. where aircraft arrive at non-designated airports and aerodromes.

2.7* The Cargo Manifest is normally required for certain general control and anti-smuggling purposes.

2.8 The gross weight for each consignment is also required.

2.8.1* A description of the goods sufficient to identify them, and the gross weight, may be required.

2.10 A written but abbreviated list of stores remaining on board aircraft is required. This enables checks of stores to be kept to a minimum.

CHAPTER 3

3.8 The United Kingdom normally charges for visas or other entry clearances. In certain circumstances the charge is excused.

3.8.1* The United Kingdom supports the concept of Machine Readable Visas but is currently not in a position to implement this Recommended Practice.

3.8.2 Visa applicants may be required to attend personally at the consulate.

3.8.3 United Kingdom entry clearances are normally valid for presentation within six months of issue. Multiple entry clearances are at present valid for presentation for varying periods up to five years.

3.8.4* Where required, United Kingdom visas and entry clearances should be obtained prior to travel and a person will normally be refused entry in the absence of the necessary clearance. The immigration officer has discretion to waive the requirement for an entry clearance in exceptional circumstances.

3.8.6* Stateless persons or foreign nationals of a country for which the United Kingdom has a visa requirement under the Immigration Rules require visas for entry unless they are travelling on valid United Kingdom travel documents authorizing their return.

Holders of refugee travel documents issued under the 1951 Convention relating to the Status of Refugees by countries which are signatories to the 1959 Council of Europe Agreement on Refugees do not require visas if coming for visits of three months or less.

Nationals of countries or stateless persons who would normally be required to obtain visas before travelling to the United Kingdom are exempt from the requirement, provided that:

a. they had indefinite leave to enter or remain in the United Kingdom when they last left and that they have not been away for longer than two years;

or

b. having previously been in the United Kingdom, they seek to return within the period of an earlier permission granted for more than six months;

* Recommended Practice

or

c. they are otherwise exempt from United Kingdom immigration control; for example, they have an entitlement to the Right of Abode (a passport should bear a Certificate of Entitlement to the Right of Abode) or diplomatic status in the United Kingdom.

3.8.7* A United Kingdom visa does not show the period of stay. This is granted by the immigration officer on arrival.

3.9* Disembarkation Cards must normally be completed by all passengers except nationals of Member States of the European Community. Embarkation Cards are issued selectively and, where required, will be given to passengers before departure from the United Kingdom.

3.10 The cards in use require the address in the United Kingdom to be recorded and the passenger's signature.

3.10.2 Disembarkation Cards must be provided by the carrier at his expense and distributed to all passengers who need to complete them.

3.16 A written declaration is generally required from crew members. The advantage of written declarations is that, if they are satisfactory, Customs may not need to interview crew members.

3.18* The normal arrangements for immigration clearance in the United Kingdom provide for examination at the first point of entry into the Common Travel Area of Great Britain and Northern Ireland, the Channel Islands, the Isle of Man and the Republic of Ireland.

3.23 Crew member certificates are not issued by the United Kingdom Public Authorities to crew members of the United Kingdom airline whether or not they are required to be licensed.

Identification documents bearing photographs of the holders are issued to United Kingdom aircrew members, licensed and unlicensed, by United Kingdom airlines, and by airport authorities on their behalf, the validity of which may be checked by contacting the issuing authority.

United Kingdom flight crew licences conform to the specification for personnel licences set forth in paragraph 5.1.1 of Annex 1. The date of birth is also included. Following the introduction of computerized licence issues, a photograph of the holder is no longer included, neither is the place of birth nor a statement of the right of re-entry to the State of issue — these items are part of the Annex 9 Appendix 6 crew member certificate specification but are not called for in paragraph 5.1.1 of Annex 1.

3.24 Crew member certificates are not issued by the United Kingdom Public Authorities to crew members of the United Kingdom airline whether or not they are required to be licensed.

Identification documents bearing photographs of the holders are issued to United Kingdom aircrew members, licensed and unlicensed, by United Kingdom airlines, and by airport authorities on their behalf, the validity of which may be checked by contacting the issuing authority.
